^q "The territory of Poligny derives its principal wealth from its wines; it is needless to boast of the vineyards of Arbois"—Wine is made in considerable quantities in the department of Jura; and the wines of Arbois and Poligni, particularly the former, are much esteemed. (Ed. Encyc.)—Arbois is situated two leagues from Poligny and in the same arrondissement.—P.

^r "Do not these old traditions derive their origin from a cruel act of charity committed by Mahaut d'Arbois, countess of Burgundy, who during a dreadful famine, finding it impossible to feed the multitude of poor people who had taken refuge with her, ordered them to be burnt in a barn (*grange*) in which she had collected them."

are well built, and the streets are kept clean by the waters that flow from several fountains. It has given birth to some celebrated men in their time; we may mention the prebend John Molinet, who translated the poem of the Rose,^m James Coitier,ⁿ physician to Louis the Eleventh, and president of the court of exchequer, and lastly, Nicholas Rollin, chancellor to Philip the Good, duke of Burgundy. Many ancient monuments are situated in the neighbourhood; two druidical stones are still held in great veneration by the peasantry, who believe that they turn round of their own accord every year, precisely at the time of the midnight mass.^o The ruins of Roman edifices are situated in different directions, but the purpose for which they were built, has not been determined. The people call them the *Chambrettes*, the traces of many halls or chambers are still apparent; little attention has hitherto been bestowed on them, it might be worth while, however, to make excavations in the vicinity; at least if we may judge from a large piece of mosaic, which the count de Caylus considered the finest specimen of the kind, and which lies at present some feet below the surface of a cultivated field.^p

The products of the vineyards form the principal wealth of the country round Poligny, but the best sorts are those near Arbois,^q a neat and well-built town, the birthplace of general Pichegru, and a place of some celebrity from the remains of Celtic monuments and Roman edifices. The ruins of the ancient castle are imposing; the people relate the nocturnal visits of the evil spirits that haunt them; it is believed by them that the fairy *Melusina* resides often in the highest and largest of its black towers. If these old traditions have not originated from an act of cruelty committed by Mahaut of Arbois, countess of Burgundy, they were at all events strengthened by them; during a severe famine, a great many poor people fled to the countess for refuge and subsistence, finding it impossible to provide for them all, she confined them in a large building which, together with the inmates, was burnt by her orders.^r

Situated at the entrance of a narrow mountain pass, watered by the Furieuse, a small river, and commanded by

the ruins of several old castles, Salins derives its name and wealth from its salt springs, which were found to be very profitable at so early a period as the sixth century, when St. Sigismond, king of Burgundy, ceded them to the monks of the abbey of St. Maurice d'Againe. These monks worked the springs with so much zeal and intelligence, that in a few years a large burgh rose in the neighbourhood of their abbey. Such was the origin of a town which has produced several distinguished men, among others, Fenouillot de Falbaire, the celebrated dramatist.^a ^b A destructive fire that lasted three days, laid Salins in ashes in the month of July, 1825. The hospital and the salt works were the only buildings that remained: the first was too small to afford shelter to the numerous victims of the calamitous event; the second, although important, employed only a small number of hands; still these must have been the only resources of the ruined inhabitants, had they not appealed to the generosity of their countrymen. Subscriptions were opened in every town, and the money given by the benevolent and the charitable, amounted to £.100,000, it was laid out in rebuilding the city.^c A spectacle was then exhibited, that afforded a signal proof of the eagerness with which even the lowest classes of the French receive instruction whenever it is offered to them: the workmen flocked every evening round a former pupil of the Polytechnic school, who applied his knowledge of geometry and mechanics to teach them the best and most economical method of rebuilding their houses.^d

The territory of Lons le Saulnier formed in the middle ages the greater part of Scoding or Sco-d'In, literally the country on the Ain,^e the inhabitants of which were distinguished then, as they are now, by their courage. The people in the high country that extends to the east of the town, are said to be more active and intelligent than their neighbours in the west, who prefer agricultural labour to manufacturing industry. Lons le Saulnier was founded in the fourth century;^f the name of the town signifies a measure of salt,^g and it is to the salt springs in its vicinity, that its origin may be attributed. It is traversed by two small rivers, the Valiere and the Solvan, which flow through an agreeable valley, surrounded with vineyards that yield excellent wine. The ruins of two strong castles, those of Montmorot and Pymont, crown the two hills that command the town. The Franciscan church, which was built in the year 1250, that of St. Desiré, still more ancient, a large hospital, in which more than a hundred and fifty patients

may be accommodated, and lastly, the salt works, of which the annual produce is not less than twenty thousand quintals, are the most remarkable buildings in Lons le Saulnier, the birthplace of general Lecourbe, of the lyric poet Rouget de Lisle, and of Roux de Rochelle, the author of the Three Ages.^h About two leagues northwards, and at no great distance from the village of Beaume, the sources of the Scille issue in large volumes from the crevices in a calcareous rock, which forms a frightful precipice not less than four hundred feet in height, and on which pieces of ice may be seen even in the fine days of spring.

St. Amour, a town of three thousand inhabitants, is situated near the western frontier of the department; several customs and ceremonies are preserved by the inhabitants, which appear to have been handed down from a very remote period. The evening of the first Sunday in Lent, or as the people call it, the evening of the *Brandons*,ⁱ is observed with the greatest solemnity; all the village girls leave their cottages, and illumine the neighbouring hills with a thousand torches.^k It is not unlikely that the custom originated from a festival to commemorate the story of Ceres seeking her daughter Proserpine.^l If children lose their father, if a wife becomes a widow, the relatives meet in the house of the deceased, and partake of a repast; the women may minister consolation, but the men are only admitted to the feast, and one of them with a glass in his hand pronounces a sort of funeral oration.^m The burgh of Arinthodⁿ rises on the ruins of a Celtic temple dedicated to *Mars Segomon*, as is proved by an ancient inscription discovered there in honour of that divinity, to whom the *Segores*, a powerful tribe in Bresse,^o consecrated part of the spoils which they took from their enemies. The ruins of the ancient castle of Olliferne, near Condes on the Ain, crown an almost inaccessible mountain, the only one in Jura which affords shelter to bears. The castle was destroyed by the French in the sixteenth century, and on account of its obstinate resistance, all those who had fled to it, were killed by the assailants. According to tradition, three noble ladies were put into a cask,^p and precipitated from the summit of the mountain into the river. There are few peasants in that part of the country who have not met these noble dames during the night, or who have not seen the lord of Olliferne and his attendants hunting in the neighbouring woods.

Several industrious towns and villages are situated in the district^q of St. Claude. Septmoncel is equally noted for its toys and cheese, neither ought it to be forgotten that more

^a "Fenouillot de Falbaire, author of the *Honnête Criminel* and the *Deux Acares*."—He wrote a great number of dramatic pieces, published collectively under the title: *Œuvres de Falbaire*, 2 vols. 1787. The most remarkable are: *L'Honnête Criminel*, *les Deux Acares*, *L'Écrite des Mœurs* and *les Moines Japonaises*. (Beauvois).—P.

^b The best pieces of Falbaire are *L'Honnête criminel* and the *Deux Acares*.—Tr.

^q "Arrondissement."

than twelve hundred persons find employment in making and cutting imitation gems. This village, which contains not less than three thousand souls, was wholly destroyed by fire in 1826; but in places remarkable for the industry of their inhabitants, such calamities are soon forgotten. Chateau des Prés supplies the neighbouring country with chairs, tables and different articles of household furniture.^a The burgh of Morez^b exports every year many clocks, watches, pendulums and spits.^c The people in Bois d'Amont, a small village in the neighbourhood, make wooden cases for clocks, and an immense number of props for the vine dressers in the department.^d St. Claude, a place of greater importance than any that has been mentioned, is the only one that remains to be described.

Two brothers, Romain and Lupicin, who are mentioned in different legends, founded an abbey within the territory of St. Claude about the beginning of the fourth century. The wealth and revenues of the abbey were augmented by the profuse donations of French kings and pious princes in different parts of Christendom; indeed in a short time the abbots of the monastery became lords of all the country, proprietors of all the lands, and sovereigns over all the inhabitants. The people allowed themselves to be divested of their privileges one after another; every individual who had resided in the country during a year, was enrolled among the vassals of the monks, by whose influence and example the inhabitants became inhospitable, indolent, cruel and superstitious. A law was passed that completed their degradation, the wife or children of a vassal could not succeed to his house, household furniture or moveable goods, they were sold for the benefit of the abbey; that iniquitous custom, against which Voltaire employed all his eloquence in vain, was not abolished before the reign of Louis the Sixteenth.^e St. Claude was originally known by the name of Condat; ^f extensive ruins in the vicinity induce us to believe that it was a place of some celebrity in the time of the Romans; it was afterwards called St. Oyant from one of its abbots; at a later period it took the name which it bears at present, but which was changed during the revolution for that of Condat-Montagne. It was completely destroyed by fire in the year 1799, but the sum of 750,000 francs, granted by the consular government, and subscriptions collected in every part of France, enabled the inhabitants to rebuild it according to an improved and more regular plan. It is situated in a low sequestered valley, bounded on one side by mountains covered with forests, and on the other by arid heights. There are twelve works, in which five hundred persons are employed; it exports clocks and watches, musi-

cal instruments, nails, pins, snuff-boxes, chaplets and toys.^g It possesses an hospital, a large college and several other useful institutions.

The mountains that cover a portion of the department of Jura, extend into that of the Doubs, which, like the former, may be divided into three regions, namely, the higher, the middle and the lower. The first is overspread with lofty calcareous rocks, the summits of which are covered with snow during seven or eight months in the year, and are for the most part destitute of vegetation; but on the southern declivities, there are excellent pastures and fine valleys shaded with forests of fir. The houses are scattered at great distances from each other; the inhabitants are hospitable, and they have preserved that simplicity of manners which distinguishes the people in mountainous countries. The second or middle region is under the influence of a milder temperature than the preceding; wheat is cultivated, and the vine grows on some of the heights. But the highest hills are covered with forests of oak or beech, which are in some places mixed with fir, a tree that disappears in the lower part of the country. The lower region, or the plain, stretches along the base of the mountains, and commences at the altitude of a thousand feet^h below their summits. No other region in the department is so populous, none so fertile, and none so abundant in corn and wine. Most of the high plains (*plateaus*) in the two other regions are covered with marshes which seem to be the natural reservoirs of the principal rivers that rise at the foot of the mountains. Among these rivers are the Doubs, which bounds France and Switzerland, but falls first from a precipice eighty feet in height, into an abyss that has never been fathomed; the Loue,ⁱ which puts in motion several mills at no great distance from its source; the Dessoubre, noted for its trouts; and the Lison, which forms a cascade near a fruitful valley, and escapes through crevices in the rocks into a different part of the country.^k Lakes and large marshes, subterranean labyrinths, grottos in the form of glaciers,^l coal mines^m and mineral springs are situated at the base of the mountains.

Pontarlier rises on the Doubs at a short distance from a pass across Jura, between France and Switzerland; as the same pass was known to the ancients, and is still defended by a fort on Mount Joux, a name probably derived from *Mons Jovis*, it may be readily believed that the town is a place of great antiquity. D'Anville supposes it the ancient *Ariolica*, which is mentioned in the Itinerary of Antonine; but Drotz, the erudite historian of Franche-Comté,ⁿ has shown that the opinion of the celebrated geographer is at least doubtful. In the most ancient documents, it bears the names

^a "Château des Prés is noted for manufacturing chairs, buffets and different articles of furniture from fir." ^b Morey. Vosgien.

^c "—many clocks (*horloges, pendules*) and jacks (*tourne broches*)." ^d "Bois d'Amont manufactures in wood, clock-cases, pails, boxes, and vine props."

^e "The domains of the abbey, enlarged by the immense donations of the kings of France, of different princes, and of all the faithful, became so important that the abbots of the monastery finally became lords of the whole country, proprietors of all the lands, and possessed of the power of life and death over all the inhabitants. Whoever had resided a year in the country was inscribed in the list of their vassals (*slaves*), and in whatever place his property was found, it was torn from his wife and children, and sold for the benefit of the abbey. This monstrous custom, which was strenuously opposed by Voltaire, was not entirely abolished till the reign of Louis XVI."—The exertions of Voltaire were not in vain. The affair was brought by him before the King's Council, who referred the decision to the parliament of Burgundy, by whom the authority of the monks was greatly abridged, and ultimately in consequence of his representations, it was entirely abolished. So far had the privileges of the abbey been abused, that the property of French merchants, who had only rented

a house for a year within their territories, and who had afterwards lived and died in other parts of the kingdom, was after their death taken from their families, and sold in the name of the abbey. (Enc. Meth.)—P.

^f Latin, *Condate, Condatistum*. (Enc. Meth.)—P.

^g "It contains 12 establishments for turnery, which employ more than 500 workmen; also manufactories of clocks and watches (*horlogerie*), musical instruments, cords, nails, pins, snuff-boxes, beads, and toys for children." ^h "300 metres."

^m "—a coal mine (*une houillère*)." ⁿ "Drotz, a learned writer, to whom we owe a history of Franche-Comté, his native country"—Fr. N. E. Droz, born at Pontarlier, 1735, author of a history of Pontarlier (*Mémoire pour servir à l'histoire de Pontarlier*, 1760. (Beauvais.)—P.

of *Pontalia* and *Pons Aelii*. The streets are regular, and the houses are well built; the industry of the inhabitants and the trade they carry on with Switzerland has doubled the population within the last forty years. It exports annually a great quantity of wormwood wine; it possesses steel and copper foundries, iron works and five tanyards.^a General D'Arson, the person by whose advice floating batteries were employed at the siege of Gibraltar, was a native of Pontarlier.^b There are nineteen works or manufactories in the district of which it is the capital; the most important are three of cotton, two of paper, and one of glass.^c

The district of Besançon is twice as populous as the preceding, and, in proportion to its size, still more industrious. This city is the ancient *Vesuntio*,^d which Cæsar chose as a place of arms during his expedition against Ariovistus; it may therefore be reasonably inferred that it was no inconsiderable town at the time the conqueror of Gaul entered the country. Although devastated by the Burgundians in the fifth century, and by the Hungarians in the tenth,^e it retained its importance; Charlemagne ranked it among his principal strong holds; it became under the dukes of Burgundy, the seat of their courts of justice, and it was raised in the twelfth century, by the emperor Frederick, to the rank of an imperial city,^f a dignity which it preserved until Franche-Comté was united to France. The Doubs divides it into two unequal parts, and almost encompasses the larger or the upper town, winding at the base of the walls, according to the expression of Cæsar, in the form of a curve not unlike a horseshoe.^g A citadel erected on a steep rock commands the town and the neighbourhood. This rock is the ancient *Mons Cælius*; the two quarters of the town communicate by means of a stone bridge, of which the foundations were laid by the Romans. The promenade of *Chamars*, the most agreeable walk in the town, occupies the site of the *Campus Martius*. The *Black Gate*,^h a triumphal arch that was raised in honour of Crispus Cæsar, the son of Constantine, is perhaps the finest ancient monument in Besançon. Within the walls are the remains of an aqueduct, and beyond them the ruins of an amphitheatre; in short, eighteen centuries have elapsed, but Besançon retains its primitive form; it may be compared to an antique statue in a modern dress; it is, however, one of the best built towns in France. The public library and scientific

collections¹ are very valuable; the former contains more than fifty thousand volumes. The products of the manufactories are sent into most parts of the kingdom, one branch of industry, the making of clocks and watches, affords employment to eighteen hundred workmen; and the number is likely to be much increased as soon as the town communicates with the canal of Monsieur.^k It is sufficient to mention the names of Suard and Moncey, among the natives of Besançon, to show that it has contributed not a little to the literary and military glory of France. Ornans, a small place in the neighbourhood, is peopled by three thousand inhabitants; it contains extensive tan works, two paper mills and other manufactories;^l it was the birthplace of the Abbé Millot.

Five hills forming a group, rise on the right bank of the Doubs, about seven leagues distant from Besançon; the nearest is crowned by the ruins of what was formerly the most important fortress in Franche-Comté, and the small town of Beaume les Dames^m stands at its base. The town is supposed to be very ancient;ⁿ it derives its surname from an abbey of canonesses, in which there were not fewer than five nobles among the principal officers or attendants of the abbess.^o The columns that formerly supported the high altar in the church, have been removed to that of St. Genevieve in Paris. Beaume les Dames is at present the capital of a subprefecture; Leclerc,^p the author of a history of Russia, was a native of the town. The small town of St. Hippolyte is situated at the confluence of the Doubs and the Dessoubre, near the extremity of a valley enclosed by hills planted with vineyards, and overtopped by mountains covered with forests. The holy swaddling clothes, which the faithful in Turin kiss and adore, were formerly preserved with superstitious care in an old chapel at St. Hippolyte.^q The neighbouring valley may be mentioned on account of numerous iron works, from which clouds of smoke rise day and night.^r

Before leaving the country watered by the Doubs, we may cross the river to Montbelliard,^s the former capital of a principality,^t and at present the chief town of a district.^u The houses are well-built, and the streets are adorned with fountains; it is commanded by a castle, that was formerly the residence of its princes, but which now serves the double purpose of a barrack^x and prison. The market, and the

church of St. Martin, in which a roof^a eighty feet long by fifty broad, is supported without pillars, are the only public buildings of any consequence. The inhabitants carry on a considerable trade, which consists in watches, fine cottons and leather; these products of industry represent an annual value of £.50,000.^b

Some branches of Jura and the Vosges constitute on the south and the west, the mountainous region in the department of the Upper Rhine; the eastern part, bounded by the Rhine, and watered by the Ill, the Birse, and other small rivers, and by the canal of Monsieur, forms a long plain; in both regions there are forests, vineyards and fruitful fields. The number of horses and horned cattle corresponds with the richness of the country; but in some places more sheep might be reared, in others the quantity of oats and wheat is insufficient for the local consumption.^c The wealth of the department may therefore be chiefly attributed to the works of which the materials are supplied by its copper, iron and lead mines, to its forests and coal mines, and lastly to its manufactories of woollen and cotton stuffs.

A rock near the base of the Vosges is crowned by an old castle that has been called Bel-Fort on account of its position; a small town of the same name, which from usage is also pronounced and written Befort, rises at the foot of the rock; it was fortified by Vauban. Some of the streets are broad and straight; the barracks are large and well built; the Savoureuse, which washes the walls, turns a great many mills.^d A large cotton manufactory^e has been erected at Massevaux or Mamunster, a town of three thousand inhabitants. Cernay contains a population of five thousand individuals, who are employed in cotton works,^f print-fields and founderies.

The population and industry of Altkirch are of little importance; it need only to be mentioned as the chief town in a district.^g Huningen^h, on the left bank of the Rhine, was a well built town, fortified by Vauban, in the year 1814, when it contained seven thousand seven hundred inhabitants; the number at present does not amount to nine hundred. It was ruined by the invasion in 1815, a disastrous period in the history of France, but one that has been signalized by heroic and glorious achievements. Blockaded by twenty-five thousand Austrians, and defended by a hundred and forty men under the command of general Barbanegre, it was not until the defenders had lost nearly half their number, that the town capitulated with all the honours of war. The small number of the defenders excited the surprise of the

^a "Le plafond"—the ceiling.

^b "The town is enriched by its commerce with Switzerland, and by the manufacture of watches (*horlogerie fine*,) cotton spinning, and numerous tanneries, the products of all which represent an annual value of 1,200,000 francs."

^c "The territory, however, does not feed a sufficient number of sheep, nor does it produce a supply of corn and oats adequate to the local consumption."

^d "Usines."—Befort possesses forges and powder mills. (Vosgien.)—P. ^e "Filature de coton"—cotton mill. ^f "Filatures."

^g "Subprefecture"—arrondissement.

^h "Huningue." Fr.—The population and also the names of the towns, rivers, &c., in the eastern division of the department, including the arrondissements of Altkirch and Colmar, as well as in the department of the Lower Rhine, are German. I have in most instances preferred the original German orthography of the names, giving the French in a note.—P. ⁱ "Mulhouse," Fr.—Mühlhausen, Germ.—P.

^k "—is the centre of manufacturing industry."

^l "Thirteen establishments for spinning wool and cotton (*filatures*,) eleven manufactories of cloths, seventeen of muslins and cottons (*cotonnades*,) and fifteen of printed goods (*toiles peintes*,) besides morocco works, tanneries and founderies."

^m "—in its different manufacturing establishments (*ateliers*,)"

ⁿ Previous to the French revolution, Mulhausen constituted a

victor; not more than eighty soldiers passed before him, and of these thirty were wounded; no time, however, was lost in demolishing the fortifications, and as the tomb erected by Moreau, in 1803, to general Abbatucci, was not even spared, it seemed as if the Austrian wished to punish the dead for the noble resistance of the living.

Mulhausenⁱ is one of the most commercial towns^k in the department of the Upper Rhine; it possessed in the beginning of the year 1828, thirteen woollen and cotton manufactories, eleven of cloth, seventeen of muslin, seventeen of printed calico, several leather works and founderies.^l It contains fifteen thousand inhabitants, exclusively of six or seven thousand workmen who are employed in the town,^m but who reside beyond the walls. It is situated on an island formed by the Ill and the canal of New Brisach. The streets are for the most part regular, and it is adorned with several public buildings, the finest of which are the town-house and the reformed church.ⁿ

Seven or eight small towns, worthy of notice from the industry of their inhabitants,^o are situated in the district of Colmar. Kaisersberg^q is well built, and encompassed with walls; it was formerly an imperial city. Ribauviller^r is adorned with an old castle. Munster carries on a considerable trade in printed cottons and in kirschenwasser. Ruffach^s and Sultz^t may each of them contain four or five thousand inhabitants. Guebwiller^u may be mentioned on account of its sugar-works and cotton manufactory; it supplies different places with nails and hardwares.^v New Brisach^y forms a regular octagon; it was built by Louis the Fourteenth, and fortified by Vauban. St. Marie aux Mines is encompassed by metallic deposits, one of which only is worked. Some writers affirm that *Argentuaris*^z, a Celtic city mentioned by Ptolemy, was situated near Colmar,^{aa} but no traces of it^{bb} can be found either in the town or in the neighbourhood. Colmar, it is well known, was a mere hamlet during the reign of Charlemagne; the emperor Frederick the Second surrounded it with walls in 1220, but it was not raised to the rank of an imperial city before the year 1552. The population was never greater than at present, but the town has long been considered one of the wealthiest places in Alsace; the revenue amounted forty years ago to 100,000 francs;^{cc} it is now more than double. The court of justice may be the finest modern edifice, but it is inferior to an old building—the church of the Dominicans. Few provincial towns in France possess so valuable a library, it consists of more than sixty thousand volumes.^{dd} Martin

small republic, allied with Switzerland. It was originally a free town of the German empire, but being threatened in its liberties by the landgraves of Alsace, it formed an alliance of protection with the Swiss cantons, in the fifteenth century.—P.

^{aa} "Half a league from Colmar."

^{bb} "No traces of the Roman period."

^{cc} "More than 100,000 livres."

^{dd} "It is the seat of a royal court; its construction [that of the edifice (*palais*)] is as beautiful, as its situation is commanding and picturesque. The church of the Dominicans is the finest of its older edifices, and its public library is one of the most important in the kingdom; it contains more than 60,000 volumes."

Schoen,^a the earliest engraver on metal, and Rewbell, one of the members of the Directory, were born in Colmar.

Bounded, like the preceding, by the Rhine on the east, and by a part of the chain of the Vosges on the west, the department of the Lower Rhine is covered with hills, forests, meadows, and fields of the greatest fertility. It joins to its agricultural and mineral treasures, the wealth it derives from different kinds of manufacturing industry, while its trade is greatly promoted, by its numerous roads and navigable water-courses.

Schelestat,^b the first town beyond the territory of Colmar, is situated on the banks of the Ill.^c The Vosges which rise on the left, the ruins of ancient castles on different heights, the vineyards that command many rich villages, the forests on the right bank of the river, and the fruitful meadows on the left, form a romantic landscape. The town, at present the metropolis of a subprefecture, was formerly one of the ten imperial cities in Alsace, and the third in point of importance. The antiquity of Schelestat cannot be denied; long the principal city of the *Tribocci*, it bore in ancient times the name of *Elcebus*, but although antiquaries assert the contrary, it may be doubted that the neighbouring village of Ell was so called from the ancient name of the town.^d It was no mean place under the Carlovingians; Charlemagne and his court celebrated the festival of Christmas at Schelestat in the year 776, and Charles the Fat chose it frequently for his residence. The decline of the town dates from the tenth century; it rose again into importance in the course of the thirteenth, but it suffered much during the thirty years' war, and from that period until Alsace was united to France; since the union it has continued to flourish; in 1802, the population amounted only to 5000; it is now nearly double that number. Martin Bucer, one of the ablest theologians in the cause of the reformation, was born in Schelestat; it was at the same place that the present method of varnishing porcelain was invented.^e The other towns in the district^f of which it is the capital, may be briefly mentioned. Barr, containing four thousand five hundred persons, stands in a pleasant valley surrounded by vineyards. Obernai,^g equal to it in the number of its inhabitants, is situated at the base of Mount Hohenburg, of which the summit is surmounted by the majestic ruins of the famous monastery of St. Odile. Rosheim,^h a town of three thousand seven hundred persons, consists of a single street; it was formerly a free and imperial city. The village of Klingenthal may be mentioned with these towns on account of the industry of its inhabitants, and also on account of a royal armory, in which swords are made that rival any in Syria.ⁱ

^a Martin Schoen, the earliest engraver on metal whose name we are acquainted with, was born at Culmbach in Franconia, 1420, and died at Colmar, 1486. (Ed. Enc. art. Engraving. Beauvais.)—P.

^d "In the time of the Romans, it was one of the principal cities of the *Tribocci*, and bore the name of *Elcebus*,* of which we find the traces in the small village of Ell, situated at a short distance from its walls."

* *Helcebus* (Ell.) D'Anv.

^e "—that the method of glazing (*vernisser*) delft (*fatence*) was invented." ^f "Arrondissement."

^g Obernai (Alm. Royal.)—Oberehnheim or Obernai, situated near the Ehn (Vosgien.)—Oberehnheim or Obernheim (Germ.)—P.

^h "Rosheim."

ⁱ "After these towns, all of which are engaged in manufacturing industry, the village of Klingenthal may be mentioned for its royal

Mutzig and Molsheim, two small towns, each contain about three thousand individuals; the first is known for its fire-arms, and the second for its excellent blades and steel; but we may leave these places on the left, and proceed towards Strasburg.^k The lofty but light steeple of the cathedral is seen from a great distance; it rises to the height of four hundred and thirty-six feet, and consequently is higher than any other edifice in Europe; indeed it is only thirteen feet lower than the great pyramid in Egypt. The cathedral may be considered a model of Gothic architecture; the clock that decorates the interior, is perhaps the most complicated piece of machinery in France;^l it represents the motions of the constellations, and the planetary system. Seven gates lead into Strasburg; it is surrounded with fortifications, and defended by a citadel, which was built according to the plans of Vauban. It is traversed by the Ill, over which there are several bridges built of wood.^m The royal castle, at present the residence of the bishop,ⁿ is the finest edifice after the cathedral. The court of justice,^o the town house, the prefect's palace^p and the new theatre are not unworthy of so important a town. The church of St. Thomas was built in the seventh century; several elegant mausoleums adorn the interior, of which the most remarkable is that of Marshal Saxe, the work of Pigal.^q The arsenal, a large building, the barracks and the cannon foundry are such as correspond with a fortified town of the first class. The protestant academy^r is one of the best in France, and as a place of instruction it may rival the most celebrated in Germany; it possesses a good collection of philosophical instruments, a museum of comparative anatomy, in which all the articles are arranged according to the most approved methods, a chemical laboratory and a valuable collection of natural history. Each faculty has a separate library, but there are besides two others in the city, one belonging to the observatory, which contains a collection of antiquities, and another open to the public, consisting of 55,000 volumes; in the last are preserved the sword of Kleber, and the poniard of his assassin.

If it be recollected that the arts, sciences and letters have been long cultivated at Strasburg, it need not excite surprise that it has produced many eminent men. Kleber and Kellermann have distinguished themselves in the military art, Ramond in the physical sciences, Weyler and Manlich in painting, and the virtuous pastor Oberlin,^s by his enlightened humanity. If we do not enter into any details concerning the scientific and literary societies at Strasburg, it must not be imagined that they are unworthy of notice, or that the members who compose them are at all deficient in zeal and knowledge. The manner in which the charitable institutions

sword manufactory (*manufacture royale d'armes blanches*), in which damask blades (*damas*) are wrought, that rival those of Syria."

^k "Strasbourg."

^l "—is a work of surprising complexity."

^m There are eight bridges over the Ill, two of which are of stone, and also a large wooden bridge over the Rhine. (Büsching.)—P.

ⁿ The episcopal palace, built in 1741 by Cardinal Rohan, is a magnificent edifice. (Büsching.)—There is a royal palace (*maison royale*) at Strasburg. (Alm. Royal, 1822.)—P.

^r The Academy of Strasburg—formerly the University of Strasburg, under the direction of the Lutherans. It at present consists of five faculties, viz.: one of theology for the Confession of Augsburg (Lutherans,) to which is attached a professorship of dogmatic theology for the Calvinistic Confession; one of law; one of medicine, with which is connected a special school of pharmacy; one of the sciences and one of letters.—P.

^s Pastor of Waldbach, in the Ban de la Roche (*Steinthal*, Stone Valley.)—P.

arc managed, is most creditable to their directors; the prison discipline that was adopted eight years ago, ought to have been imitated throughout France; if to effect the moral improvement of the prisoners be the great object of prison discipline, that object has been attained at Strasburg.^a

The island of Robertsau^b is the place of greatest resort in the neighbourhood, it rises on the south-east of the town, it is encompassed by the Ill and the Rhine.^c A neat village, several country houses and different works^d are situated on the island; but the agreeable is also united with the profitable, there are many fine gardens and walks shaded with trees.^e An obelisk to the memory of Kleber has been erected on a piece of ground near the town, at present a place for the exercise of artillery.^f Another obelisk in honour of Desaix rises behind the citadel, in the island opposite the village of Kehl.^g

Although the origin of Strasburg may be very uncertain, still the name of *Argentoratum*, by which Ptolemy designates it,^h and which is derived from a Celtic root, proves that it was anterior to the Roman conquest. Drusus enlarged it and made it an important fortress; much about the same time, the arms and armour made at Strasburg were highly valued.ⁱ In the time of Julian, who defeated the Germans under its walls, and took their king Chrodamaire prisoner, it was much frequented as furnishing a convenient passage from Gaul into Germany; from this circumstance, it was called *Strata-Burgus*^k in the fifth century, whence the origin of its present name.

The inhabitants of provincial towns follow the fashions of the capital; it is not therefore in such places that one can judge of a national costume. The peasants in the villages between Strasburg and Haguenau go to mass or to the reformed church^l in their best dresses. A square black coat is purposely left open to show a red waistcoat with gilt buttons; loose boots made of soft leather, or long gaiters are attached to black rateen breeches; a broad hat completes the costume.^m The dress of the women has been thought more graceful; it is certainly more showy; the hat does not conceal floating ringlets or ribbons of various colours,

^a "The prison (*prison civile*), in particular, has for the last eight years, furnished a model which ought to be imitated throughout France, above all for its complete success in the moral amelioration of the prisoners." ^b Ruprechtsau (Germ.)—Robert's meadow (Eng.)—P.

^c "The first object which attracts attention, in a north-eastern* direction from Strasburg, is the island of Robertsau, surrounded by the Ill and the Rhine."

* This is the true direction. See Map accompanying Philippart's Memoirs of Moreau.—P.

^d "Usines."

^e "Manufacturing establishments may be seen in every direction in the vicinity of Strasburg, but in the island of Robertsau, the agreeable is united with the useful; the whole landscape has the appearance of a beautiful English garden."

^f "Near the town, and in the opposite direction [from that of Robertsau,] an obelisk in honour of Kleber rises in the midst of an open space reserved for the exercise of artillery."

^g The promenades in this island are preferred to all others in the vicinity of Strasburg. M. B.—P.

^h —"by which it was first designated by Ptolemy."—Ptolemy is the first author who makes mention of Strasburg. (Enc. Meth.)—P.

ⁱ "The *Notitia Imperii* informs us that it was celebrated for its manufacture of arms."

^k *Strateburgus* (Büsching.)—Lat. *stratum*, plu. *strata*, a paved street, and *burgus*. German, *strasse*, a street, and *burg*, a castle or fortified town.—P.

^l "Prêche"—meeting, either of the Lutherans or Calvinists, both of whom prevail in Alsace. The term *reformed church* is applied to the Calvinists in M. B.—P.

^m "The square open black coat of the men shows beneath it a red vest with gilt buttons; large soft boots or long gaiters fastened to black rateen breeches, and a broad hat, complete the costume."

but the latter are only worn by the young, never by married women. Long gilt pins serve to fasten the hair, they rise in the form of a coronet; a black silk handkerchief covers the breast; the bodice is adorned with many ornaments, broad sleeves of white linen descend to the wrist, the petticoat is made of green serge, and bordered with red ribbons.ⁿ

Haguenau^o contains several manufactories, and a population of seven thousand five hundred individuals; it was founded by Frederick Barbarossa, and was included in the number of the imperial cities in Alsace. The sandy lands in the neighbourhood are very fruitful in madder, of which more than 2,000,000 kilogrammes are annually sent to different parts of France and England.

The small town of Saverne^p is situated near the base and on the lowest declivities of the Vosges; it is well built, and the heights round it are planted with vineyards. The hill^q that bears its name, rises on the west, while on the southwest are seen the ruins of Haut-Barr, a castle founded in the twelfth century. Bouxviller^r is commanded by a fine Gothic castle, surrounded with agreeable walks; it contains about three thousand five hundred inhabitants, and is situated, like the last, at the base of the mountains.

Two or three places may be mentioned in the most northern district^s of the Lower Rhine, which borders with Rhenish Bavaria. Sultz sous Forets,^t a town of two thousand inhabitants, carries on a trade in the best wines that are produced in the department; coal mines and a saline spring, that yields a great quantity of salt, are worked in the neighbourhood.^u Seltz does not contain a greater population than Sultz sous Forets, if it be better known, it may be attributed to the gaseous and mineral water, of which more than thirty thousand casks are annually consumed in Paris.^x Weissemburg or Wissemburg,^y a town on the Lauter, derives the importance which it possesses, from its position on the northern frontier. Its fortifications have been celebrated in the annals of war from the reign of Louis the Fourteenth to the year 1815. The inhabitants carry on a trade in linen, porcelain and leather; the population has quadrupled since the time that Alsace was united to France.^z

ⁿ "The dress of the women is richer and more graceful. Their headdress consists of a large straw hat, with a low crown, while floating tresses, terminated by knots of ribbons, are worn only by the unmarried. Instead of a hat, they often turn up their hair in the form of a crown, and fasten it with long gilt pins (*flèches d'or*). A black silk cravat falls over the breast. Their bodice (*corset*) is adorned in front with golden ornaments and ribbons; wide sleeves of fine white linen are fastened at the wrist, where they terminate in plaited cuffs, and a petticoat of green serge, bordered with a broad red ribbon, reaches only to the middle of the leg, and shows a tight white stocking and a high heeled shoe, fastened with a silver buckle."

^o Haguenau (Germ.)—P.

^p Zabern (Germ.)—called also Elsass-Zabern (Alsace Saverne), to distinguish it from Rhein-Zabern (Rhine-Saverne) in the former bishopric of Spire.—P.

^y "Weissemburg or Wissemburg," Fr.—Weissenburg (Germ.)—P.

^z "Its only manufactures are those of leather, linen (*toiles*) and delft (*faïence*), but its commerce has always been flourishing since Alsace was united to France, and its population has nearly quadrupled."

BOOK CXLVI.

EUROPE.

Europe continued.—Kingdom of France.—Fifth Section.—Northern Region.

THE twenty-one departments in the northern region are formed by the ancient provinces of Lorraine, Champagne, the Isle of France,^a Normandy, Picardy, Flanders and Artois. Education is more general, and wealth is more diffused than in the rest of the kingdom; the population relatively to the surface is also greater, for the mean number of inhabitants to every square league is nearly equal to one thousand six hundred and forty. It surpasses the other regions in the extent of the forests, in the number of horses and oxen, in the industry of the inhabitants, and in the amount of the revenue.

The department of the Moselle is contiguous on the north to the possessions of Bavaria, Prussia and the Netherlands. Its length from east to west is equal to thirty-nine leagues, or to three times its greatest breadth from north to south. Its territory, although uneven and woody, yields twice as much corn as the inhabitants consume. It is well supplied with horses, and if more attention were paid to the breed, they might furnish a very valuable resource for the light cavalry. Although many oxen are reared, they are not sufficiently numerous; it is however in the supply of sheep, that the department is particularly defective. The abundance of timber enables the inhabitants to carry on many works or manufactories in which fuel is required, and to derive a considerable profit from their iron mines. The prosperity of the country may be attributed to the extent of the roads and navigable rivers, and to the aptitude for labour by which the lower orders (manufacturers as well as husbandmen) are distinguished.^b Agriculture is generally in a more advanced state than in the rest of France; the peasant,^c as indefatigable in labour as he is brave in war, adopts willingly every improvement, converts his old fallows into artificial meadows, raises a great variety of products, multiplies nurseries, and manages his fruit trees with much intelligence; the vineyards which he cultivates, particularly those on the left bank of the Moselle, do not yield much wine of a good quality, but it should be recollected that the exportation of wine is not encouraged, and the petty propri-

etors do not think it worth while to substitute the best vines of Burgundy for the inferior kinds of Lorraine.

Bitche,^d situated at the foot of the western declivity of the Vosges, contains two thousand seven hundred inhabitants; it is considered a strong hold of the fourth class, and is defended by an impregnable fortress on the summit of a steep rock of red sandstone; the Prussians attempted in vain to take it in the year 1792. Sarralbe^e derives its name from its situation at the confluence of the Albe and the Sarre; the number of inhabitants amounts to three thousand three hundred; the salt works in the neighbourhood yield annually a thousand tons^f of salt. Sarreguemines,^g of which the ancient German name, *Gemunde*,^h signifies a river's mouth (*embouchure*), is situated above the last mentioned place, at the junction of the Sarre and the Blise. The population has increased two-thirds since the year 1790.ⁱ The red porcelain made in the town, and generally used in the department, and the snuff-boxes made in the neighbourhood are the principal articles of trade; the yearly sale of the latter is supposed to produce a sum almost equal to £42,000.^k The houses are well built; a broad street extends through the whole length of the town, and terminates at the bridge over the Sarre. The road that communicates with the same bridge, leads to Forbach, a small town of three thousand inhabitants; it was there that Charles the Fifth encamped in 1552, when he determined to risk his military glory before the ramparts of Metz. In this town, which is situated at the foot of a hill, in an agreeable plain, a custom-house is established.

Bouzonville is the most important place in the country between Forbach and Thionville; the latter town was founded in the eighth century;^l as a strong hold, it belongs to the third class; part of the ramparts were constructed by the Spaniards, from whom it was taken by Condé after the battle of Rocroy. The riding-school is perhaps the finest building, but there are few edifices of any consequence; the wooden bridge, more remarkable for its clumsy shape than any thing else, is mentioned as a wonder both by ancient and modern geographers,—it can certainly be quickly taken to pieces in a case of emergency.^m The population of the

^a "L'Ile-de-France."

^b "The abundance of wood, which furnishes the means of carrying on a great many iron works (*usines*), and of deriving a very considerable profit from its iron mines; the extent of its roads, the importance of its navigable rivers, and the aptitude for labour, which may be remarked in all classes of its inhabitants, agricultural, manufacturing and commercial, are the principal causes of its prosperity."

^c "Paysan messin."—The country in the neighbourhood of Metz was formerly called the Messin or the Pays Messin.—P.

^d Bitche or Biche (Vosgien. Enc. Meth.)—Bitsch (Germ.)—P.

^e Saralbe (Vosgien.)

^f "20,000 quintals."

^g Sarguemines, Sarguemine (Vosgien.)—Saar-Gemünd (Germ.)—P.

^h *Gemund* (Enc. Meth.)—*Gemünd* (Germ.)—P.

ⁱ "In 1790, its population was only two-thirds (*des deux tiers*) of what it is at present."

^k "Its red pottery (*faïence*), which is widely circulated, and the paper snuff-boxes (*de pâte de carton*) manufactured in its neighbourhood, are its principal articles of commerce; the sale of the latter forms an annual amount of nearly 800,000 francs."

^l "Its origin does not date from an earlier period than the eighth century."

^m "The riding-school is the only remarkable edifice; the wooden bridge, mentioned as a wonder in all the older and more recent geographies, has nothing to compensate for its ugliness, but the facility with which it may be taken to pieces in case of emergency."

town, now the capital of a district,^a is ten times greater than when it was united to France by the treaty of 1659. The village of Cattenom is situated about two leagues below Thionville, on the left bank of the Moselle; it is the place where the greatest cattle fair in the department is annually held.^b Sierck^c on the banks of the same river, may be about two leagues and a half distant from the village;^d it stands at the foot of a rock, on the summit of which rises a strong castle. It carries on a trade in different manufactures; the stones which are obtained from a neighbouring quarry, are used in paving the streets of Metz and Nancy.^e

Longwy,^f situated to the west of Sierck, and like the latter, not more than half a league from the frontier, contains hardly three thousand inhabitants, but is divided into an upper and lower town.^g The first stands on a rock, and was fortified by Vauban; the second occupies the site of an ancient fortress, where many Roman medals have been at different times discovered. There is reason to believe that the same place was the station of a Roman camp, it bore the name of *Longus Vicus* during the middle ages.^h Briey, the capital of the district, is a very insignificant town, consisting of steep streets on the declivity of a hill which rises above a fruitful and well wooded valley, watered by the Voigot, a small river.ⁱ

The most frequented road to the ancient capital of Lorraine,^k is not considered the best approach; to judge favourably of it, one must descend from the neighbouring heights to the village of Rozerieulles, which is concealed in a narrow valley, and surrounded by orchards and vineyards.^l The Moselle winds below the village, waters fruitful meadows, and divides itself into several branches which give perhaps a more imposing appearance to the formidable fortifications of Metz.^m The court of justice,ⁿ a white building, seen to most advantage from a distance, forms a quadrangular mass near the lofty trees on the glacis,^o the finest walk in the town. The blackness of the cathedral contrasts well with the general colour of the houses; it may be admired also on account of a light and bold steeple, not less than a hundred and forty-five feet above the ground, and surrounded with others of a smaller size.^p

^a "Arrondissement."

^b "Its cattle fair is the most important in the country."

^c Sierck, Sirque, Sierck or Sierques. (Enc. Meth.)

^d "Two leagues beyond the village, the small town of Sierck rises on the banks of the Moselle."—Sierck is 4 leagues N. E. of Thionville, on the eastern bank of the Moselle. (Vosgien.)—P.

^e "It has several manufactories, and supplies Metz and Nancy with excellent paving stones from a rock of ferruginous quartz (*quartzite ferrugineux*) in the neighbourhood."

^f Longui (Vosgien).—Lonwic; in modern Latin, *Longus Vicus*. (Enc. Meth.)—P.

^g Old and new town—the latter was built by Louis XIV. after the peace of Nimègue, and strongly fortified in the style of Vauban. (Enc. Meth.)—P.

^h "In the second, there was formerly a fortress, on the site of which Roman medals have been often discovered. The public square is large and regular. There is reason to believe that Longwy, which in the middle ages bore the name of *Longus Vicus*, occupies at present the site of a Roman camp."

ⁱ "Although a small town, and noted only for its bacon and hams, it [Longwy] is much more important than Briey, its capital; the latter consists of narrow streets, situated on the declivity of a steep hill, which commands a pleasant valley bordered with woods and watered by the small river Voigot."

^k Capital of the arrondissement, in which Longwy is situated.—P.

^l "Pays Messin."—Nancy was considered the capital of Lorraine.—P.

^m "We shall not follow the most frequented road that leads from Briey to Metz, formerly the capital of the *Pays Messin*. In order to judge favourably of the latter town, it is necessary to descend into its beautiful valley (*bassin*) by the zig-zag road that leads from the highest plateau

The heavy modern portal is not in harmony with the graceful Gothic architecture of the building; the nave is not less than 363 feet in length and 73 in breadth. When the great bell, called the *Mutte*, is rung, all the steeples are perceptibly shaken.

Near the village of Longeville, where the waters of the Moselle are confined by a dike, and form a cascade, that of Ars sur Moselle is situated at the foot of the heights last mentioned; it contains two paper mills, a velvet and cloth manufactory.^q Its name, derived from the Latin word *Arx*, indicates the site of a Roman fortress. The remains of an ancient aqueduct may be observed in the neighbourhood; pillars are seen in the vineyards and on the river, they extend along the right bank to the village of Jouy, and support the majestic arcades that the country people call the *Devil's Bridge*.^r This aqueduct, it is supposed, was the work of Drusus; it supplied the baths and the naumachia of *Divodurum*, a city of the *Mediomatrici*, which in the time of the Roman empire was called *Metis*, and afterwards corrupted into Metz.^s An ancient bath of red porphyry, an admirable work of art, and much larger than any in the Louvre,^t is preserved in the cathedral, where it is used as a baptismal font. Roman tombs have been discovered at different periods near the site of the former citadel, particularly at the time when the building was pulled down in order that the public walk might be enlarged and completed. Ruins attest the past splendour of Metz, but the ancient edifices have been destroyed by time and barbarians; it might be difficult to recognise the place from the pompous panegyric of Ausonius, which has been engraved below the peristyle of the townhouse.^u

Metz was the capital of Austrasia, a country of which Thierry was the first king. Louis the Debonnaire died there in the year 840, and the body of that unfortunate prince was deposited within the church of St. Arnould,^v then in the suburbs, but now in the town. It became a free and imperial city during the reign of Otho the Second; it reached the height of its prosperity about the end of the fourteenth century. It maintained long and bloody wars against different sovereigns, and even many princes solicited the honour

in its neighbourhood, to the pleasant village of Rozerieulles, which is concealed in a narrow pass, covered with orchards and vineyards."

ⁿ "At the foot of this descent, we perceive the Moselle winding in the midst of beautiful meadows, and afterwards dividing into several branches, which render the imposing fortifications of Metz still more formidable." ^o "Palace of justice." ^p "Esplanade."

^q "The cathedral, whose dark hue forms a striking contrast with the general colour of the other buildings, rises on the left of the court of justice (*palais de justice*), and is crowned with a light and lofty spire, not less than 345 feet in height, and surrounded by others, wrought in open work in the form of obelisks."

^r "two paper mills, a manufactory of velvet, and one of cloth for the army."

^s "The pillars that rise in the vineyards, and which form obstructions (*ecueils*) in the midst of the river, are continued on the right bank in majestic arcades, as far as the village of Jouy, the inhabitants of which give to these ruins the name of the Devil's Bridge (*Pont-du-Diable*)!"

^t ^u ^v ^w ^x ^y ^z ^{aa} ^{ab} ^{ac} ^{ad} ^{ae} ^{af} ^{ag} ^{ah} ^{ai} ^{aj} ^{ak} ^{al} ^{am} ^{an} ^{ao} ^{ap} ^{aq} ^{ar} ^{as} ^{at} ^{au} ^{av} ^{aw} ^{ax} ^{ay} ^{az} ^{ba} ^{bb} ^{bc} ^{bd} ^{he} ^{hf} ^{hg} ^{hh} ^{hi} ^{hj} ^{hk} ^{hl} ^{hm} ^{hn} ^{ho} ^{hp} ^{hq} ^{hr} ^{hs</}

of being enrolled among the number of its citizens. It was added to the dominions of Henry the Second by the intrigues and address of the constable Montmorency. The duke of Guise compelled Charles the Fifth to retire from its walls, after he had attacked it with an army of more than a hundred thousand men. Although very populous in proportion to its size, it is much less so than when it was independent.^a

The improvements made in the city, the number of broad streets that have been built in modern times,^b the quarter of St. Thiebaud,^c the large barracks, the arsenal, the military hospital, the royal college, the church of St. Vincent, of which the portal is adorned with a triple row of columns, the new market-house, the theatre and five spacious squares render Metz worthy of being ranked among the best built towns in France. The public library consists of thirty-six thousand volumes; the places connected with education are a school of artillery and fortification, an academy of commerce and drawing, schools of arithmetic and geometry in its application to the arts, and lastly, an institution where lectures are delivered on natural philosophy and chemistry. Much certainly has been done for the intellectual improvement of the inhabitants since the time of Voltaire; but the philosopher condemned Metz, because when he happened to pass through it, he saw only one bookseller's shop, and read the signs of several confectioners and pastry-cooks. Among the charitable institutions are an orphan-hospital and a gratuitous school for the Jews. The citizens refused a passage to the allied forces when they left the French territory, and the troops had to cross the Moselle on a bridge which was built for the purpose below the ramparts. A foreign flag had never been seen within the walls in time of war,—such a spectacle was thought disgraceful in time of peace.^d

The country through which the Meuse flows from south-east to north-west,^e is intersected in the same direction by long fruitful valleys, and by lofty ridges,^f where the air is cold but wholesome. The lands are well wooded, and yield plenty of grain, and the neighbourhood of Bar is noted for its wine; the inhabitants rear many horses, but the number of other domestic animals might be increased with advantage.

Leaving the ancient province of Lorraine,^g we may cross

	Inhabitants.

^b “The number of broad streets that have been substituted for those which were narrow and crooked.”

^c St. Theobald.

^d “Its library which consists of 36,000 volumes, its important special school of artillery and engineering, its schools of commerce and design, its courses of instruction in arithmetic, geometry applied to the arts, mechanics, physics, chemistry and midwifery, its society of medicine, and that of sciences, arts and letters, together with its benevolent associations, such as that of maternal charity, that of arts and trades for the Jews, and that of mutual relief for the working classes, all combine to prove that this city has made great progress in intelligence, since the period when Voltaire, in passing through it, was astonished to find only a single bookseller's shop in the midst of a crowd of pastry-cooks and confectioners. Metz has shown its patriotism in refusing a passage to the allied armies, when they retired from the territory of France. A bridge was ordered to be erected beneath its ramparts, by which they crossed the Moselle, and thus the city, which had never seen a foreign plume within its walls, was preserved from the disgrace of such a spectacle even in time of peace. Nothing less could have been expected from the birthplace of Fabert, Custine and Lassalle.”^h

^e Distinguished French generals; the first under Louis XIV; the two latter during the wars of the revolution.—P.

^f The department of the Meuse

^g “Elevated plateaus.”

the heights that rise above the right bank of the Meuse,^h and arrive at Etain,ⁱ the first town in the department; it contains three thousand inhabitants; it is well built, but ill situated in a marshy plain on the banks of the Ormes, a river abounding with fish.^k

The ramparts of Verdun^l are seen at no great distance from Etain. Iron and glass-works, paper-mills and manufactories are situated in the neighbourhood:^m the town rises on both banks of the Meuse; the houses are very well built, but the streets which descend rapidly towards the river, are paved with sharp stones, as inconvenient for foot passengers as for carriages. The horse barracksⁿ and the ancient episcopal palace are the finest buildings, indeed there are no others of any consequence in the place. Verdun is mentioned in the Itinerary of Antonine under the name of *Virodunum*.^o A road along the banks of the Meuse leads to Stenay, a pleasantly situated town of three thousand inhabitants, formerly a stronghold, and which still possesses very large barracks. Montmedy,^p although ill built and inferior in population, is more important as a fortified town and as the metropolis of a district.^q If the inhabitants are poor, it may be attributed to the want of commerce and industry.^r

Bar, one of the three cities of the same name in France, and the chief town in the department, is watered by the Ornain. It was formerly called Bar le Due,^s because it was the capital of a duchy which made up the small country of Barrois. The town was founded in the tenth century by Frederiek, duke of Mosellane,^t the brother-in-law of Hugh Capet. It is supposed that on an average fifty thousand kilogrammes^u of cotton are annually manufactured at Bar; that branch of industry, the numerous iron works, the conveyance of the timber which is obtained from the neighbouring forests, and the transport of wines, account for the activity that prevails in the harbour.^x Four leagues above Bar, the Ornain flows below the small but neat town of Ligny.

The other places that remain to be described in the department, are situated in the fruitful valley of the Meuse. St. Mihiel,^y a town of five thousand inhabitants, was formerly fortified, but the danger to which Louis the Thirteenth was exposed when he besieged it, induced him to raze the fortifications. It is pleasantly situated, the river passes below

^x “Its sweetmeats (*confitures*) are celebrated for their delicacy; its numerous spinning mills (*filatures*) prepare annually about 500,000 kilogrammes of cotton; that branch of industry, together with the exportation of its wines, of the iron from the forges in its vicinity, and of the timber (*planches*, boards and planks) from the neighbouring forests, render the trade of its small port very active.”

^y St. Miel, St. Mihiel, St. Michel. (Enc. Meth.)—St. Mihiel (Hubner).—*Sancti Michaelis Fanum* (Lat.)—P.

well wooded banks, cultivated fields and hills covered with vineyards. A monument, that judges are likely to appreciate, may be seen within the modest cemetery of the parish church; it is a sepulchre made from a single block of granulated limestone, white as marble; thirteen figures indicate the hand of a master from the simple way in which they are grouped, as well as by their finished workmanship; they are attributed to Legier-Michier, a pupil of Michael Angelo.^a Commercy, a neat town on the same river, encompassed by a forest through which a road has been made, is situated at the distance of four leagues above St. Mihiel.^b The Meuse leads also to Vaucouleurs, which derives its name from the verdant meadows enamelled with flowers, that adorn the valley in which it is situated. The town contains two thousand souls, and is built in the form of an amphitheatre; a small canal supplied by the Meuse and the fountain of Vaise, serves to augment the trade of the inhabitants, which consists chiefly in leather and cotton stuffs.^c It was the birthplace of the Abbé L'Advocat, who published a geographical dictionary under the feigned name of Vosgien.^d

It is necessary to ascend the Meuse the distance of four leagues, to visit the village where the heroine of the fifteenth century was born. Domremy la Pucelle^e rises in a valley embellished by the windings of the river. These verdant meadows, these hills covered with pastures, were the places where the young Joan of Arc^f tended her flocks; her days were spent in solitude and in peace until she left her rural labours, and led the French to victory after they had been disheartened by defeat. The house in which she was born, stands near the church; it may be easily discovered by a Gothic door that supports three scutcheons, adorned with the fleur-de-lys^g, and a statue, in which she is represented in full armour. In the year 1818, a Prussian count wished to purchase the statue from the proprietor of this ancient abode; on his refusal to part with it, he was offered six thousand francs for the house; but the Frenchman unwilling to sell it to a foreigner, ceded it to the department for a third part of the sum. The house of Joan of Arc thus became national property, and the former owner was decorated with the cross of the Legion of Honour, as a reward for his patriotism. Louis the Eighteenth granted the village^h twelve thousand

^a "Its picturesque situation is not the only motive which induces the stranger to visit it. It contains within the humble walls of its parish church, a specimen of sculpture worthy the admiration of connoisseurs. It is a holy sepulchre,^g formed of a single block of stone of the grain and whiteness of marble, and adorned with thirteen figures, which by the simplicity of their arrangement and the finish of their execution, announce the hand of a master. It is the work of Ligier-Michier, a pupil of Michael Angelo."

^g "Saint-sepulchre"—a sepulchre of the Saviour.

^b "Commercy, a pleasant town on the Meuse, is situated at the distance of four leagues above St. Mihiel. Its streets are perfectly straight, and one of them leads to the forest which surrounds the town. It contains a fine castle built by Cardinal de Retz, and since converted into barracks for cavalry."

^c "A small canal, fed by the Meuse and the fountain of Vaise, serves to supply its tanneries and its manufactories of cotton stuffs (*cotonnades*)."

^d J. B. Ladvocat, professor at the Sorbonne. The best edition of his geographical dictionary is that of Letronne, Paris, 1813. (Beauvais.)—The edition referred to by me, is that of Morel, Paris, 1813.—P.

^e Douremy. (Beauvais.)—This and the following towns are situated in the department of the Vosges.—P. ^f Jeanne d'Arc.

^g The Maid of Orleans, when she took arms against the English, carried on her banner a sword surmounted by a crown. This, with the addition of a fleur-de-lys, the king of France afterwards assigned as arms to her brothers, who were ennobled, by letters patent, in the year 1421, and took the name of Du Lys. (Ed. Encyc. art. Heraldry.)—P.

^h "Commune."

ⁱ "Communes."

^k "The house was rebuilt according to the original plan; a fine picture, the gift of the king, decorates the interior; the public square was embellished with a regular plantation of poplars, in the midst of which a fountain was erected, consisting of four pilasters supported by a quad-

francs to erect a monument to the memory of Joan, eight thousand to found a school of mutual instruction, for the education of young girls in Domremy and the neighbouring hamlets,ⁱ and eight thousand besides as a fund for the support of a sister of charity to teach the school. The house, which had almost fallen into decay, was lately rebuilt, but the original plan has not been altered; a fine painting, the gift of the king, decorates the principal room. The market-place is surrounded with poplar trees, and watered by a fountain, of which the quadrangular base supports four pilasters crowned with an entablature and a double pediment, beneath them is placed a statue of the Maid, which was also the gift of royalty.^k The inscription on this monument: *To the memory of Joan of Arc*,^l may recall the simple habits of the person it is intended to commemorate.^m

The burgh of Grand, about three leagues on the west of Domremy, stands on the site of an ancient city, and at no great distance from it are the remains of a large amphitheatre; the inhabitants carry on a trade in hard-wares.ⁿ The neat town of Neuf-Chateau,^o the capital of a subprefecture,^p is situated in the midst of high hills at the confluence of the Mouzon and the Meuse. Mirecourt, also a chief town,^q is watered by the Modon; it bore the name of *Mercurii Curtis* in the Latin of the middle ages; it does not exhibit, however, any traces of antiquity. It is for the most part ill-built, but the neighbouring country is fruitful and well cultivated; the trade of the inhabitants consists chiefly in lace.^r Contrexville, a small village encompassed by the waters of the Vair, which divides itself into two branches, is noted on account of a medicinal spring to which many persons afflicted with obstructions resort; more than four thousand bottles of the water are annually sent to Paris.

Ramberviller or Rambervillers^s carries on a great trade in hops;^t the inhabitants are wealthy and industrious; their number amounts to not less than five thousand; there is a public library in the town, consisting of ten thousand volumes. It is the last place of any consequence in the lower region of the department of the Vosges. The lofty region is formed by a series of rounded summits with gentle declivities, very different in appearance from the heights that extend on the side of Alsace.^u There are no old castles associated

angular base, and crowned with an entablature and a double pediment, beneath the last of which is a bust of the heroine, also granted by the royal munificence." *A la mémoire de Jeanne d'Arc.*

* Count François de Neufchateau, member of the Academie Française.—P

^r The capital of a subprefecture or arrondissement.

^s "It contains several lace manufactories, and fabricates an immense quantity of hand-organs (*orgues*), serinettes, and stringed instruments.—It is noted for its wine and brandy, and for its manufactories of lace, serinettes and musical instruments. (Vosgien.)—It manufactures lace, *turlutaines* and excellent violins. (Enc. Meth.)—*Serinette*, a bird organ, from *serin*, a canary-bird.—*Turlutaine*, also a bird organ, from *turlutte*, a lark (Dict. de Trevoux).—P. ^t Rambervillers. (Vosgien.)

^u "Centre d'une grande culture de houblon"—hops are extensively cultivated in its neighbourhood.—P.

^v "The mountainous region exhibits in its whole extent that series of summits, which from their rounded forms and gentle declivities, have been called the *Ballons* (balls or balloons;) but its appearance is entirely different from that presented by the same chain* on the side of Alsace."—The broken summits along the eastern line of the Vosges are primitive, containing remarkable deposits of specular iron at Framont, of fluor spar at Giromagny, and of galena in granite at La Croix. The rounded summits on the west are secondary.—P.

* The chain of the Vosges.

with different periods of the middle ages, but scenery constantly varied, and landscapes not unlike those in Switzerland, although on a much smaller scale. The mountains abound in iron, copper and lead;^a these metals are a source of wealth to the inhabitants, and numerous works are set in motion by the streams which descend from almost all the heights.^b Thus, although the products are different, the two regions are equally favoured by nature; the plains and low valleys yield as much corn as the inhabitants require, and a surplus quantity of oats equal to 1,800,000 bushels;^c it might be inferred from so great an excess that there were not many horses in the country; the contrary, however, is the fact, for in proportion to the surface, it contains twice as many as the mean number in other departments. The same remark may be applied to the number of oxen, but little attention is bestowed on the breeding of sheep; it appears, indeed, that there is not a tenth part of the average quantity in the country.^d

Epinal^e is situated at the foot of the Vosges, and is watered by the Moselle, which divides it into two equal parts; walks shaded by trees extend on both banks of the river; the town was formerly fortified, but the ruins of an old castle are all that remain of the ramparts.^f Although ill peopled, it contains different places of education, a collection of antiquities, and a library of more than seventeen thousand volumes.^g

The small town of Remiremont^h rises on the left bank of the Moselle, above Epinal; it stood on the opposite bank about the beginning of the tenth century, but its position was changed on account of the devastations that were committed by the Hungarian invaders.ⁱ The name of Remiremont is derived from a mountain that commanded the ancient site, and on which count Romaric built the castle of *Romarimont*.^k The same powerful and rich lord, despising the vanities of this world, founded there two convents in the

year 620, the one for men and the other for women, to which he bequeathed all his wealth; his liberality was rewarded with the title of saint. One of these convents, the abbey of lady canonesses, as it was afterwards called, became in time very celebrated.^l The inmates were not required to take an oath, they enjoyed many privileges;^m the abbess was entitled a princess of the Holy Empire; on occasions of ceremony she was preceded by a senechal, who held her crosier, and followed by a lady of honour, who carried her mantle. It was customary for the same person to review the burgesses, and to present them with colours; other prerogatives which are only conferred on sovereigns, were attached to the office.ⁿ Plombières, a small place in the neighbourhood, noted for its mineral waters,^o is indebted to king Stanislaus for an hospital and a large church. The village of Bussang near the sources of the Moselle, is also well known for its cold mineral waters, of which more than two hundred thousand bottles^p are annually sent into different parts of France. The finest cascade in the Vosges is situated at an equal distance from Epinal and Remiremont, near the village of Tendon; it falls from the height of a hundred and twenty-five feet.

The small town of St. Dié or St. Diey,^q the capital of a subprefecture, and the seat of a bishopric that was erected about fifty years ago,^r possesses little or nothing of any consequence; it is regularly built and encompassed with walls,^s and is situated on the banks of the Meurthe. The best cheeses in the Vosges are made in the neighbourhood, but the greatest number are exported from Gerardmer or Geromé, a burgh of five thousand inhabitants, situated in a very romantic part of the country; *Lac-Blanc* and *Lac-Noir*, the lakes of Longemer and Retournemer may be seen in the vicinity, but the Gerardmer, the largest of any, covers a surface of nearly a hundred acres, and gives birth to the Valogne, a feeder of the Moselle.^t

A. D. 450, and even laid siege to Orleans, but were entirely defeated in a sanguinary battle, near Chalons in Champagne.—P.

s “—surrounded with old walls.”—Its walls were begun by Matthew, duke of Lorraine, and completed in 1282, under Frederick (*Ferri*) II. (Enc. Meth.)—P.

t “Of all the small towns (*bourgs*) and villages, which are engaged in that kind of industry [cheese-making,] Gerardmer or Geromé is the most considerable; it contains more than 5000 inhabitants, and is situated in the most picturesque part of the Vosges. Several lakes may be seen in the vicinity, such as the White Lake (*Lac-Blanc*), the Black Lake (*Lac-Noir*), and those of Longemer and Retournemer; but that of Gerardmer* is the most important: it covers a surface of 36 hectares,† and gives birth to the small river Valogne, a branch of the Moselle.”

* The termination *mer*, in these names, undoubtedly signifies lake or pond, from the German *meer* (Fr. *mare*, a pond or pool; Eng. *mere* (in Cumberland and Westmoreland,) a large lake, in distinction from *tarn*, as in Winandernere—*meer* (in Huntingdonshire and Cheshire,) a small lake or pond, as in Whittlesy-*meer*, Combermeer.) Gerardmer, then, is Gerard's lake, and Longemer, probably long lake; Retournemer, if not of French derivation, may be a corruption of *Riethemmeer* (Germ.) reed lake. The German *meer* has indeed changed its meaning as a common name, and now signifies the sea or ocean, although in the Netherlands it still signifies a pond or lake. On the contrary, the German *see* signifies a lake, a singular instance of transposition of meaning in cognate dialects. This distinction has not been observed by some of the *English* (not *American*) translators of German poetry, and their inadvertence has led them into rather singular absurdities. Thus, the murmur of the lake or pond in the meadow, in the last canto of Schulze's *Enchanted Rose* (*Bezauberte Rose*)

a “These mountains contain iron, copper, and particularly lead, all of them more or less abundantly disseminated.”

b “—which issue from the base of nearly all these mountains”—a trait peculiar to limestone formations.—P.

f “Pleasant walks (*promenades*) surround it and border the banks of the Moselle, by which it is divided into two unequal parts, both of them containing several straight and well built streets. It was formerly fortified, but its ramparts have been demolished, and there only remains at present the ruins of its ancient castle.”

g “—several establishments for public instruction, a museum, and a library of 17,000 volumes.”

h *Romarici Mons*, in the Latin of the middle ages. Rumelsberg or Romberg, in German. (Enc. Meth.)—P.

i Remiremont was formerly situated on the east side of the Moselle, on a mountain where Count Romaric had a castle. But this place was entirely ruined at the commencement of the tenth century, by the Hungarians or new Huns, who having passed the Rhine during the reign of Lewis the son of Arnold (*Arnou*), laid waste the country.* It was then transferred to its present site in the plain on the west bank of the river. (Enc. Meth.)—P.

* The kingdom of Germany, under Lewis the son of Arnulf,† was invaded by the Huns, who seized and settled on those extensive provinces on the Danube to which they gave the name of Hungary. (Rankin's Hist. of France, vol. II. p. 117.)—About the year 900 the Hungarians, who were in possession of Transylvania, by the cession of the late emperor (Arnold,) invaded Bavaria with great cruelty. The duke of Bavaria raised an army to oppose them, and, indeed, defeated them; but five years afterwards, they renewed their invasions with the same barbarity as before. The emperor (Lewis IV.) then took arms, but was defeated at Augsburg by the barbarians. (Guthrie and Gray's Hist. of the World, vol. viii. page 367.)—These invaders were the present Hungarians (*Magyars*), who invaded the country on the Upper Theiss, in Eastern Hungary, about the year 834. (Malte-Brun, tome VI. p. 385.) They even penetrated, during their incursions, into the mountains of Switzerland, where they are still called Saracens in the traditions of the country. Simond's Travels in Switzerland.) The proper Huns under Attila entered France, VOL. III.—NO. 51 33

The department of Meurthe resembles that of Vosges; mountains not different in their component parts, although less elevated, extend from south to north on the western and eastern frontiers.^a As to their products, the two departments differ essentially from each other; like that of the Vosges, the department of the Meurthe produces much more grain than it consumes; the vineyards are more abundant, and the forests more extensive; there are fewer oxen, but a comparatively greater number of horses and sheep.^b

Three places of some importance from their industry, situated in the chain of the Vosges, may be briefly mentioned. Cirey is situated on the right bank of the Vezouze; it carries on a considerable trade in glass and crystal, which the inhabitants manufacture; the second or Saint-Quirin possesses works of the same sort, and under the management of the same company; the third or Phalsbourg, a strong town, rises on a height, contains about three thousand inhabitants, and exports a great quantity of liqueurs and essences.^c All the three are situated in the district^d of Sarrebourg,^e an ancient city of Gaul, the *Pons Saravi* of the Romans, so called from its position on the banks of the Sarre. The inhabitants carry on a trade in plaster ornaments and in cases for small cloaks, which, although made of the same substance, might be readily mistaken for gilt bronze.

It is not improbable that the Seille derives its name from the saline lands it waters; leaving the marsh of Indre, it passes through Dieuze, a town of four thousand souls, important chiefly on account of springs from which salt has been extracted during eight hundred years. It must have been more considerable in ancient times, for it was the *Decem-Pagi* of the Romans. Some remains of antiquity have been discovered at Marsal, a stronghold in an unhealthy and marshy situation. Salt springs are worked near Moyenvic, which was dismantled by Lewis the Fourteenth. Vic contains twice as many inhabitants, and possesses a very

valuable mine of rock salt. Chateau Salins, at some leagues on the north of Vic, is pleasantly situated on the banks of the Little-Seille; a small spring rises in the vicinity.^f

Invalids repair to the mineral fountain of Lombrigny, near the small town of Blamont^g on the Vezouze, where the former princes of Salm-Salm used to reside.^h Badonvillersⁱ is watered by the Blette; it supplies different parts of France with awls and punches that are little inferior to the best in Germany.^k Baccarat stands on the banks of the Meurthe, at the base of a lofty and steep hill, near a large forest; it may be mentioned among the industrious towns of France, for it possesses glass and crystal works, in which more than three thousand persons are employed.^l

The Vezouze traverses a fruitful plain, and waters Luneville,^m a place of some celebrity from the treaty concluded between France and Austria in 1801. It was a small stronghold about the middle of the seventeenth century; it was afterwards improved and embellished by duke Leopold. The castle, which served as a residence to the dukes of Lorraine and to king Stanislaus, has been converted into barracks for cavalry. The new infantry barracksⁿ may serve as a model for other buildings of the same kind; the architecture is simple, and the interior commodious and well aired; indeed nothing has been omitted which can contribute to the health of the inmates. The riding school, one of the largest in France, is three hundred feet long by eighty broad.^o A fountain, in which the water issues from eight different outlets, adorned the principal square;^p as it is still mentioned in the most recent geographical dictionaries, itineraries and descriptions of France, it does not appear to be generally known that it was destroyed in the year 1796. Luneville was the birthplace of Boufflers,^q Monvel^r and the eloquent Girardin.^s

The road from Luneville to Nancy extends along the forest of Vitrimont, which borders the right bank of the Meurthe; Rosiere aux Salines rises on the opposite bank;

marshy situation, near which several remains of antiquity have been discovered; by Moyenvic, which was dismantled by Louis XIV., and which derives its support from its valuable saline springs; and lastly by Vic, which contains twice as many inhabitants as the latter, and which its mine of rock salt will undoubtedly render still more important. Chateau-Salins, at the distance of some leagues to the north of Vic, on the banks of the Little Seille, also possesses saline springs.^t

and in the fisher-boy's song on the Lake of Lucerne, in the first scene of Schiller's *Wilhelm Tell*:

Der Knabe schlief ein am grünen Gestade (*scil. des Seen*)—

The boy falls asleep on the lake's green shore—

is rendered:

The boy sleeps on the ocean's brink !!

I may here add, in conclusion, that a great number of small round lakes in the chain of the Etyel, supposed to occupy the craters of extinct volcanoes, are called *maars*, in the dialect of the inhabitants. (Daubeny on Volcanoes.)—P.

† 74 acres nearly.—P.

a "The department of the Meurthe resembles in its general surface that of the Vosges; its eastern and western extremities are traversed from south to north by the same chains of mountains, although less elevated."

b "It abounds more in wine, horses and sheep; but it possesses fewer oxen, and its forests are less extensive."

c "The first of them is the small town (*rille*) of Cirey, which stands on the right bank of the Vezouze, and possesses a manufactory of plate, common and crystal glass (*de glaces, de verreries et de cristaux*;) the second is St. Quirin, which contains a similar establishment, belonging to the same company; the third is Phalsbourg,* a small fortified town (*rille forte*) of 3000 inhabitants, built upon a height and noted for its liqueurs."

* Phalsbourg (Enc. Meth.)—Pfalzburg (Germ.)—P.

d "Arrondissement."

e Sarbourg or Saarbourg (Vosgien.) Sarbourg, or Sarbruck. (Enc. Meth.)—The latter name, Sarbruck, in German, Saarbrücke, signifies the same as *Pons Saravi*, viz. the bridge over the Sarre.—P.

f "The Seille probably derives its name from the saline lands which it waters; after issuing from the lake of Indre,* it flows by Dieuze,† a town of 4000 souls, important from its saline springs, which have been worked for at least 800 years, and a place of considerable note under the Romans, from whom it received the name of *Decem Pagi*; then by Marsal, a small fortified town (*place forte*) in a

the inhabitants employed themselves formerly in extracting salt from neighbouring springs; at present, however, they are no longer worked.^a The river begins to be navigable at St. Nicolas du Port,^b a small town of three thousand inhabitants, in which the only remarkable building is a fine Gothic church.

Nancy consists of broad, straight, and almost deserted streets; in the number of public buildings it surpasses most towns of the same size; the Royal Place forms the principal square, the others are large and regular, many of them are adorned with fountains. The prefect's palace, the theatre and the townhouse, little inferior to any other in France, are the most remarkable edifices within the walls. Four bronze fountains rise in the centre of the Royal Place, and several long streets reach from it to the extremities of the town, two of them extend in different directions, and meet at a triumphal arch. The hospital and the barracks are decorated with many ornaments, the churches are more modest or at all events not so gawdy in point of architecture.^c The church of Bon-Secours in the suburb of St. Nicholas, contains a master-piece by Girardon; it is the mausoleum erected to the memory of Stanislaus, king of Poland,^d the person to whom the city is indebted for its principal embellishments. The tombs of the dukes of Lorraine are much inferior as specimens of art; they are placed within the cathedral.^e The old town resembles what Nancy was before the virtuous Stanislaus, whose income did not certainly exceed £.100,000, undertook to build a new city,^f which together with the improvements made by him at Luneville, and the sums laid out in founding a great number of schools and other useful institutions, proves what may be done by economical and judicious management. It is to the same prince that Nancy owes an academy of sciences and letters, a valuable museum, a public library of 26,000 volumes, and a botanical garden, in which there are more than four thousand plants. Commerce and the various branches of industry connected with

it were not held in great estimation; the town might have been compared to a French noble of past days, who thought himself degraded if he engaged in trade. But these prejudices and other effects of ignorance have within the last ten years been gradually removed; the inhabitants are now aware that their town possesses nothing royal but deserted palaces and melancholy associations. It carries on a trade in vulnerary drugs, embroidered stuffs, cloth and cotton, for which there are two large manufactories.^g The impulse has been given, and the canal from Paris to the Rhine may render Nancy one of the most industrious cities in France. The inhabitants may then distinguish themselves in literature and in the arts, for they have not forgotten that Callot,^h whose patriotism was only equalled by his talents, that Madame de Graffigny,ⁱ Palissot,^k St. Lambert,^l and other celebrated persons still living, were born in the town.

The Meurthe joins the Moselle at the distance of two leagues below Nancy. Pont à Mousson is situated on the last river, at the foot of a high hill, in a valley surrounded by fruitful declivities. The town is divided into two parts, which communicate with each other by means of a bridge; it contains seven thousand inhabitants, the houses are well built, one of the squares is encompassed with arcades.^m It was the birthplace of the brave Duroc, who fell in battle on the twenty-third of May 1813. Remains of ancient times have been discovered on the height from which it derives its name, and which, it has been proved, was crowned with a temple dedicated to Jupiter.ⁿ

The name of Toul has undergone during a period of eighteen hundred years fewer changes than that of most towns; it was called *Tullum* when it was the capital of the *Leuci* in the time of Cæsar. The Moselle flows beneath its walls; its public buildings are hardly worthy of notice; the ancient diocesan church is of Gothic architecture, but without ornaments and without majesty.^o The town is not very populous, the trade is insignificant, it consists chiefly in earthen ware and leather.^p

^a "Its salt springs have been long since abandoned. The government, however, maintains there one of the finest studs (*haras*) in France."

^b St. Nicolas, or Nicolasbourg, a town in Lorraine, with a very fine church dedicated to St. Nicholas, a place of pilgrimage. (Enc. Meth.)—P.

^c "Nancy consists of broad, straight and almost deserted streets. Its edifices are of the greatest beauty; its public squares are very large and adorned with elegant fountains; the Royal Square (*Place Royale*) is the most remarkable: the prefect's palace (*la préfecture*), the theatre and the townhouse, the latter one of the finest in France, are the principal edifices that surround it; it is watered by four bronze fountains, and from its centre the eye measures the whole extent of several long straight streets which reach to the extremities of the city; two of them, opposite one another, are each terminated by a beautiful gate in the form of a triumphal arch.^{*} The barracks and the hospital are magnificent, but the churches are less splendid in their architecture."

^{*} The eastern and western gates, which are similar, terminate two fine streets, which unite in the square built by Stanislaus. (Ed. Encyc.)—P.

^d The ci-devant cloister of the Franciscans, at the end of the Fauxbourg of St. Pierre, contains the mausoleum of king Stanislaus, which is the chef-d'œuvre of Girardin. (Ed. Encyc.)—The mausoleum of king Stanislaus, erected by order of the municipality in the church of St. Roch, was sculptured by Sentksen. The monument of Catharine Opalinski his wife, is contained in the church of Notre-Dame de Bon-Secours. (Enc. Meth.)—Girardon, the celebrated sculptor, died in 1715. Stanislaus died in 1766. (Beauvais.)—Girardet (J.) painter to king Stanislaus, was born at Luneville (1709), and died at Nancy (1778.) The Descent from the Cross, in one of the churches at Nancy, is considered his master-piece. (Beauvais. Dict. Hist. Caen.)—P.

^e "The tombs of the dukes of Lorraine are contained in the cathedral.^{*} The finest promenade is that of the nursery (*pépinière*.)"

^{*} In the Franciscan church. (Vosgien.)

^f "The quarter called the old town, is still such as it was at the

period when the virtuous Stanislaus, with a revenue of less than two millions [francs,] undertook to build a new city—"

"Proud of its beauty, Nancy still bears some resemblance to the old nobility, who thought themselves degraded by engaging in useful occupations; but this prejudice, which ill becomes a town that has no longer any thing royal but its melancholy magnificence and its old recollections, has, for the last ten years, been gradually disappearing. It now joins to the preparation of vulnerary balls (*boules vulnérables*),^{*} for which it has always been celebrated, embroidery on the lightest stuffs, the manufacture of cloth, and cotton spinning, for the last of which it possesses two large establishments."

^{*} *Globuli Martiales* (Fr. *boules de Mars*), prepared by mixing two parts of cream of tartar and one of iron filings; employed externally in contusions, luxations and gunshot wounds. The balls are soluble in water, and are thus used externally as a bath or lotion, or taken internally. (Parr's Med. Dict. Blancardi Lex. Med. Dict. de Trevoux.)—P.

^h J. Callot, distinguished as an artist, particularly as an engraver—born 1593. (Beauvais.)—P.

ⁱ Author of the Peruvian Letters (*Lettres Péruviennes*).—P.

^k Ch. Palissot de Montenois, born 1730, distinguished as a poet and historian.—P.

^l St. Lambert, the author of the Seasons, was born at Veselise, in Lorraine, a small town five leagues S. W. of Luneville. (Beauvais. Vosgien.)—P.

^m "It has a population of 7000 inhabitants; it is well-built, and contains a square surrounded with arcades."

ⁿ "On the height from which it derives its name,^{*} several remains of antiquity were formerly discovered, which prove that in the time of the Romans it was crowned with a temple dedicated to Jupiter."

^{*} *La montagne de Mousson*, Mount Mousson.

^o "Its principal church, formerly the see of a bishopric, is built in the Gothic style, but without ornament or majesty; the portal is the only part held in estimation."

^p "Its population is not large, and its manufactures are unimportant; it has only a manufactory of pottery (*une faïencerie*), two of embroidery, and a few tanneries. There is no other town of any importance in the arrondissement, of which it is the capital."

The inhabitants of Upper Marne are industrious; the fields, the vineyards and the woods are productive. The soil, unequal and mountainous, is richer in iron than any other department; it is very fruitful in different kinds of grain, and it is doubtful, if relatively to the superficial extent, more horses and oxen are reared in any other part of the kingdom; in short, if the means of communication corresponded with the fruitfulness of the soil, or with the industry and activity of the inhabitants, it might be classed with the most wealthy and most populous departments in France.^a

Bourbonne les Bains rises on the eastern slope of the plateau of Langres; it is built on a declivity at the confluence of two small rivers, the Borne and the Apance. Many of the houses are old, most of the streets are crooked, and the town does not contain more than three thousand inhabitants; but it derives some importance from the celebrity of the baths, and also perhaps from a large military hospital in which there are more than five hundred beds.^b The temperature of the springs varies from thirty to forty-eight degrees of Reaumur;^c a person, it is said, cannot hold his hand in the water, but he may drink it without any painful sensation. The use of them is recommended in nervous complaints, in paralysis and other diseases; the first baths were erected by the Romans, and the place was called *Aqua Borvoni*.^d The Meuse takes its rise in a valley about four leagues eastward of the town. Two small valleys on the south of it are watered by two streams; their junction forms the Marne, which traverses the department from south to north.

Langres is situated near the sources of the same river, on the summit of a steep height;^e it exports a great quantity of cutlery into different countries, and carries on a considerable trade in fur with Switzerland. It seems as if the prosperity of the town depended on these branches of industry, and as the population was much diminished about ten years ago, there is reason to believe that without them it might fall into decay. There are different useful and charitable institutions, the most celebrated perhaps are the schools in which geometry and mechanics in their application to the arts, are gratuitously taught. The cathedral is considered a fine monument of the middle ages, but the

^a "The department of the Upper Marne is important from its manufacturing industry, its agriculture, its vineyards and its forests. Its surface is hilly and uneven, but it is richer in iron mines, than any other department in the kingdom; it is also one of the most fruitful in corn and oats, and one of those that rears the greatest number of horses and cattle; and in fine, if the means of communication were more extended, the activity of its inhabitants would soon place it among the most productive and the most populous."

^b "The town is ill-built, and contains only 3000 inhabitants; but it is important from its magnificent bathing establishment, and from its large military hospital in which there are more than 500 beds."

^c 99½° to 140° Fahrenheit.—P.

^d "These waters are considered efficacious in nervous diseases, and are accounted a sovereign specific for the cure of paralysis and gunshot wounds; they were held in much estimation by the Romans, who formed there an establishment that bore the name of *Aqua Borvoni*."

^e Langres is situated at a greater height than any town in France. (Ed. Encyc.)—It is the most elevated point in France; several rivers rise in its neighbourhood, which fall into three different seas, viz. the Meuse, into the German Sea; the Marne (a branch of the Seine.) into the English channel; and the Vingeanne (a branch of the Saone.) into the Mediterranean. (Enc. Meth.)—It stands on the summit of an elevated table-land, called the Plateau of Langres, which forms the principal water-shed in the N. E. of France.—P.

^f "The fine quality of its cutlery, of which it exports considerable quantities to every part of Europe, and the importance of its fur trade with Switzerland, render it probable that it would find it difficult to subsist without these two branches of industry, since for the last ten years its population has sensibly diminished. Its cathedral is a fine monument of the middle ages; its public library consists of 30,000

public buildings form a sad contrast with narrow and deserted streets; on the whole, it is a very different place from what it was under the Roman emperors. It bore the name of *Andematunum*, but the Romans called it *Lingones*, for thus the inhabitants and the people in the neighbouring country were designated;^f it had its senators, its capitol, its temples and its theatres; the people raised statues and triumphal arches to their Roman masters, and it is certain that inscriptions found within its walls, have served to illustrate some difficult points connected with history and antiquarian research. The town is mentioned in the writings of Tacitus and Plutarch; they have related the history of Sabinus, a citizen of the place, who revolted against Vespasian, and who after the defeat of his party, set fire to his habitation, by which stratagem he was believed to have perished in the flames. Sabinus concealed himself in a sepulchral vault,^g and confided only in the discretion of a faithful slave, and in the affection of his wife Eponina;^h but the frequent absence of the latter, and the birth of two children, revealed a secret which had been kept nine years. They were conducted to Rome, and brought before the emperor; the sufferings of Sabinus, the heroic devotedness of his wife, the sight of the two children, their prayers, and the tears of their mother, were all unavailing. Eponina was permitted to share the fate of a husband with whom she had lived so long in a tomb. Sabinus and Eponina, from their adventures and the celebrity of their historians, may be mentioned among the most remarkable natives of Langres, but it should not be forgotten that Diderot was also born in the same place.

Nogent le Roi, a small town of two thousand inhabitants, shares with Bourmont a trade in cutlery and hardwares;ⁱ the latter does not contain more than twelve hundred individuals; it possesses, however, a public library; both of them are situated in the district^k of Chaumont,^l a well built city on the declivity of a hill above the banks of the Marne. It was fortified by Louis the Twelfth, and was formerly the capital of Bassigny;^m Russia, Austria, and Prussia concluded there an alliance against Napoleon. As the capital of the department, it possesses such useful and benevolent institutionsⁿ as in the present state of society may be considered indispensable; the old walls have been repaired since the year 1821, and it is now ranked among the strong

volumes. It possesses a theatre and a fine promenade, but its public edifices, its assemblies, its courses of instruction in geometry and mechanics in their application to the arts, and its other establishments, form a striking contrast with its deserted streets and ill-built houses. It is far from retaining the importance it enjoyed under the Roman emperors: it was an ancient city of the Gauls, and bore at first the name of *Andematunum*;^g but the Romans gave it that of *Lingones*, by which the people in the surrounding territory were designated—"

* *Andematunum*. (Moreri).—P.

^g "Souterrain"—any subterranean place; not necessarily, a sepulchral vault. Plutarch (*Ἐρωτικὸς*—Opera, t. ii. (Moralia), p. 770-1, edit. Xylandri, Francof. 1620, fol.) says he hid himself in certain subterranean excavations for storing commodities (subterranean granaries)—*αποδυρας χρηματων ορνιθιας ελογειν*—which he afterwards calls simply subterranean places (*τα ελογεια*—*latebra*, Tacit.) The original says below that he lived in a tomb (*tombeau*.) but it might have there only intended to say that he had lived as if buried in a tomb; at any rate, since its only authorities are Tacitus and Plutarch, in the first of whom there is no detail of particulars (Histor. L. IV. § 67.) we may consider the statements of the latter as best entitled to credit, and conclude that he lay concealed, not in a *sepulchral vault*, but in one of those subterranean granaries, so common among the ancients, and still in frequent use in the countries around the Mediterranean.—P.

^h *Epponina* (Tacitus)—*Εμρονα* [*Εμρονα*] (Plutarch).—P.

ⁿ "Establishments for public charity and education."

towns in France.^a The celebrated men of Chaumont are Bouehardon the sculptor, and Lemoine the jesuit.^b

The windings of the Marne lead to Joinville, a small town of four thousand inhabitants, still commanded by the castle in which the companion of St. Louis^c and the celebrated Cardinal Lorraine were born. It was at Vassy or Wassy, situated at the distance of some leagues from the Marne,^d that the followers of the duke of Guise massacred in 1561 a number of Protestants, while they were assembled in their church, an event that proved the harbinger of the civil wars. St. Dizier,^e at the northern extremity of the department, is well-built, and encompassed with pleasant walks;^f it contains six thousand inhabitants, and is a town of some consequence from its commerce and industry: twice in the space of six months,^g the allied armies were defeated under its walls by the French.

The extent of the roads and navigable rivers in the department of the Aube, counteract the disadvantages of an unfruitful soil. The Seine and the Aube water it from south-east to north-west; the roads to Dijon, Befort, Sens, Chalons sur Marne, and Paris, cross it in different directions. Undulated ridges form the surface, which may be divided into two regions.^h That on the north-west, consisting of plains and hills, covered with a thin stratum of alluvial soil, is by no means productive; oats, rye and buckwheat are the only kinds of grain that succeed, but they yield so scanty crops that a great part of the land is suffered to lie waste. The same region, wholly destitute of trees, has been called Champagne Pouilleuse, a name that may be considered very descriptive of it;ⁱ the inhabitants are as poor as the soil. The region in the south-east differs little from the last in its geological structure, but the chalk is everywhere covered with thick and very fertile alluvial deposits; in some districts, however, they are so heavy and tenacious that it requires twelve horses to draw the plough. The fruitfulness of the country forms a happy contrast with the sterility in Champagne Pouilleuse, which might indeed be rendered less unproductive by planting resinous trees and others that thrive on light lands. Cattle, poultry and bees are reared in the more fertile districts. The population in the department falls below the mean term in the rest of France, but the grain harvests are three times more abundant, and the quantity of potatoes is still greater

in proportion. It produces excellent wines, of which two-thirds are exported; it is well supplied with horses, but not so with oxen and sheep. The industry and trade of the department are rising into importance; the chalk so common in the country is fashioned into different shapes, and sold as an article of commerce; cotton and cloth are the principal manufactures.^k

The burgh of Clairvaux,^l on the left bank of the Aube, was once famed for a very wealthy abbey, founded in the year 1115, by Hugh count of Troyes,^m and Stephen abbot of Citeaux. St. Bernard was the first abbot, and a vat may be seen, that is still called by his name, it can contain eight thousand tuns.ⁿ The building has been partly converted into manufactories, in which the workmen make cloths, bed-covers and cotton stuffs.^o The almost ruined walls in the small town of Bar sur Aube bear testimony to the devastations committed by the hordes of Attila;^p the neighbourhood was the scene of a destructive combat between the allies and the French in the year 1814.

Brienne, at no great distance from the right bank of the Aube, is divided into two parts, which are separated from each other by a space not less than a thousand paces in extent; the one is called Brienne la Ville,^q and the other Brienne le Chateau. The first rises near the river, and the second on the declivity of an artificial height, crowned by a castle that was built for a military school by Lomenil de Brienne;^r the same school counts Napoleon Bonaparte in the list of its pupils. The town was taken and retaken in January 1814 by the French and allies; many of the buildings were much injured, the population has been greatly reduced, it does not exceed at present two thousand inhabitants.^s

Bar sur Seine, although less populous, is better built than Bar sur Aube; a stone bridge of elegant architecture communicates with both banks of the river, and public walks shaded with lofty trees extend in the neighbourhood.^t The town of Les Riceys, containing 4000 inhabitants, is formed by the union of Ricey-Haut, Ricey-Bas and Ricey-Haute-Rive,^u three burghs that were founded by an ancient Helvetic tribe. Ten thousand casks of excellent wine are every year exported from the district into Belgium and other countries in the north.^x

Troyes,^y the ancient capital of Champagne, stands in the

^a Its townhouse (*hôtel-de-ville*) is remarkable for its elegance. M. B. Pierre Lemoine, author of the epic poem of St. Louis. (Beauvais).—P.

^y Troye. (Moreri.)

middle of a large and fruitful plain which the Seine waters; the river encompasses part of the town, and divides itself into several artificial branches by means of canals that were constructed in the twelfth century by Theobald the Fourth,^a to whom the inhabitants are indebted for the institutions that ensure the prosperity of their town. It is long since the palaces inhabited by that prince and some of his successors have disappeared, but the remembrance of their wise administration is still preserved in the country. The marriage between Henry the Fifth, king of England, and Catharine of France, the daughter of Charles the Sixth, was celebrated at Troyes on the 21st of May 1420. The same Charles was not ashamed to sign a treaty, by which his son-in-law became master of his dominions;^b but nine years afterwards the English were expelled by Charles the Seventh, assisted by Joan of Arc. The town was encompassed with feeble ramparts anterior to the middle ages, at which period it bore the name of *Treca*. At the time when the Huns desolated Gaul, St. Loup, the bishop, sent a deputation consisting of seven clerks and a dean^c to Attila; the barbarian conqueror was about to receive them, when the luminous rays reflected from the sacred ornaments that were carried with great solemnity, terrified the horse of one of his generals, who was in consequence thrown from his seat, and killed on the spot. Magic, Magic! cried the furious chief, and the poor clerks with their dean^d were put to death. Troyes, however, was spared; but Attila, compelled by the Roman general Aetius to retire from Gaul, passed again through the town, and, in order to protect his retreat, made St. Loup accompany him to the Rhine. Troyes was a place of some importance when Julian defeated the Germans, who threatened to besiege it. Augustus conferred on it the privileges of a city, and gave it the name of *Augustolona*.^e It may be ranked from the great number of wooden houses among the ill-built towns in France; still some of the streets are broad and straight, and some of the edifices are remarkable. The cathedral may be mentioned for the elegance of its Gothic architecture, the magnificence of its portal, and the boldness of its arches. It was founded in the year 872, and demolished by the Normans in 898; having been rebuilt in the follow-

ing century, it was destroyed in 1188 by a fire which consumed the whole town; the inhabitants began to build it for the third time about the commencement of the thirteenth century, but it was not finished before the sixteenth. The church of St. Urban is considered a model of elegance and lightness; the townhouse was built according to the plans of Mansard, the front of it is in every way worthy of that great architect.^f The public library, which contains 55,000 volumes and 5000 manuscripts, may be classed with the most valuable in France. We may mention among the great men who were born at Troyes, pope Urban the Fourth, the son of a cobbler, and who instituted the festival of the Holy Sacrament, Passerat, one of the authors of the *Satire Menippée*, Juvenal des Ursins,^g the historian of Charles the Sixth, Girardon the sculptor, and Mignard the painter. Piney, a flourishing burgh,^h in which more than a hundred and twenty workmen are employed in making cordage,ⁱ is situated in the neighbourhood.

Arcis sur Aube was much injured by the allied army in 1814, but it has since been enlarged and improved by the industrious inhabitants. The burgh of Romilly, about two leagues above the confluence of the Aube and the Seine, carries on a trade in hosiery and cottons. The body of Voltaire was interred in the neighbouring abbey of Selliere,^k in the year 1778, but the building has been since destroyed. The river waters Nogent sur Seine, a neat town and the capital of the district, in which are situated the ruins of Paraclet, a monastery founded by Abeilard.^l

The department of Marne extends on the north of the last; the soil, although of the same sort, may be considered more fruitful; long ridges of chalk are covered with alluvial lands, that yield very valuable wines and a great quantity of corn. The wines are divided into two classes, *those of the river and the heights*; the vineyards near the Marne belong to the first, the others at a distance from it to the second. The people in the rural districts rear a greater number of sheep than the inhabitants of most agricultural departments, the lower orders in the towns find employment in manufactories and in different branches of industry.^m

The ancient town of Vitryⁿ on the river Orne,^o now the village of *Vitry le Brûlé*, derives its surname from an act

^a "Count Thibaud IV."—Count of Champagne, 1102—1152. (Moreri).—P.

^b Charles VI. at the time of the treaty, was in a state of imbecility, and in the hands of the Queen and the Duke of Burgundy, who were inveterately hostile to the Dauphin, (afterwards Charles VII.) The design of the treaty, on the part of those who directed the king, was to crush the Dauphin. For this purpose it was stipulated that Henry should espouse the princess Catharine, that he should not invade or disturb the kingdom during the life of Charles VI., but that immediately on his death, the crown of France should descend to Henry and his heirs forever, and that in the meantime he should preside as regent in the government of France. The disgrace of the treaty does not therefore attach to Charles VI., but to the active agents, the Queen and the Duke of Burgundy.—P.

^c "Diacre"—deacon.

^d "Les pauvres envoyés"—literally, the poor envoys—the deputation.—P.

^e It was afterwards called *Tricasses*, from the name of the tribe of which it was the capital. (D'Anv.)—P.

^f "The front (*façade*) of the town-house does honour to Mansard."

^g J. Jouvenal des Ursins (called also Juvenal des Ursins,) son of an advocate of Paris, who became provost of the city, 1388. (Beauvais).—P.

ⁱ "Well-ropes of linden bark (*cordes en tilleul pour les puits*)."—The bark of the linden tree is much used in making ropes for wells, and for drawing in hay and straw from the fields [for country harness or traces.] Most of the well-ropes of linden bark, sold in Paris, are brought from Normandy. (Savary, Dict. Comm. t. III. p. 391).—P.

^k Sellieres, Scellieres. (Enc. Meth.)

^l "Arcis sur Aube, by means of its cotton mills (*filatures*), has been able to repair the losses which it sustained in 1814 from foreign invasion. At the distance of two leagues above the confluence of the Aube and the Seine, the small town (*bourg*) of Romilly, in which they manufacture needles and hosiery, extends for a league along the left bank of the Seine (*peure*, the main river;) the abbey of Selliere, in which the body of Voltaire was interred in 1778, stood formerly in its neighbourhood. The Seine then flows by Nogent sur Seine, a small but neat town, and the capital of an arrondissement, which still retains some traces of the invasion of 1814. Some remains of the convent of the Paraclet (*Paraclet*)—may be seen in its vicinity."

^m "The department of the Marne, on the north of that of the Aube, resembles it in its surface, but is more fertile: it every where presents extensive plateaus of chalk covered by an earthy and sometimes sandy stratum, which produces considerable harvests of grain, and a great quantity of excellent wine. Its wines are distinguished into two great classes, viz. the river and the mountain wines (*vins de rivière et de montagne*;) according as the vineyards that produce them are situated on the banks of the Marne, or at some distance in the interior.* It rears a greater number of sheep than most of the other agricultural departments, and is thus enabled to carry on several important manufactures of woollen stuffs."

* In the province of Champagne there are two kinds of wine; the white wines, called *Rivière de Marne* wines; and the red wines, called *Montagne de Rheims* wines. The white wines are produced from the vineyards situated in the valleys, and upon the sides of the hills. (Ed. Encyc. art. France).—P.

ⁿ Vitry. (Enc. Meth. Vosgien.)

^o Orney. (Enc. Meth.)—It stands on the river Saulx. (Vosgien.)—The Saulx and the Orney both pass by Vitry le Brûlé, and soon afterwards enter the Marne. (Enc. Meth.)—P.

of cruelty committed by Louis the Young. While that prince was engaged in war against Theobald, count of Champagne,^a he made himself master of Vitry, and put all the inhabitants to death.^b Actuated by scruples that cannot be easily defined, he refused to pollute a church with blood, to which 1300 persons had fled for refuge; but he set it on fire, assisted in destroying the victims, heard their cries, and saw the flames extending their ravages without emotion, and did not leave the place until the silent smoke rising from the ruins announced that his vengeance was complete. The sad surname which the town had thus acquired, was confirmed by new disasters in the sixteenth century; it was burnt by the troops of John of Luxemburg, and afterwards wholly destroyed by Charles the Fifth.^c Francis the First then determined to rebuild it, but he chose a more advantageous site on the banks of the Marne, and gave it his name, which proves that it ought to be called *Vitry le François*, and not *le François*; ^d at present, however, it is generally styled *Vitry sur Marne*.^e The founder intended to make it a strong place, but it is merely encompassed by a ditch and earthen ramparts; the houses are well built, the streets are broad and straight.^f

The road from Vitry to Sezanne crosses large and monotonous plains, the scene of unequal struggles between the French and allied armies, in 1814; the small town of Fere-Champenoise^g was one of those which suffered the most. Sezanne, formerly a strong place, and more populous than at present, contains about four thousand inhabitants. It has experienced many calamities; the earl of Salisbury took it by assault; the protestants levelled it with the ground in the reign of Charles the Ninth; it was entirely destroyed in 1632 by a fire that lasted several days, and which occasioned a loss of property, that was then thought equivalent to £.250,000; it carries on at present a trade in different articles, but principally in agricultural produce.^h Montmirail or Montmirel stands on a small eminence, on one of the two roads that lead from Paris to Chalons; it contains about two thousand inhabitants, and is celebrated on account of a

victory which the French gained on the seventeenth of February 1814.ⁱ

Epernay^k is situated in a small valley on the left bank of the Marne: a gate formed by two towers leads to the public walk, and is all that remains of the fortifications^l which defended Epernay in the time of Henry the Fourth, who made himself master of the town,^m but not before the duke of Biron,ⁿ on whom he leant, was killed at his side. The principal suburb is built on the banks of the river, and very extensive cellars have been cut in the chalky heights that command it.^o The inhabitants have a theatre and a public library;^p their trade consists in *fire proof* or Champagne earthen ware, of which the average quantity that is annually exported into other departments does not weigh less than five hundred tons.^q The wealth of Epernay is principally derived from the sale of its white and red wines; the latter are chiefly produced on the left bank of the Marne, near the small but ancient town of Vertus; the sparkling white wines are partly obtained from the village of Pierry, and the burgh of Avize, but the best sorts are those on the opposite bank, where Ai, a burgh of two thousand five hundred inhabitants, rises in the form of an amphitheatre, where the vineyards on the heights round Mareuil are not less famous; Cumieres and Hautvillers on the left, are not perhaps so well known, still they produce excellent wines. The finest part of the country is formed by the line of populous villages and fruitful heights that are crowned by the forest of Reims.^r

The road on the left bank of the Marne commands a view of the varied and romantic sites, that extend on the opposite bank from Epernay to Chalons sur Marne. It might be shown that Chalons,^s or Chaalons, as it was formerly written, is derived from *Catalaunum*, the name it bore in the time of Ammianus Marcellinus; ^t it was a city of the *Catalauni*,^u and it is called *Duro-Catalauni* in the Itinerary of Antonine. It stands between two plains in the midst of meadows; the larger plain was the place where the emperor Aurelian defeated Tetricus, who had been proclaimed em-

^a Thibaud IV. See note ^a, page 982.

† "The name of the latter [Chalons,] formerly written Chaalons, is derived from that of *Catalaunum*, which it bore in the time of Ammianus Marcellinus."—The name is written *Catalauni* and *Cathelanni*, in Amm. Marcell. (l. xv. xvii.) edit. Valesii, Paris, 1636.—P.

‡ "The city (capital) of the *Catalauni*."

peror in Gaul. The position of Chalons is not unfavorable for trade, an advantage it derives from its situation on the Marne, and from the six important roads that traverse it. It is encompassed with walls and ditches; most of the houses are built of wood, but the streets are broad and straight.^b The townhouse is adorned with a fine front; the prefect's palace, and the school of arts and trades, are remarkable for the simplicity and elegance of their architecture; the cathedral might be admired, if it were not for two clumsy pyramidal towers and a Greek portal, that accords ill with the rest of the building.^c The botanical garden contains fifteen thousand plants; there are also a collection of natural history, and a good library. Lacaille, the celebrated astronomer,^d David Blondel the architect,^e and Perrot d'Ablancourt,^f were born in the town. The gate on the road to Strasburg leads also to the Jard, perhaps the finest public walk in the department.^g

We may observe at the distance of two leagues on the same road, an elegant Gothic building, the church of Epine;^h it was erected by Louis the Twelfth for the purpose of fulfilling a vow; it is to be regretted that it was thought necessary to pull down one of its towers in order to raise a telegraph. The long village of Courtisols or Courtisou is situated on the right, at no great distance from the church; it occupies an extent of nearly two leagues from one extremity to the other; it is formed by two parallel streets, consisting of houses that are separated from each other by plantations; it is divided into three parishes, namely, those of St. Julian, St. Mammie, and St. Martin. The population is not less than two thousand individuals. The language which the inhabitants speak amongst themselves, is not known in the neighbouring villages; they observe certain ceremonies of an ancient character, that are not practised in other parts of the country; they are excellent husbandmen, indeed their lands are the best cultivated and the most productive in the department.ⁱ From these facts, it has been inferred that the Courtisians are descended from

^a Tetricus was proclaimed emperor at Bordeaux (A. D. 268.) during the reign of Claudius II. He continued to govern Gaul, Britain and a part of Spain, until after the conquest of Zenobia, when wearied with the insolence of his soldiers, he voluntarily surrendered his authority into the hands of Aurelian, at Chalons, A. D. 274. He was afterwards appointed by Aurelian, governor of Lucania.—P.

^b "—but as the principal streets are clean and straight, its appearance on the whole is very agreeable."

^c "The cathedral, whose two pyramidal towers, wrought in open work, are in rather a rustic style, is not without merit; it is disfigured, however, by a portal of Greek architecture."

^d N. L. De la Caille, the celebrated astronomer, was born at Rumigny in the department of the Ardennes. (Beauvais. Vosgien. Dict. Hist. Caen, 1804.)—P.

^e David Blondel, a celebrated protestant minister, and professor of history at Amsterdam, was a native of Chalons.—Francis Blondel, a celebrated architect during the reign of Louis XIV., was the son of Francis Blondel, lord of Croisettes, who dwelt at Ribemont in the diocese of Laon.—J. Fr. Blondel, a native of Rouen, was also distinguished as an architect. (Born 1705; died 1774.) (Beauvais. Moreri. Dict. Hist. Caen.)—P.

^f Nic. Perrot d'Ablancourt, born at Chalons, 1606; celebrated for his numerous translations from the ancients.—P.

^g "On issuing from the town by the road to Strasburg, the justly celebrated promenade of the Jard presents itself in all its beauty; its alleys are magnificent."—The promenade called Le Jard, is reckoned the finest in France. (Ed. Encyc.)—P.

^h L'Epine, a village of Champagne, two leagues from Chalons.—Courtisols, a *bourg* of Champagne, two leagues N. E. of Chalons. (Vosgien.)—P.

ⁱ "They are so far advanced in the knowledge and practice of agriculture, that their lands are the best cultivated and the most productive in the whole country."

^k "—that were established in Gaul by the successors of Constantine."

^l Mémoires de la Société royale des antiquaires de France, tome V.

some one of the barbarous tribes that settled in Gaul after the reign of Constantine;^k others have considered them a colony of Helvetians.^l Their language, however, is merely a French *patois*, and the name of their village signifies detached houses. As to their origin, it is very doubtful that they migrated from Valais, they are probably descended from some of the ancient tribes in Gaul, they have preserved the manners and customs of their ancestors.^m The remains of a Roman road, and the traces of the enclosure where Attila and his army encamped,ⁿ may be seen in the neighbourhood.^o The famous camp of Lune, and the village of Valmy, where the king of Prussia was defeated in 1792 by an army of volunteers under the command of Kellermann, are situated on the road between Courtisou and St. Menehould, the latter a town watered by the Aisne, and remarkable for the regularity of the streets and buildings. Although the works which defended it are now in ruins, it may be observed that it was the first place which Louis the Fourteenth besieged.^p

The population and industry of Reims or Rheims render it an important town; as a place of antiquity it is not without interest, but its celebrity depends principally on the historical associations connected with it. In ancient times it was the chief town in the country of the *Remi*, who gave it the name of *Durocortum*, but ancient geographers call it indifferently *Durocortorum* and *Durocortora*. It was famed for different schools in the time of Hadrian, and it then possessed monuments, of which ruins or traditions are all that remain. The gates of Phebus, Ceres and Bacchus indicate so many temples beyond the walls; the gate of Mars forms a triumphal arch which, it is believed, was erected by Julian; part of it was repaired by Napoleon, but an old wall that conceals it, has not been removed. The gate of Mars stands near the *Arena*, where traces of an amphitheatre may be easily discovered.^q The tomb of Jovinus, a citizen of Reims, who rose at Rome to the consular dignity in the year 366, is preserved in the cathedral. It is a monument

^a "As for their origin, it does not seem necessary to search for it in the Valais; it may have been Celtic: is it not indeed probable that the Courtisians are descendants of the ancient Gauls, who have preserved the language and manners of their ancestors?"

^b Previous to the battle fought in the plains near Chalons, in which he was totally defeated by Actius, the Roman general, in alliance with Merovæus, king of the Franks, and Theodoric, king of the Visigoths.—P.

^c "—may be seen on the left of the village."

^d "The town (*ville*) of *Sainte-Menehould* is built of stone and brick with much regularity; its town-house is an elegant edifice. It is surrounded by the Aisne, and was formerly fortified; it was the first place besieged by Louis XIV."—It is situated in the midst of rocks, in a marsh on the Aisne. (Vosgien.)—It has a castle on a rock. (Enc. Meth.)—P.

^e "Reims, or as it was formerly written, Rheims, is important from its population and its industry, and interesting from its antiquity, its historical associations and its monuments. The *Remi*, of whom it was the capital, called it *Durocortum*, and the ancient geographers, *Durocortorum* and *Durocortora*,* until after it had taken the name of *Remi*.† In the time of Adrian, it was celebrated for its schools; it also contained several monuments, of which ruins or traditions still remain. The gate of Apollo (*Dieu lumière*), and those of Ceres and Bacchus, indicate so many temples beyond the walls; that of Mars is a triumphal arch attributed to Julian: Napoleon partly restored it, but it is not yet entirely disengaged from the wall in which it was formerly concealed. Not far from this gate, without the city, is a place called the *Arènes*,‡ where the vestiges of an amphitheatre may be distinguished."

* It was called *Duroncourt* in the language of the Gauls, *Durocortum* by Cæsar,* *Δυροκορτορα* by Strabo, *Δυροκορτορα* by Ptolemy, and *Durocortorum* in the Itinerary of Antonine and the Table of Peutinger. (Enc. Meth.)—P.

† This is probably a mistake. It is *Durocortorum* in the edition of Scaliger, Elzev. 1635, and in that of Martaire, Lond. 1790.—P.

‡ Whence the origin of the present name.—P.
 † *Arènes*, plur., from the Latin *arena*, is used by the French for amphitheatre. Thus the amphitheatre of Nîmes is called *Les Arènes*.—P.

in white marble, representing a lion-hunt. Most of the streets are broad and straight; the Royal Square^a is adorned with a bronze statue of Louis the Fifteenth, which was removed at the time of the revolution, and replaced in 1819. The hospital is a large and elegant building; the cathedral is one of the few Gothic edifices of the kind which have been finished; the portal is loaded with figures, in form it resembles a pyramid;^b within the building the kings of France are consecrated. The ashes of St. Remi, the benefactor and tutelary saint of the town, repose in the church of the same name, a church much more ancient than the cathedral, and the one where the holy *ampulla* is kept with superstitious care; but the famous phial was publicly destroyed in 1793, a new one, however, has been obtained, and according to report, it contains some drops of the oil with which Clovis was anointed by St. Remi.^c By an anachronism not unfrequent in the monuments of the middle ages, the king and the twelve peers of France are represented together on the tomb of the saint.^d The statue of Henry the Fourth has been restored to its ancient place above the portico of the townhouse, a large building, which contains a valuable library. Old writers mention the church of St. Nicaise on account of a shaking pillar that excited in past times much curiosity, but many years have elapsed since the pillar was destroyed.^e The town is surrounded with a wall flanked by old towers, and shaded by an inner range of trees; it is also encompassed by ditches, and a public walk extends round them to the place where the marshy banks of the small river Vesle bathe it on the south.^f It was destitute of good water from the nature of its soil, until the prebend Gaudinot had a machine constructed at his own expense, by which the streams of the river are now distributed to every part of the town.^g The same excellent

^a *Place Royale.*

^b "Near the square (*Place Royale*.) we may observe a fine hospital (*Hôtel-Dieu*) and the cathedral; the latter one of the few Gothic edifices which have been finished. Its portal, although overloaded with ornaments, is remarkable for its pyramidal figure, and its majestic interior is adorned with magnificent painted windows (*vitreaux*.)"

^c "The church of St. Remi, much more ancient than the cathedral, is celebrated for the tomb of that bishop, one of the benefactors of Reims; in it is preserved the holy *ampulla* (*sainte ampoule*.) or at least the phial which has supplied its place since its public destruction in 1793, and which still contains, it is said, some drops of the oil with which St. Remi anointed Clovis."

^d "The institution of the twelve peers of France is of much more recent date than the time of Clovis. It is generally referred to the reign of Louis VII., who assembled the twelve first nobles of the realm, six ecclesiastical and six laic, at the consecration of his son Philip Augustus, A. D. 1179. (Enc. Meth.)—St. Remi, archbishop of Reims from 471 till after 523, was the contemporary of Clovis. (Moreri.)—P."

^e "The famous shaking pillar in the church of St. Nicaise has been long since removed." The church of St. Nicaise is frequented by strangers on account of a pillar which shakes perceptibly when either of the four bells in one of its towers is rung. (Enc. Meth. Geog. Mod. 1784.)—P.

^f "The town is surrounded by ditches, and by a wall flanked with old towers; the latter is shaded by an alley of trees on the inside, while a fine promenade borders the ditches on the outside, except near the marshy banks of Vesle which bathes it on the south."—The city is surrounded with a ditch and earthen mound, planted with a double row of trees on both sides. (Ed. Encyc.)—The other fortifications were removed in 1812.—P.

^g "The well water in Reims is very unwholesome, but the Abbé Godinot, a canon of the cathedral, having amassed, during many years, from the sale of his wines, a very considerable sum, left it by his will to his native city, for the purpose of introducing into every part of it the waters of the Vesle, which now flow from a great number of fountains. (Vosgien.)—N. Godinot, born at Reims 1661, expended more than 500,000 livres (400,000. Enc. Meth.) in establishing public fountains, constructing sewers, founding hospitals and schools, and embellishing the choir of the cathedral. (Beauvais.)—P."

^h J. B. Colbert, minister of Louis XIV.; born 1619 at Reims.—P.

ⁱ "The department of the Ardennes consists chiefly of a region entirely covered with forests before it had been invaded by the wants of

person may be mentioned among the distinguished townsmen of Reims; it was also the birthplace of Colbert,^h Linguet, and the Abbé Pluehe.

Before the region of Ardennes was peopled by civilized inhabitants, it formed in all probability a vast forest; the Celts called it *Ard* from a mountainous chain, which steep declivities and rugged summits render apparently more lofty than it really is. But according to a different account, the name of the country may be derived from the goddess *Ardeiana*, the Diana of the ancient Belgians. The Romans called it *Arduena Sylva*; at present, however, the forest of Ardennes does not occupy a greater extent than 250,000 acres. The department may still be considered one of the best wooded in France; timber forms the principal article of commerce; as the grain harvests are inadequate to the consumption, and as comparatively few vineyards are situated in the country, the wood is exchanged for corn and wine; the remainder is used as fuel, and serves to supply different works and manufactories. The rocks on the mountains are chiefly calcareous and schistous; the people work a great quantity of iron, some veins of lead, and extensive slate quarries. The geological products are various, most kinds of rocks from granite to chalk may be observed in the department. The Meuse and the Aisne are the two most important rivers, the extent of roads is not so great as in other parts of the kingdom; the population might be increased, if the means of communication were improved.¹

Vouziers is the capital of a poor and small district, that contains little likely to attract attention;^k the town is situated on the left bank of the Aisne, which afterwards waters Attigny, a place of some celebrity at an early period, because the French kings of the first and second race chose it as their summer residence; at present, however, it can hardly

civilized society, and to which the Celts gave the name of *Ard** because it was traversed by a chain of mountains that from their broken summits and steep declivities are apparently more elevated than they really are. The name of this region has, however, been derived from a goddess *Ardeiana*, the Diana of the ancient Belgians. Either or both of these etymologies may be adopted.† The Romans called it *Arduena Sylva*,‡ but at present the ancient forest of the Ardennes occupies in France only an extent of about 150,000 hectares.§ The department to which it belongs is, however, one of the best wooded in France; the exportation of wood is one of the principal means it employs in supplying itself with oats, of which it produces but a very small quantity, and also with wine, of which it is almost entirely destitute; the remainder of its wood is used in carrying on its iron works (*usines*.)|| The rocks of which its mountains and plains are composed, are chiefly calcareous and schistous; they are, however, so diversified in their geological character, as to exhibit specimens of almost every formation from granite to chalk. Much iron, a few veins of lead, and very extensive slate quarries, are wrought in the department. The Meuse and the Aisne are its principal rivers; the extent of its roads is less than in any other region in France, and it is undoubtedly owing to this want of communications, that its population has made no greater advances in industry."

* *Ard*, high, lofty, (whence the Latin *arduus*)—a word common in many names of Celtic origin, particularly in Scotland and Ireland; as *Ardrass*, the headland or height of the peninsula; *Ardfglass*, the green headland or promontory.—P.

† The author may here mean that both are derivable from the same Celtic root—*Ardeiana*, the goddess of the heights or mountains. So in the Latin poets—*Diana montivaga*—*montium domina*—*tubet hortari celeres per juga summa canes*, &c.—P.

‡ *Arduenna Sylva*. (D. Anv. Enc. Meth. Cesar. De Bell. Gall. V. VI.)—The forest is still called by the French, either *Ardenne* in the singular, or *les Ardennes* in the plural, (the forest of Ardenne, or of the Ardennes.) (Moreri.)—There is a large forest between Sedan and Rheims called the wood of the Ardennes (*bois des Ardennes*); a part of the same forest between Ste. Menould and Verdun is called the forest of Ardenne (*forêt d'Ardenne*.) (Enc. Meth.)—The present forest of the Ardennes is in the north of the department. (Peuchet.)—P.

§ The ancient forest of the Ardennes (*Arduenna Sylva*) extended from the Rhine through the territory of the *Treviri*, to the borders of the *Remi*, and to the *Verrii*,* and was consequently far more extensive than that part of it now in France. A part of the same forest still occupies a considerable extent of Luxemburg, from which circumstance that province was called the department of the Forests (*des Forêts*.) when it was annexed to France.—P.

* Cesar. De Bell. Gall. V. §3. VI. §27.

|| The department contains a very great number of forges and steel founderies. (Peuchet.)—P.

^k "Vouziers, a small town and the capital of a sub-prefecture (*petit chef-lieu de sous-préfecture*.) contains nothing worthy of notice."

be called a town; the population is not equal to fifteen hundred individuals.^a The same river flows at the foot of Rethel, which stands on a height near the site of an old fortress^b that the Romans called *Castrum Retectum*; the inhabitants manufacture cloth, flannels and woollen stuffs.^c The Aisne begins to be navigable at Chateau-Portien.^d

Many populous villages are scattered in the territory of Sedan; the inhabitants export different manufactures, and are engaged in different sorts of industry; if little attention is bestowed on agriculture, it must be imputed to the sterility of the soil. The capital or Sedan was, like Rethel, originally a fortress. Charles the Bald took possession of it in the year 880. It became an important place, after it was made the chief town in a principality subject first to the archbishops of Reims, then to the family of La Marck, and at a later period to the house of La Tour d'Auvergne; it was ceded in 1642 to Lewis the Thirteenth in exchange for the duchies of Albret, Chateau-Thierry and the county of Evreux. The woollen stuffs of Sedan were exported into different countries, but when it was added to France, it lost with its freedom part of its trade. Colbert, however, encouraged the manufacturers, and they derived considerable profits by supplying the Parisians with a light-coloured cloth, which Lewis the Fourteenth affected to admire, and which on that account, became very fashionable; it is in making black cloth, however, that the present manufacturers of Sedan are said to excel. The town is well built, the streets are broad and straight, the houses are large, and a fine bridge rises on the Meuse. The arms of many famous knights are preserved in the arsenal; and an old castle in the vicinity was the birthplace of Turenne.^e Sedan is at present included among the strong places of the third class. Donchery, situated on the right of the Meuse, and a flourishing town before the principality was united to France,

^a "At present, however, it contains only 1500 inhabitants."

^b "—which stands on a height (*montagne*) and occupies the site of a fortress—"

^c "—flannels, cloths and cashmeres."

^d Chateau-Portien.—Lat. *Castrum Portianum*.—P.

^e "Covered with industrious villages, the territory of Sedan compensates for its want of fertility by its numerous manufactures. The town of Sedan, like that of Rethel, appears to have derived its origin from a strong castle. Charles the Bald made himself master of it in 880. It was already a place of some importance, when it was erected into a principality, at which time it belonged to the archbishops of Reims. It afterwards passed into the house of La Marck, and then into that of La Tour d'Auvergne, by which it was finally ceded, in 1642, to Louis XIII., in exchange for the duchies of Albret and Chateau-Thierry, and the county of Evreux.* It was even then noted for its manufacture of woollen stuffs; but on its union with France, it lost with its municipal franchises (*franchise de sa commune*) a part of its industry: Colbert, however, succeeded in restoring it to its former prosperity, by encouraging the manufacture of large quantities of a fine light cloth,† which Louis XIV. affected to admire, and which on that account became very fashionable, and a source of great profit to the manufacturers. At present, it excels principally in the manufacture of black cloths.‡ It is a well built town, with several broad and straight streets, and many elegant houses, and also with a fine bridge over the Meuse, and an arsenal, in which the armour of many celebrated knights is preserved. The old castle of Sedan was the birthplace of Marshal Turenne."

* Sedan belonged formerly to the archbishops of Reims, with the title of sovereign principality: it passed from them into the house of La Marck; then by marriage into that of La Tour d'Auvergne, holding neither of the emperor nor of the king of France. But Frederick Maurice de La Tour d'Auvergne, duke of Bouillon, and father of Turenne, ceded this sovereignty to Louis XIII. in 1642, in exchange for the duchies of Albret and Chateau-Thierry and the county of Evreux, reserving, however, the title of Prince of Sedan.† (Enc. Meth.)—P.

† This is a mistake. He was the elder brother of Marshal Turenne. P.

‡ In 1642, he was compelled to surrender Sedan to the crown; reserving, however, the title of prince. In 1651, both the sovereignty and title were surrendered by treaty, in exchange for the county of Auvergne and the county of La Tour, which had been united to the crown by the marriage of Catharine de Medicis, daughter of Maedalen de La Tour d'Auvergne, and also for the duchies of Albret and Chateau-Thierry, the county of Evreux, &c. (Moreri.)—See note under the head of Tulle (department of the Correz.)—P.

† "Drap léger."

‡ The department of the Ardennes is particularly noted for its superfine cloths, called *draps de Sedan*, of which the black are remarkable for their beauty. (Pencet.)—The cloths of Julianne, and the superfine fabrics of Sedan, as well in scarlet

does not now contain more than eighteen hundred inhabitants.

The Meuse forms many windings, and returns twice nearly to the same place, it waters Mezieres, a town of which the importance depends more on fortifications than on the number of inhabitants.^f It was made the capital of the department on account of its military position; the houses and streets are ill built, the walls are old and clumsy, but it was there Bayard compelled Charles the Fifth and his numerous army to retreat.^g It is only separated from Charleville by the Meuse which in one of its windings forms a small peninsula;^h the latter town is much larger than Mezieres; it contains nearly eight thousand inhabitants, and it also differs from it in other respects; its streets are broad and straight, and the regularity with which it is built, renders the defects of the neighbouring city more apparent. The four principal streets terminate in a large square, encompassed by arcades, and decorated with a marble fountain. The theatre is a large building, several valuable manuscripts are contained in the public library, and some curious articles may be observed in the collection of antiquities. More industrious than Mezieres, it supplies the department with a great quantity of cutlery, hardwares, nails and other goods of the same kind; there are different workshops in which fire-arms are made, one of them was established by government. A favourable position and a convenient harbour account in some measure for its trade.ⁱ It was founded in the seventeenth century by Charles de Gonzague,^k duke of Nevers and Mantua; but it was taken in the year 1686 by the French, by whom its fortifications were destroyed. A height in the neighbourhood, formerly commanded by a strong castle, has been dignified with the classical name of Olympus. The duke of Nevers and Mantua retired to the castle after the loss of the town, he was at last compelled to yield to his more powerful adversary.^l

as in other bright colours, and in black, are fit only for the rich. (Ed. Encyc. art. France.)—The manufacture of fine cloth at Sedan, owes its origin to Nicholas Cadeau, a native of France, who had learned the mode of manufacturing fine cloths in Holland. He obtained letters patent for twenty years in 1646, in conjunction with J. Binet and Yves de Marsailles, merchants of Paris. That privilege having expired in 1666, new letters patent were granted by Louis XIV. during the administration of Colbert, by which all the master manufacturers then in Sedan, and those who should afterwards settle there, were erected into a community, to be governed by a body of statutes which had been previously prepared by an assembly of the magistrates and manufacturers. (Ed. Encyc. vol. IX. p. 425. Savary, Dict. Comm. t. III. p. 253, 1699.)—P.

^f "The Meuse, which in its course forms two large curves (*se repliant deux fois sur elle-même*) and many windings, waters Mezieres, a town of more importance from its fortifications than from the number of its inhabitants."

^g "It has never been taken by an enemy, and although ill built, is a place of much interest to a stranger, from the circumstance that Charles V. with a numerous army, was obliged to retreat from before its walls, in consequence of its vigorous defence by the Chevalier Bayard."

^h "Charleville is only separated from it by the Meuse, which again bends on itself so as to form a small peninsula."—Charleville is situated on the Meuse near Mezieres, with which it is connected by a bridge and a causeway. (Vosgien.)—P.

ⁱ "It possesses a handsome theatre, a large public library, and a cabinet of natural history and antiquities, in which there are many remarkable curiosities. More industrious than Mezieres, it manufactures annually about 4,000,000 kilogrammes of nails, besides arms* and hardware;† the government also carries on there a manufacture of fire-arms.‡ Its port is convenient and its commerce very active."

* "Armes de luxe"—arms of elegant and costly workmanship.—P.

† "Fronnerie"—certain small articles of hardware, wrought with the hammer only, particularly such as are used by coach, harness and trunk makers, and by saddlers. (Savary.)—P.

‡ It contains one of the five great manufactories of arms in the kingdom. (Mor.)—P.

^k Charles Gonzague.

^l "On a roek near the town, to which the name of Mount Olympus (*Mont Olympe*) has been given, a castle was formerly situated. After the duke of Nevers and Mantua had lost the town, he remained proprietor of Mount Olympus; but the king of France was master of the gates and walls of the castle, which made the sovereignty of the duke a source of much pleasantry."

Before the Meuse leaves France, it waters a tongue of land below Charleville, which comprehends the greater part of the forest of the Ardennes. It passes by Fumay, a town of 1600 inhabitants, of which the schistus quarries yield annually forty millions of slates. The same river, near the frontier, separates Givet-Notre-Dame from Givet-St. Hilaire and Charlemont; the two latter are situated on the left bank, but all the three are united by their fortifications, and form in reality only a single town, that is ranked among the strong places of the first class. Charlemont, as its name signifies, stands on a height; the two Givets are situated below it, the one on the declivity and the other near the base of a hill in an opposite direction; they are regularly built, adorned with large squares, and enriched by trade. The harbour is convenient; the duties were lately diminished, and the commerce between it and the Netherlands has consequently been increased.^a Givet was the birthplace of Mehul, one of the best French composers. The origin of this double town has been attributed to two villages, which according to tradition were built before Cæsar's time;^b the fortifications were planned by Vauban. Charlemont was founded by Charles the Fifth, but it has belonged to France since the treaty of Nimeguen, which was concluded in 1678. Rocroy, a strong place, is situated in a fruitful plain, encompassed by the forest of the Ardennes; it is celebrated on account of a victory that the great Condé, then hardly twenty-two years of age, gained over the Spaniards.

The Oise traverses the department of the Aisne from north-east to south-west, whilst the river from which it has taken its name, flows across it from east to west. The two rivers first water a chalk region, but as they proceed, they pass between calcareous rocks, to which the chalk serves as a support. The heights are mostly confined to the south, low plains extend on the north.^c The Somme, the Scheldt and the Sambre rise in the department.^d The temperature is very variable, and the frosts in spring are often hurtful to vegetation.^e The forests are large and extensive; indeed the mast or fruit of the beech produces, in some years, a quantity of oil, equal in value to £.20,000;^f it is sold and consumed in the country.^g Agriculture has arrived at a high degree of perfection; more than two-thirds of the harvest are exported; the number of horses, oxen and sheep, relatively to the extent of surface, is much greater than in most other parts of the kingdom. The department is well

provided with roads and navigable rivers, and it seems as if the knowledge and industry of the inhabitants were proportionate to their means of communication.^h

The Oise is not larger than a rivulet at the burgh of Hirson, which carries on a trade in lace, cutlery, nails and iron bars.ⁱ Nouvion en Tierarche^k contains three thousand individuals; glass forms the principal article of commerce, and the glass-works are the most remarkable buildings in the place. The rich pastures in the district enable the inhabitants to supply different parts of France with excellent cheese.^l The small town of Guise, formerly a stronghold, was erected into a duchy^m by Francis the First in favour of Claude of Lorraine;ⁿ it is at present peopled by three thousand five hundred inhabitants, and the lower orders are mostly employed in manufacturing cotton.^o Vervins, still less populous, rises like an amphitheatre on the banks of the Velpion; it is mentioned in history on account of the treaty concluded in 1598, between Henry the Fourth and Philip the Second of Spain.

Many villages, burghs and small towns are scattered in the district of St. Quentin; the inhabitants manufacture fine linen, gauze and shawls of different sorts.^p All these branches of industry are united in St. Quentin,^q the chief town, of which the population has doubled within the last forty years. It is well built, and a subterranean canal, almost two leagues in length,^r facilitates the conveyance of goods. Its situation on the banks of the Somme, at the distance of some leagues from its source, corresponds very well with the position of *Augusta Veromanduorum* on the *Samara*,^s in ancient times, the chief city of the *Veromandui*. It was sacked by the barbarians at the commencement of the sixth century, and afterwards rebuilt, when it took the name which it now bears, in honour of St. Quentin, because St. Eloi pretended to have found his bones in the ruins of the ancient city, three hundred and sixty years after his martyrdom.

The Oise, at no great distance below its confluence with the Serre, waters a large island, at the southern extremity of which is situated the small fortified town of La Fere; it contains two thousand five hundred inhabitants, and has a school of artillery, and an arsenal. A subterranean passage, two hundred feet in length, supported by arcades sixty feet in height, is said to be the work of Goujon, it is certainly constructed with great elegance and skill.^t A detachment

^a "Charlemont, as its name indicates, is situated on a height (*montagne*.) The two Givets, one of which is placed on the declivity of the same height, and the other on a corresponding declivity on the opposite side of the river, are regularly built and adorned with fine public squares; they possess a convenient port on the river, from which they carry on a flourishing commerce: it would, however, be much increased by a diminution of the duties that now (1829) obstruct communication with the Netherlands."

^b "—which existed, it is said, in the time of Cæsar."

^c "The surface of the territory is characterized by heights on the south, and by low plains on the north."

^d On its northern frontier.—P.

^e During the last thirty years, the temperature of the climate appears to have diminished; this may perhaps be attributed to the increase of the forests, since within that period the number of trees has been considerably augmented. M. B.

^f "—to more than 200,000 francs"—about £.8,500.—P.

^g M. Brayer, *Statistique du département de l'Aisne*.

^h "It exports about one-third of the grain it produces, rears many more sheep than most of the other departments, and possesses a much greater number of horses. The extent of its roads and navigable waters is greater than the medium extent in France, and its population, industry and intelligence are in proportion to these advantages."

ⁱ M. le baron Ch. Dupin, *Forces productives et commerciales de la France*, t. II. p. 87.

^j "—which carries on several kinds of manufacture; it furnishes thread for lace (*fil à dentelles*), chafing-dishes (*rechouids*), nails and bar-iron."

^k Tierarche (Vosgien.) Tierache (Encyc. Meth.)—a district of Picardy, in which Nouvion is situated. See page 1018. Tierarche must be a typographical error.—P.

^l "Nouvion en Tierarche, a *bourg* of 3000 inhabitants, possesses a large glass manufactory (*verrierie*.) Its fertile pastures enable it to furnish a great quantity of cheese similar to that of Marolles."

^p "It possesses several cotton mills (*filatures de coton*.)"

^q "The arrondissement of St. Quentin is full of villages, *bourgs* and small towns (*villes*), in which lawn, gauze and cashmere shawls are manufactured."

^r St. Quentin.

^s "—and its canal, which is carried under ground for an extent of nearly two leagues"—St. Quentin communicates with the Oise by the canal of La Fere, 11 leagues in length, and with the Scheldt by another canal, more than 32 miles in length, in which there are two tunnels, one of 1191 yards, and another of 3 miles 1026 yards; there is also a third canal along the Somme below St. Quentin. These three canals are called the canals of Picardy. (Ed. Encyc. art. Navig. Inland.)—P.

^t The ancient name of the Somme.—P.

^u "It possesses a subterranean gallery 160 feet in length, of which the arcades are 60 feet in height, and which from its elegant construction has been attributed to Jean Goujon;" (a celebrated sculptor in the 16th century.)—P.

of the Prussian army appeared before La Fere on the 26th of February 1814, and as it was then only defended by four hundred men, it was compelled to surrender; the enemy took possession of whatever there was in the arsenal and in the library.^a The Prussians having been informed that it was well supplied with provisions,^b attempted to take it a second time in 1815. The garrison was by no means strong, but the troops, the national guard and even the women displayed great bravery and determination; they suffered the severest privations during a blockade that lasted nearly five months, when at last the enemy thought it prudent to retire. The Prussians asked permission to pass through the town, a condition which the citizens refused; the general then raised the blockade, and sent a letter to the authorities, congratulating them on the courage of the inhabitants and the garrison. The burgh of St. Gobain^c in the same district,^d is known in France for its mirrors and looking glasses, some of the former are ten feet in height by five in breadth;^e three millions of bottles are made every year in the neighbouring burgh of Folembray.^f

Laon, a strong and well built town about five leagues to the south-east of La Fere, crowns a detached hill in the middle of a large plain. It owes its origin to a Gallic fortress, which in the fifth century bore the name of *Laudunum*;^g it was enlarged by Clovis,^h and it became a royal residence under the kings of the second race; indeed Lothaire and Louis the Fifth were born in the town. The most remarkable buildings are the old cathedral,ⁱ a fine Gothic edifice, built in the year 1115, and the tower of Lewis d'Outre-Mer, which the Vandals of the revolution attempted in vain to destroy in the year 1794.^k The burgh of Notre-Dame de Liesse,^l about three leagues to the north-east of Laon, was built in the time of the crusades; it was formerly celebrated for a miraculous image of the Virgin, which, according to the legends, was brought from Cairo in a single night by the daughter of an Egyptian sultan.

ⁿ "Arrondissement."

opric, is a neat and well built town, and claims a very ancient origin; it was called *Noviodunum*ⁿ before the munificence of Augustus induced the inhabitants to change the name to that of *Augusta Suessionum*. It is situated in a fruitful valley watered by the Aisne; it had its kings before the conquest of Gaul, and even after the invasion of the Franks.^o It was in its neighbourhood that the feeble remains of the Roman power were destroyed by Clovis. The present fortifications were erected by the duke of Mayenne, who made it his principal depot of arms and ammunition.^p The temporary works of defence that were raised in 1815, enabled it to offer a long resistance to the allied armies.

The small town of La Ferté-Milon^q near the forest of Villers-Cotterets, is built like an amphitheatre on the declivity of a hill; it is watered by the Ourcq, encompassed with walls, and commanded by the ruins of a strong castle.^r It claims the honour of having given birth to Racine;^s the bust of the poet decorates the public library, which contains seventeen thousand volumes, but his statue ought to be erected in the court of the town-house.^t As there are three churches, an hospital and different public institutions, it might be supposed that the town was a place of some importance, the population, however, does not exceed two thousand three hundred, individuals.^u Chateau-Thierry^x is situated on the Marne; a public walk extends on the right bank of the river, and the town is separated by a modern bridge from one of the suburbs. The new buildings contrast well with the ruins of the castle, from which the town derives its name.^y The castle itself was built by Charles Martel in the year 720, as a residence for the young king Thierry the Fourth.^z It was inhabited by that prince, by the counts of Vermandois, and by those of Champagne, by Henry the Second, by the duke of Alençon, who died in it, by Louis the Thirteenth, and by the dukes of Bouillon; houses were gradually built round it, and in one of them still inhabited, the celebrated Lafontaine was born.^{aa}

The department of the Seine and Marne is traversed on

ⁿ It was the *Noviodunum* of Cæsar (De Bell. Gall. II. §13.)—P.

^o Soissons was the capital of some of the French kings of the first race, who were on that account called kings of Soissons. (Enc. Meth.)—P.

^p "It owes its present walls (*enceinte*) to the duke of Mayenne,^q who made it one of his principal strong holds (*places d'armes*)."^r

^q Chief of the League, after the death of Henry III.—P.

^r Lat. *Firmitas Milanis*.—There are fifteen French towns, mentioned in Vosgien, that bear the name of Ferté, with a surname attached.—Ferté (Lat. *Firmitas*) signifies a strong place, generally built on a rock, and intended as a place of refuge from the incursions of enemies. (Enc. Meth.)—P.

^s "—it contains the ruins of a strong castle."—It possesses a very fine castle (*château*), called the great house (*la grande maison*), which belongs to the bishops of Soissons. (Enc. Meth.)—P.

^t Racine was born at La Ferté-Milon, Dec. 21, 1639.—P.

^u "—in the public square fronting the town-house (*place de l'hôtel-de-ville*)."

^v "Its three churches and its hospital are well kept and of elegant architecture. From this circumstance it might be concluded that the town was a place of some importance; its population, however, scarcely exceeds 2000 souls: we can hardly need therefore a more striking proof of the spirit and intelligence of its inhabitants."

^w Lat. *Castrum Theodorici*.

^x "Its promenade borders the right bank of the river, and an elegant bridge separates it from one of its suburbs. It is a well built town, and rises in the form of an amphitheatre. It presents a fine appearance when seen from the left bank of the Marne, and contrasts strongly with the ruins of the castle from which it derives its name."

^y Thierry II. of the kings of Neustria (Soissons or Paris,) and IV. of the Merovingian dynasty.—There were several branches of the Merovingian family; the three principal were those of Neustria, Orleans and Austrasia.—P.

^z "In consequence of this residence, the town of Chateau-Thierry rose at the foot of the castle. It was the birthplace of Lafontaine, the celebrated fabulist, and the house in which he was born still remains."

the south by the first of those rivers, and on the north by the second. La Ferté sous Jouare,^a a small town on the Marne, is situated in a pleasant and fruitful valley; the cleanliness which prevails, the elegant simplicity of the houses, and the activity of the port on the Marne, indicate an industrious city. The population amounts to about four thousand souls; there are two manufactories of carding combs, in which forty thousand kilogrammes of leather and iron are used every year; it exports a great quantity of mill-stones into different countries, and carries on a considerable trade in wood and charcoal for the supply of the capital.^b The neat burgh of Dammartin to the north of the Marne, rises on a detached hill, in the form of an amphitheatre, and commands a view which extends to a distance of more than fifteen leagues; a cattle fair of some consequence is held every year in the month of December.^c Juilly, a place of some celebrity on account of a college,^d is situated near the burgh of Chelles,^e where Chilperic was assassinated in 584; part of a rich abbey still remains, it was founded in the seventh century by Batilda, the wife of Clovis the Second.^f

Meaux on the banks of the Marne^g is the chief town in a subprefecture, and the see of a bishopric. It was the ancient city of *Jatinum*, the capital of the *Meldi*; hence it was called *Meldæ* after the Roman conquest.^h It was a place of some importance under the kings of the first race; at a later period the inhabitants were among the first in France, who embraced the principles of the reformation, and no other town suffered more during the religious wars in the sixteenth century.ⁱ The Marne divides it into two unequal parts, and the Ourcq canal flows below the remains of walls that were destroyed in the time of the League.^k The streets are regular, the houses are well built, and within the cathedral are deposited the ashes of the celebrated Bossuet. The town carries on a great trade with Paris in oats and corn; it sends besides into different parts of France, more than 3,200,000 kilogrammes^l of cheese, which still bears the name of the ancient province.^m

Many places are supplied with quills from Brie-Comte-

Robert; the church is elegantly built, the Gothic arches in the interior are remarkable for their lightness, and the tower rises to a considerable height; ruins covered with ivy indicate the site of an ancient castle, that belonged to the counts of Brie.ⁿ Melun, the birthplace of James Amyot,^o and the ancient city of *Melodunum*, is divided into three parts^p by the Seine; it stands at the base of a hill, and neat houses and clean streets add perhaps to the effect of a picturesque situation; the ruins of an old castle rise on the adjoining hill, it was inhabited by queen Blanche and several kings of France.^q Melun is the capital of the department, and a road leads to Fontainebleau, from which it is distant about four leagues; the latter town is regularly built and surrounded by a large forest. The neighbouring country is covered with the richest verdure, lofty oaks shade the walks and alleys, inequalities in the soil, and masses of sandstone vary the scenery. The plan of the royal castle was committed to Primatice by Francis the First, it was afterwards embellished by five kings. Henry the Third was born in the same edifice, and Pius the Seventh resided in it eighteen months; it was there that the crime which has been attributed to Christina of Sweden was committed, it was there that Napoleon abdicated. The town consisted originally of the houses which were grouped round a castle built by Lewis the Young in 1169. It has been affirmed that it was first called *Fontaine-Belle-Eau*, but the name of *Fons Bliaudi* which occurs in several deeds, serves to confirm the common opinion concerning the discovery of a spring. A dog named *Bliaud*, belonging to Lewis the Seventh, was missed in the chase, and after a long search the king found it quenching his thirst at a stream until then unknown; the place was afterwards chosen as the site of a hunting residence. Dancourt and Poinset are perhaps the most distinguished literary men that the town has produced.^r

Nemours is situated at the extremity of the same forest below the old castle of *Nemus*; the groves, by which they were formerly surrounded, account for the names of the castle and the town. Nemours was erected into a titular duchy in the fourteenth century, and the duke who fell at the bat-

ligious wars in the sixteenth century.^s

^a It was the first town in France, in which the Protestants began to preach their doctrines. (Moréri.)—P.

^b "The canal of the Ourcq* flows at the foot of its ruined walls, which date from the period of those religious troubles."

^c A canal drawn from the river Ourcq, for the purpose of supplying Paris with water.—P.

^d The kilogramme is equal to 2 lbs. 3 oz. 5 dr. Avoirdupois. Tr.

^e "It is a well built town, and within its cathedral, a building of elegant architecture,* the ashes of Bossuet are deposited. It is the centre of an extensive trade in oats and corn, for the supply of Paris; it manufactures cotton stuffs, and exports annually 3,200,000 kilogrammes of cheese, which still retains the name of its ancient province."[†]

*The choir of the cathedral is considered a master-piece. (Vosgien.)—P.

[†] Meaux was the capital of Upper Brie (*Haute Brie*.) (Vosgien.) See Note 1 p. 974.—The cheese made in Brie [*fromages de Brie*, Savary] is esteemed the best in France. (Ed. Encyc.)—P.

ⁿ "Brie-Comte-Robert,* a small town of 3000 souls, in which writing quills are prepared, contains an elegantly built church—and some remains of the ancient castle of the counts of Brie."

* Now called Brie sur Yerres. (Vosgien.)—P.

^o The translator of Plutarch.—P.

^p "—into several parts"—Melun, like Paris, is divided into three parts by the Seine—one part on the north in Brie, another on an island in the river, and a third on the south in Gatinois. (Moréri.)—P.

^q "Its position at the foot of a hill, its neat houses, and its straight and regular streets, give it an agreeable aspect. It still preserves the ruins of a castle, which Queen Blanche and several of the kings of France inhabited."[†]

^r "At the distance of four leagues to the south of Melun, the capital of the department, Fontainebleau, regularly built in the midst of an extensive forest, which has become celebrated from the richness of its vegetation, its old oaks, its broad and beautiful alleys, its uneven sur-

^a La Ferté-Aucoul (*Firmitas Auculphi*) [-Aucout, Enc. Meth.] or La Ferté sous Jouarre. (Vosgien.)—The latter name is derived from its situation below the *bourg* of Jouare, formerly noted for its magnificent abbey of Benedictines.—P.

^b "It derives its prosperity from two card* manufactories, in which 40,000 kilogrammes of leather and iron are consumed annually; from its large buhrstone† quarries, in which mill-stones are made to such an extent that 50,000 kilogrammes of iron are employed in hooping them, and from which they are exported in great quantities to foreign countries; and also from a considerable trade in wood and charcoal for the supply of Paris."

* "Cards"—cards for wool, cotton, &c.

† "Pierres meulrières."

^c "It manufactures lace, and a cattle fair of considerable importance is held there every year in the beginning of December."

^d Originally an abbey, but erected into a college by the Congregation of the Oratory, 1639.—P.

^e "After passing through Juilly*—we arrive at the *bourg* of Chelles"—Dammartin is on the northern frontier of the department, 5 leagues N. W. of Meaux, and Chelles near the Marne, 4 leagues E. of Paris, and consequently S. W. of Meaux. Juilly is 3 leagues N. W. of Meaux, and of course on the route from Dammartin to Chelles.—P.

* Juilly, or Jully. (Enc. Meth.)—Jully. (Moréri.)

^f "The building is all that remains of the rich abbey, founded in the seventh century by Batilda, wife of Clovis II."—An abbey of Benedictine nuns, founded 662—suppressed during the revolution. The original does not say that a part of the abbey remains, but that nothing is left of the institution but its buildings.—P.

^g "Ascending the Marne [from Chelles] we arrive at Meaux —Meaux is 12 leagues N. E. and Chelles 4 leagues E. of Paris. (Vosgien.)—P.

^h "—whence it afterwards took the name of *Meldæ*."

ⁱ "It was one of those towns which most readily embraced the reformation,* and also one of those which suffered most from the re-

tle of Cerignole, was the last descendant of the family of Armagnac.^a The duchy has been perpetuated in the house of Orleans since the time of Louis the Fourteenth. The population amounts to three thousand seven hundred inhabitants. An old castle rises above a modern bridge on the Loing, but the town is also watered by a canal, and it carries on a considerable trade in proportion to its size.^b The same feeder of the Seine, and the same canal water the ancient and pleasant town of Moret; but the Yonne enters the Seine about two leagues above it at Montereau-Font-Yonne,—the *Condute* of the Gauls, so called from its situation at the confluence of two rivers; the name of *Monasteriolum*, which it obtained after the introduction of Christianity into the country, has been gradually corrupted into Montereau.^c The bridge in the town serves to recall two important events: Charles the Seventh, then dauphin, and John Sans Peur, duke of Burgundy, having agreed to meet there in the year 1419, the duke was murdered by assassins, who were suborned by Charles: it was near the same bridge that the allied armies were defeated by the French in 1814.^d The town possesses a considerable trade in porcelain; the population does not exceed four thousand inhabitants.^e

A road from the small town of Bray sur Seine extends along the valley watered by the Vouzie, and leads to Provins, which is called *Castrum Provinum*^f in the chronicles of the eighth century; it is not, however, improbable that it

face, covered by a sandy soil, here and there interspersed with hillocks formed by broken blocks of sandstone, and in short from the beauty of its scenery, is remarkable for its royal palace (*château royal*), built under the direction of Primaticcio by Francis I., and which five kings have since embellished. This edifice has been the scene of many interesting events, from the birth of Henry III. to the eighteen months' residence of Pius VII., and from the act of cruelty committed there by Christina of Sweden,* to the abdication of Napoleon. The town owes its origin to the houses that were grouped round a castle built by Louis the Young in 1169. Its original name is said to have been *Fontaine-Belle-Eau*;[†] but that of *Fons Bliaudi*, which it bears in the documents of the period, serves to justify the opinion, that the discovery of a spring by one of the dogs of Louis VII., called Bliaud, who was found quenching his thirst in it, led that prince to select the place as the site of a hunting residence. Before this castle was erected, the surrounding forest bore the name of the forest of Bievre. Philip the Fair may be mentioned among the princes, and Dancourt and Poinset[‡] among the literary men, who were born in Fontainebleau.[§]

* The murder of Monaldeschi, her master of horse, by her orders, and almost in her immediate presence.—P.

† Lat. *Fons Belloquæus*—said to be so named from the beauty of a fountain in the palace gardens.—P.

‡ P. C. Dancourt, the dramatist, born 1661—A. A. H. Poinset, another dramatic author, born 1735.—P.

§ “The pleasant town of Nemours rises on the skirts of the forest of Fontainebleau, at the foot of a castle called *Nemus*, from its situation in the midst of woods. The name of the town is derived from that of the castle.* Its lords first took the title of chevaliers, but in the 14th century it was erected into a duchy (*duché-pairie*.) The duke of Nemours who fell in the battle of Cerignola,[‡] was the last descendant of the house of Armagnac.[†]”

* Its Latin name is *Nemus*. It was formerly called *Nemox* and *Nemouz*, the last of which has been changed into Nemours. (Enc. Meth.)—P.

† A town in Apulia, where the French were defeated in 1503.—P.

‡ The seignory of Nemours was purchased of its original feudal lords, (who merely bore the title of chevaliers,) by St. Louis and Philip the Hardy, in the 13th century. It was erected into a duchy by Charles VI. in 1404, in favour of Charles III. king of Navarre; but reverted to the crown in 1425. Louis XI. ceded it, in 1461, to James d'Armagnac, who left two sons, John and Louis, both of whom died without issue; the latter fell in the battle of Cerignola, 1503. As the duchy was descendible only in the male line, it again reverted to the crown on the death of Louis d'Armagnac, and in 1507 was granted by Louis XII. [by a new erection. Enc. Meth.] to his nephew, Gaston de Foix, who was killed at the battle of Ravenna, 1512. Francis I. gave it in 1515 to Julian de Medicis, and again in 1524, to his uncle, Philip of Savoy, in whose family it continued till its termination in 1659, on the death of Henry of Savoy, the last of the male lineage. The duchy was finally granted by Louis XIV., to his brother, Philip duke of Orleans, in whose family it still continues, whence the title of the second son of the present king of the French. (Moreri. Enc. Meth.)—P.

b “The streets in Nemours are broad and straight; it possesses a large library in proportion to its population, an old castle, and a fine bridge over the Loing; it is also traversed by a canal,* and carries on a considerable commerce.”

existed in the time of the Romans.⁵ It is encompassed with old walls, and with ramparts;^h the upper town is built on a hill, and the remains of a fort that the inhabitants attribute to the Romans, rise on the summit;⁵ several monuments of the middle ages may be observed in different directions. It has of late years become a place of resort on account of a ferruginous spring.ⁱ The counts of Champagne used formerly to reside at Provins; the number of its inhabitants, inconsiderable in proportion to its extent, renders it probable that it was then more important than at present. Rozoy^k on the small river Yerres^l is surrounded with ramparts shaded by lofty trees, and is adorned by a fine Gothic church, but it is chiefly worthy of notice on account of the famous paper manufactory at Courtalin, an adjoining hamlet; the waters that supply the works rise to the height of a hundred and sixty feet.¹ Corn and leather are the principal articles of trade at Coulommiers, the small capital of a subprefecture.^m

Before we leave the department of the Seine and Marne, it may be remarked that it abounds in cornⁿ and wine, that more sheep are reared in it than in most other departments, and that it derives great advantages from numerous means of communication.

The department of the Oise is more populous, and almost as productive in corn, but it does not yield more than a fifth part of the wine produced by the former department; the inhabitants rear a great many sheep;^o like all the departments that surround Paris, it is intersected by numerous

* The canal of the Loing, communicating with the canals of Briare and Orleans, below Montargis, and extending to the Seine at Mamort, below Moret.—P.

c “The Loing, before it enters the Seine, waters the ancient and agreeable town of Moret,* which is traversed by the canal that passes through Nemours. Two leagues above it, the Yonne falls into the Seine, at Montereau-Faut-Yonne.[†] The Gauls gave the latter town the name of *Condute*, from its situation at the confluence of those two streams; but after the establishment of Christianity, it took that of *Monasteriolum*, whence the origin of its present name.”

* Moret or Muret. (Moreri.)

† Montereau-Faut-Yonne. (Vosgien.)

d “Charles VII., then dauphin, had an interview there, in 1419, with John the Fearless (*Jean-Sans-Peur*.) duke of Burgundy, when the latter was assassinated by a blow from an axe: * the same bridge, which has been rebuilt since 1814, was witness to a complete victory obtained by the French over the allies.[†]”

* The duke was assassinated by the followers of the dauphin, but it is uncertain whether his murder was premeditated, or whether it only arose from the passion of the moment. See Rankin's Hist. of France, Vol. V. p. 51.—P.

† Bonaparte carried the bridge of Montereau (Feb. 1814,) after four desperate attacks, in which he lost a great number of soldiers.—P.

e “Montereau is favourably situated for commerce, and possesses important manufactories of pottery (*faïence*, delft.) Its population amounts to 4000 souls.—It manufactures white porcelain and delft. (Vosgien.)—P.

f *Prævinum*, *Provinum* or *Provinum castrum*, in the Latin of the middle ages. (Enc. Meth.)—P.

g “It existed, however, in the time of the Romans——at least the remains of an ancient fortress on the summit of the hill on which the upper town is built, have been attributed to that people.”

h “Boulevards.”

i “It is much resorted to in the summer season on account of a ferruginous spring.”^k Rosoy—Hyerès. (Vosgien.)

l “At the hamlet of Courtalin, in the neighbourhood, there is one of the most celebrated paper-mills in France. It is supplied with water by an artesian well,* in which the water rises spontaneously to the height of 160 feet.”

* A well formed by deep boring in districts where surface strata, suited for the retention and transmission of water, have sunk to a considerable depth. The water is there disposed to rise to the height occupied by the same strata where at the surface, and consequently ascends spontaneously, when the superincumbent strata are perforated.—P.

m “Coulommiers, a small town and the capital of a subprefecture, carries on a considerable trade in corn, and possesses important tanneries.”

n “Wheat (*froment*.)”

o “It possesses a greater number of sheep than are necessary for its consumption.”

roads. Crepy or Crespy^a is finely situated in a valley watered by two streams, which flow through the town;^b it was formerly more flourishing than at present, and was defended by a castle now in ruins. The old walls are flanked with bastions, the number of inhabitants does not amount to more than two thousand.^c An excellent road communicates with Senlis, which the Romans called *Augustomagus*, and where the remains of the fortifications that they raised, are still apparent. It obtained afterwards the name of *Silvanectes*, probably on account of the forests with which it was surrounded.^d It rises on the declivity of a hill, the base of which is watered by the Nonette.^e Most of the streets are narrow and crooked; the cathedral is remarkable for the lightness of its Gothic architecture, and the height of its steeple. The water in the small river is supposed to possess a peculiar quality, which renders it better adapted than any other for washing wool; the fact may be doubtful, but it must be admitted that many persons are employed in that branch of industry. There are not fewer than two hundred and fifty workmen in the cotton manufactories; the print-fields furnish occupation to more than two hundred, and the making of flour and other substances from potatoes to a hundred and fifty. The forests of Hallate, Ermonville, Pontarmé and Chantilly are situated in the neighbourhood, and the numerous streams in the large park of Mortefontaine add to the beauty of the country. Ermonville still recalls the philosopher of Geneva, and associations connected with the great Condé give additional interest to Chantilly.^f The magnificent castle, the residence of the hero, was destroyed during the revolution; while they were engaged in demolishing the chapel, they found the remains of Coligny, whose body had been secretly transported from the gibbet of Montfaucon to the domain of Chantilly, which then belonged to the house of Montmorency.^g The small castle and the principal stables remain entire, the latter are the finest buildings of the kind in France. The burgh might

^c "It is surrounded by walls flanked with towers, and contains at present only 2000 inhabitants."

^d "A fine road leads from Crepy to Senlis, where the remains of the walls which the Romans constructed, may still be distinguished. Senlis was the *Augustomagus* of the Romans; it afterwards took the name of *Silvanectes*, probably on account of the forests with which it was surrounded."—Senlis was the capital of the *Silvanectes*, a tribe of the Gauls, and like most other such towns in Gaul, took the name of the people that inhabited it. (D'Anv.)—P.

^e Nonnette (Enc. Meth.)—a branch of the Oise.—P.

^f "The water in the small river that flows by the town, is supposed to be peculiarly adapted for washing wool; consequently, a great number of hands are employed in the wash-houses (*lavoirs*) of Senlis." Its other branches of industry, are the spinning and weaving of cotton, which employ 250 workmen; the business of cotton printing (*d'imprimerie*), in which more than 200 are engaged; and the preparation of starch from potatoes, which furnishes occupation to nearly one hundred and fifty. In the neighbourhood of Senlis, are situated the forests of Hallate, Ermonville, Pontarmé and Chantilly; the fine park of Mortefontaine,† in which abundant supplies of water add to the beauty of the scenery; the park of Ermonville, which still recalls the philosopher of Geneva; and that of Chantilly, alike associated with the memory of the great Condé.‡

* A great quantity of wool is washed at Senlis for the manufactories of Beauvais. (Enc. Meth.)—P.

† Mortefontaine. (Vosgien.)

‡ Louis II. prince of Condé, son of Henry II. of Condé, and Charlotte Margaret, heiress of the house of Montmorency.—P.

§ Chantilly passed from the house of Montmorency (branch of the dukes of Montmorency) into the house of Bourbon-Condé, by the marriage of Henry II. prince of Condé, with Charlotte de Montmorency, daughter of Henry I. duke of Montmorency, on the death of her brother Henry II., who died without issue [executed for high treason.] 1632.—P.

h "The only remains of this magnificent residence are the small castle (*petit château*), and the great stables, the latter a master-piece

be more correctly denominated a town, it carries on a trade in porcelain, blond and lace.^h Creil is situated on the left bank of the Oise; it may be mentioned on account of porcelain works, in which more than nine hundred persons are employed.ⁱ Montataire^k is situated in a fruitful valley, and watered by the Therain, it supplies many places with iron and the machinery in the works is moved by the river. It was an ancient village, the church rises on an eminence, Peter the Hermit preached in it, and maintained the necessity of the first crusade.^l The country round Creil^m is remarkable for the industry of the inhabitants; in a space not greater than four leagues in length by two in breadth, there are not less than a hundred and seventy-nine manufactories and eight thousand workmen; the annual proceeds of their labour represent a value equivalent to 16,000,000 of francs. On the supposition that industry was as much diffused over the rest of France, the number of workmen in the kingdom would amount to 24,000,000, while the products of their labour would indicate a value equal to nearly 48,000,000,000 francs, or £2,000,000,000. Pont St. Maxenceⁿ on the Oise is the only other town of any consequence in the district^o of Senlis; the bridge over the river was constructed by Peyronnet; it is supported by detached columns, and adorned on either side of the two extremities by obelisks.

It is affirmed that Compiègne was a town in the time of the Romans, that they called it *Compendium*, because it contained ammunition or military stores.^p A Roman way, incorrectly denominated the *Chaussée de Brunehault*,^q traverses the forest in the neighbourhood,^r and seems to attest the ancient origin of the town. But Compiègne did not become a place of importance before the time of Charles the Bald. Louis the Fair^s and Louis the Idler^t were buried in the church of St. Corneille;^u Pepin Le Bref^x placed in the same church the first organ that was seen in France, and which he had received from Constantine the Sixth.^y

of architecture. The *bourg* [of Chantilly,] which might rather be called a town (*ville*), manufactures porcelain, blond and lace."

ⁱ "It holds an important rank in the annals of French industry, from its large manufactory of English pottery (*faïence anglaise*), in which 900 workmen are employed."—Imitations of Staffordshire ware are made at Chantilly. (Ed. Encyc.)—Chantilly is about two leagues from Creil.—P.

^k Montataire. (Vosgien.)

^l "Montataire is situated in a pleasant valley watered by the Therain, which serves to move the machinery of an important manufactory of sheet-iron; it was formerly a village, with a church built on a height, in which Peter the Hermit preached, while engaged in exciting the first crusade."

^m "The canton of Creil—"

ⁿ "Pont-Sainte-Maxence" or Maixence (*Pons Sanctæ Maxentiæ*).—P.

^o "Arrondissement."

^p "It has been pretended that Compiègne existed in the time of the Romans, and that its Latin name, *Compendium*, was given it because it was an important depot of military stores.—"It was called *Compendium* in the Latin of the middle ages.—P.

^q "The highway of Brunehault."—Brunehault (Gothic, *Brunchild*, from *brun*, brown, and *hild*, love,) was the daughter of Athanagilde, king of the Visigoths in Spain, and the wife of Sigebert I. king of Austrasia (in the 6th century.) (Dreux du Radier, Mém. des Reines de France. t. I. p. 231.)—P.

^r "Its large forest"—The forest of Compiègne contains about 29,000 arpents. (Vosgien.)—P.

^s "Louis le Bel."—This must be a mistake—there is no such Louis in the line of French kings. Louis the Stammerer (*le Begue*) died at Compiègne, A. D. 879, and was buried in the abbey of St. Corneille. (Moréri.)—P.

^t "Louis le Fainçant"—*Juvenis qui nihil fecit*, in the language of the old chronicles.—P.

^u St. Cornelius.

^x "Pepin le Bref" (*the Short*), father of Charlemagne.—P.

^y "Constantine Copronymus"—Constantine IV. (Moréri) V. (Beauvais. Platt's Chronol. Biography, vol. II. p. 497.)—P.

The royal castle is a large edifice;^a it was rebuilt by Louis the Fifteenth, finished by Louis the Sixteenth, and embellished^b by Napoleon. There are several fine buildings in the town, but the streets are for the most part narrow and crooked. It was formerly surrounded with walls; the English besieged it in 1430, and in a sally, Joan of Arc was there taken prisoner. A treaty of alliance between France and Holland was concluded at Compiègne by Cardinal Richelieu in 1624. Noyon is without doubt a place of greater antiquity; the Romans changed its Celtic name into that of *Noviomagus*; it was the seat of a bishopric in the time of Charlemagne,^c who was crowned in the town; the same monarch finished the cathedral, which was begun by Pepin Le Bref. Noyon was the birthplace of Calvin the reformer, and of Sarrazin, a celebrated sculptor of the sixteenth century.^d

Because the castle of Clermont-Oise stands on the summit of a hill, and the town on the base, it has been concluded that it was built by the Romans, although the ancient castle does not in any way resemble a Roman edifice. It is at present chiefly remarkable for the beauty of the surrounding country.^e Philip the Fair was born in the town,^f but it is more renowned as having been the birthplace of the celebrated Cassini.^g It was in the thirteenth century the capital of a county, which St. Louis gave to his son Robert, the founder of the house of Bourbon. A religious ceremony was formerly observed on the anniversary of Saint Jengou,^h the tutelary saint of easy husbands; it has been discontinued probably on account of the additional number of good wives; at all events the moral improvement of the inhabitants may be attributed to the progress of industry. The memory of the duke De Liancourt is revered in the country; the population in the small village from which he derived his title, was equal a few years ago to eight hundred inhabitants, it exceeds at present thirteen hundred. Liancourt is about a league and a half from Clermont, and the small manufactories in other places in the neighbourhood afford the means of subsistence to laborious inhabitants.ⁱ

^a "The royal castle (*château*) is one of the most remarkable for its extent, the splendour and proper distribution of its apartments, and the arrangement of its gardens"—It is still one of the royal residences (*maisons royales*).—P.

^b "Modernised."

^d J. Sarazin, born 1598, died 1660. (Dict. Hist. Caen, 1804.)—P.

^e "The singular construction of the castle of Clermont-Oise,* which rises on the summit of a hill, at the foot of which the town is situated, has led to the belief that it was built by the Romans, and that the origin of the town itself ascends to the remotest period: the castle, although ancient, does not appear to exhibit the characters of a Roman building; the beauty and extent of the prospect it presents, form its principal recommendation."

* So called from its situation in the department of the Oise.—Clermont. (Vosgien. Alman. Royal.)—Clermont en Beauvoisis. (Enc. Meth. Moreri.)—It stands on the small river Breche, a branch of the Oise.—P.

^f "Petit chef-lieu"—small town, and capital of an *arrondissement*.

^g Philip the Fair, king of France, was born at Fontainebleau. (Moreri—Dict. Hist. Caen.)—P.

^h "—boasts of being the birthplace of our celebrated Cassini"—probably Count Cassini, member of the National Institute. His father, grandfather and great-grandfather were all eminent astronomers. The two former were born in Paris, and the latter in the county of Nice. His father, C. Fr. Cassini de Thury, was born in Paris, 1714. His grandfather, J. Cassini, died at Thury, an estate he possessed near Clermont, 1756. (Dict. Hist. Caen.)—P.

ⁱ "They made formerly, in the month of May, a kind of pilgrimage to Clermont, in honour of St. Jengou—"

* St. Gengoux. (Enc. Meth.)

^j "The moral character of the people has been sensibly ameliorated throughout the whole *arrondissement*, by the progress they have made in industry, chiefly in consequence of the special encouragement given it by the Duke of Liancourt, (whose memory is justly venerated,) on his

The same industry and activity are observable in the villages round Beauvais; indeed more than three hundred workmen are employed in the burgh of Bresle.^k Beauvais,^l the former capital of Beauvaisis,^l a small country anciently inhabited by the *Bellovaci*, is said to have been called *Bellovacum*, before it received the name of *Casaro-Magus*.^m The streets are sufficiently broad, but many of the houses are built of wood, which gives it a disagreeable appearance. The choir of the cathedral is complete, the nave and other parts of the building are still unfinished.ⁿ The old ramparts have been changed into public walks. The English besieged it without success in 1443, and Charles, duke of Burgundy, was not more fortunate in 1472. The latter siege is mentioned in history on account of the noble resistance of the inhabitants; they were not dismayed by an army of eighty thousand men, and even the women sought the honour of defending the breach; under the conduct of Joan Fouquet or Lainé, surnamed the *Hatchet*, they fought with as much intrepidity as the men. A Burgundian soldier had planted a standard on the wall, but Joan vanquished him, and carried away the trophy;^o this heroic action is represented in a picture which decorates the town-house. The siege was raised in the month of July; to commemorate the event, a procession went forth every year in the same month, and the women took precedence of the men; the ceremony was abolished at the revolution.^p Beauvais is a place of considerable trade; it has cloth, carpet and cotton manufactories.^q It has given birth to Philip de Villers, to Del' Ile-Adam, great master of the order of Malta,^r to Restaut the grammarian, to the Abbé Dubos, and to Herman and Vaillant,^s two distinguished antiquarians.

The Oise enters the department of the Seine and Oise, a short way above the village of Noisy. Beaumont, the first town through which it flows, contains two thousand inhabitants; it rises on a chalky height, and commands a view of the plain which extends on the right bank of the riv-

er estate situated a league and a half from Clermont. By his exertions, the petty village of Liancourt which hardly reckoned 800 inhabitants, now contains nearly 1300; while its neighbourhood is full of small manufactories that offer the means of subsistence to the labouring population."

^k "—Great quantities of peat are dug in the neighbourhood of that town [Beauvais:] nearly three hundred workmen are employed in the turbarry near the *bourg* of Bresle."

^l Beauvoisis—Beauvoisis.

^m Beauvais, *Bellovacum*, *Casaro-magus*. (Enc. Meth. Geog. Mod.)—*Casaromagus*, the capital of the *Bellovaci*, according to Ptolemy: it afterwards took the name of the people, and was called *Bellovaci*. (Enc. Meth. Geog. Anc. D'Anv.)—P.

ⁿ "The cathedral, which is still unfinished, and without a nave, is celebrated for the beauty of its choir."

^o "Under the conduct of Jeanne Fouquet or Lainé, surnamed *Hachette*, they fought with even more intrepidity than the men. She herself tore down a standard, which one of the enemy had planted, and threw him from the wall."—She is generally known in history, by the name of Jeanne Hachette. She is said to have been the first who met the assailants in the breach, holding an axe (*hachette*) in her hand. (Beauvais.)—P.

^p "To commemorate the raising of the siege, a procession was made every year in the month of July, in which the women took precedence of the men; it was, however, abolished during the revolution."

^q "It possesses cloth manufactories, cotton mills (*filatures de coton*.) and a royal manufactory of raised tapestry (*tapisseries de haute lice*)."—P.

^r "—to Philip de Villers, de l'Ile-Adam, grand master of the order of Malta"—Philip de Villiers de l'Ile-Adam, 43d grand master of the order of St. John of Jerusalem [Malta.] (Beauvais.)—P. de Villiers, l'Ile Adam, 4th son of the lord of Isle-Adam. (Moreri.)—P.

^s Godefroi Hermant, doctor of the Sorbonne, born at Beauvais, 1617—wrote lives of the fathers, translations of their works, an index of ecclesiastical law, and several polemic treatises.—J. F. Vaillant, a distinguished medallist, born at Beauvais, 1632.—(Dict. Hist. Caen. Beauvais.)—P.

er.^a The abbey of Royaumont, about a league distant from the small and agreeable town of Luzarches,^b was founded by St. Louis, but has recently been converted into a cotton manufactory;^c a neat village was lately built in the vicinity.^d

Pontoise rises like an amphitheatre at the confluence of the Oise and the Viorne.^e The streets are narrow and steep, but many of the houses are handsome; the walls have been repaired, but part of those still remain, which were scaled by the army of Charles the Seventh,^f when the town was taken from the English in 1442. The states-general assembled at Pontoise in 1561; the parliament of Paris met in the same place^g in 1652, 1720 and 1753. The Celts gave the name of *Isar*^h to the river that waters it,ⁱ whence the town was called *Brivisara*,^k which signifies literally, the bridge over the *Isar*. The Oise was called *Inisa* in the seventh century, and the town *Pons Inisæ*: lastly, *Æsia* having been substituted for *Inisa*, Pontoise took the name of *Pons Æsia*, which was afterwards changed into *Pontasia*.^l It was traversed by a Roman road, which extended from Paris to Rouen; some remains of it are still observed in the neighbourhood. Philip of Burgundy, the son of John the Second of France,^m and General Leclerc were born in the town.

The small town of Mantes,ⁿ surnamed *La Jolie*,^o because it is well built and finely situated on the left bank of the Seine, was, according to some authors, founded at the time when the druids still retained their authority. The Latin name of *Petro-Mantalum*,^p and the mistletoe on its ancient arms, seem to prove that the Celts venerated on the site which it occupies, the sacred stones and other emblems of the druidical worship. The church of Notre-Dame was built by Blanche of Castile and Margaret of Provence,^q the one the mother, and the other the wife of St. Louis. Articles of consumption are not liable to any tax or toll on entering the gates; the economical way in which the town's

^a "Beaumont, the first town at the foot of which it flows, contains 2000 inhabitants; its promenade, situated on the summit of a chalky plateau, commands a view of the plain on the right bank of the river."—Beaumont stands on the declivity of a hill, sloping down to the left bank of the Oise.—P. ^b Luzarche.

and terminates at St. Germain,^a forms a part of that called the forest of Laye until the eleventh century, the time in which the town of St. Germain was founded. It is encompassed with walls, and covers a surface of more than sixteen thousand acres.^b Shaded by lofty and luxuriant trees, intersected with broad avenues, there are few walks in France, that can be compared with it. The castle rises on a terrace, which is said to command a finer view than any in the neighbourhood of Paris; the length of the terrace is equal to two thousand four hundred yards, and the height to thirty.^c The castle of St. Germain^d was begun during the reign of Francis the First, and was enlarged by Henry the Fourth and Louis the Fourteenth; it serves at present as barracks for a company of body guards. In the same edifice were born Margaret of France, the daughter of Francis the First, Henry the Second, Charles the Ninth and Louis the Fourteenth. The town is well built, and is adorned with a large market-place and a fine church;^e while the workmen were digging the foundation of the latter in 1826, they discovered the remains of James Stuart.^f

The road from St. Germain to Paris extends along the Seine, and communicates with Marly,^g and on the heights above it are the remains of the machine that Lewis the Fourteenth erected to supply the aqueduct that leads to Versailles.^h Malmaison, at a greater distance from St. Germain, was the residence of Napoleon when at the height of his power, and also during the disastrous days that succeeded his defeat.ⁱ The small burgh of Ruel or Rueil contains three thousand inhabitants; it stands at the foot of a hill planted with vineyards. The neighbouring castle was inhabited by Cardinal Richelieu; it was the scene of his pleasures, and it was there he gratified his vengeance; making a confidant of none but the executioner, he there privately received those whom he had determined in secret to put to death, with the utmost affability and kindness. The tomb of the empress Josephine is situated within the church of Ruel. Argenteuil stands on the right bank of the Seine; it contains four thousand six hundred inhabitants, and the neighbouring country is very fruitful in wine.^k The remains of walls indicate the site of a monastery, which was founded in the seventh century; it is memorable as the retreat of Heloise, who became the abbess^l of it. A garment with-

^c "The beauty of its vegetation, and the broad avenues with which it is intersected, render it a magnificent promenade for the town, which also enjoys from a terrace 1200 toises in length by 15 in breadth, on which the castle is built, one of the finest prospects in the neighbourhood of Paris."

^d The castle or palace (*château*) of St. Germain is still one of the royal residences (*maisons royales*).—P.

^e "—a handsome market (*beau marché*), and a newly built church, remarkable for its architecture and ornaments."

^f James II. of England, died at St. Germain 1701.—P.

^g Marly le Roi.

^h "The road from St. Germain to Paris extends along the Seine, and passes by Marly, where we may still observe the remains of the machine erected by Louis XIV. in order to supply the aqueduct which produces so magnificent an effect on the hill of Louveciennes, whence its waters are conveyed by canals to Versailles. The machine is now disused, and its place supplied by a powerful steam engine."—The machine is situated on the river, by the current of which its wheels (14 in number) were moved; these gave motion to 225 pumps, by means of which the water was raised to the top of a tower on a neighbouring hill, whence it entered an aqueduct 330 toises in length. From this it was conveyed by iron pipes to the reservoir of Marly, and thence to the gardens of Marly and Versailles. (Piganiol de la Force, Description de Paris, t. VIII. p. 106.)—P.

ⁱ Napoleon, after his second abdication, was required by the provisional government to retire to Malmaison, where he continued only a few days, previous to his departure for Rochefort.—P.

out any seams, according to tradition, worn by our Saviour, and presented by the empress Irene to Charlemagne, has been removed from the convent to the church, where it is now preserved in a shrine above the altar.

St. Cloud on the left bank of the Seine, was called Nogent till after the death of Clodoald, the son of Clodomir, king of Orleans; aware that his uncle Clotaire, the murderer of his brothers, had determined to put him to death, he fled for refuge, and found safety in a cloister.^m James Clement assassinated Henry the Third in the old castle of St. Cloud, then the property of Jerome de Gondy. The heart of the unfortunate prince was deposited in the village church, and the place where it rests, was marked with the following inscription: *Passenger, pity the fate of kings.* Louis the Fourteenth purchased the domain, and gave it to his brother, the duke of Orleans, who built the present castle; since his time, it has been a royal residence, it was enlarged by Marie Antoinette.ⁿ Bonaparte, after his return from Egypt, assembled there the council of Five Hundred on the ninth of November 1799; the assembly was dissolved by an armed force on the same day, the eighteenth of Brumaire, as it is called in the annals of the revolution. The castle was Bonaparte's favourite residence; he embellished and furnished it with royal luxury; to improve the view from the principal apartment, an obelisk was raised, and a monument similar to the one erected at Athens by Lysicrates the sculptor^o, which antiquaries have surnamed the Lantern of Demosthenes. Rabelais rendered Meudon a place of celebrity before cardinal Lorraine built the castle that Lewis the Fourteenth purchased for the dauphin. The building rises on a hill, and the famous glass works are situated below it. The long burgh of Sevres extends to the village of Chaville; it contains more than four thousand inhabitants; the royal porcelain works are certainly not inferior to the finest in Europe.^p

The entrance to Versailles by the road from Paris might give one a favourable idea of a court-town,^q if the broad avenue^r were lined with regular buildings; the approach might thus be made to correspond with the magnificence of the castle.^s Neat houses are situated at the extremity of the avenue, and at no great distance from them, a large prison, of which the grated windows and iron doors may be

^k "Its vineyards produce annually on an average, more than 100,000 hectolitres of wine."

^s Palace (*château*).

seen from the triple entrance. Barracks front the private treasury of the king, where the assemblies of the states-general were held. The civil and commercial tribunals are nearly opposite the mansion house, and the avenue terminates on the right and on the left at the royal stables. A broad walk surrounded with lofty trees extends from the stables to the castle, where two Corinthian porches protrude on each side of a brick building;^a such unsuitableness can only be excused by the filial veneration which induced Louis the Fourteenth to preserve the old hunting seat of his father. The front on the side of the garden is wholly the work of the great king; still even there the palace is not without faults; the centre or body of the building is out of proportion,^b and the wings are too long. The grounds are laid out with admirable taste, a broad canal reaches to the verge of the horizon, groves are scattered in verdant lawns, plants more than four hundred years old, are preserved in the orangery, water issues from fountains in every variety of form, and jets rise above the highest trees. The largest Trianon is covered with marble and surrounded by woods that seem to realize the brilliant fictions of Tasso in the description of the palace of Armida; the other is nothing more than a simple pavilion.^c These two edifices indicate the character of the two kings by whom they were built; Louis the Fourteenth, when tired of his magnificent residence at Versailles, repaired to the first, which still retains an air of pomp and grandeur, while Louis the Fifteenth, preferring the solitude of the second to the cares of a crown and the tiresome etiquette of a court, forgot in it the disasters which marked his reign.

The magnificence of the royal buildings at Versailles serves to justify the common opinion that Louis the Fourteenth, surprised at the vast sums expended on them, determined to conceal the amount from posterity, and committed the papers of Mansard^d to the flames. But Mirabeau, Volney and other writers have thought themselves sufficiently informed on the subject to publish the results.^e According to an abstract of the expenses, that has been attributed to Mansard, and according to other documents that are pre-

served in the archives of the crown, we may arrive at the following conclusion: namely, that all the sums expended from 1664 to 1702 in building and furnishing the royal edifices, in laying out the grounds, in making the gardens, and even in erecting the two principal churches in the town, amounted to 95,800,000 livres which, according to the mean value of silver during the last thirty-eight years, is equivalent at present to 172,400,000 francs or nearly £.7,184,000.^f

After a revolution which has lasted almost forty years, and which has changed the customs, manners and institutions of France, Versailles is again a court town; many nobles reside in it, but the people are ignorant, idle and poor. But if there are few works or manufactories in the town, it may be partly attributed to its situation at a distance from every natural current of water.^h The population amounts only to one-third of what it was in 1790; although it has increased rapidly since the restoration,ⁱ most of the broad and regular streets are still gloomy and deserted. Versailles is not without schools and charitable institutions; there are several preparatory schools to a military education, a large college, in which lectures are delivered on geometry, mechanics, music and drawing, and a public library containing 50,000 volumes. The royal hospital is the most useful of the charitable institutions.^k The town was the birthplace of Louis the Sixteenth, of the Abbé De l'Épée, and of Ducis, general Hoche and marshal Berthier. The octroi or the tax levied on provisions and other articles imported into the town, is not much less than £.20,000; the greatness of the sum may be partly attributed to the facility of communication; more than six hundred stage coaches proceed from the capital to the department of Seine and Oise, and the most of them pass through Versailles, which is visited by every stranger in Paris.^l

The country round Versailles is embellished with pleasant walks, romantic sites and industrious villages. The inhabitants of Villepreux manufacture shawls; Gregnon has been often visited by mineralogists on account of a calcareous stratum abounding in fossil shells, the lands in the

* "Neat houses first present themselves; then a large prison, whose triple entrance displays its wickets (*guichets*) and bolted doors; beyond it, extensive barracks front the former *Hôtel des Menus-Plaisirs*, in which were held the assemblies of the states-general;^a farther on, the civil and commercial tribunals, and the hunting-house (*la venerie*),[†] rise opposite the mayoralty (*bâtiments de la mairie*), and the avenue is finally terminated on the right and left, by the great and little stables. The fine fronts of these two buildings, the great alley which separates them, the two others which border their sides, and the woods that surround the city, produce a magnificent effect when seen from the entrance of the palace. But the front of the palace itself, where two Corinthian porticoes protrude on either side of a brick building, exhibits a striking want of symmetry—"

* The states-general held their first sitting in the *Salle des Menus*, May 5. 1789. (Le Maire, *Hist. de la Revol. Franç.* t. I. p. 55.)—P.

Vaysse de Villars, *Tableau descriptif, historique et pittoresque de la ville, du château et du parc de Versailles, compris les deux Trianons*. 1827.—Le Comte d'Hauterive, *Faits, calculs et observations sur la dépense d'une des grandes administrations de l'Etat à toutes les époques, depuis le règne de Louis XIV. et inclusivement jusqu'en 1825*. 1828. § "Many of the old noblesse."

h "Consequently it contains few manufacturing establishments, a circumstance that may, however, be partly attributed to its distance from natural streams."

i "—although its annual increase since the restoration, has been very perceptible—"

k "Versailles possesses several establishments for the purposes of education and public charity; it contains a great number of university schools (*écoles universitaires*),^a several preparatory institutions for the military schools, a magnificent college,[†] public courses of instruction in geometry and mechanics, music and drawing, a valuable library of 50,000 volumes, and a royal hospital (*hospice royal*) of great importance."

^a See note b p. 1030.

† The Royal College (*Lyceum*) of Versailles.

l "The town carries on a trade in articles of consumption of sufficient importance to enable it to realize a local revenue* of nearly 600,000 francs, which circumstance may be chiefly attributed to the great resort of strangers, owing to its frequent communications with the capital; more than 600 public conveyances (*voitures*) leave Paris for the department of the Seine and Oise, and the greater part of them for Versailles."

* Arising from its entrance duties, &c. (*droits d'octroi*.)

^m M. J. J. N. Huot, *Aperçu topographique, physique, géologique, historique et statistique du département* (*Annuaire de Seine-et-Oise*, 1819.)

neighbourhood were purchased by his majesty, who has lately presented them to an agricultural institution.^a The military school at St. Cyr meets in the royal abbey, a large edifice founded by Madame de Maintenon.^b Jouy^c is situated in a fruitful valley, traversed by an aqueduct; the industry of the inhabitants is confined to their print-fields; during the imperial government more than sixteen hundred workmen were employed, the number at present does not exceed three hundred.^d

The neat town of Montfort-l'Amaury,^e near the forest of St. Leger, is built on the declivity and at the foot of a hill, crowned by the ruins of an old castle; one of the towers still remains, and is adorned with handsome Gothic sculptures. The town was the birthplace of Simon, count of Montfort, who in the beginning of the thirteenth century, rendered himself infamous by his cruelties in the crusade against the Albigenes.

The small town of Rambouillet is situated on the other side of the forest; during the imperial government it became the capital of a subprefecture, perhaps on account of a castle, which has nothing royal but the name.^f It is flanked with towers, one of which is furnished with battlements and appears to be less ancient than the others; on the whole, the style of the building resembles that which prevailed in the sixteenth century. Francis the First died in the castle of Rambouillet in the year 1547. The park is one of the finest in France, but there is nothing in the town, at all worthy of notice; the beauty of the former depends on varied views, verdant groves and limpid streams.^g Dourdan, which also gives its name to a neighbouring forest,^h was formerly a stronghold; the castle in the middle of it was built by Gontrand, king of Burgundy, in the sixth century. It contains two thousand five hundred inhabitants, and was the birthplace of La Bruyere.

Etampesⁱ covers a considerable space in a fruitful valley;

^a "Grignon, which has been long celebrated among geologists for a bed of limestone, rich in fossil shells, has acquired additional interest, since an estate, purchased there by the king, has been gratuitously appropriated to the establishment of an agricultural school."—The stratum at Grignon, so celebrated for its fossil sea shells, of which not less than six hundred species have been enumerated by DeFrance, consists of a very tender and friable coarse-grained limestone (*calcaire grossier*), which may in fact be considered a bed of calcareous sand, below another stratum of hard limestone, also abounding in shells, but of a different kind. (Cuvier et Brongniart, *Géologie des Environs de Paris*.)—P.

^b "St. Cyr contains a special military school, established in the extensive buildings of the royal abbey founded by Madame Maintenon."—This school is intended for those only who have received a preparatory military education.—P.

^f "After having traversed the forest of St. Leger, which is continuous with that of Rambouillet, we arrive at the town that bears the same name with the latter [Rambouillet.] During the imperial government, it owed to its castle* the rank of chief town of a subprefecture.† The castle has nothing royal in its structure."

* One of the royal residences (*maisons royales*.)—P.

† It was the chief town of an arrondissement (subprefecture,) in 1822. (Alman. Royal.)—P.

^g "The park, which is laid out in the English fashion, is remarkable for the purity of its water and the beauty of its prospects. It contains a dairy (*laiterie*.) the interior of which, cased with marble and watered by fountains, is adorned with a rock, representing a grotto in which a nymph is bathing. The celebrated royal farm (*ferme royale*),* established during the reign of Louis XVI.† for the naturalization of merinos, is situated in the immediate vicinity of the park."

* One of the royal sheep-folds (*bergeries royales*.)

† A. D. 1786.

^h In the same manner with Rambouillet. See note ^f of this page. Estampes. (Enc. Meth. Moréri.)

it is watered by a small river that serves to turn several mills.^k It follows from different old deeds that the town must have been founded before the sixth century, indeed the appearance of the houses attests their antiquity.^l Saclas, a village about two leagues from Etampes, is much more ancient; it rises on the site of *Salioclitia*, a city mentioned in the Itinerary of Antonine. The river Essonne^m waters the small town of the same name; the inhabitants manufacture cotton and woollen stuffs;ⁿ they possessed formerly a powder manufactory, but as many of the houses were demolished by an explosion, that branch of industry has been removed to Bouchet,^o a place near the confluence of the Juine and the Essonne.^p Corbeil, the capital of a district,^q is not more than a mile from Essonne;^r it possesses several cotton and linen manufactories, and carries on a trade with Paris in grain and flour.^s

The rich pastures in the department of the Seine and Oise afford food to numerous flocks, and the same country abounds in corn and wine.^t The mineral substances, although not highly valuable, are useful; the gypsum furnishes the immense quantity of plaster that is consumed in the capital, and the quarries afford excellent stone.^u Several mineral springs might be mentioned, but the only one of any note, is that of Enghien in the valley of Montmorency.

The department of the Seine and Oise encompasses the department of the Seine, in which Paris occupies nearly the centre. When the Romans, under the command of Cæsar, arrived about fifty-five years before the vulgar era, at the mean and solitary city in the territory of the *Parisii*, which the barbarians called *Luthouezzy*, and their conquerors *Lutetia*,^x the houses or rather cottages were built of clay, and covered with straw, the country was poor, and the position was not considered favourable for a town.^y But the *Parisii* adopted readily the usages of civilized life; they were good mariners, and brave in war. *Lutetia* was gradually enlarg-

^k "It is watered by a small river* that never freezes, and which serves to turn a great number of mills."

* The Loet or Etampes (Vosgien)—the Juine (Enc. Meth.)—the Ivette (Moréri.)—The Juine rises at Neuville, passes by Malesherbes and Pithiviers, and uniting with the Etampes, takes the name of the Essonne, and enters the Seine at Corbeil. The Ivette is a branch of the Orge, which enters the Seine opposite Ville neuve St. George. (Vosgien.)—P.

^l "It was the birthplace of Guettard the naturalist. It is a place of considerable antiquity, since it is mentioned in documents of as early a period as the sixth century; some old buildings serve to confirm their testimony."

^q "Arrondissement."

^r "A quarter of a league from Essonne."

^s "It possesses several flour mills (*moulins*.) a cotton mill (*filature de coton*.) and a manufacture of hempen tubes (*tuyaux*) without seam; it is one of the principal marts (*magasins*) for the supply of Paris with grain and flour."

^t "The department of the Seine and Oise is one of the richest in corn, wine and sheep."

^u "They consist of chalk, building-stone* and gypsum, the last of which furnishes the immense quantity of plaster that is consumed in Paris."

* Chiefly calcareous.—P.

^x *Lutetia*. Cæsar. De Bell. Gall. VII. § 54.—*Lutetia Parisiorum*. Cæsar. De. B. G. VI. § 3

^y "When, fifty-five years before the vulgar era, the Romans, under the conduct of Cæsar, arrived at this city, then a mean place, and the only town belonging to the small tribe of the *Parisii*, by whom it was called *Luthouezzy*, a name which the Romans changed into *Lutetia*, they saw in its few dwellings, built of earth and cut straw, and situated on the island which now comprehends that part of Paris called the *Cité*, only an advantageous position in a miserable country."

ed and embellished; it became the seat of a prefecture, and the temporary residence of several emperors, particularly of Julian, who styled it his *dear Lutetia*.^a The only buildings connected with that remote period, are the baths, which were attached to the imperial palace.^b The feeble Romans might have been aware of their danger at the approach of the Franks, but it was not foreseen that the city was to become the metropolis of those barbarians, and fourteen centuries afterwards, the capital of an empire as vast as it was of short duration, and in which Rome itself was merely a provincial town.

Paris was enlarged after Clovis chose it for his residence; pillaged several times by the Normans, it was encompassed with fortifications by the weak successors of Charlemagne; but under the third dynasty, the limits both on the north and south, having been considerably extended, it was divided into four parts or quarters,^c and surrounded by a wall which on a surface of six hundred and sixteen English acres,^d enclosed several villages beyond the boundaries that were first traced under the Carolingians. Different streets may still serve to recall the names of these villages or burghs; the most remarkable were *Bourg-l'Abbé*, *Beau-Bourg* and *Bourg-Tiboud*, the name of the last has been applied to the street of Bourtibourg.^e Two forts which have been often rebuilt since the Roman conquest, defended the approaches to the city; the one was the Great Chatelet on the right bank of the Seine, at the entrance to the Pont au Change; the other or Little Chatelet guarded it on the left.^f Four large towers bounded the enclosure in the direction of the river; ^g that called the Tournelle rose on the left bank of the river, near a wooden bridge, which although since built of stone retains its ancient name;^h another, erected on the opposite bank at the extremity of Old Temple Street,ⁱ served as a gate to the city; it was first called *Porte Barbelle*, and afterwards *Barbette*. The tower and the gate of Nesle were built at one extremity of the present bridge of Arts, near the Mazarine library; a large tower on the other side defended the right bank of the Seine, it rose opposite the castle of the Louvre, then an old edifice beyond the walls, it was repaired or rebuilt by Philip Augustus.^j

^a *Τὴν γὰρ Λευκετιαν*—*dear Leucetia*.—P.

^b "The only building belonging to that period, is that of the *Thermae*, which formed part of Julian's palace."—At the time of his residence in *Lutetia*, Julian was governor of Gaul under the emperor Constantius.—P.

^c *Quartiers*.

^d "739 arpents."

^e "These villages or *bourgs*, which the names of certain streets still serve to recall, were *Bourg-l'Abbé*, *Beau-Bourg* and *Bourg-Tiboud*, the last of which gave its name to the street of Bourtibourg."

^g "Four large towers, situated on the banks of the river, marked, above and below, the limits of the city."

^h "—at the head of a wooden bridge, which although since built of stone, still retains its original name"—still called the *Wooden Bridge* (*Pont de Bois*).—P.

ⁱ "La Vicille rue du Temple."

^j "At one extremity of the present bridge of the Arts (*Pont des Arts*), the tower and the gate of Nesle, then called the gate of Philip Hamelin, rose in the place now occupied by the pavilion of the Mazarin library, while at the opposite extremity, fronting the old castle (*château*) of the Louvre, which had been recently rebuilt by Philip Augustus, and was then situated without the walls, a large tower defended the right bank of the Seine."

^k "1284 arpents."

^l "During the reign of Francis I. the limits of the capital were extended only on the north."

^m "Place du Palais-Royal."

ⁿ "Rue des Fossés-Montmartre—Rue Neuve-Saint-Eustache."

^o "About 1400 arpents."

Charles the Sixth enlarged the boundary on the north, and divided Paris into sixteen quarters, which covered a surface of 1,070 English acres.^k It was also extended in the same direction by Francis the First;^l the walls were traced from the square of the Palais Royal^m along the streets of Fossés Montmartre and Neuve-St. Eustacheⁿ to the gate of St. Denis, and from that gate to the Bastille; the surface thus enclosed was little less than 1,167 English acres.^o The number was increased to fourteen hundred in consequence of new additions made by Henry the Fourth.^p Others were made on the north by Louis the Thirteenth; they may be still traced from the bridge of Louis the Sixteenth,^q along the Royal Street^r and the Boulevards, to the bridge of Austerlitz; but the former limit on the south was not changed. On the right bank of the Seine and within the boundaries, were the Louvre, the palace and garden of the Tuileries,^s the abbey of St. Martin, the Temple, the Royal Square,^t and the house of Richelieu, then called the Palais Cardinal;^u the last edifice having been left to Louis the Thirteenth by his minister, became the residence of Anne of Austria, when the name was changed into that of Palais Royal, which it retained after Louis the Fourteenth had given it to his brother, the duke of Orleans. The court of justice and the cathedral, of which the fronts were concealed by old buildings, the Sorbonne, founded by Robert de Sorbon, the chaplain of St. Louis, and rebuilt by Richelieu, the college of Cluny, that was completed in the thirteenth century, and the church of St. Genevieve, or the burying place of Clovis and the shepherdess of Nanterre, were situated in the southern part of Paris.^v Several convents and charitable institutions rose beyond the northern enclosure; the most remarkable were the pest-house of St. Lazarus,^w founded in the eleventh century, the hospital of St. Louis,^x built in 1607, and the abbey of St. Anthony,^y which was afterwards changed into an hospital. Beyond the walls on the south were the abbey of St. Germain des Prés, of which the foundation dates from the time of Childebert the First; the church of St. Sulpice, which was finished by Louis the Fifteenth;^z the palace of the Luxembourg, of which the foundations were laid by Mary de Me-

^p "Under Henry IV., new additions increased it to 1660 arpents."

dicis in 1615; the abbey of Val de Grace, which was founded in 1645; the Garden of Plants, which was begun in 1635; and the house of correction,^a which was erected in 1656.

Paris was also enlarged by Louis the Fourteenth, and the hospital of Invalids^b was comprehended within the enclosure; during the same reign the old ditches were filled up, the ramparts and gates demolished, and two triumphal arches substituted for the gates of St. Martin and St. Denis. The boundaries of the city were so much enlarged in consequence of these improvements, that at the accession of Louis the Fifteenth, it covered a surface equal to 2,740 acres.^c The village of Roule^d was included some years afterwards within the limits that were fixed in 1728, and the extent was thus increased to 3,244 acres.^e Lamps of the same sort as those that are now seen in the streets, were erected in the year 1766, but a hundred years before that period, Paris was lighted by means of lanterns. To obviate the inconvenience arising from crooked streets, a law was first passed in 1785, regulating the plan according to which they were to be built in future; five years afterwards a new wall was raised, the limits have not been since much extended; they enclose a space somewhat less than 8,400 acres.^f

Having enumerated the principal additions made to Paris at different periods, we may mention the monuments and edifices by which it has been embellished from the accession of Louis the Fourteenth to the present day. The Mazarin college,^g now the hall of the Institute,^h the colonnade of the Louvre,ⁱ the Gobelins manufactory,^k the Observatory,^m the Foundling hospital,ⁿ the hospital of Invalids,^o the gates of St. Denis^p and St. Martin,^q the Royal Bridge^r, and the edifices surrounding the Place Vendome,^t were raised during the reign of Louis the Great.

The monuments of the following reign^u are the Bourbon

^j From 1806 to 1814; but it is still unfinished.

^k From 1807 to 1814.

^l In 1807.

^m Finished in 1810.

ⁿ "The magnificent colonnade of the Louvre was embellished and terminated; the gallery intended to complete the connexion between the Louvre and the Tuileries,* was begun; a triumphal arch, loaded with ornaments, and built after the model of that of Septimius Severus at Rome, rose in the Place du Carrousel to commemorate the Aus-

lossal statue of its founder, adorned Vendome place.^m Last-ly, the exchange,^o the most sumptuous edifice in Paris, was founded on a site, formerly encumbered with o'd houses.^p

The fall of the extraordinary man by whom these works were accomplished, and the exhausted state of the finances after two years of invasion and defeats, interrupted, but did not prevent, the embellishments of the capital. The blessings of a long desired peace gave such an impulse to individual enterprise, that more workmen were employed than in the time of Napoleon. Gardens and fields were changed into streets,^q and villages rose beyond the gates. The mania of building became the disease of the rich and of speculators without capital; it was not until many of them were ruined, until whole districts or quarters were deserted, that their folly was discovered.^r Some works that had been long projected or begun, were after many interruptions continued; the granaries, the slaughter-houses, the markets of Saint Martin and Saint Germain were finished; the statues of Henry the Fourth and Lewis the Fourteenth were erected on the Pont-Neuf and the Place-Victoire. A monument was raised to Lewis the Sixteenth by the city of Paris, and it was determined to place the statue of Lewis the Thirtieth on the Royal Square, not on account of any admiration for the prince, but because his statue had been there before.^s

Every successive addition made to Paris was in all probability rendered necessary by a corresponding increase in the population; but nothing like accurate information can be obtained concerning the number of inhabitants before the fourteenth century. It cannot be doubted that both before

trian campaign of 1805; a similar monument, remarkable for its colossal dimensions, crowned the terrace (*plate-forme*) which terminates the avenue of the Champs-Élysées; † the church of La Madeleine, modified in its construction, received the title of the Temple of Glory (*Temple de la Gloire*); a peristyle, serving as a back-front (*arrière-façade*) to the Palace of the Chamber of Deputies, was made to correspond with that of the temple; a column, after the model of that of Antonine ‡ at Rome, covered with basso-reliefs in bronze, and surmounted by a colossal statue of its founder, || decorated the Place Vendome.—"

* The gallery connecting the Louvre and the Tuileries on the south, was begun by Henry IV. Bonaparte formed the plan of connecting the two buildings on the north by a similar range of building, which he begun and completed for about one third of the distance. When entirely finished, the vast square of the Carrousel will be completely enclosed.—P.

† The triumphal arch of *L'Etoile* (the Star)—called also the *Barrière de l'Etoile*; situated at the *Barrière de Neuilly*, at the extremity of the broad avenue which extends from that barrier to the Place Louis XV. through the whole extent of the Champs Élysées.—P.

‡ Trajan. (Ed. Encyc. Hervé.)—P.

|| Removed at the restoration.—It is now to be replaced.—P.

o "Palais de la Bourse."

p From 1808 to 1814.

q "New quarters were formed within the walls, where there had been only fields and gardens."—A considerable part of the space enclosed within the walls is still unoccupied.—P.

r "The ruin of many of them served to check this extravagance, and entire quarters, scarcely finished, attest by their solitude the extent of the delusion."

s "Several works, long since projected or begun, have been slowly continued; at the Tuileries, an iron railing, in a style of elegant simplicity, has been substituted for the wall on the terrace of the Feuillans; some of the arcades of the Louvre have been built; the granaries (*greniers de réserve*), the slaughter-houses, the wine market, the markets of St. Martin and St. Germain, the canals of St. Denis and St. Martin, and the quays of Bignon and the Invalids, have been finished; the statues of Henry IV. and Louis XIV. have been erected, the former on the Pont-Neuf, and the latter in the Place des Victoires; the vast buildings of the treasury department (*ministère des finances*) have added to the beautiful regularity of the Rue de Rivoli; the Exchange and the Temple of Glory, the last of which has again become the church of La Madeleine, have been completed; a monument to the memory of Louis XVI. has been raised in the square of Louis XV. (*Place Louis XV.*) which the city of Paris has undertaken to embellish at its own expense; and lastly, the statue of Louis XIII. is to be reinstated in the Place Royale, not from any motives of admiration, but because it formerly occupied the same locality."

and after that early period, little or no attention was bestowed on a subject, to which political writers of the present day attach so much importance. It is difficult, however, to suppose with M. Dulaure, that Paris contained only forty-nine thousand inhabitants in the reign of Philip the Fair.^a The chroniclers of the time assert that there were fifty thousand men capable of bearing arms, which indicates a population of more than a hundred and twenty thousand individuals. It may be allowed that chroniclers are not the best authority, but it should be recollected that the capital consisted then of thirty-four parishes, and it might be shown that the average number of inhabitants in each parish was at least equal to three thousand.^b If it were necessary to bring forward other arguments, it might be remarked that there were sixteen colleges in Paris in the year 1336,^c and that eight years afterwards a pestilential disease lasted several months, and while it was at its height, not less than five hundred persons died daily. The number of inhabitants must have been much greater in the following century, for a plague that began in 1418, and lasted three months, carried off a hundred thousand individuals.^d In the year 1467, Louis the Eleventh reviewed the men between sixteen and sixty, capable of bearing arms, and their number amounted to more than sixty and less than eighty thousand, so that the population may be supposed greater than 180,000. If 25,000 students from foreign countries and different parts of France, then in Paris, be included, the total population was without doubt greater than 200,000 individuals.^e The number of houses in Henry the Second's time amounted to 12,000, from which it may be inferred that the population was equal to about 240,000. When Henry the Fourth besieged Paris in a season of famine and devastation, there were in the town, exclusively of the suburbs, more than two hundred thousand persons. The total number of inhabitants amounted to 492,000 about the end of Louis the Fourteenth's reign; since that period the population has always been progressive.^f

^a M. J. A. Dulaure, *Histoire civile, physique et morale de Paris*, tom. iii. p. 281, 3e édition, 12mo.

^b "We cannot, however, agree with a distinguished writer (M. Dulaure,) who estimates the population of the capital, during the reign of Philip the Fair, at only about 49,000 souls. Whatever be the exaggeration of the chroniclers of the time, in valuing at 50,000 the number of individuals capable of bearing arms, which would indicate a population of more than 120,000 souls, it cannot but be admitted, in our opinion, that a city which then comprehended 34 parishes, must have contained about that number of inhabitants, for each parish must have reckoned at least 3000 individuals, in order to maintain the great number of priests that served them."

^c The colleges of the Sorbonne, Boissy, Huban, Mignon, Chanac, Boncourt, Burgundy, the Lombards, the Germans, Tours, Lisieux, Autun, Cambray, Aubusson, Tournay and Justin.

^d "—since in 1418, a plague that lasted three months, carried off 100,000 individuals."

^e "In 1467, Louis XI. reviewed the men between sixteen and sixty, and as their number amounted to between sixty and eighty thousand, the whole population may be reckoned at more than 180,000, and if the 25,000 students then in Paris, from different parts of France, be included, at more than 200,000."

^f The registers afford better means of determining the increase and fluctuations in the population since the accession of Louis the Fifteenth: the following are some of the results.

In 1719	- - - -	509,000
In 1762	- - - -	576,000
In 1776	- - - -	658,000
In 1785	- - - -	685,000
In 1791	- - - -	666,000
In 1798	- - - -	640,000
In 1802	- - - -	672,000
In 1815	- - - -	714,000
In 1827	- - - -	890,000

The remarkable decrease in the above series from the year 1791 to 1802, must be attributed to revolutionary troubles.[†]

Paris contained before the revolution a hundred and sixty catholic houses of worship: viz. fifty parish churches, ten others possessing the same privileges, twenty collegiate churches and eighty chapels of ease; there were besides eleven abbeys, three of which were inhabited by women, fifty-three convents and forty-six nunneries.⁵ It does not contain at present more than thirty-eight catholic churches, namely, twelve parish churches and twenty-six chapels of ease, besides thirty-five monasteries for women, four for men, and as many monkish seminaries.^h Six chapelsⁱ belong to different sects: viz. three to the Calvinists, one to those of the Augsburg confession,^j one to the eastern Christians,^k and one to the Jews.

There are nine public libraries, many scientific collections, others connected with the arts, schools of law, medicine and theology. It is foreign to our purpose to mention all the schools, seminaries or colleges in which the various departments of knowledge are taught; of these the polytechnic school is not the least important, and it may be remarked that the method of instruction which was first introduced there, has been since adopted in different countries. The number of public institutions amounts to thirty-six, of public schools to a hundred and thirty-five; there are twenty-three learned societies, independently of the Royal Institute, the most celebrated of them all. Much good has been effected by philanthropic societies, by benevolent institutions; knowledge has thus been communicated to those, who otherwise must have remained ignorant, the evils of poverty have thus been mitigated. As ostentation is not a pretext for the noble duty of relieving the poor, or mitigating human suffering, the neglect of it cannot be imputed to carelessness or indifference. The charitable institutions in Paris, the numbers that subscribe to them, the zeal and judgment with which they are managed, are the best proofs of progressive improvement, the best answers that can be given to the narrow-minded men, who have vainly attempted to calumniate the present generation.¹

⁵ "Since the accession of Louis XV., the public registers may be relied on with a good degree of confidence, and by means of them we may safely establish the progressive increase and fluctuations in the population of Paris—"

[†] "The population in this series, is calculated according to the births, to which has been added the number of illegitimate children, taking care to retrace one third for those which, although born in Paris, do not actually belong to the city. It will be perceived that the revolutionary troubles occasioned a considerable diminution from 1791 to 1802; but since the return of peace, the increase of the population has again become rapidly progressive."

¹ Rather from 1785, or at least 1789, to 1798.—P.

⁵ "There were besides 3 abbeys for men and 8 for women, and also 53 convents (*communautés*) for men and 46 for women."

^h "35 convents (*communautés*) for women, 4 convents (*congrégations*) for men, and 4 seminaries."

ⁱ "Temples"—churches.

† Lutherans.

^k "—to the Greek Church."

¹ "Among the establishments for the purposes of education and public instruction, Paris possesses 9 public libraries, numerous collections connected with the sciences and the arts, celebrated schools of theology, law and medicine, public courses of instruction in all the branches of human knowledge, 7 colleges, 7 special schools, namely, the school of civil engineering (*ponts et chaussées*.) that of mines, that of geographical engineers, that of the staff (*état major*.) and those of music, the fine arts, and the oriental languages, the polytechnic school, one of the most important, of which the plan and mode of instruction have been imitated in many foreign countries, 37 private institutions, 56 boarding schools (*pensionnats*.) 135 primary schools (*écoles populaires*.) the Royal Institute, and 23 other learned societies. There are also 16 philanthropic societies, besides a great number of charitable establishments. These institutions for the diffusion of light and knowledge, and for the relief of indigence and misfortune, are not founded through ostentation, nor neglected through indifference: the schools, the libraries and the collections, the learned societies and the benevolent associations, are frequented with a zeal which places this city in the highest rank of intelligence, and notwithstanding the vain calumnies of certain narrow and retrograde minds, attests the increasing improvement of the present generation."

Paris is subdivided into twelve mayoralities,^a and its environs form the two subprefectures of St. Denis and Sceaux. The small town of St. Denis^b may be mentioned on account of an ancient Benedictine abbey, and also on account of a church, a Gothic building, perhaps more remarkable for lightness than any other in France, it was begun in the seventh century, and finished in 1181. The orphan daughters of the Legion of Honour are at present educated and maintained in the ancient abbey. A feeder of the Ourcq canal passes at the extremity of the town, and contributes to the trade of the inhabitants. Saint Denis is also a place of some importance on account of four fairs that are held in the course of the year; it is calculated that on an average £.62,500 worth of cloth, £.25,000 of linen, and £.16,000 of woollen stuffs are sold. More than ninety thousand sheep are bought at the fair of Landit, a neighbouring burgh.^c

Vincennes is situated in the district of Sceaux; the old towers and the dungeon which were long used as a state prison, are built on the royal manor of Philip Augustus;^d they were begun by Philip of Valois, and finished by Charles the Fifth. The first of these kings^e changed the wood into a park by enclosing it with a wall, and it was under a venerable oak, which is said to have existed at so late a period as the sixteenth century, that St. Louis administered justice.^f Lewis the Tenth, Charles the Fourth, Charles the Fifth, Charles the Ninth^g and Cardinal Mazarin^h died in the castle of Vincennes. The village of Bercy on the banks of the Seine is the principal depot of the wines, brandy and oil that are consumed in the capital. The aqueduct of Arcueil is built on the site of the one that was raised by the emperor Julian, an ancient work of which some imposing ruins still remain.ⁱ The neat village of Fontenay aux Roses possessed the privilege of supplying the court and the par-

^a "Paris forms only a single arrondissement, and even a single commune subdivided into twelve mayoralities (*mairies*.)"—The prefect of the department of the Seine performs the duties of subprefect within the limits of the city or commune of Paris, in the same manner as the prefects of the other departments officiate as subprefects in the arrondissement in which they reside; in this sense, Paris may be said to form a single arrondissement. The twelve divisions into which the commune of Paris is divided are called mayoralities (*mairies*) and communal arrondissements, and also cantons or judicial districts.—P.

^b St. Denys.

^c "The small town of St. Denis was formerly celebrated for its ancient abbey of Benedictines. The church, which was begun in the seventh century, and finished in 1181, is a Gothic edifice, remarkable for its lightness.* The buildings of the abbey are at present occupied by the royal establishment for the education of the orphan daughters of the members of the Legion of Honour.† The commerce of St. Denis has been rendered more active by the canal which passes by the skirts of the town and afterwards unites with that of the Ourcq;‡ it, however, owes its importance to the fairs which are held there four times in a year, and in which, it is calculated, there are annually sold, on an average, 1,500,000 francs worth of cloths (*draps*), 300,000 francs worth of linens (*toiles*), 200,000 francs worth of woollen stuffs (*lainages*), and 800,000 francs worth of Rouen goods (*rouenneries*.) At the fair of Landit, more than 90,000 sheep are sold annually."

* The remains of the royal family of France, since the time of Dagobert, have been deposited in the church of St. Denis, in crypts or subterranean chapels round the choir. By a decree of the convention in 1793, the bodies of the princes of France, buried at St. Denis, were ordered to be removed from the vaults, and thrown promiscuously into two large pits without the church, where they still remain. A chapel has been erected by Louis XVIII. in expiation of this sacrilege, in which are inscribed, on black marble tablets, the names of the princes whose tombs were violated. (Hervé.)—P.

† Maison Royale de St. Denis.

‡ Canal of St. Denis.

^d "Vincennes, in the arrondissement of Sceaux, is remarkable for its Donjon. These old towers, which were long used as a state prison (*prison d'Etat*.) occupy the site of the royal mansion-house (*maison royale*) of Philip Augustus."—The old castle of Vincennes consists of a Donjon and nine other square towers. The Donjon has a separate ditch and drawbridge. In 1270, there was a royal mansion (*maison royale*; Lat. *manerium regale*) at Vincennes, which appears to have been built by Philip Augustus, who enclosed the wood with walls.

VOL. III.—NO. 52

41

liament with roses, a privilege that accounts for its name. It was customary for the peers and magistrates to hold an assembly in the month of May, and each person received a bunch of flowers in which the number of roses was arranged according to the rank of the individual; but the ceremony gave rise to so many disputes about precedence that it was at last abolished.^j It is certain, however, that more roses are at present cultivated at Fontenay than in any other place round Paris. The burgh of Sceaux^k on the small river Bievre shares with Poissy the advantage of a cattle market for the supply of Paris. The luxury of the Parisians exerts a great influence in the surrounding districts, and village girls appear on Sundays in the same dress as the belles of the capital.^l

The department of the Eure, formerly included in the ancient province of Normandy, is contiguous on its eastern boundary to that of the Seine and Oise. A great many horses, and the finest oxen that appear in the markets of Sceaux and Poissy, are reared in the pastures and artificial meadows in the department; the inhabitants manufacture a considerable quantity of corn, cloth and cotton stuffs.^m Several places are connected with historical events that are not uninteresting even in the present day: the troops of Charles the Bad, king of Navarre, were defeated between Evreux and Vernonⁿ by Duguesclin in 1364; sixty years afterwards, the English gained a victory over Charles the Seventh in the neighbourhood of Verneuil; lastly, the army under the command of the duke of Mayenne was destroyed on the plains of Ivry by Henry the Fourth.^o

Vernon rises on the left bank of the Seine, and a bridge of twenty-two arches serves as a communication between the town and one of the suburbs. The public records are preserved in an old tower, all that remains of the fortifications. Evreux, a town built of wood, is situated in a fruit-

(Piganiol de la Force, t. VIII, 41, 43.)—The castle of Vincennes is still used as a prison, not for those confined by *lettres de cachet* or secret imperial orders (happily, such despotism is abolished,) but for such as are imprisoned by due process of law, as in the case of the ministers of Charles X.—P.

^e Philip Augustus.

^f The castle contains a neat Gothic chapel, built by Henry II. The Duke D'Enguien was executed at Vincennes, March 21, 1804; a granite column and a weeping willow, placed in one of the ditches, serve as monuments of the fatal deed. (M.B.)—The Duke D'Enguien was shot in one of the ditches, by the orders of Bonaparte, just after midnight, March 20, 1804.—P.

^g Charles V. was born in the castle of Vincennes, A. D. 1338, and died at the castle of Beauté sur Marne, A. D. 1380. Louis X. (A. D. 1316,) Charles IV. (A. D. 1328,) and Charles IX. (A. D. 1574,) died in the castle of Vincennes. (Moréri.)—P.

^h "Cardinal Mazarin, who had been appointed governor of the castle.—"

ⁱ The aqueduct of Julian was intended to supply the *Thermæ* in his palace, (now Palais des Thermes.) The modern aqueduct was constructed by Mary de Medicis—finished 1624. Arcueil has become a place of interest to men of science, from the valuable memoirs (*Mémoires d'Arcueil*) published by a society for the cultivation of the physical sciences, established at the country residence of Berthollet.—P.

^j "The neat village of Fontenay aux Roses derives its name from the privilege it formerly possessed of supplying the court and the parliament with roses. In the month of May, in a public assembly, each of the peers and magistrates received, according to his rank, a bouquet of roses; but the disputes that arose about precedence led to the abolition of the ceremony."^k Seaux. (Vosgien.)

^l "The luxury of Paris exercises such an influence on the surrounding country, that the village girls in their dress have preserved nothing of the ancient costume; on the contrary, they have assumed that of the belles (*grisettes*) of the capital, with whom they mix freely in the rustic balls (*bals champêtres*.) which on festival days, attract to Sceaux a numerous crowd of visitors."

^m "It exports a considerable quantity of eorn, and its numerous iron works (*usines*.) cloth manufactories and cotton mills (*filatures de coton*) prove the activity of its industry."

ⁿ Near the village of Cocherel. M. B.

^o "In 1590, the plains of Ivry were the scene of the victory gained by Henry IV. over the duke of Mayenne."

ful valley, watered by the Iton. It is a place of great antiquity; excavations have been made at different times, and many ruins have been discovered; indeed it cannot be doubted that it occupies the site of the Celtic city, originally called *Mediolanum*, and at a later period *Ebuovices* by the Roman conquerors. The iron arches that support the bridge of Arts and the bridge of Austerlitz, were founded at the iron works near Conches, at no great distance from Evreux; the industrious inhabitants are casting at present the different parts of an iron steeple, which is to weigh 900,000 kilogrammes or 884 tons, it is intended to be placed on the cathedral of Rouen.^a

Other towns are situated in the country on the north of the Seine. Gisors contains three thousand inhabitants; the principal building is a church, of which the ornaments were sculptured by John Goujon.^b The old tower that rises on an eminence, is all that remains of a castle once inhabited by queen Blanche. The road from Gisors traverses a long ridge on the left of the Great and Little Andely, two small towns which at present form only one.^c Nicholas Poussin was born in an adjoining hamlet;^d a monument has been erected to his memory at Little Andely. At no great distance are the ruins of a fortress which according to tradition was built by Richard Cœur de Lion.

The village of Fleury is situated in the middle of the valley through which the Andelle flows.^e The sinuous course of the small river, the manufactories at irregular distances, Charleval on one side, and the hill of Deux-Amans^f on the other, the declivities covered with pastures, and the woods which crown their summits, render the valley as agreeable as any in Normandy. Charleval bore the name of Nogeon sur Andelle until the time that Charles the Ninth laid the foundation stone of a country seat, that was never finished, but different chambers in it were converted into dwellings for the peasantry.^g Romilly rises on the Andelle near its confluence with the Seine; the river puts in motion the works on which the importance of the town depends; more than three hundred persons are employed in making wire, kettles and different articles of brass or copper; it is believed that the weight of the products which issue every year from these works cannot be less than 900,000 kilogrammes.^h

^a "Conches possesses important iron-works, in which were cast the iron arches of the bridge of the Fine Arts (*Pont des Arts*) and of the bridge of Austerlitz, and where they are now casting the spire of the cathedral of Rouen, the weight of which is to be 900,000 kilogrammes"—more than 900 tons. See note ¹ p. 989.—Conches is 4 leagues S. W. of Evreux. (Vosgien.)—P.

^b "The ornaments of its church were sculptured by J. Goujon."—There is only one parish-church in Gisors. (Enc. Meth.)—P.

^c "The road to Rouen traverses a long plateau, beyond Gisors, leaving on the left" the Great and Little Andelys,¹ two small towns which are at present considered as forming only one."

^d Consequently the road is on the right of the Andelys. (See *Tableau des Postes de France*.)—P.

^e The Andelys (*Les Andelys*) at present, the chief town of an arrondissement—consisting of two small towns, separated by a paved road, and only a quarter of a league distant from each other: namely, Little Andely (*Le Petit Andely*) on the right bank of the Seine, and Great Andely (*Le Grand Andely*) on a small stream called the Gambon. (Vosgien.)—P.

^f Nicholas Poussin was born in Great Andely. (Moreri. Enc. Meth.)—P.

^g "The road to Rouen [note ^c of this page] descends into the pleasant valley of the Andelle, in the middle of which the village of Fleury is situated."

^h "Hill of the Two Lovers (*montagne des Deux-Amans*.)"

ⁱ "—but of which there still remain a guard room and several gilded chambers, that serve as dwellings for the peasantry."

^j "The foundry of Romilly," situated near the point where the Andelle unites with the Seine, is the principal manufacturing establishment supplied by the former of those rivers. Three hundred workmen are there employed in making copper plates, brass and copper

kettles and brass wire; the annual amount of the products is estimated at 900,000 kilogrammes."

^k Romilly sous Andelle, a village of Normandy, celebrated for its copper foundry. (Vosgien.)—P.

^l "—but which have latterly employed more than six thousand."—The very superfine French cloths are made at Louviers in Normandy. (Ed. Encyc.)—P.

^m Situated on the left bank of the Seine. (Enc. Meth.)—It is situated at the confluence of the Andelle and the Eure with the Seine It has a bridge over the latter of 22 arches. (Vosgien.)—P.

ⁿ Quillebeuf—Lat. *Henricopolis*.—P.

^o "Owing to the difficulties of the navigation, arising from the shifting sands accumulated by the Seine, which prevent large vessels from ascending the river to Rouen, and compel them to discharge their cargoes at Quillebeuf, the harbour of the latter is of considerable commercial importance."—There is a quay at Quillebeuf, at which all the vessels moor, that are destined for Rouen, and where the largest are discharged, on account of the shifting sand banks in the river. (Vosgien.)—Ships of 150 to 200 tons can ascend to Rouen by the aid of the tide, larger ones being lightened further down the river. (Ed. Encyc.)—P.

^p "—Audomer, a French lord (*seigneur*), who built there a bridge over the Rille—"It stands on the Rille, over which there is a bridge, built by one Audomer or Audemer, whence its name. (Enc. Meth.)—P.

^q "The houses are built of brick and with a certain degree of elegance, the streets are handsome, and the public squares regular."

^r Carentone. (Vosgien.)

^s "One of the most considerable fairs in France is held there annually, at which the sale of horses is so extensive as to attract to it more than 40,000 persons."

^t Department of the Orne.

Louviers on the right of the Eure may be seen from the heights that command Romilly; it is well known on account of its numerous cloth manufactories, in which only two thousand workmen were employed forty years ago, but which furnish occupation at present to more than six thousand.¹ The wealth and industry of the inhabitants have enabled them to adorn their town with several fine edifices, an elegant theatre and different public walks. Pont de l'Arche, a small place of fifteen hundred inhabitants, was built by Charles the Bald; it is situated below Louviers on the right bank of the Seine,² at a point in the river where the tide is already perceptible.

The small town of Quillebeuf^k at the mouth of the river,¹ was originally called *Erricarville*; it was a strong place of some consequence before the fortifications were razed by Louis the Thirteenth; it does not contain at present more than fifteen hundred persons. As the moving sands that are accumulated by the Seine, render it impracticable for merchant vessels to ascend to Rouen, their cargoes are transported in lighters from the harbour of Quillebeuf.^m Neat villages are scattered through the country between the river and Pont-Audemer; they are surrounded by orchards and meadows. The time in which the last town was founded, cannot be exactly determined; it is known, however, that it was called after Audemer, a Frenchman, who built a bridge on the Rilleⁿ in the thirteenth century. It is encompassed with walls and ditches, the houses are built of brick, the streets are straight and regular.^o Bernay, to the south of Pont-Audemer, may be mentioned as the capital of a sub-prefecture; the small river Charentonne^p flows below its walls. It contains, at a certain season of the year not fewer than forty thousand persons, the most of whom repair to it on account of a fair, in which more horses are sold than in any other in France.^q

It would be tedious to enumerate all the manufacturing establishments in the department; suffice it to say that they amount to fifteen hundred, that they furnish employment to thirty thousand persons, and that the value of their products amounts to at least 26,000,000 francs or £.1,083,000.

The Orne gives its name to a department,^r in which calcareous rocks, granite and others of an ancient date form high hills and narrow valleys covered with pastures or arable

land. The people do not cultivate much corn, but they rear a great many horses and oxen. Linen, cotton and different manufactories furnish employment to great numbers; wealth is thus diffused among the four thousand inhabitants of Vimoutiers^a on the Vie, and among twenty thousand persons of both sexes in the neighbourhood.^b Argentan rises on the Orne, and is commanded by the ruins of a strong castle, the only remains of its fortifications; its ramparts have been long since changed into public walks; it carries on a trade in a particular kind of lace, which the French call *Point-d'Alençon*.^c The village of Sainte-Honorine-la-Guillaume has become more flourishing since granite quarries were worked in the vicinity;^d it contains at present two thousand inhabitants. The Rille flows near a lofty forest that bounds the department of Eure, and passes through the neat town of Aigle,^e a place that carries on a great trade in pins and needles;^f one of its manufactories is provided with machinery by which two hundred thousand needles can be made in a day. The straight and well built streets of Mortagne are situated on the declivity of a hill;^g the town may be considered the centre of a considerable trade in the coarse and fine linens that are exported to the colonies.^h Belesme^k stands on an eminence that commands a plain and the forest that bears its name; it is regularly and well-built, and the inhabitants manufacture coarse linens and cotton stuffs.^l

We have had occasion to mention the *Saïi* in the account of the Roman provinces in Gaul. The Orne waters Seez, anciently *Saïum*,^m their principal city, which was built before the conquest of Cæsar. The Normans destroyed it in the ninth century;ⁿ Lewis the Young set fire to it in the

^a Vimoutier or Vimontier. Lat. *Vimomasterium*. (Vosgien.)—P.

^b "The department of the Orne is as varied in its physical constitution as in its industry. Chalk,^{*} limestone of an earlier date,[†] and granite, the last of which forms lofty hills and narrow valleys,[‡] are covered with soils suited for cultivation and pasturage. But little corn is raised in the department, but it rears many horses and oxen, and possesses important iron-works (*usines*) and several cotton mills (*filatures de coton*.) The linen manufacture[¶] is also one of its branches of industry; it is that which diffuses prosperity among the 4000 inhabitants of Vimoutiers, a flourishing town situated on the small river Vie, and which employs more than 20,000 persons of both sexes in the neighbourhood."

^{*} "Calcaires crayeuses"—chalky limestone. Qu. hard chalk or lower chalk—situated below the soft white chalk, sometimes resembling limestone in colour, hardness and texture, but distinguished by the chalk fossils.—P.

[†] Secondary limestones, situated below the chalk. Transition limestones, near the granite?—P.

[‡] The great Chalk Basin of S. England and N. France skirts the department on the north, while the projection from the primitive region of Brittany, extending eastward towards the plateau of Beauce, skirts it on the south. In the intermediate parts are found the secondary limestones above indicated.—P.

[¶] Iron is wrought in the department to the amount of 5000 tons of cast, and 3000 of wrought iron annually. (Ed. Encyc.)—P.

^{¶¶} "Fabrication de toile de crotte" [crotte]—manufacture of *crottes*. *Crotte*, a kind of mixed cloth of hemp and linen, made in Normandy—the chain of hemp and the woof of linen. (Savary, Dict. Comm. t. II. p. 769. Enc. Meth. Dict. Comm. t. I. p. 756)—P.

^c "It manufactures that kind of lace formerly celebrated under the name of *Point-d'Alençon*." The point lace of Alençon has long enjoyed a great reputation through France, England, Germany, &c. The point lace of Argentan (*point d'Argentan*) is also celebrated. (Ed. Encyc.)—P.

^d The royal stud (*haras*) of Le Pin is situated in the neighbourhood of Argentan. M. B.

^e "The village of St. Honorine la Guillaume (*Sainte-Honorine-la-Guillaume*.) a few leagues to the west of Argentan, has become of considerable importance from its granite quarries"—P.

^f L'Aigle (Vosgien,) Laigle (Alm. Royal,) Aigle (Enc. Meth. Moreri.)—P.

^g "Near a large forest that borders the department of the Eure, the small river Rille flows through the neat town of L'Aigle, which is celebrated for its pins and needles"—P.

^h Two thousand, according to the translator.—P.

ⁱ "On the declivity of a hill, fronting the east."

^j "It is the centre of a considerable manufacture of strong and light linens (*toiles fortes et toiles légères*) for the supply of the colonies."—

twelfth, and it was taken in the fourteenth by the English who razed the fortifications.^o It was a more important place before the Norman invasion than at present;ⁿ it does not now contain five thousand inhabitants.^p The cathedral is a fine Gothic edifice: the diocese is very ancient;^q St. Latinian, the first bishop, died about the beginning of the fifth century.^r

The distance from Seez to Alençon is not more than five leagues; few visit the last place without remarking the simple and elegant architecture of the prefect's residence,^s and the fine appearance of the corn market, a circular building, and also of the townhouse, in the last of which the two towers are the remains of the castle that was inhabited by the dukes of Alençon. Marshal Matignon who had the courage to disobey the commands of government on St. Bartholomew's day, the historian Mezeray, and the deputy Valazé were born in the town. Although less important than it once was, it carries on a greater trade in lace than at any former period; and it appears that more than two thousand persons are employed in embroidering and manufacturing muslin.^t

Domfront, an insignificant and ill-built town near the western extremity of the department, is only remarkable for its position; it rises on the summit of a steep rock, divided by a vertical fissure more than two hundred feet in depth, at the bottom of which flows the small river Varennes. The industry of the inhabitants consists chiefly in making coarse linen and different stuffs; but it is the capital of a district^u in which the smallest villages are engaged in manufactures. Some of these villages are called burghs, they contain about three or four thousand inhabitants; we may mention four

The distinction in these linens is not in the degree of fineness of thread, but in that of thickness and closeness of texture.—They manufacture at Mortagne, great quantities of very strong hempen cloths, and also moderately strong hempen cloths for napkins. They also manufacture coarse hempen cloths called canvas (*canvas*.) (Savary, t. III. p. 425.)—P.

^k Belême, Bellesme (Enc. Meth.) Bellême (Alm. Royal.)—Situated 4 leagues S. of Mortagne. (Vosgien.)—P.

^l "Toiles communes—cotonnades."

^m *Saïi*. (D'Anv. Enc. Meth. Geog. Anc.)—Sées, Sées, Sez, Sais or Setz; Lat. *Sagium, Saïum, Saïorum Civitas* (Enc. Meth. Geog. Mod.)—P.

ⁿ "About the ninth century, when the Normans destroyed it, it was much more considerable than at present."—The diocese of Seez is 24 leagues in length, by 13 in breadth; it was much more extensive in the ninth century, when the Normans invaded it. (Enc. Meth.)—(?)—P.

^o "It was burnt in the twelfth century by Louis the Young, and in the fourteenth, by the English, who razed its fortifications."—Louis the Young besieged it in 1174, but the resistance of the inhabitants compelled him to raise the siege; in 1353, it was burnt by the English. (Enc. Meth.)—(?)—P.

^p "It contains 5000 inhabitants."—Population 5400 (Vosgien.)—5500 (Alm. Royal, 1822.)—P.

^q Seez is still the seat of a bishopric.—P.

^r "St. Latinian was the first bishop of Seez, at the commencement of the fifth century." ^s "Hôtel de la préfecture."

^t "In other respects, although some of the streets are broad, clean and well paved, the town has a gloomy aspect; a defect that may be attributed to the grayish colour of the granite of which its houses are constructed. Marshal Matignon,^{*} who refused to perpetrate the horrible massacre of St. Bartholomew, was born at a little distance from one of its five suburbs; but the historian Mezeray,[†] and the deputy Valazé,[‡] were born within the town. Although the manufacture of lace is less important than it was formerly, it is still carried on to a considerable extent at Alençon;^{||} more than 2000 persons are also employed there in manufacturing and embroidering muslin."

^{*} J. de Matignon, born at Louvray in Normandy, A. D. 1526. He refused to massacre the Protestants on St. Bartholomew's day, 1572, at Alençon and St. Lo, of which places he was then governor.—P.

[†] Fr. Eudes de Mezeray [Mezerai,] the historian, was born at the village of Ry near Argentan [at the village of Mezeray, near Argentan. Moreri.] He took the name of *de Mezeray*, from that of a hamlet in the parish of Ry. (Beauvais.)—P.

[‡] C. E. Dufrique de Valazé, born at Alençon, 1751. He was an active member of the Gironde party, and was consequently condemned by Robespierre, but he anticipated his fate by suicide, Oct. 30, 1792.—P.

^u "Arrondissement"

of them: Athis is noted for cloth and silk, Ferté Macé for cottons and ribbons, Flers for tools and snuff-boxes, Tinchebrai for iron works and paper mills.^a

The Channel^b bounds the extensive coasts of the department^c into which we are about to enter. Metals, argil well adapted for porcelain, slate and granite quarries are worked on the hills; the plains are fruitful in corn and pastures, but the whole country is almost destitute of timber. Such are the principal products in a department ill provided with roads and other means of communication; it may excite surprise therefore that it is one of the most populous in France, but the inhabitants are laborious and well informed, they devote themselves to fishing, agriculture, commerce and manufacturing industry.^d

Mortain, the small capital of the most southern district,^e is encompassed with granite rocks; the inhabitants manufacture paper and earthen ware.^f Avranches,^g one of the most ancient Armorican cities, is situated on a hill^h at no great distance from the sea; it bore the Celtic name of *Ingena*, it was afterwards called *Abrincata*, and at a still later period, *Abrinca* or *Avrinca*. The early inhabitants, the *Abrincata* or *Avrincata*, were formerly settled in the country of *Avranchin*. The present cathedral dates from the twelfth century, but before that time Avranches was the capital of a diocese, and a place of importance, as a fortified town.ⁱ The safe and convenient harbour of Granville was constructed in 1784; eight years afterwards the inhabitants defended themselves successfully against an attack of the English.^j The town contains a population of eight thousand souls; it is ill-built and encompassed with walls; most of the people are engaged in commerce, they equip many vessels for the coasting trade and cod fisheries.^k Coutances^l is probably a place of as great antiquity as Avranches; it was the *Cosedia* of the Celts and the *Constantia-Castra* of the Romans;^m the country round it was formerly called Cotentin,ⁿ a name by which it is still designated in Norman-

^a "Some places, to which they have given the name of *bourgs*, ought rather from their population of three or four thousand inhabitants, to be considered as towns (*villes*); four of them only will be mentioned; namely, Athis, noted for its plain and ribbed cassimeres (*reps et casimirs*); La Ferté-Macé, for its plain cottons (*toiles de coton*); its tapes (*rubans de fil*); and its box-wood snuff-boxes (*tabatières de buis*); Flers, for its tools^o and twilled cottons (*cotonnades croisés*); and lastly, Tinchebrai,[†] for its forges and paper mills."

^{* "Outils."—Qu. *coutils*, tent-cloths, tickings—a very strong and coarse kind of cloth, generally made of hemp, manufactured in the greatest quantities in Normandy and Brittany. (Savary, t. II, p. 730.)—P.}

[†] Tinchebrai. (Vosgien.)

^b "La Manche"—English Channel.

^c Department of the Channel (*Département de la Manche*).

^d "Bounded by the Channel, as its name indicates, the long and narrow department we are about to enter, comprehends a great extent of coast, some land that is fertile, principally in corn, but little forest, much pasture, and a chain of low hills (*petites montagnes*), that furnish slate and granite, besides metals and clay suitable for porcelain.* From this brief enumeration of its natural advantages, connected with the fact that it is not provided with sufficient means of communication, we should be surprised to learn that it is one of the most populous departments in France,† did we not know that its inhabitants are very industrious, and devote themselves successfully to agriculture, fishing, commerce and manufactures."

* These hills form the eastern front of the primitive region in N. W. France, and are immediately connected with the similar region in S. W. England; a line drawn from Cape La Hogue N. W., striking the granite of Daitmoor.—P.

† Population of the department (1802), 1,663 inhabitants per square league—that of the whole of France, on an average, being 1,086, that of the Lower Seine 1800, and that of the Seine and Oise, in the immediate vicinity of Paris, 1502. (Peuchet, *Statist. de la France*, p. 153, 230, 97, 95.)—P.

^e "—the small capital of a subprefecture (*arrondissement*), that first presents itself in the most southern part of the territory."—The *arrondissement* of Mortain occupies the south-eastern extremity of the department, and is the only one contiguous to the department of the Orne, last mentioned—that of Avranches is directly west of it, and occupies the south-western extremity of the department.—P.

[†] "Stone ware (*poteries de grès*)"

^g Avranches.

dy. The Bulzard flows beneath the walls,^o and the remains of a Roman aqueduct may be seen in the fruitful meadows near the banks of the river. The town is the seat of a bishopric; the cathedral may be compared with the finest Gothic edifices in France.

The works which were begun during the reign of Lewis the Sixteenth, continued under the imperial government, and almost neglected since 1813, have rendered Cherbourg an important place both as a strong town and a sea-port. Eight formidable redoubts guard the entrance, while three forts and a large battery are placed in such a manner as to defend the anchorage, of which the depth at low tide is not less than forty feet. It is enclosed by an embankment 3866 yards in length, 80 in breadth at the base, and 30 at the summit. Although the embankment was commenced in the reign of Lewis the Sixteenth, it is not yet finished, but so many difficulties have been already overcome, that it may be considered a gigantic undertaking. It was necessary to construct a great many conical frames 69 feet in height, 60 in diameter at their summit, and 140 at their base; they were afterwards filled with stones, and let down into the water. The spaces between them were covered with loose stones, still the barrier was insufficient to resist the impetuosity of the waves, and the work was only accomplished by successive accumulations. The whole mass is formed by enormous blocks of granite and sand-stone together with 40,000,000 cubic yards of loose stones. The former harbour of Cherbourg was merely adapted for merchant vessels, more than 50 ships of the line may ride at anchor in the present during the lowest tides. It is encompassed with store-houses and dockyards, in which the largest ships may be built; but the town is an assemblage of clumsy houses, of narrow and crooked streets; the only monument worthy of notice, is the one that was erected to commemorate the landing of the Duke de Berry in 1814.^p The temperature of Cherbourg is very mild relatively to the latitude; in

^h "Declivity (*coteau*)."—Situated on a hill, at the foot of which flows the Sée [*Séez*], half a league from the sea. (Enc. Meth.)—P.

ⁱ "Its Celtic name was *Ingena*, afterwards exchanged for that of *Abrincata*,* which finally became *Abrinca* or *Avrinca*.† The people to whom it belonged were the *Abrincata* or *Avrincata*,* and the territory which they inhabited was formerly called *Avranchin* (*L'Aeranchin*).‡ Avranches was the seat of a bishopric [before the revolution,] and its cathedral dates from the twelfth century.§ At that period, it was a place of importance as a fortified town (*place d'armes*).||"

* *Abrincata*. (D'Anv. Enc. Meth.)—*Ingena* (Avranches), afterwards called *Abrincata*. (Enc. Meth. Geog. Anc.)—P.

* *Castra Constantia*. (Ammian. Marcell. L. XV.)

ⁿ "Le Cotentin" (Côtantin, Constantin. Moreri)—a maritime district of Lower Normandy, bounded by the sea on the north and west, and partly on the east, by Avranchin on the south, and by Bessin and the Bocage, (or the districts of Bayeux and Vire,) on the east; forming the promontory at the N. W. extremity of Normandy.—P.

^o It stands partly on a height, and partly in a plain, near the small river Siolé. (Enc. Meth.)—Situated on the Burd. (Moreri.)—P.

^p "The immense works, that were begun during the reign of Louis XVI., and continued under the imperial government, but which have

winter the thermometer is always five degrees higher than at Paris, a fact which tends to confirm what has been already said concerning the influence of the sea in modifying climate. The proximity of Cherbourg to Cape Hogue renders it very probable that it occupies the same position as the ancient *Corialum*. It bore the name of *Carasbur* in the tenth century;^a it was included at a later period in the appanage of Charles the Bad, who delivered it to the English, and it was the last conquest made by Charles the Seventh.^b The English, having made themselves masters of the town in 1756, plundered the inhabitants, razed the fortifications, and destroyed the harbour. It was more fortunately in 1815, for the Prussians attacked it without success. Cape Hogue or Hougue, the *Caput Oga* of the ancients, is about six leagues on the south-east of Cherbourg; it is mentioned in history on account of the naval engagement which took place between the French and English in 1692. Marshal Tourville had not more than forty-six ships, Admiral Russel commanded a fleet of more than ninety sail. The Frenchman fought gallantly during ten hours, and was at last completely defeated, but his science and courage extorted the admiration of his enemies.^c

been almost interrupted since 1813, have rendered Cherbourg a place of great importance, not only as a military and naval station (*place de guerre—port militaire*), but as a commercial town. Eight redoubts defend the town, while three forts and a large battery are placed in such a manner as to guard the entrance of the road. The depth of the latter, at low tide, is not less than forty feet. It is closed by a dike 1933 toises in length, of which the breadth at the base is forty toises, and at the summit fifteen. Although this dike was begun in the reign of Louis XVI., it is not yet entirely completed. Its progress has been obstructed by so many difficulties, that it may be regarded as a gigantic enterprise. They at first employed conical frames, 69 feet in height by 60 in diameter at their summit and 140 at their base; these were loaded with stones and sunk to the bottom, and the intervals between them filled up with loose stones; but the force of the sea overturned them, and it is only by means of accumulated masses of stone, that they have been able to resist the fury of the waves. 500,000 cubic toises of materials, consisting of loose stones and enormous blocks of granite and sandstone, have been employed for this purpose. The dike serves as a shelter to the vessels moored in the road. There was formerly at Cherbourg, only a harbour for merchant vessels, but a harbour for ships of war (*port militaire*) has been since excavated, sufficiently large to contain 50 sail of the line always afloat, even at the lowest tides. It is surrounded with storehouses and dockyards, in the last of which ships of the first class may be constructed. The town is irregularly built; the marine hospital is the only remarkable edifice, and the only monument worthy of notice is that of granite, on the parade (*place d'armes*), erected to commemorate the landing of the Duke of Berry in 1814.—The road is capable of holding 500 ships, and enormous sums of money have been expended in the attempt to construct a mole, by sinking cones to render it a secure station for line of battle ships, [i. e. to form what is now called a Breakwater.] This mole or dike crosses the entrance of the road, leaving a passage at each end 1000 feet wide, on which are block-houses and forts. In order to form a port for a fleet, Buonaparte had a basin cut in the solid rock, the bottom of which was sunk thirty feet below the level of the sea at low water. This work was finished in 1813, and opened in the presence of the Empress with an imposing ceremony. (Tuckey's Mar. Geog. v. ii. p. 17, 18.)—The excavation for the basin is 1000 feet long, 770 wide, and 50 deep. A wet dock of the same dimensions was begun by Buonaparte in 1813, and nearly completed in 1822, at which time it had cost, with the basin, the sum of nearly five millions sterling.—P.

^a "The proximity of Cherbourg to Cape La Hogue renders its position identical with that of *Coriallum*. It was called *Curasbur* in the tenth century, at which period it was fortified and commercial."—*Coriallum* is placed by D'Anville in the immediate vicinity of Cape La Hogue [at Havre de Gouril.] (Enc. Meth. Geog. Anc.)—Latin name of Cherbourg, *Cesaris Burgus* (Enc. Meth.) *Cesarisburgum*, *Caroburgum*, or *Caroburgus* (Moreri).—P.

^b A. D. 1453. (Moreri).—P.

^c "In 1753,* the English pillaged it, and destroyed the harbour and fortifications; but the Prussians tried in vain to get possession of it, in 1815. Cape La Hogue or La Hougue,† called *Caput Oga* by the ancients,‡ is about six leagues to the north-west of Cherbourg; it is celebrated for a naval engagement in 1692, in which Marshal Tourville, after having fought a whole day with 46 ships against an English fleet of 90 sail, was completely defeated, but not until he had exhibited pro-

Valognes is situated in a pleasant valley watered by the Merderet, at no great distance from *Alauna*, an ancient city now in ruins.^d Carentan, a place of 3000 inhabitants, is defended by a strong castle; it was formerly surrounded with fortifications that have fallen into decay. Saint Lo, the capital of the department, was the Celtic *Briovera*, which signifies *a bridge on the Vere* or *Vire*, the river that waters the town. *Saint Laudo* who was born there, had the honour of giving his name to his native city; he lived during the reign of Clovis, and became bishop of Coutances. The ancient cathedral of Saint Lo is a light and graceful building, and the church of the Holy Cross is certainly the finest monument of Saxon architecture in France. The town was one of the most populous in Normandy, before the province was conquered by Edward the Third; it has risen into importance of late years, it carries on a trade in cotton manufactures and hardwares.^e

The ship *Calvados* formed part of the fleet which Philip the Second sent against England in 1583; it was wrecked on the rocks that extend to the distance of six leagues between the mouths of the Vire and the Orne. The same rocks were afterwards called *Calvados*, and they have given

digies of science and valour which even extorted the admiration of his enemies.‡"

* The translator is wrong in his date of 1756. See Hume and Smollet, Jones' Ed. vol. II. p. 438.—P.

† Called also Cape La Hague. (Tuckey).—P.

‡ Latin name of Cape La Hogue (pronounced *La Hougue*, in the neighbourhood.) *Ogas* (Vitalis, 12th cent.), *Oggia* (Cenalis, 16th cent.), *Caput Oga* (Baudiand, 17th cent.), *Oga* (generally.) (Enc. Meth. Geog. Mod.)—P.

§ The French fleet under Tourville consisted of about 50 sail of the line. (Ed. Enc.)—The French fleet did not exceed 63 ships of the line. (Smollet's Hist. Eng. vol. VIII. p. 446, 3d Ed. 1769. Jones' Ed. vol. II. p. 26.)—French fleet 46 ships (Enc. Meth.) 44 ships (Beauvais).—Allied fleet, consisting of the English squadron under Admiral Russel, and three united Dutch squadrons, 99 ships of the line, besides frigates and fire ships. (Smollet, *ut supra*).—‡ he fleets hove in sight of each other at 3 o'clock A. M. May 19th, and the battle began about 8 o'clock A. M. and continued till 3 P. M., when the fleets were parted by a fog; but this abating, a chase commenced, and at 8 in the evening there was another brief engagement. (The battle lasted 12 hours. Beauvais.) May 2d, about half the French fleet were driven into La Hogue and destroyed, and the rest escaped through the Race of Aldeney.—P.

^d "The neat town of Valognes,* five leagues to the south-east of Cherbourg, is situated in a pleasant valley watered by the Merderet, at a little distance from the ruins of the ancient city of *Alauna*; it was the birthplace of Letourneur; and the celebrated physician Vicq-d'Azir.‡"

* Valogne.

† *Alauna*, Moutiers d'Alaune. (Enc. Meth. Geog. Anc.)—*Crociatonum*, Valognes. (D'Anv. Enc. Meth. Geog. Anc. Tab. de la Gaule.)—At Aleaume, near Valognes, are Roisan monuments, the remains of the ancient city of *Crociatonum*, the capital of the *Unelli*. (Vosgien).—*Crociatonum* is generally supposed to have occupied the site of Carentan. (Enc. Meth. Geog. Anc. *au mot*).—P.

‡ P. Le Tourneur, born at Valognes 1736, known by numerous translations from the English (Young's Night Thoughts, Ossian, Shakspeare, &c.)—P.

§ F. Vicq-d'Azir, born 1743, more particularly celebrated as an anatomist and physiologist.—P.

^e "Carentan, a town of three thousand inhabitants, defended by a strong castle, and surrounded with fortifications now in ruins, is situated in the midst of unhealthy marshes. St. Lo,* the capital of the department, is traversed by the Vire. It is supposed to have borne originally the name of *Briovera*, which signifies in Celtic, the bridge over the Vere,† or rather the Vire. The name which it bears at present is derived from St. Laudo, who was born during the reign of Clovis, and was afterwards bishop of Coutances.‡ The ancient cathedral of St. Lo is remarkable for its elegance and lightness, and the church of the Holy Cross (*église de Sainte-Croix*) is considered the best preserved of all the monuments of Saxon architecture in France. Before the conquest of Normandy by Edward III., this town was one of the most important in the province for its industry, and at present it contains numerous manufactories of stuffs (*tissus*)|| and is noted for its cutlery."

* "Saint Lô."—St. Lo (Enc. Meth. Savary.) St. Lô (Alm. Royal).—P.

† "Pont sur la Vère."—The river is now called the Vire. (Vosgien).—P.

‡ Some writers pretend that the town is of ancient origin, and that its earliest name was *Briovera*, composed of two words, *bria* or *briva*, a bridge, and *Vera*, the river Vire. But it is more probable that it owes its origin and its earliest name to a church built under the auspices of St. Lo (*Sanctus Laudus* or *Laudo*), bishop of Coutances, who was born in a castle there situated, and who lived under the successors of Clovis. (Enc. Meth.)—St. Lo was raised to the see of Coutances, A. D. 528. The reign of Clovis extended from 481 to 511. (Moreri).—P.

|| The term *tissu* is applied generally to all kinds of cloth (texture) woven by the shuttle in a loom, whatever be the materials. It is also applied particularly to a kind of coarse girth or webbing. (Savary).—St. Lo manufactures serges and shalloons (*serges, ras.*) (Enc. Meth.)—It has manufactories of cloths (*draps*.) stuffs (*laines*), galloons, thread and serges. (Vosgien).—P.

their name to a maritime department; they form during high tides a flat surface several hundred yards in length, and about thirty in breadth; sometimes, however, they are wholly concealed by the ocean. Calvados is bounded on the side of the continent by the departments of Manche, Orne and Eure; it yields rich harvests, it abounds in cattle, it is well supplied with coal.^a

Isigny^b rises on the bay in which the Vire throws itself into the channel; it possesses a small harbour, and carries on a considerable trade in the produce of the neighbouring country. The town contains only 2000 inhabitants, and it sends annually more than 3,600,000 pounds of butter into different parts of France.^c The country between Isigny and Bayeux, a distance of seven leagues, is covered with orchards, rich pastures and fruitful fields. The latter place was the ancient *Aragenus* or *Baiocasses*,^d which in the time of Cæsar, was surrounded with forests, and possessed a celebrated school under the direction of the Druids. A spacious and elegant street extends from one extremity of the town to the other, forming an exception to the rest, which are for the most part ill built. The cathedral, a fine Gothic edifice, is adorned with a magnificent portal, surmounted by three lofty towers: but the exterior is not the only part that fixes the attention; it has a treasury in which there are several curiosities, among the most remarkable of which, is the tapestry worked by queen Matilda, representing the exploits of William the Conqueror. Lace and porcelain are the principal articles manufactured in the town; it has given birth to the eloquent Alain Chartier and to Oliver Basselin, a lyric poet, celebrated as the inventor of the *Vau de Vire*; his lively songs were at first confined to the banks of the Vire, but having become fashionable at Paris, they were styled *vaudevilles*.^e Vire, so called from the river that waters it, was gradually built round the castle which dates

from the time of Philip Augustus.^f Condé sur Noireau,^g situated in a deep valley at the confluence of the Dronance and the Noireau, contains five thousand inhabitants, together with several cotton and linen manufactories.^h

A hill rises in a district covered with woods, fruit trees, and pastures; the Anté, a small river, flows below it, and Falaise, a Norman city, is built near the base.ⁱ The town is encompassed with three suburbs; Guibray, one of them, might be sufficient to render it a place of celebrity, for two very important fairs^j are held there every year, the first of which begins on the tenth, and lasts to the twenty-fifth of August, while the other continues eight days from the eighth of September; an immense number of horses are sold during the first fair;^k the second is set apart for the sale of cattle and different articles of merchandise. In the same suburb are situated the remains of a strong castle with a tower in a good state of preservation; it was the birthplace of William the Conqueror.^l An excellent road leads from the town to the capital of the department.

It is vain to determine the time in which Caen was built: it does not appear to be very ancient, but the date of the foundation is unknown. It was formerly encompassed with walls, and flanked with twenty towers: many of the streets are broad and adorned with well built houses; the public buildings are imposing, and such is the excellent quality of the stone in the neighbouring quarries, that Caen may in time become one of the finest towns in France. The Royal Place forms a large square; the townhouse, a simple and elegant edifice, rises at one extremity, and a public walk extends round the centre, which is adorned with a bronze statue of Lewis the Fourteenth. The abbey church is finer in point of architecture than any in Caen, within it are contained the tombs of William the Conqueror by whom it was built, and of his wife Matilda.^m The town is chiefly impor-

^a "A chain of rocks that extends from east to west, to the distance of six leagues, between the mouths of the Vire and the Orne, derived its name of Calvados* from the wreck of a ship of that name, which formed part of the fleet that Philip II. sent against England in 1588.† In high tides, these rocks present above the water only a flat surface of a few hundred metres in length by about thirty in breadth, and sometimes even entirely disappear. They have given their name to a maritime department,‡ bounded on the land side by the departments of the Channel, the Orne and the Eure, and important from its corn, cattle, coal mines§ and manufactures."

* *Le Calvados*.

† Not 1553, as in the translation. See Hume's Eng. p. 510—13, Jones' Ed.—P.

‡ Département de Calvados (*département du Calvados*).—P.

§ There are mines of coal and iron in the department. (Ed. Encyc.)—P.

^b Isigni. (Vosgien.)

^c "At the bottom of the bay, in which the Vire enters the Channel in the midst of shifting sands, Isigny possesses a small port and carries on a considerable commerce in the products of its territory, noted for the goodness of its cider and the excellent quality of its butter, of the last of which it exports annually more than 1,600,000 kilogrammes; it has a population of only 2000 inhabitants."—Isigny is situated at the mouth of the Vire (Vosgien)—at the confluence of the Esques with the Vire, eight miles from the sea; vessels of 8 or 9 feet draft go up to it with the tide (Tuckey. vol. II. p. 16.)—The Vire becomes navigable at St. Lô, leaves Isigni on the right, receives the river Esque and then falls into the Channel, where it forms a small bay (*gulf*), fordable at low tides. (Vosgien.)—P.

^d The name of *Aragenus*, which belonged to the little river Aure [on which Bayeux is situated,] as well as to the city of the *Bajocasses*, has been replaced by that of Bayeux. (D'Anv.)—The people who anciently inhabited the diocese of Bayeux, are supposed to have been the *Belloassi*, mentioned by Cæsar (L. VII. § 69.) Bayeux has been variously named by Latin authors, *Bajocæ*, *Bajocassium* *Civitas*, *Julio-bona* *Biducassium*, and *Bajocum*. Gregory of Tours calls the people who inhabited it the *Baiocassini*, and Ausonius (Carm. 4th) the *Baiocasses*. (Moreri.)—The *Belloassi*, of Cæsar, have been confounded by some authors with the *Velocasses*, but the latter inhabited the territory of Cassel in Flanders. (Cæsar. Edit. Scalig. Elzev. 1635—Nomenclator Geographicus A. Ortelii adj.)—P.

* Tu Baiocassis stirpe Druidorum satus,
Si fama non fallit fidem,

Belani sacratum ducis e templo genus—

Ausonii Commemoratio Professorum Burdigalensium, IV. Attius Paterna.—P.

^e "It gave birth to Alain Chartier, the father of French eloquence, and to Oliver Basselin, no less celebrated for having invented the *Vau-de-Vire*, a kind of satirical song, first confined to the banks of the Vire, but which having become fashionable in the capital, took the name of Vaudeville."—Alain Chartier, born at Bayeux 1386, was called in his time, the father of French eloquence (*Père de l'éloquence française*). (Beauvais.)—O. Basselin, a fuller of Vire in the 15th cent., composed many convivial songs (*chansons à boire*), which he sung at the foot of a hill, called the Vaux, on the banks of the Vire, whence they took the name of *Vaux-de-Vire*, afterwards corrupted into *Vaudeville*. (Dict. Hist. Caen. Beauvais.)—The Vaudeville originated in the valleys (*vaux*) of the Vire. (Vosgien.)—Vaudevilles are short comic dramas, with a song (the Vaudeville) every few minutes—performed more particularly at the Theatre Vaudeville in Paris.—P.

^f "—is a neat town, which in the time of Philip Augustus was only a castle." ^g Condé sur Nereau. (Moreri.)

^h "—together with a great number of cotton mills (*filatures de coton*) and manufactories of different stuffs (*tissus*)."—It has manufactories of serges, particularly the kind called *lingettes* (Savary)—cloths (*draps*) (Enc. Meth.)—P.

ⁱ "Falaise, a long and narrow town of Norman origin, is built on a hill near the banks of the small river Anté, in the midst of a territory covered with woods, pastures and fruit trees."—It rises on an eminence in the form of a ship, and its castle, which is built on a rock, occupies the place of the stern. (Moreri.)—It derives its name from its position on a rock [*falaise*, a bluff.] (Enc. Meth.—Its situation resembles that of the old town of Edinburgh.—P.

^j "—two of the largest fairs in Europe."—The fair of Guibray is the most celebrated in the kingdom after that of Beaucaire. (Enc. Meth.)—P.

^k "The first is noted for the sale of fine horses (*chevaux de luxe*)." ^l William the Conqueror was born in the castle of Falaise, A. D. 1027.—P.

^m "The *Place Royale** is a spacious and regular square; the townhouse, a simple and elegant edifice, rises at one extremity, while the centre, which serves as a promenade, is adorned with a bronze statue of Louis XIV.† The churches are not at all remarkable, with the sin-

tant on account of an university, a botanical garden, a public library of forty thousand volumes, and a very valuable collection of natural history. It possesses also an academy of science and belles-lettres, Linnean, antiquarian and agricultural societies; the transactions which are published every year, attest the zeal and knowledge of the members.^a The celebrated Lamouroux, by whose premature death science sustained no ordinary loss, occupied a few years since, the chair of natural history in the university.^b The town has given birth to Malherbe, Segrais, Malfilatre^c and Huet, bishop of Avranches. It stands in a fruitful and pleasant valley, at the confluence of the Odon and the Orne; activity reigns in its small harbour, and a public walk, remarkable for its beauty,^d is bounded on one side by verdant meadows, and on the other by the river. If it be added that the inhabitants are alike distinguished by their knowledge and industry, it cannot be wondered that the good effects of their example extend to most places in Normandy.

The remaining towns in the department are comparatively of little importance. Lisieux^e is encompassed with ditches and old walls;^f it was formerly the capital of a diocese,^g in which the first bishop was Litarde, who flourished in the sixth century.^h There is reason to believe that it occupies the site of *Noviomagus*, a Celtic city, and it is certain that it

is the only exception of that of the abbey of St. Stephen,† in which are contained the tombs of William the Conqueror, by whom it was founded, and of his wife Matilda. Among the other public buildings, the ancient strong castle, which formed part of the fortifications built by that prince, and a large hospital, are also deserving of attention."

* Royal Square. † An equestrian statue, in a Roman habit. (Ed. Encyc.)
† L'Abbaye aux Hommes.—There were two abbeys in Caen, viz. that for men (*Abbaye aux Hommes*, Enc. Meth.—*St. Etienne de Caen*, Moreri.) and that for women (*Abbaye aux Dames*, Enc. Meth.—*St. Trinité*, Moreri)—the former founded by William the Conqueror, and the latter by his wife Matilda.—P.

^a "The town is chiefly important as the seat of a university, in connexion with which it possesses a botanical garden, a public library containing 40,000 volumes, a cabinet of natural history at the town-house, remarkable for its extent and arrangement,^{*} and also several learned societies, viz. the academy of sciences and belles-lettres, the Linnean society, the society of antiquaries and that of agriculture; the memoirs published annually by these societies, attest the zeal and knowledge of their members."—The university was first founded in 1431 by Henry VI. of England, for the study of civil and canon law; the faculties of theology and the arts were added in 1436, and that of medicine in 1437. (Ed. Encyc.)—The academy [university] of Caen consists of three faculties, viz. those of law, sciences and letters. There is also a royal college [lyceum] at Caen. (Alm. Royal.)—P.

* The collections of Lamouroux, which were very complete and extensive, particularly in marine productions (animal and vegetable,) are now deposited in the museum of Caen.—P.

^b J. J. N. Huot, Notice sur la vie et les travaux de J. V. F. Lamouroux (Annales des Sciences Naturelles, t. V.)—[Lamouroux died at Caen in 1825.—P.]

^c Three distinguished French poets—Malherbe born 1555, Segrais 1624, and Malfilatre 1733.—P.

^d "—a fine promenade called the Course (*Cours*.)"

^e "Lisieux."

^f The edifices most worthy of attention, are the cathedral and the episcopal palace, the last of which is noted for a fine staircase. M. B

^g Suppressed during the revolution.—P.

^h Present at the first council of Orleans, A. D. 511. (Enc. Meth.)—P.

ⁱ "It bore among the ancients the name of *Noviomagus*, which was afterwards exchanged for that of *Lixovium*."—*Noviomagus*, afterwards *Lexovii*, Lisieux. (D'Anv. Enc. Meth. Geog. Anc.)—The Latin names of Lisieux are, *Civitas Lexoviorum* s. *Lixoviorum*, *Lexovium* and *Lixovium*. (Enc. Meth. Geog. Mod.)—*Lexobii* (Cæsar. edit. Maittaire.) *Lexovii* (Pliny.) *Lexobii* or *Lexovii* (Strabo.) *Lexubii* (Ptolemy.) was the name of the people, afterwards that of their capital.—*Neomagus*, the capital of the *Lexubii* (Ptolemy.)—*Lixovium* does not occur in either of these ancient authors. It is the modern Latin name of Lisieux.—P.

^j "It is the centre of an extensive manufacture of linens (*toiles*), blankets (*couvertures*) and ribbons (*rubans*), which furnishes employment to more than 3,000 workmen."—It has manufactories of linens and flannels (Vosgien)—linens, particularly *cretannes* [see note ^b ¶ p. 1003.] and woollen stuffs (*serges*, *frocs*.) (Savary.)—The term *couvertures*, without qualification, is used for woollen blankets, by Savary. (It is now also used for cotton coverlets.) He observes that Normandy is

was one of the places that the Romans called *Lixovium*.¹ It carries on at present a considerable trade in linen, cotton stuffs and ribbons, a trade which furnishes employment to three thousand workmen.² The inhabitants of Pont l'Évêque^k are engaged in the same sort of industry, but it is thinly peopled and ill built.¹

The heights above Honfleur are covered with lofty trees, but a vista reveals the rich country in the neighbourhood—the embouchure of the Seine, and the sea that bounds the horizon. The town itself is an irregular assemblage of dirty houses, and the most frequented church is built of wood. Two pharos direct vessels to the harbour; although it is small, the commercial intercourse between Honfleur and Havre, and the equipments necessary for the herring, cod and mackerel fisheries, render it the scene of much activity and confusion. But the port was once more flourishing than at present; some distinguished navigators were born there; it was from Honfleur that Chinot-Palmier and captain Gonnevillle departed in the sixteenth century on their voyages of discovery. The town is called *Honnefleu* in several old charts, a name which, according to an antiquary of some celebrity, signifies in northern languages a hamlet on a small gulf; the etymology, it must be admitted, accords with the position.^m ⁿ

one of the provinces in which blankets are manufactured in greatest quantity.—P

^k Pont-l'Évêque. (Moreri.)

¹ "Pont-l'Évêque, although a town of less interest than the preceding, carries on, however, a considerable manufacture of linens (*toiles*), but it is poorly peopled and ill built."—Population about 2000.—P.

^m From *ham*, hamlet, and *fluct*, a small gulf. See Notice des Gaules by Valois.

ⁿ "The traveller on the road from Pont-l'Évêque to Honfleur, cannot fail to admire the fine prospect that presents itself at the extremity of the high plateau which commands the latter: he finds himself surrounded by woods, but through a vista that serves to heighten the beauty of the landscape, he perceives at a distance the mouth of the Seine, the sea stretching to the horizon, and the houses of Honfleur rising along the declivity of the *Côte de Grâce*, the summit of which is shaded with trees, and crowned by a chapel held in veneration by mariners. The town is irregular and dirty, and the most frequented church is built of wood; but the harbour, which can receive only 30 ships, and the entrance to which is pointed out by two light-houses (*phares*), exhibits a great degree of activity from its constant intercourse with Havre, its general commerce, and its herring, whiting^o and mackerel fisheries. The port was formerly more flourishing than at present; it has supplied France with many good seamen (*marins*.) It was from Honfleur, in the 16th century, that Chinot-Palmier, and a few years afterwards, Captain Gonnevillle, departed for the discovery of the *Terra Australis*.¹ The town is designated in old charters (*chartes*) by the name of *Honnefleu*, the root of which signifies in the northern languages, a hamlet on a small gulf—an etymology that appears to be very probable.²"

^o "Merlan"—*Godus Merlangus*, Linn.—P.

¹ Chinot-Palmier, a gentleman of the vicinity, who in 1503 first discovered the *Terra Australis*, which he called the Southern Indies (*Indes Meridionales*), sailed on his voyage from the port of Honfleur. (Enc. Meth.)—N. Binot Paulmier de Gonnevillle, born at Honfleur about the middle of the 15th cent., was employed in 1505 to conduct an expedition to the East Indies. On his return he pretended to have discovered a country (*terre australe*) beyond the Cape of Good Hope, which has never yet been revisited. He brought with him a son of the king of the country, named Essomerie, whom he constituted his heir. The Abbé Paulmier de Gonnevillle, great grandson of Essomerie, published an account of his discovery in 1663. (Beauvais.)—Burney supposes the country discovered by him, to have been Madagascar—others New Holland, or even New Zealand. Essomerie married into the family of the Sieur de Gonnevillle, whence his descendant, the Abbé, derived his name. In 1738, M. Lozier Bouvet sailed from L'Orient, in search of the land discovered by Gonnevillle; and Jan. 1, 1739, discovered the island of *Cap de la Circoncision*, in 54° 20' S., and 25° 47' E. from the meridian of Teneriffe (13° 6' E. from Greenwich.) (Burney's Hist. of Voyages and Discov. in the S. Sea. Vol. I. p. 378—9. Vol. III. p. 275—7. Vol. V. p. 31—4.)—It is obvious from this statement, that the Chinot Paulmier of the Enc. Meth. is the Binot Paulmier de Gonnevillle of Beauvais (the Sieur de Gonnevillle of Burney), and that the compiler of the original (M. B.) has bisected his long name, and thus made two separate navigators and two distinct voyages, where there should be but one only. A fine parallel to this mistake may be found in the *Dict. Hist. et Biograph. de Prudhomme*, in which the Abbé Paulmier de Gonnevillle is called the Abbe Paul Myer. Such writers as these seem to think that one name, and even half a name, is enough for one man.—P.

² "From *ham*, hamlet, and *fluct*, a small bay (*golfe*). See Valois, Notice des Gaules."—[Honfleur is called in old documents (*titres*.) *Honnefleu* and *Honneflotum*; this name, according to M. de Valois, *Not. Gall.* p. 241, * is derived from *ham* a village or hamlet, and *fluct* or *flot*, written *riet* in the Low Countries,† which signifies a small bay (*golfe de mer*.) (Enc. Meth.)—P.]

The distance by sea from Honfleur to Havre^a is not more than three leagues, and steam vessels sail from the one place to the other in less than an hour.^b The first object that a stranger observes on entering the port of Havre, is the tower of Francis the First, an old building connected with the fortifications that were erected by the same prince; it serves at present as a station to watch the approach of ships.^c Three basins communicate with the harbour; it is defended by a citadel, and the whole town is surrounded with bastions. The streets in the Old Quarter are sufficiently regular, but the houses are ill built; the New Quarter extends along the basin of Ingouville, and it accords better with the commerce of the port, which has constantly increased since the peace. But the finest part of Havre fronts the iron works and the dock yards; a large court planted with trees forms a public walk, and well built quays or spacious streets traverse the town from the gate of Ingouville to the harbour.^d It may be remarked, however, that the public buildings correspond ill with the wealth of the inhabitants; the customhouse is a very large edifice, but the townhouse, the subprefecture, the exchange, the court-house^e and the two churches are very ordinary in point of architecture. The town has produced a few distinguished men, but it was the birthplace of Bernardin de St. Pierre.^f Many country houses are situated near the suburb of Ingouville which contains five thousand inhabitants. Two light-houses are erected on the hill behind Havre at the extremity of the ridge that forms Cape Heve; ^g they were built to indicate during the night the dangers of the coast.

A fruitful valley extends from the northern extremity of the same ridge to the sea, and terminates at Fecamp,^h a town of eight thousand inhabitants; it possesses several cotton manufactories,ⁱ and equips a number of vessels for the cod fisheries. Another valley on the south of it, perhaps the most picturesque of any in the department, is watered by the Bolbec, a small river, that has given its name to an industrious town of seven thousand inhabitants, who carry on a trade in muslin and different manufactures.^j Before the river falls into the Seine, it passes by Lillebonne,^k a burgh that stands on the site of the ancient city of *Julio-Bona*,^l the

importance of which is attested by the ruins of three Roman ways, and by recent excavations that have led to the discovery of a theatre and of several statues and other objects of antiquity.

Caudebec was formerly the capital of Caux,^m a small country in which agriculture has attained a high degree of perfection, and in which every house, surrounded by trees of different kinds, contributes so much to adorn the landscape, that the country watered by the Seine from Havre to Rouen, may vie with the vaunted banks of the Loire. Caudebec was a very flourishing town before the revocation of the edict of Nantes; it was almost ruined in consequence of that impolitic measure, and although it still possesses a convenient harbour, the population does not exceed three thousand souls.ⁿ It is situated in the district^o of Yvetot, a small town^p of which the lords, before the reign of Louis the Eleventh, were styled kings by their vassals.

Rouen is situated in a fine valley enclosed by chalk hills, and covered with verdant meadows or cultivated fields. The Seine flows through the same valley, and waters several islands; the ramparts of the town rise above the river, and the port is crowded with vessels of every nation. A modern bridge leads to the suburb of St. Severe, part of which is formed by large barracks and an open space that is reserved for military exercises. The town may be enriched by the commerce and industry of the inhabitants, but many of the streets are disfigured by wooden houses, and almost all of them are crooked; those of a very recent date form the only exception. Although Rouen is not remarkable for modern edifices, it possesses several monuments of the middle ages; St. Ouen, an old church, equally worthy of notice for the architecture and the beauty of the painted windows, the cathedral of which the steeple was lately destroyed by fire, the linen market, an old and large building, and the court of justice, an elegant Gothic edifice are those perhaps which have been most admired; it may be remarked too, that the infirmary is larger than any other in France. The inhabitants are devoted to trade, but they possess a collection of valuable paintings, a library of forty thousand volumes, a good botanical garden, schools of med-

* Adrian de Valois, *Notitia Galliarum*, 1695, fol. (Beauvais.)

† *Fleet*, a stream, river. (Wilcocke.)—*Vie*, although not found in the common Dutch dictionaries (Kilianus, Hatma, Wilcocke) is also used by the Dutch for an inlet (as in the *Vie-Stream*) or for a tide creek, as the *Vie* in New York, which gave name to the Fly Market. Fleet Street in London is so called from having been built over a fleet or creek which there opened into the Thames.—Ang. Sax. *fleet*, an arm of the sea, a place where the tide flows, a bay or road; also, a river, or running stream. (Somner's Ang. Sax. Dict.)—P.

^a "Le Havre"—Le Havre (Alm. Royal.) Havre de Grace—Le Havre de Grâce (*Portus Gratia*), so named from an ancient chapel adjoining.—P.

^b "The time of high water approaches; the vessels aground in the harbour, rise slowly with the tide; the quicksands that render the mouth of the Seine so dangerous, disappear beneath the waves; the bell of the steam-boat warns the traveller who wishes to cross to Havre that the hour of departure has arrived; and in less than an hour, after a passage of about three leagues, he is landed at Havre, next to Rouen, the most important town" in the department of the Lower Seine." The general view of the department, p. 1010, ought regularly to be placed before the description of Havre; but it has been displaced by the itinerary form of the original.—P.

^c "Chef-lieu"—capital of an *arrondissement*.

^d "—as a signal station."

^e "Three basins communicate with the harbour, which is defended by the citadel, while the town itself is surrounded with bastions. The town is divided into two sections, namely, the Old Quarter, in which the streets are quite regular, but ill built, and the New Quarter, that borders the basin of Ingouville, in which the beauty and regularity of the buildings correspond with the high degree of commercial importance that the port has enjoyed since the peace. It is particularly in front of the marine arsenal (*forges de la marine*) and the mast-houses (*ateliers de la mâture*.) that the interior of Havre presents the most imposing aspect: an elegant square planted with trees and forming a promenade within the walls, a fine quay, a spacious street that traverses the city

from the gate of Ingouville to the harbour, the front of the new theatre, the coffee houses and the private mansions are there exhibited to the best advantage."

^f "Tribunal."—Havre has a *tribunal de première instance* and a *tribunal de commerce*. (Alm. Royal.)—P.

^g Havre was the birthplace of the Scuderys (George and Magdalen,) the former of some distinction in his day as a poet, and the latter still celebrated for her voluminous romances; also of the Countess La Fayette, the novelist.—P.

^h "After passing through the suburb of Ingouville, which contains several fine country houses and 5000 inhabitants, and after having climbed the declivity (*côte*) on which it is situated, the traveller perceives at the extremity of the plateau that terminates in Cape La Heve (*Cap de la Hève*.) two light-houses constructed in a style of elegant architecture."

ⁱ "At the northern extremity of the plateau, a pleasant valley descends to the sea and terminates at the port of Fecamp" [Fescamp. Enc. Meth.]—P.

^j "Manufactories of *cotonnades*."

^k "Another valley to the south of the former, and one of the most picturesque imaginable, is watered by the small river Bolbec, which traverses a neat town of the same name, enriched by its cotton mills (*filatures*) and its calicoes (*indiennes*), and with a population of 7000 inhabitants."

^l Islebonne (Moreri.) *Juliobona*. (D'Anv.)

^m "Le Pays de Caux."—Caux or Pays de Caux. (Moreri.)—It occupies the triangular point between the Channel and the Seine.—P.

ⁿ "Caudebec stands in an agreeable situation, at the foot of a woody hill, on the banks of the Seine. Before the revocation of the edict of Nantes, it was very flourishing; at present, although its population does not exceed 3000 souls, it derives great advantages from the convenient position of its harbour." ^o "Arrondissement."

^p "—a neat town (*jolie ville*.)"—Population 9853.—P.

icine and pharmacy, two theatres, an academy of sciences and belles-lettres, an agricultural and antiquarian society. It has produced some great men, among others Fontenelle and the two Corneilles; the modest house that the latter inhabited may still be seen in the street of La Pie. The etymology of Rouen has given rise to different opinions, some antiquaries derive the name of the ancient capital of Normandy from the small river of Robec, the Latin *Rotobecum*; others believe it to have been so called from *Rotho*, an idol which they affirm, the *Veliocassi* adored. It might be difficult to form a correct opinion on the subject, but it is certain that *Rothomagus* was a very insignificant place in the time of Cæsar, the Roman general does not mention it, and the first notice of it appears in the geography of Ptolemy. It fell into the power of the English in 1419, they kept possession of it during twenty years. It was in 1431 that several prelates, rebels to their lawful king, deaf to the voice of patriotism, instruments in the hands of foreigners, judged and put to death the heroine who saved her country. A statue of Joan d'Arc, afterwards erected on the market

a "Whether we arrive at Rouen by the road from Yvetot or by that from Paris, its position in a magnificent valley, formed by chalk hills covered with cultivated fields and pastures (*prés*); the broad current of the Seine, which bathes several islands and flows in the midst of fertile meadows (*prairies*); the boulevards that border the river as it passes by the city;* the spacious quays; the port filled with ships of all nations; the fine bridge of stone that leads to the suburb of St. Sever;† the extensive barracks which occupy a wide space between that suburb and the left bank of the Seine; and the activity that prevails in every quarter; all combine to give the most favourable idea of its opulence and industry. Most of the streets, however, with the exception of a few that have been recently built, are disfigured by wooden houses, and nearly all of them are irregular and crooked (*mal alignées*).‡ Although Rouen is not remarkable for its modern edifices, it possesses many interesting monuments of the middle ages. Passing by several fountains of that period, we may mention the church of the former abbey of St. Ouen,‡ equally worthy of notice from its architecture and its magnificent painted windows; the cathedral, the spire of which was lately destroyed by fire,|| but is now rebuilding;§ the linen market (*halle aux toiles*), an old and extensive edifice; and the palace of justice (*palais de justice*),¶ a Gothic building remarkable for its elegance. The hospital (*Hôtel-Dieu*) is one of the largest in the kingdom. Although the inhabitants of Rouen are devoted to trade and manufactures,** it possesses, however, a museum rich in excellent paintings, a library of 40,000 volumes, a fine botanical garden, two theatres, an academy of sciences, arts and belles lettres, a central society of agriculture, a free society of emulation (*société libre d'émulation*), a society of medicine and one of pharmacy, another society destined to promote the progress of commerce and industry, and lastly, a commission charged with the investigation and description of antiquities. It was the birthplace of Fontenelle and the two Corneilles, and the modest dwelling inhabited by the latter may still be seen in the street of La Pie (*Rue de la Pie*).†† Various opinions have been entertained with regard to the etymology of the original name of Rouen:‡‡ some derive it from the small river Robec, called in Latin *Rotobecum*, while others trace it from the idol *Rotho*, said to have been worshipped by the *Veliocassus*.||| § § However it may be, it cannot be doubted that *Rothomagus* was a place of little importance in the time of Cæsar, for no mention of it occurs in his writings, and the first notice of it appears in the geography of Ptolemy. It is well known that it fell into the power of the English in 1419, and that they kept possession of it during twenty years,¶¶ and also that in 1431, while acting under the influence of foreigners, several prelates, rebels to their lawful king, and deaf to the voice of patriotism, tried and condemned to death the heroine who had saved her country.*** A statue of Joan of Arc, erected in the market-place, is an evidence of the esteem with which her memory is now regarded."

* The Cours.—The beautiful promenade of the Cours on the banks of the river. (Ed. Encyc.)—P.

† The bridge of boats over the Seine, which rests on nineteen large barges, rising and falling with the tide, was to be replaced by a handsome bridge of stone, which must now be nearly finished. (Ed. Encyc. 1829.)—The construction of the new bridge was in progress as early as 1820. (Morse.)—It was one of the public works (extraordinary) under the direction of the general commission of civil engineers (*Direction générale des Ponts et Chaussées*), in 1822. (Alm. Royal.)—The old bridge of boats was paved with stone, and occasionally opened for the passage of vessels. It was also removed almost every winter, to prevent injury from the ice in the river. (Vosgien. Enc. Meth.)—There was formerly a bridge of stone at Rouen, but it was destroyed in the 16th century. (Enc. Meth.)—P.

‡‡ L'ancienne église de St. Ouen.—The finest churches in Rouen, are the cathedral of Notre Dame, the abbey-church of St. Ouen, the parish church of St. Maclou, and the church belonging to the college of the Jesuits. (Moreri.)—The abbey, which bears the name of St. Ouen, and which belongs to the reformed Benedictines, enjoys a revenue of more than 80,000 livres. (Enc. Meth.)—The church of St. Maclou

place, proves that her memory is revered in the town where she was unjustly condemned.^a

Elbeuf^b is situated about four leagues to the south of Rouen, in a pleasant valley watered by the Seine;^c it is a place of considerable importance from its cloth manufactories, which furnish employment to eight thousand workmen.^d Gournay carries on a great trade in butter; several mineral springs rise in the neighbourhood; the houses round one of them—the fountain of Jouvence, form a small town of three thousand five hundred inhabitants.^e Aumale, the ancient *Albemarle*, is an ill-built town on the north of Jouvence; it is enclosed by large meadows, and watered by the Bresle, on which a bridge has been erected; the two columns at one extremity indicate the place where Henry the Fourth was wounded by a shot from an arquebuse during the battle that was fought against the troops of the League.^f No town of any consequence can be mentioned in the district of Neuf-Châtel, a district that supplies many parts of France with excellent cheese;^g leaving it on the right,^h we may proceed to Dieppe, a well-built city, in which there are six public

is much admired, and also that of St. Ouen, which is a fine Gothic structure near the centre of the city. (Ed. Encyc.)—P.

§ Destroyed by lightning.

¶ The spire is to be formed of cast iron See page 1002, art. Foundry at Conches.—P.

¶ Parliament house. (Ed. Encyc.)—Rouen, before the revolution, had a parliament of its own, one of the first in the kingdom; originally, the sovereign court of the dukes of Normandy.—P.

** Rouen has long been one of the principal manufacturing cities in France. Coarse cottons are made there to a great extent, and finer ones have been making great progress. Woollen and linen goods are also manufactured, together with wax cloth, paper, hats, pottery and hardware. The dyeing of cotton and woollen has been long carried on to a great extent, and there are several sugar refineries. It has been estimated that 50,000 of its population* are employed in manufactures, and that the annual value of its industry is about £2,000,000 sterling. (Ed. Encyc.)—Rouen is the principal seat of the cotton manufacture in France—it has been called not inapty the Manchester of France. (Ed. Encyc. art. France.)—P.

* Population 90,000. M. E.

†† It was also the birthplace of Basnage (History of the Jews,) Bochart, Brumoy (Greek Theatre,) Father Daniel (History of France,) Lemery (the chemist,) St. Amand and Pradon (poets satirized by Boileau,) Sanadon (the translator of Horace,) Madame Dubocage (the poetess,) and J. P. Blondel (History of French Architecture.)—P.

‡‡ *Rothomagus*.—*Rotomagus*. (D'Anv.)

||| *Veliocassus*. (D'Anv. Cæsar. De Bell. Gall. II. §4. Edit. Scaliger. 1635, Elzev.)—P. § § It cannot be doubted that the ancient name of Rouen (*Rothomagus*) was of Celtic origin; but its etymology is uncertain. Some derive it from the idol *Rotho*, there worshipped, and from *magus* or *magum*, which signifies a town, in Celtic: others adopt the same word *magus*, and unite it with the two first syllables of *Rotobecum*, the Latin name of the small river Robec, which flows by Rouen. (Enc. Meth.)—P.

¶¶ The English held possession of Rouen from 1418 to 1449 (Moreri)—consequently about 30 years.—Normandy was conquered from the English in the space of about a year from July 1449, at which time it was invaded by four French armies. (Rankin's Hist. of France. Vol. V. p. 100.)—P.

*** She was burnt in the old market place of Rouen, May 30, 1431 (Rankin's Hist. Vol. V. p. 77, 80)—May 30, 1430 (Moreri.)—P.

^b Elbeuf. (Vosgien.)

^c "—on the left bank of the Seine."

^d "—which in a population of 10,000 souls, furnish employment to 8000 workmen."

^e "Gournay, a town on the eastern limits of the department, which carries on a great trade in butter, and which also possesses several mineral springs, one of them called the fountain of Jouvence, is surrounded by pleasant boulevards and agreeably situated on the banks of the Epte; it contains 3500 inhabitants and possesses a public library."

^f "Aumale, formerly called Albemarle,* an ill built town to the north of Gournay, is situated in the midst of large meadows (*une vaste prairie*) watered by the Bresle; two columns at the extremity of the bridge which crosses the river, indicate the place where Henry IV. was wounded by a shot from an arquebuse in the battle that he fought before the town with the troops of the League."

* Aumale or Albemarle (Vosgien.) Lat. *Albamala* (Moreri.) Aumale or Albemarle, Lat. *Alba-Marla* (Enc. Meth.)—It was called Albemarle when in possession of the English, and from it the Earls of Albemarle took their title. The title was first conferred by William the Conqueror on Stephen son of Odo, descended from the counts of Champagne. The present title was conferred on Arnold Van Keppel by William III.—P.

† It is situated on the declivity of a hill, on the borders of a meadow (*prairie*) watered by the Bresle. (Enc. Meth.)

‡ "Neuf-Châtel, the capital of an arrondissement,* is only noted for its excellent cheese."—Excellent cheese is made at Neufhâtel en Bray, the capital of an arrondissement (subprefecture) in the department of the Lower Seine. (Vosgien.)

*** La sous-préfecture de Neuf-Châtel.—This merely refers to the town of Neuf-Châtel, not to the arrondissement. Gournay and Aumale are situated in the arrondissement of Neufchâtel (Alm. Royal.)—P.

^h The principal route from Aumale to Dieppe passes through Neuf-châtel, but the direct line from Aumale to Dieppe passes to the north

squares and not fewer than sixty-eight fountains, the last of which are fed by a brick aqueduct more than a league in length. The harbour is safe and commodious, but the entrance is narrow; although the inhabitants clean it at regular intervals by opening the sluices of a basin which was built for the purpose, it is often encumbered with the gravel that the sea accumulates.^{a b} The battle of Arques, in which Henry the Fourth defeated the duke of Mayenne, was fought in the neighbourhood. The navigators that discovered Canada, and the first Frenchmen that founded commercial stations on the coasts of Africa, set sail from Dieppe.

The department of the Lower Seine is one of the most commercial in France; the products of the fisheries are equivalent to five millions of francs or to more than £.208,300; the value of the cotton manufactures amounts to thirty-five millions or nearly £.1,500,000; all the other manufactures have been estimated at seventy millions or £.3,125,000.^c As a proof that agriculture is in a very improved state, it may be mentioned that not more than a sixteenth part of all the arable land remains fallow.^d

The department of the Somme consists of the chalky plains watered by the Somme and its feeders. The soil of these plains is for the most part fruitful; corn, flax and hemp are cultivated, and the inhabitants rear a great many cattle and sheep, the breeding of the last of which is a branch of industry too much neglected in France. The country, it must be admitted, is ill supplied with wood, but the valleys abound in peats, which make up in some measure for the deficiency of other combustibles.

The small port of St. Valery^e is situated at the mouth of the Somme; three or four hundred vessels enter it every

of Neufchâtel, consequently leaving it on the left. The route from Gournay to Dieppe passes to the south of Neufchâtel, and consequently leaves it on the right. See *Tableau des Postes de France*—also Atlas of the Society of Useful Knowledge: France in departments, No. 1.—P.

^a "The harbour is safe; but its narrow entrance is liable to be obstructed by the pebbles which the sea accumulates, notwithstanding the care that is taken to remove them by opening the sluices of a basin reserved for the purpose."—Dieppe is situated at the mouth of the Bethune, where it receives the Arques. Its harbour dries at low water, but has three fathoms and a half at high water; it is in the form of a semicircle, and is enclosed by two fine moles of strong brickwork about half a mile long. Dieppe is largely engaged in the home and foreign fisheries; a regular line of packet-boats sails from it to Brighton, a distance of 66 miles. (Tuckey, vol. II. p. 14. Ed. Encyc.)—P.

^b The celebrity given to it by the Dutchess of Berry, as a place of resort for sea-bathing, attracts to the town a great concourse of strangers. M. B. (1829.)—This was written a year too early.—P. (1831.)

^c "The fisheries produce about 5,000,000 francs, cotton spinning 35,000,000, and the manufacture of Rouen goods (*rouenneries*) 70,000,000."—Reckoning the franc at 10½ d. sterling, which is not far from its real value, these three sums will be respectively equal to £.210,937. 10s., £.1,476,562. 10s., and £.2,953, 125.—P.

* Rouen cottons and linens.

^d *Annuaire Statistique de la Seine Inférieure.*

^e St. Valeri, St. Vallery.

^f The forces assembled by William at the mouth of the small river Dive [in the department of Calvados] consisted of a fleet of 3000 vessels, great and small, and an army of 60,000 men. Several of the vessels were lost, however, in his passage along the coast to St. Valeri [St. Valeri] where he was detained for some time by contrary winds, before his final departure for England. (Hume's England, p. 43, Jones' Ed.)—P.

^g "Abbeville is traversed by the Somme."—The Somme, which there separates itself into several branches, divides the town into two parts. (Ed. Encyc.)—Some of the branches into which the Somme divides itself flow through the town, and some without. (Moréri.)—P.

^h "Place de guerre."—The fortified towns (*places de guerre*) in France are distributed into four classes according to their importance, and arranged under the respective military divisions. In the first class there are only six, besides Paris: viz. Metz, Strasburg, Toulon, Brest, Gravelines and Lille; in the second, ten; in the third, twenty-four; and in the fourth, seventy-three. In addition to these, there are a great number of forts and military posts. (Alman. Royal, 1822.)—P.

ⁱ It was first fortified by Hugh Capet, A. D. 992. (Enc. Meth. Moréri.)—P.

^j St. Vulfran. (Enc. Meth.)

^k "The town is built of brick, and contains several edifices of an

year, and it was thence that William departed to conquer England with a fleet of eleven hundred sail, and a hundred thousand men.^f Abbeville rises on the same river^g about four leagues above St. Valery; it is a strong town^h of the fourth class, and was fortified for the first time by Charlemagne.ⁱ The houses are built of brick, but there are several fine old buildings, among others the church of Saint Vulfran,^j a Gothic edifice.^k The inhabitants boast of the poet Millevoie,^l as their townsman,^m and some of them too have not forgotten that the Chevalier de la Barre, a youth not more than fifteen years of age, was condemned at Abbeville to be beheaded, to have his right hand amputated, and his tongue torn from his body, because he sung licentious verses and remained uncovered during a religious procession.ⁿ

Amiens is situated at the distance of nine leagues above Abbeville; it bore in ancient times the name of *Samarobriva*, which signifies a bridge over the Somme. It was the capital of the *Ambiani*, and one of the places in Gaul, in which good weapons were made. It was the principal city in the kingdom of the Franks, under Clodion; it is at present a strong town of the third class; it carries on a considerable trade, the manufactures are linens, cottons and velvet.^o The cathedral is considered a model of Gothic architecture,^p and the public library is not inferior to the one at Rouen. Amiens has produced many great men, among the most remarkable of whom are Peter the Hermit, who persuaded the faithful to undertake the first crusade, Marshal D'Estrees, Voiture, Dueange, Gresset and the celebrated astronomer Delambre. It was united to France in the reign of Louis the Eleventh, but the Spaniards gained it by a singular stratagem in the time of Henry the Fourth.^q Some

early period (*anciens edifices*); one of them, namely, the church of St. Vulfran, is a fine specimen of Gothic architecture."—Abbeville has been long known for its manufacture of fine cloths, established in 1665 by Van Robais of Holland, under the auspices of Colbert. The cloths made at Abbeville, though fine, are much inferior to the superfine cloths of Louviers in Normandy. (Ed. Encyc.)—P.

^l C. H. Millevoie, born in 1782, died 1816. (Beauvais.)—P.

^m It was also the birthplace of Nicholas Sanson, the celebrated geographer.—P.

ⁿ "Some of them still recollect the sentence pronounced in 1766, by the tribunal of their town, by which the Chevalier de la Barre, then only fifteen years of age, was condemned to have his right hand cut off, his tongue torn out, to be beheaded, and finally to be delivered to the flames, simply because he had sung licentious verses, and had refused to uncover himself while a religious procession was passing." It would have been a dreadful crime indeed to have remained uncovered during a religious procession, as the translator has it!—J. Fr. Lefevre, chev. de la Barre, then a student at Abbeville, was accused of having mutilated a wooden crucifix on the bridge of the town, along with another youth of the name of D'Etallonde, and of having blasphemed the eucharist, and sung impious songs. He was condemned to be burnt alive, by the judges of Abbeville, but the parliament of Paris, by a decree of June 4, 1766, so far mitigated the sentence, as to order that he should be decapitated before he was thrown into the flames; the sentence was executed at Abbeville on the first of July following. Young D'Etallonde, who was condemned to a still more horrible punishment, escaped to Prussia, where he was protected by Frederick the Great. (See the Account of the death of the Chev. de la Barre (*Relation de la mort du chev. de la Barre*) by M. Casen (Voltaire,) 1766.) (Beauvais.)—P.

^o "It is noted in commerce for its spinning mills (*filatures*), its quilts (*piqués*), its velvets, and its dying, and among epicures for its duck pies (*pâtés de canards*)."—Amiens was formerly the seat of an extensive manufacture of woollen stuffs (*saeteries*), established by Colbert in 1665. Among the goods manufactured were serges, shallons, camblets, baizes, plushes, &c., and also some cloths. (Savary, Dict. Comm. vol. I. p. 14.)—In the flourishing period of the manufactures of Picardy, there were made in the city of Amiens only, 129,500 pieces of woollen stuffs, and the value of the woollen manufacture at that place was computed to amount to nearly 1,600,000 livres annually. Besides cloths, properly so called, camblets, callinancoes, baizes, kerseys, and wool and hair plushes, are still made at Amiens. (Ed. Encyc.)—P.

^p The nave is 366 feet in length and 132 feet in height. M. B.

^q March, 1597. (Moréri.)

soldiers, clad as peasants, conducted a cart loaded with straw and nuts, as soon as they entered the town, the cart was purposely upset; while the burgesses were gathering the nuts, the disguised soldiers put them to death, and delivered Amiens to their companions without the gates. It is not in such a way that strong places are now taken, but six months had hardly elapsed before it was again in the possession of the French.^a The people of Peronne boast that their town was never conquered; they repelled in 1563 a numerous and warlike army under the command of Henry of Nassau.^b The ramparts are now planted with trees, and changed into public walks which the Somme serves to embellish.^c

Montdidier^d is built on the summit of a hill above the small river Don; it need not be mentioned because it was the residence of some of the French kings during the twelfth century, but because it is the capital of a subprefecture, and the birthplace of Parmentier.^e Douvens^f on the left bank of the Authie, is not a place of greater importance; it carries on, however, a considerable trade in the coarse linens, that are manufactured in the district. A double citadel adds greatly to its strength; it possesses a large cotton manufactory and several oil mills.^g

Boulonnais,^h Artois and part of Picardy make up the departmentⁱ which derives its name from the narrow branch of the sea that separates England and France.^j Its surface is divided by a chain of hills into two regions, namely, the northern and the southern. The latter is intersected by small valleys, and slopes gently towards the banks of the Authie, which forms the boundary between the present department and that of the Somme, while the former inclines more perceptibly towards the north. In both regions the soil is productive, and the shores of the sea are

^a "A number of soldiers, in the disguise of peasants, entered the town with a cart loaded with straw and nuts; scarcely had they passed through the gates, when by a premeditated accident the ground was strewn with the nuts,* and while the attention of the citizens (*bourgeois*), who guarded the entrance,† was thus diverted, the disguised soldiers slaughtered them, and delivered the town to a body of troops that followed in their rear; it is not in such a manner that strong places are now taken. Scarcely six months had elapsed, however, before Amiens was again in possession of the French.‡"—P.

* Some of the sacks having been designedly opened, the pavement was covered with the nuts. (Enc. Meth.)

† The soldiers of the garrison. (Enc. Meth.)

‡ Henry with an army of 20,000 men, reinforced with 4000 by Queen Elizabeth, besieged and retook it the same year (1597.) (Ed. Encyc.)

^b "Peronne proud of its title of Maiden Town (*puelle*), has never allowed itself to be taken; in 1536, it repelled a numerous and warlike army commanded by Henry of Nassau."—Peronne is called the Maiden Town (*La Puelle*), because, although several times besieged (in 1536, by Henry of Nassau,) it has never yet been taken. (Enc. Meth. 1784.)—P.

^c A few leagues above Peronne, the Somme waters the small town of Ham, commanded by an old strong castle,* in which is a tower one hundred feet in height and the same in diameter.† Although the town is of little importance, it boasts of having given birth to one of our most intrepid warriors, who was also a brilliant orator, and one of the ablest defenders of our liberties, and whose children have been adopted by his sorrowing country.‡ M. B.

* The citadel of Ham is used as a state prison, now occupied by the ministers of Charles X.

† The walls of the tower are 36 feet in thickness, 100 in height and of equal diameter. (Enc. Meth.)

‡ General Foy, born at Ham, 1775. Immediately after his death (1825,) a subscription was opened throughout France in order to provide for the relief of his children, and for the erection of a monument to his memory.—P.

^d Mont-Didier.

^e Ant. Galland, translator of the Arabian Nights (*Mille et une Nuits*), was born at Rollet, two leagues S. E. of Montdidier.—P.

^f Douvens or Dourens (Vosgien;) Dourens or Dourens (Moréri;) Doullens (Alm. Royal).—P.

^g "Douvens, on the left bank of the Authie, is not a larger town than Montdidier;* it serves, however, as a mart for the manufacture of bagging (*toiles d'emballage*) carried on in its vicinity. It is fortified by a double citadel,† and possesses a large cotton mill (*filature de coton*) and an oil mill (*fabrique d'huile*)."†

* Population of Douvens 3690: of Montdidier 3730.—P.

covered with sandy hills or downs on which agriculture is continually making new conquests.

Montreuil rises on a hill above the banks of the Canche; it was founded in the ninth century by the first count of Ponthieu; the houses are built of brick, and the town is defended by a citadel and ramparts. Hesdin^k is situated on the same river above Montreuil; it contains about four thousand inhabitants, and is encompassed with ditches and ramparts.^l Boulogne^m must be considered a place of greater importance than either of the two last; it is also more ancient; arms and other articles evidently of Roman origin were discovered there at so late a period as 1823. It was the Celticⁿ *Gesoriacum*,^p a seaport of the *Morini*, whom Virgil calls the remotest inhabitants of Europe.^q It was from the same port that the Roman fleets set sail for Great Britain. Constantine gave it at a later period the name of *Bolonia*, but the sea rose then to the highest part of the town, and rings to which the ancients used to attach their vessels, have been at different times discovered; the antiquity of the same quarter is attested by narrow, crooked and irregular streets; the low town, on the contrary, is built with great regularity, it was originally a small suburb. Although the harbour was enlarged by Napoleon, it is still difficult of access; vessels are embedded in ooze during the reflux of the tide, they are lifted by the flux which raises the waters to the height of fourteen feet. While Napoleon menaced England with an invasion, the army assembled on the coast, resolved to erect a marble monument to their chief; but it was not finished until the restoration, and the purpose for which it was intended, was of course changed, it now records the arrival of the Bourbons in France.^r

Calais at the northern extremity of the department, pos-

† Coarse cloths made of the tow of hemp, chiefly manufactured in Picardy (Savary).—P.

ⁱ Department of the Straits of Calais (*Département du Pas-de-Calais*.)

^j "Boulonnais, Artois and a portion of Picardy are comprehended in the department which derives its name from the narrowest part* of the Channel† (arm of the sea—*bras de mer*) that separates England from France."

* Straits of Dover—Fr. *Pas-de-Calais*.

† The Channel is said to begin at the South Foreland, to the north of Dover (Ed. Encyc).—P.

^k Hesdin or Hedin (Enc. Meth.) Hesdin-Fert (Moréri)—It took the latter name from the ancient device of the house of Savoy (F. E. R. T.) It formerly stood a league above its present site; but having been destroyed in the wars between Charles V. and Francis I., it was rebuilt where it now stands, by the orders of the former, under the direction of Philibert Emmanuel, duke of Savoy, A. D. 1554. (Moréri. Enc. Meth.)—P.

^l It was the birthplace of the Abbé Prevost. M. B.

^m Boulogne sur Mer. (Savary.) "Its antiquity is undoubted."

ⁿ This is added by the translator. *Gesoriocum* was a town of the *Belge*, who although a kindred nation, differed in language and customs from the true Celts (*Celtae*). They were mixed with the Germans, and are supposed by Adelung to have belonged to the same race with the modern Welsh and Bretons (*Kymry*.) while the *Celtae* were of the same race with the Irish and Highland Scotch (*Gaël*).—P.

^p *Gesoriacum*, afterwards *Bononia*. (D'Anv.)—It took the name of *Bononia*, about the time of Constantine. (Enc. Meth. Geog. Anc.)—It is supposed to have been the *Portus Iccius* s. *Itius*, from which Cæsar sailed on his expedition to Britain. It was also called *Portus Morinus* s. *Morinorum*, *Gesoriocus Portus*, *Gesoriacum Navale*, *Bononia* and *Bolonia*. (Moréri.)—The *Portus Iccius* s. *Itius* was more probably Witsand [Vissant—Wuissan or Wuyssen (Vosgien)] half way between Boulogne and Calais. (Enc. Meth. Geog. Anc.)—P.

^q *Extremique hominum Morini*, Rhenusque bicornis.

Æneid. Lib. VIII. v. 727. Tr.

^r "During the reign of Constantine, it took the name of *Bolonia*;* but the sea then extended to the foot of the upper town,† a fact that is proved by the discovery made about forty years since, of a ring for fastening cables, fixed in a rock which then formed the bottom of a cellar (*cave*.) The antiquity of the upper town is indicated by its narrow and irregular streets. The lower town, on the contrary, which was origi-

esses several advantages: it is a strong town of the first class;^a it has a convenient, although a small and shallow port; it is encompassed with ramparts that form agreeable walks; and the houses and streets are regular and well built.^b It may be remarked, on the other hand, that sand is constantly accumulating in the harbour,^c and the inhabitants have no other water than what is collected in cisterns. A tower of finished architecture serves as a belfry, it rises on the Place d'Armes near the large town-house. A column was erected on the port to commemorate the arrival of Lewis the Eighteenth in 1814.^d The coasts of England are seen from the pier, and it is even said that Dover castle is also visible in clear weather. Calais, now so much frequented by strangers, and peopled by about nine thousand individuals, was only a village in the thirteenth century, but it was so well fortified by Philip of France, count of Boulogne, that Edward the Third of England besieged it during thirteen months, before he could render himself master of it, nor did the inhabitants finally capitulate until they were compelled to do so by famine; it was then that the six persons whose names are so honourably recorded in history, generously devoted themselves to appease the anger of an exasperated victor.

nally only a small suburb, is built with much regularity. † Although the harbour was enlarged by Napoleon, it is still difficult of access; at low water, the vessels are aground in the mud, but they float with the tide, which rises to the height of fourteen feet. While Napoleon threatened England with invasion, the army assembled on the coast erected to its chief a marble column, which was not completed, however, until after the restoration, and which is now destined [1829] to commemorate the return of the Bourbons. † Boulogne has a large establishment for sea-bathing, furnished with twenty elegant bathing machines, and several fine assembly rooms (*salons de réunion*)."

* See note p p. 1011.

† At the time when *Gesoriacum* took the name of *Bononia*, it occupied only the quarter called the upper town. The whole space now occupied by the lower town has been since recovered from the sea. (Enc. Meth. Geog. Anc.)—P.

‡ The upper town, placed on the declivity of the Chalk mountain, is surrounded with a wall, and contains about 400 houses; before the revolution it was inhabited chiefly by nobility. The lower town, though much larger, and nearer the sea, is without walls, very irregularly built, with narrow winding streets, and is inhabited by trades-people. (Ed. Encyc.)—The upper town is much the most pleasant, containing a wide avenue with handsome houses, and several stately edifices. (Carter's Letters, vol. I. p. 384, Second Ed.)—The upper town is well built and is adorned with several squares and fountains; it contains the palace of justice, the cathedral of Notre Dame, the abbey of St. Wilmer, and many other religious edifices. (Moréri.)—P.

§ On the summit of an eminence near the entrance into the town, stands a lofty Corinthian column, 155 feet in height, and 12 or 14 in diameter. It was begun by Napoleon, as it is said, to commemorate his meditated conquest of England; but the change in his fortunes left the monument to be finished by his less ambitious successor. It is used merely as an ornament, and an observatory for viewing the harbour and surrounding country. (Carter's Letters, vol. I. page 384.) It is seen from and commands a view of the English coast. (Hervé's Guide to Paris, p. 29.)—P.

^a A *place de guerre* of the second class. (Alm. Royal, 1822.)—P.

^b "It consists of straight and regular streets, bordered by handsome brick buildings."—The town has the form of a parallelogram, with the long side towards the sea. The streets are straight, well paved, and tolerably clean, and the houses are well built. (Ed. Encyc.)—The town of Calais is built of stone, with confined dirty streets. (Carter's Letters, vol. I. p. 381.)—P.

^c The harbour of Calais is formed by a small rivulet; but it is now in a great measure obstructed with sand. It commences at the gate of the town,^{*} where a large solid quay terminates in two long wooden piers, which stretch into the sea. It is dry at ebb tide, and with a common flow has three fathoms at high water. At the beginning of the 18th century, this harbour admitted frigates of 40 guns; if it were properly deepened, it would still afford the same accommodation. (Ed. Encyc.)—The harbour is formed by the mouth of the small river Hames, and is enclosed by two jetties of wood, on one of which is a light-house. (Tuckey's Mar. Geog., vol. II. p. 12)—Calais is surrounded by a marshy country watered by the Hames, which by means of sluices can be overflowed at pleasure.—P.

* A strong barrier, with a handsome iron gate, separates the port from the town. (Carter's Letters, vol. I. p. 378.)—P.

^d "A tower of delicate architecture, which serves as a belfry," rises on the Place d'Armes near the town-house, and fronting the port is a column erected in honour of the arrival of Louis XVIII. in 1814.—This column stands on the quay near the Custom-House.—P.

* * Belfroy, a watch tower, an alarm tower. *—Clocher, the belfry of a church.—P.

* The principal street in Calais extends from the land-gate to the port; it passes

A marshy country extends on the south of Calais to Guines, formerly a fortified city, and to the small town of Ardres, now watered by a canal to which it has given its name. It was in the same country that Francis the First and Henry the Eighth agreed to hold an interview in the year 1520, and the place where they met was decorated with so much magnificence that it still retains the name of the *Champ du Drap d'Or*.^{e f} The marshes of Aa near St. Omer enclose several small islands;^g the town itself is fortified and well-built, and its origin dates from the seventh century; it was the birthplace of Suger, abbot of St. Denis, and minister of Louis the Young.^h The neat and strong townⁱ of Aire^k about four leagues from St. Omer, contains nine thousand inhabitants; it counts Malebranche in the number of its townsmen.^l Bethune is built on a rock, and the fortifications that defend it,^m were planned by Vauban.ⁿ The small town of Lens may recall the victory of Condé, by which he put an end in 1648 to the war between France and Austria.^o St. Pol is visited for its mineral waters; it is the capital of a district.^o

Arras,^p a strong town of the third class, rises in a plain surrounded by hills, and watered by the Scarpe^q and the Crinchon;^r it is divided into four parts, the high and low

through the great square, on which stands the town-house, and near it the palace of the auditory and the watch tower (*Tour de Guet*). (Moréri.)—P.

^e The Field of the Cloth of Gold. Tr.

^f "It was in the marshy country that extends to the south of Calais, that Francis I. and Henry VIII. held an interview in 1520, between Guines, formerly a fortified place, and the small town of Ardres, now situated on a canal to which it has given its name,* on a spot decorated with so much magnificence that it retained the name of the Field of the Cloth of Gold (*Champ du Drap d'Or*)."—Guines† at that time belonged to the English, as a dependency of Calais, and Ardres to the French. Henry lodged in a temporary wooden house near the castle of Guines, and Francis in another near Ardres, both on their own territories. The interview took place near the boundary line of their respective possessions (in the valley of Arden. Smollet.)—P.

^q Scarpe (Belg.)

^r Crinchant. (Moréri.)

town, the city and the citadel.^a Handsome houses built of freestone, extensive squares encompassed with arcades,^b a Gothic cathedral remarkable for the boldness of its architecture, a large townhouse in the same style, and spacious barracks, render it one of the finest towns in France. Although not a place of great trade, it possesses some cotton and lace manufactories, beetroot sugar works and about twenty oil mills. It contains also a public library of thirty-four thousand volumes, a collection of paintings and antiquities, a botanical garden and two literary societies.^c It has given birth to several great and infamous men; in the one class may be mentioned Baudouin the historian,^d Lecluse the physician,^e and Palissot the botanist,^f and in the other, Damien the fanatic,^g the two Robespierres and Joseph Lebon.^h Arras stands on the site of *Nemetacum* or *Nemetocenna*, the capital of the *Atrebatens*; as it was taken by Cæsar, it must have been founded at least fifty years before the Christian era.ⁱ

If the department in which the capital is situated be expected, no other is so wealthy or so populous as the department of the North;^j were the population diffused throughout the whole kingdom in the same ratio as in that department,^k France would contain more than 85,000,000 of inhabitants. The surface of the department is covered with fields, that produce in proportion twice as much as those in the other parts of France; it is intersected by twice as many roads, and four times as many canals. It possesses the most abun-

dant iron and coal mines; it contains the greatest number of populous towns and strong places; and in short, it is the one in which the inhabitants are the most enlightened and also the most industrious.

The Scheldt is by no means a large river at Cambray, but the canal of St. Quentin that crosses it, contributes greatly to the commerce of the town. The importance of linen and cambric, as articles of trade, is admitted by all, but it is not so generally known that Cambray claims the honour of having first manufactured them. It is at present the capital of a subprefecture; as a place of war, it belongs to the second class. Antiquaries have shown that it is a very ancient town, it bears the name of *Camaracum* in the Theodosian table and the Itinerary of Antonine. It possesses several fine buildings, of which the cathedral is not the least remarkable; the interior is adorned with the monument that was erected to Fenelon, who was both a native and an archbishop of Cambray. The streets are for the most part straight, but many of them are disfigured by the gables of old houses.^l

Landrecy^m rises in the middle of a plain covered with meadows, and the Sambre, which is there navigable, divides it into two parts. Although it contains hardly 4000 inhabitants, the present fortifications enabled it to resist Charles the Fifth, who assembled an army of 50,000 men under the walls, and besieged it in vain during six months.ⁿ

^a "It stands on sloping ground (*terrain en pente*), and is divided into four parts: namely, the upper and the lower town (*haute et basse ville*), the city (*cité*) and the citadel."—It is situated on a mountain [hill] near the river Scarpe, and is divided into two parts, called the town and the city, by a ditch, a rampart, and a narrow valley, watered by the rivulet Crinchon. (Ed. Encyc.)—It is divided into two towns, viz. the old town, called the *Cité*,^{*} and the new town, called the *Ville*. The two towns are separated (as described in the preceding extract.) (Enc. Meth.)—P.

^{*} So called because it was the residence of the bishop, and under his jurisdiction.—Arras is still the seat of a bishopric.—P.

^b It has two fine public squares, each of them surrounded with a peristyle, viz. the great square in the city, and the little square in the town; the former of which is fronted by the cathedral, and the latter by the town-house.—P.

^c "Although it possesses some cotton mills (*filatures*),^{*} lace manufactories and beet root sugar works, and about twenty oil mills,[†] it is not, however, a place of much importance for its manufacturing industry;[‡] but a public library of 34,000 volumes, a collection of pictures and different works of art, a botanical garden, and two literary societies, suffice to prove the intelligence of its inhabitants."

^{*} At the period of the revolution there were small manufactures of cotton goods in French Flanders. (Ed. Encyc.)—P.

[†] Rape (*Brassica Napus*) and colza (*B. arvensis*) are extensively cultivated for oil in Artois and French Flanders.—P.

[‡] Arras was formerly celebrated for its tapestry, called *arras*. [Tapestries, or Arras hangings, were originally made in this town. (Ed. Encyc.)—P.]

^d Fr. Baudouin, born 1520—professor of law at Bruges; he wrote in Latin, on jurisprudence, history and theology.—P.

^e Ch. de l'Écluse (Lécluse,) born 1526, better known by his Latin name *Clusius*; an eminent botanist.—P.

^f Baron Palissot de Beauvois, born 1752—known chiefly by his *Flora of Oware* and *Benin* 1804—21, 2 vol. fol.—Ch. Palissot de Montenois, born at Nancy 1730, known as a poet and historian.—This distinction of orthography (*Palissot* and *Palissot*) is generally observed.—P.

^g R. Fr. Damiens, born in the diocese of Arras [in the hamlet of La Tieuloy, in the parish of Monchy le Breton in Artois, Jan. 9. 1715. Dict. Hist. Caen]—executed at Paris 1757, for the attempted assassination of Louis XV. (Beauvais.)—P.

^h Born 1765—originally a priest of the Oratory; afterwards a member of the National Convention, and commissary at Arras, where he rivalled the ferocity of Carrier—executed at Paris, Oct. 5, 1795, aged 30!—P.

ⁱ "Arras, under the name of *Nemetacum* or *Nemetocenna*,^{*} was the capital of the *Atrebatens*, taken by Cæsar;[†] consequently its origin dates from at least 50 years before the Christian era. In 1492, it was betrayed to the archduke Maximilian of Austria. It bore then for its arms, three rats sable,[‡] which led the Spaniards to place above one of its gates, the following inscription: "Quand les Français prendront Arras, les rats mangeront les chats" (when the French shall take Arras, the rats will eat the cats.) When the French made themselves masters of the town in 1640, one of them, as if actuated by a spirit of prophecy, erased the P from the inscription.|| This conquest was in fact secured to the French by treaty.[§]"

^{*} *Nemetacum* or *Nemetocenna*, afterwards *Atrebatens*. (D'Anv.)—*Nemetocenna*. (Cas. De Bell. Gall. VIII. §37, 43.)—P.

[†] Cæsar wintered at *Nemetocenna*. (De Bell. Gall. VIII. §37.)—P.

[‡] The arms of Arras were: azure, on a fess argent, three rats passant sable: in chief, a mitre; in point, two crossiers crossed saltierwise; all proper. (Enc. Meth. Blason.)—The rats in the shield allude to the name (Arras); the mitre and crossiers to the jurisdiction of the bishop (see note a *).—P.

|| Substituting *prendront* for *prendront*; so that the inscription would then read: When the French shall surrender Arras, &c. Qu. was the inscription in French or Spanish, or was it not rather in Latin, the common language of inscriptions?—P.

§ By the peace of the Pyrenees, A. D. 1659.—P.

|| "Département du Nord."

^k Population in the Department of the North, 2786 per square league. (Peuchet, Stat. p. 90.)—P.

^l "Cambray" is situated on the Scheldt,[†] which is only a small stream as it passes through the town;[‡] but the canal of St. Quentin,^{||} which also traverses the town, contributes greatly to its commerce. It is well known that lawn (*limon*) and cambric (*batiste*) are its most important branches of manufacturing industry,[§] and it even claims the honour of having first manufactured them. As a fortified town (*place de guerre*), it only belongs to the second class;[¶] but it is the capital of a subprefecture. Its antiquity is undoubted; it is mentioned by the name of *Camaracum* in the Theodosian Table and the Itinerary of Antonine.^{**} It possesses several fine buildings; the cathedral is admired for the delicacy of its steeple (*clocher*),^{††} and in its interior is a fine monument erected to the memory of Fenelon, who was at once the child and the father of Cambray;^{‡‡} the parade (*place d'armes*) is sufficiently large to contain the whole garrison in order of battle; lastly, the streets are spacious and regular (*bien percées*), but there is still a great number of old houses, with their gables towards the street, which form a disagreeable contrast with the more modern buildings.|||| The public library is very valuable, and the society of emulation is zealously employed in the cultivation of literature and the sciences."

^{*} "Cambray."—Cambray (generally by the French,) Cambray (Moreri.)—Belg. Kamerik (Hubner.)—P.

[†] Schelde (Belg.)

[‡] Cambray is divided by the Scheldt into two parts. (Enc. Meth.—Ed. Encyc.)—P.

^{||} The third part of the canal of Picardy consists in joining the Somme to the Scheldt between St. Quentin and Cambray. (Ed. Encyc.)—See also note r. p. 987.—P.

[§] In the year 1779, there were manufactured at Cambray, 1231 pieces of lawn and 5757 pieces of cambric. (Ed. Encyc.)—P.

[¶] To the third class. (Alm. Royal, 1822.)

^{**} *Camaracum* is first mentioned in the Theodosian Table and the Itinerary of Antonine. (Enc. Meth. Geog. Auc.)—P.

^{††} The pyramidal steeple has been much admired, though inferior to the steeples at Vienna, Strasburg and Antwerp. (Ed. Encyc.)—P.

^{‡‡} This can only be considered a conceit, without any reference whatever to the birthplace of Fenelon; it refers merely to the mildness and simplicity of his manners on the one hand, and to his paternal benevolence on the other. Fenelon was born at the castle of Fenelon in Perigord [in Quercy (Dict. Hist. Caen)] A. D. 1651, and was appointed archbishop of Cambray A. D. 1695.—Cambray is now only the seat of a bishopric.—P.

|||| The houses are all built in the Spanish fashion, with their gable ends to the street (Ed. Encyc.)—P.

^m Landrecie or Landrecy (Enc. Meth. Vosgien.) Landrecies (Moreri.) Landreci (Hubner.)—P.

ⁿ "Although at present a place of little importance, since it contains hardly 4000 inhabitants, still its fortifications" serve to remind the

Avesnes,^a a small fortified town, watered by the Helpe,^b is the residence of a subprefect; coal mines, extensive marble and slate quarries are worked in the district.^c Maubeuge, a strong town of the third class, is situated on the Sambre below the last place;^d it contains 6000 inhabitants. Bavay^e to the west of it, is only remarkable for the remains of antiquities; it bore the Latin name of *Bayacum*;^f it was an important town under Augustus, who embellished it with a circus, an aqueduct and other edifices. An inscription on an ancient pyramid informs us that three Roman roads, which were constructed by the same emperor, terminated in the market-place.^g

It has been said that Valenciennes,^h formerly the capital of Hainaut,ⁱ was founded by the emperor Valens, an error that can only be accounted for by the similitude of the two names; it is certain that Valenciennes was merely a village in the time of the early French kings.^j If it is at present one of the most important places in the kingdom, it may be attributed to its situation at the confluence of the Ronelle and the Scheldt. Some of the squares are very imposing, but the rest of the town is ill-built.^k The manner in which it fell into the power of Louis the Fourteenth^l affords an instance that rash daring may be sometimes attended with more fortunate results than the wisest plans or the most skilful combinations. The enemy's patrols had advanced beyond the gates, when some French recruits,^m impelled by the impetuosity of youth, pursued them and entered the

stranger that Charles V. in vain assembled an army of 50,000 men beneath its walls; after a siege of six months, he was finally obliged to retire.ⁿ—This statement, with the omission, however, of the date, is almost literally copied from Moreri. The Enc. Meth. (Geog. Mod.) says it was retaken by Charles V. in 1543, having been previously taken from him by Francis I. This is, however, a mistake. Landrecy was taken by Francis I. early in 1543, and fortified with great care. Charles besieged it in Sept., assisted by 6000 English troops sent to him by Henry VIII. The garrison having made a vigorous resistance, and Francis having approached with all his forces and succeeded in relieving the place, he was obliged to withdraw his army into winter-quarters. (Robertson's Charles V. p. 223, 229, Jones' Ed.)—P.

* The present fortifications were constructed by De Ville* and Vauban. (Enc. Meth. Vosgien, 1813.)—P.

^p A. Wateau, born 1684. (Beauvais.)—P.

^q “The manufacture of cambrics (*batistes*.) linens (*toiles*.) and cottons (*percales*.)”—*Percalles*, a kind of white cottons brought from India. (Savary.)—P.

^r “The village of Anzin, in the immediate vicinity of Valenciennes (*à ses portes*.) derives its extensive population, not only from its glass and iron works (*verrieres, usines*.) but also from its coal mines, the latter the most important of any in France. They are wrought by the aid of steam engines, and by means of sixteen main pits (*grands puits*.) from two to three hundred metres in depth. The working is continued night and day by relays of workmen, and the whole number employed is not less than 16,000. The annual produce amounts to 4,000,000 quintals.”

^s “Famars, in Latin *Fanum Martis*,* a village situated in the vicinity of Valenciennes,[†] has of late years become a place of some celebrity. Many dissertations have been written on the ancient Roman fortress, traces of which may be there distinguished, but different excavations, skilfully conducted, have revealed so great a number of antiquities that the site which the village occupies has become an object of speculation to the learned.”

* It is mentioned as an important place in the *Notitia Imperii*. (Enc. Meth. Geog. Anc.)

† About a league S. of Valenciennes.—P.

^t Condat (Belg.) *Condatum* or *Condate* (Lat.)—Its original name, which signifies a confluence, is derived from its position near the confluence of the Haisne and the Scheldt. (Vosgien.)—It has given its name to the princes of Condé.—P.

^u Eng. Free North.

war, it belongs to the first class.^a St. Amand, a town of 9000 inhabitants, carries on a great trade in lint that is mostly cultivated in the neighbouring country; it may be mentioned, too, on account of mineral springs which, although much frequented by the Romans, were seldom visited afterwards until the reign of Lewis the Fourteenth.^b

According to Cæsar, Douay^c was one of the principal cities of the *Caluaci*; it stands in a situation favourable to commerce; the Scarpe waters it, communicates with the Scheldt by the canal of Sensee, and thus enables it to carry on a trade with the principal towns in the Netherlands. Old walls flanked with turrets form a large enclosure, indeed there are almost as many gardens as houses, and the streets are for the most part straight. The principal buildings are the townhouse, the church of Saint Peter, and an arsenal supposed to be the largest in France. John de Bologne, the celebrated sculptor to whom the Parisians are indebted for the statue of Henry the Fourth, was a native of Douay.^d Orchies^e about four leagues northwards,^f was the ancient *Origiacum*, the only city of the *Atrebrates*, according to Ptolemy.

Lille^g is situated in a very fruitful and highly cultivated plain, and is watered by the Deule, a small navigable river, and by a canal that communicates with the sea.^h It was founded by Baldwin the Fourth, count of Flanders, in the beginning of the eleventh century. Seven large gates adorned with sculptures lead into the town; the fortifica-

tions are formidable, and it is said that the strong fortress was one of the first works of Vauban.ⁱ The streets are broad, and the houses are well built;^j the finest edifices are the hospital,^k the townhouse and the corn-market.^l By means of its roads and canals, the inhabitants of Lille are enabled to carry on a great trade,^m and the activity that prevails within its walls, renders it very different from most strong towns, and makes the stranger apt to forget the seven sieges it has supported at different periods and under different masters, as well as the sad associations connected with its fortresses and ramparts, the monuments of ambition and cruelty. Loos, a village almost at the gates of Lille, contains several manufactories and a large house of correction,ⁿ in which more than fifteen hundred men and women are confined. A small port on the right bank of the Lys,^o tends to facilitate the trade of Armentieres,^p a neat town of seven thousand seven hundred inhabitants, most of whom are employed in manufacturing lint, hemp and cotton.^q Quesnoy sur Deule is a place of trade, and Comines is noted for its ribbons; the population in each of them may amount to four or five thousand souls.^r Roubaix,^s a manufacturing town, and Turcoing,^t a large burgh that supplies different parts of France with woollen and cotton stuffs, may together contain fifteen or sixteen thousand inhabitants.^u All these places are situated to the north of Lille, and the most remote of them is not more than three or four leagues distant from it.

Bailleul, Cassel, Merville and Estairs are the four princi-

^a To the fourth class. (Alm. Royal 1822.)—P.

^b "Three leagues to the west of Condé, the Scarpe passes by St. Amand, a town of 9000 inhabitants, important from the great quantities of flax cultivated in its neighbourhood, and also from its mineral springs, which, although much frequented under the Roman government, did not begin to be celebrated in modern times until the reign of Louis XIV." ^c "Douai." Lat. *Duacum*.

^d "The roads in the department are constructed and maintained with a degree of excellence corresponding with the industry of the inhabitants. Their breadth, however, may be considered excessive, a defect common to them with most of the public roads (*chaussées*) in France. That which leads from Cambrai to Douay is magnificent. The latter town, which Cæsar mentions as one of the principal cities of the *Caluaci*,* is favourably situated for commerce. The Scarpe, which waters it, communicates with the Scheldt, by the canal of the Sensee, and thus enables it to carry on a trade with the principal towns in the department, as well as in the Netherlands. Its enclosure, formed by old walls flanked with towers, is very extensive, and contains almost as many gardens as houses. It has broad and straight streets (*rues bien percées*), and a fine public square, and its principal edifices are the town-house, the church of St. Peter and the arsenal, the latter reckoned one of the most considerable in France. It was the birthplace of John of Bologna, the celebrated sculptor, to whom the Parisians were indebted for the former statue of Henry IV. §"—Douay has long been celebrated for its English colleges (*Collèges Britanniques*;) for the education of Roman Catholics from England and Ireland. It also carries on an extensive manufacture of linens and cambrie. (Ed. Encyc.)—P.

* It is supposed to have been the capital of the *Catuauci*, of which Cæsar makes mention in his Commentaries. (Moreri.)—*Catuauci*, the name of a people in Gaul, according to some editions of Cæsar. It is considered a corruption of *Atuatici*. (Enc. Meth. Geog. Anc.)—*Atuatici* and *Atuatici*, Edit. Scaliger.—*Atuatici*, Ed. Maittaire.—For a description of the capital or stronghold of the *Atuatici*, see Cæsar. de Bell. Gall. li. §29.—P.

† "La Sensée."—La Censée (Alm. Royal).—The Sensee [*Le Sensel* or *Sansel*, or *La Sensée*, Enc. Meth.] is a small river which rises in Artois and enters the Scheldt at Bouchain, 4 leagues S. E. of Douay. The canal of the Sensee connects Douay with the Scheldt at Bouchain, where it communicates with the canal of St. Quentin by the canal along the Scheldt from Cambrai. There is also a canal along the Scarpe from Douay to St. Amand, thus opening another communication with the Scheldt. From Douay to the sea, the communication is opened, first by a canal to Lille, the latter part of its course along the Deule; then by the channel of the Deule and the Lys to Armentieres, whence by a canal along the Lys, at variable distances from its banks, to Aire; then by a canal to the Aa at St. Omer, whence it is continued along that river to the sea at Gravelines, sending off lateral canals in that part of its course, viz. one on the left to Calais, and on the right, one by Berg to Furnes, whence to Ostend, and another to Dunkirk.—P.

‡ Douay is situated on the Scarpe, and communicates with the Deule by a canal. (Enc. Meth. 1784.)—Douay is advantageously situated on the navigable river Scarpe [a branch of the Scheldt,] which communicates by canals with Lille, St. Omer, Dunkirk and the North Sea, and by means of the Scheldt with Valenciennes, Cambrai and Tournay. (Ed. Encyc.)—P.

§ Giovanni di Bologna (in Italian)—a pupil of Michael Angelo.—P.

¶ The equestrian statue of Henry IV., formerly erected on the Pont-Neuf (A. D. 1614

—not completed till 1635.) The horse was cast at Florence, by John of Bologna; the figure of the king was executed by Dupré. (Enc. Meth.) This statue was destroyed during the revolution. It has, however, been recently replaced (Aug. 25, 1818) by another equestrian statue of Henry IV., executed by Lemot.—P.

^e Orchie. ^f Population 3000. M. B.

^g Lille or Lisle (Ed. Encyc.)—L'Isle, L'Île, Lille (Fr.) Ryssel (Belg.) *Insula* (Lat.) (Hubner.)—The French call it L'Isle or Lille. (Enc. Meth.)—It is situated in a marshy soil, and is watered by the river Deule, from which several branches traverse the city in different directions. Its Latin name was *Insula* or *Insule*, *Islo* or *Castrum Illense*, and its Flemish name Ryssel, from its having been once surrounded by several marshes, which were drained by the industry of the inhabitants. (Ed. Encyc.)—P.

^h "Lille—is watered by the canal which opens a communication from the Sensee to the sea, and by the Deule, a small navigable river."—See note ^d †.

ⁱ "Its citadel (*forteresse*), a work of great importance, is said to have been the first attempt (*coup d'essai*) of Marshal Vauban."—Its citadel, the *chef d'œuvre* of Vauban, is the first in Europe after that of Turin. It is a mile in circuit, and is situated to the N. W. of the town, from which it is separated by a spacious esplanade and a canal. (Morse.)—Louis XIV. took Lille in 1667, and ordered a citadel to be constructed, the government of which was conferred on Vauban in 1668. (Moreri.)—P.

^j "Its streets are broad, its houses well built, its squares large and regular, and its public buildings constructed in the best style of architecture."—The Great Square and the public buildings have been much admired. (Ed. Encyc.)—P.

^k "The great hospital (*hôpital général*.)"

^l "Halle aux Blés."

^m Many of the merchants of Lille fit out vessels for foreign trade at Dunkirk, Ostend and Calais, with which towns it has direct communication by canals. Lille has important manufactures of woollens, cottons, linens, silks, lace, carpets, &c. About 200 windmills are employed in the neighbourhood, in the manufacture of the oil of colzat [*colza*] (Ed. Encyc.)—P.

ⁿ "Maison centrale de détention." See note ^o p. 981.—P.

^s Roubaix.

^t Turcoing.

^u "Roubaix, essentially a manufacturing town,* and Turcoing, a large burgh, enriched by its woollen and cotton stuffs, contain together from 14,000 to 16,000 inhabitants."—Population of Turcoing, 11,998—of Roubaix, 8,724. Total 20,722. (Alm. Royal, 1822.)—P.

pal towns in the fruitful district of Hazebrouck; the first is built on a height, the second was once fortified, it rises on a hill, and commands a view of the ocean and thirty-two towns; the third is situated in a marshy country, and the fourth contains six thousand inhabitants.^a Although the population of Hondtschoote^b does not exceed four thousand souls, it is a place of celebrity from the victory which the French gained over the English in 1793. Bergues, a place of importance as a corn market, was formerly surrounded by marshes, that have been partly drained; the canals of Dunkerque, of Upper and Lower Colme meet at the base of the hill on which it stands; the houses are regular, but all of them are built of brick. As a strong place it belongs to the third class, the possession of it, however, was considered a matter of so much consequence that it has been eight times taken and retaken, seven times sacked, and three times besieged without success; it does not contain more than six thousand inhabitants.^c Gravelines,^d a town of three thousand souls, was founded in 1160 by Henry, count of Flanders:^e it is on the whole well-built, but the marshes near the mouth of the Aa render it unhealthy.^f It was first fortified by Charles the Fifth, but the greater part of the present works were erected by the Chevalier Deville and Marshal Vauban.

The road from Gravelines to Dunkerque extends along the sandy hills that rise on the sea shore. The last town was gradually built round a chapel, which was founded by St. Eloi in the middle of these sandy downs.^g Large, well-

* It manufactures fine woollen stuffs, and also woollen thread for hosiery. (Vosgien.)—P.

^a "Quitting the territory of the prefecture,* we shall proceed to Hazebrouck,† the capital of one of the two remaining arrondissements,‡ situated in one of the most fertile districts (*contrées*) in the former French Flanders.¶ Around it as a centre, there are three towns worthy of notice for their manufacturing industry: namely, Baillieu,§ a well built town on a height; Merville,|| in a marshy country; and Cassel,** formerly a strong town, situated on a hill (*montagne*) which commands a view of 32 towns and of the ocean; besides these, the village of Estairs †† may be mentioned, which from its population of 6000 inhabitants and its linen manufactures, also deserves the name of a town."

* The arrondissement of Lille, the capital of which is also the residence of the prefect.—P.

† Hazebrouck (Vosgien.) Hazebrouck (Enc. Meth.)

‡ Those of Hazebrouck and Dunkirk.

¶ French Flanders, in its narrowest meaning, signified that part of the county of Flanders (Flem. *Vlaanderen*) annexed to France, and included all that portion of the department of the North extending from Douay and St. Amand on the east to the sea on the west. The former province or rather government of French Flanders corresponded very nearly with the limits of the present department of the North, including French Flanders properly so called, Cambresis, French Hainault, and certain districts in the county of Namur and the bishopric of Liege.—P.

§ Belle (Flemish.) Moreri.—Large quantities of thread, lace and woollen stuffs are manufactured there.—P.

|| Situated on the Lys—manufactures table linen. (Vosgien.)

** Cassel or Mont Cassel. Lat. *Castellum Morinorum*. (Hübner.)

†† Estaires, Estaire.—Flem. *Stegers*. (Moreri.)—P.

^b Hondtschoote, Hondtschote.—This and the following places are in the arrondissement of Dunkirk.—P.

^c "Bergues,* a place of importance as a corn market, is situated in a marshy country, that has been recently drained;† the canal of Dunkirk and those of the Upper and the Lower Colme; unite at the foot of the hill on which it is built;|| its houses are regular, but all of brick. It is a fortified town (*place de guerre*) of the third class,§ and the possession of it has always been regarded of such importance, that during the last ten centuries, it has been eight times taken and retaken, seven times sacked, and three times besieged without success.¶ It contains a population of about 6000 souls."—Bergues was taken by the duke of Parma in 1537, by the duke of Orleans in 1646, by the Spaniards in 1651, and by Turenne in 1658, when it was finally ceded to France by the treaty of the Pyrenees. The English invested it in 1793, but were forced to raise the siege.—P.

* Berg St. Vinoc. (Vosgien.)—Bergues or Bergue St. Vinoc, Bergh St. Winoc, Moreri.—Wynoxbergen (Flem.) *Mons Sancti Vinoci* (Lat.) (Hübner.)—P.

† Literally, rendered wholesome by hydraulic works.

‡ The Colme is one of the branches into which the river Aa divides below St. Omer. See note § p. 1012.—P.

§ It is built at the foot of a hill, on the Colme. (Vosgien.)—P.

¶ Of the fourth class. (Alm. Roynl, 1822.)—The fortifications were constructed by Vauban.—P.

** Literally, delivered from its enemies.

† Graveline (Moreri.)—Flemish, Grevelingen (Hübner.) Graveling Enc. Meth.)—P.

peopled and well-built, its position between two seas, and the proximity of England and the Netherlands, account for its past prosperity. Baudouin the Young, count of Flanders, conferred on it the rank and privileges of a city in the tenth century; since that time it has excited the jealousy or covetousness of several princes. It was burnt by the English in 1388; built anew, it fell successively into the power of Flanders, Spain and France. The Spaniards took it from the English, and the latter were expelled by the French. The treaty of Chateau-Cambresis put Spain in possession of it, but it was retaken by Conde in 1646. The Spaniards having made themselves masters of it again, the victory which Turenne gained at Dunes in 1658, rendered it an easy conquest to the French. It was afterwards ceded to the English; Lewis the Fourteenth purchased it from Charles the Second for five millions of francs, and rendered it impregnable; but by a shameful clause in the treaty of Utrecht, the same monarch was obliged to fill up the harbour and to destroy the fortifications; the works were rebuilt by Lewis the Fifteenth. The duke of York besieged it in 1793 without success, indeed he was compelled to leave his artillery in the hands of the enemy. The trade of Dunkerque has increased since 1816; a large sluice was lately constructed for the purpose of clearing the sand that obstructs the entrance into the harbour.^h

Every place of any importance in France has now been mentioned; we have adhered strictly to the political divi-

^e It was built by Theodorie, count of Flanders, about the year 1160. (Enc. Meth.)—It is said that Thierry of Alsace, count of Flanders, either built or rebuilt Gravelines, where he died 1168. (Moreri.)—Thierry (Theodorie) of Alsace was count of Flanders from 1125 to 1168. (Moreri.)—There is no one of the name of Henry in the list of the counts (earls) of Flanders in Moreri.—P.

^f "It consists of spacious and regular streets, and is situated at the mouth of the Aa, in the midst of marshes."

^g Dunkerque signifies in Flemish a church on the downs.

^h "The road from Gravelines to Dunkirk* extends along the downs or sand hills (*collines de dunes*)† that rise on the sea shore. The latter place, a town of considerable population; and extent and of a regular construction, and one that has long been important from its commerce, owes its origin to a chapel built by St. Eloi‡ in the midst of the downs.§ It was indebted for its former commercial consequence to its position between two seas¶ and its proximity to England and the Netherlands, and it derives its present prosperity from the cod fishery.** Its seamen have always been noted for their intrepidity, and many of them have acquired distinction in naval warfare; of these the most celebrated is John Barth,†† to whom a statue has been erected in the Place Dauphine. Since the period when it took the rank of a city, in consequence of the privileges conferred upon it in the tenth century, by Baldwin the Young, earl of Flanders,‡‡ it has excited the covetousness and jealousy of several powers. In 1388, it was burnt by the English; built anew, it fell successively into the hands of Flanders, Spain and France.¶¶ It was taken from the Spaniards by the English, and from the latter by the French. §§ The treaty of Chateau-Cambresis¶¶ secured the possession of it to Spain;*** it was, however, retaken by Condé††† in 1646. The Spaniards again made themselves masters of it;‡‡‡ but Turenne, after his victory at the battle of the Downs (*des Dunes*),|||| reduced it anew in 1658. Having been ceded to the English by treaty, §§§ Louis XIV. purchased it of Charles II.¶¶¶ for the sum of five millions,*** and rendered it impregnable; but by a shameful clause in the treaty of Utrecht,†††† he was obliged to fill up the harbour and destroy the fortifications.††††† New works, however, were constructed by Louis XV. ||||| which restored it to its former importance. The Duke of York besieged it in 1793, but he was forced to retire after abandoning his artillery to the French. §§§§ The late treaties were unfavourable to it in their stipulations; but the privilege of a free port granted to it in 1816,¶¶¶¶ and the large sluice constructed for the removal of the sand banks that obstructed the entrance of its harbour, have nearly restored it to its former prosperity."

* Fr. "Dunkerque," Dunkerke, Dunquerque. Flem. Duinkerken (*duin*, a sand-hill or down, and *kerk*, a church.)—P.

† The coast of the Netherlands from Calais northwards is faced by hillocks of sand (Fr. *dunes*, Du. *duinen*), of the greatest importance for the protection of the country against the sea.—P.

‡ Population 24,517. M. B.

§ St. Eloy, bishop of Novon in the 7th century; born 588, died 658. (Moreri.)—P.

¶ *Kerk*, in Flemish, signifies a church. Dunkirk (*Dunquerque*) may therefore be rendered the church of the downs.—Dunkirk (*church of the Downs*), from a church said to have been built there by St. Eloi. (Tuckey, vol. 11. p. 11.)—Said to have been

sions of the country, and endeavoured to avoid as much as possible the tediousness arising from a long and often uniform description, but to do so wholly was incompatible with the nature of the subject. We cannot, however, leave the kingdom without taking a rapid survey of the roads, canals and finances. These causes and effects of public prosperity are more fully developed in the tables at the end of this book, and from those tables the reader will also be enabled to estimate the entire resources of France, as a commercial, agricultural and military nation.

Every one admits that numerous roads and canals have a powerful effect on the agriculture, commerce and general industry of a country. While in animated beings we admire the order with which the vital functions are ramified by the aid of vessels and organs constructed so as to diffuse motion into every part of the individual, we cannot fail to perceive that in like manner the welfare of a state depends mainly on its means of communication, and that it is by them, in fine, that life is made to circulate in every part of it. A few of the great roads in France are kept with sufficient care, but they form an exception, and it appears from the estimates of the ablest engineers, that it would require sixty-seven millions of francs^a or nearly £2,800,000 to prevent the remainder from becoming wholly useless.^{b c} The entire extent of the great roads in the kingdom is equal to eight millions of leagues;^d but as sixteen thousand square leagues are unprovided with them, their total length must be doubled before the advantages of commerce can be extended throughout the kingdom. To complete the roads that are still unfinished, would require at least forty-four millions of francs or £1,850,000.^e The sum of 111 millions of francs or £4,650,000^f is therefore necessary for their improvement and completion. Twenty millions of francs or less than £850,000 are annually expended on

them at present, it is vain then to expect that new roads can be made, indeed a long period must elapse before the present are finished and repaired.^g Ninety-six canals are mentioned in the statistics of France; of these sixty-four are completed, eighteen are in progress, and fourteen are projected. Those which are completed and in progress occupy an extent of six thousand and ninety-three English miles,^h an extent that must be more than doubled, before France can derive from canals all the advantages which England does at present. The sums necessary for the improvement and extension of the roads and canals are immense, but the vast resources that France possesses, must not be overlooked. The taxes may be estimated at nine hundred and eighty millions of francs or £41,333,340; Austria is the only state that has an equal population, Russia contains nearly twice the number of inhabitants, but in Russia the taxes are less than a half, and in Austria they do not amount to a third part of the above-mentioned sum.ⁱ The finances are in a much more prosperous state than in England; for if the products of both kingdoms were applied to the extinction of the national debt, it might be liquidated in the one in about four years and a half, while it could not be cancelled in the other in thirteen.

The quantity of money in a country is a sign of wealth: inasmuch as it corresponds generally with the circulation of commerce and industry: the money in flourishing states according to political economists, ought to be equal to a fifth part of the products; but in France it exceeds that amount, for the products of agriculture and industry represent 8,800,000,000 francs, while the money in circulation amounts to more than two thousand millions. The kingdom, it has been shown, has abundant means of improvement, it is highly favored by nature, the inhabitants are distinguished by their genius and industry.^j

so called because the tower of its church was the first object seen by mariners above the downs. (Moreri).—P.

† The North Sea and the English Channel.—Situated at the entrance from the former into the Straits of Dover.—P.

** The inhabitants derive their principal support from fishing and smuggling in peace, and from privateering in war. The principal contraband trade is in gin and tea to England. (Tuckey, vol. II. p. 11.)—It has, however, a regular foreign trade of considerable importance. It has employed as many as 200 merchantmen in time of peace.—P.

†† "Jean Bart" of Barth, the son of a fisherman; born 1651, died 1702—noted for prompt and daring enterprises. He was raised to the rank of commodore (*chef d'escadre*) and enabled, by Louis XIV.—P.

††† It was built by Baldwin the Young, earl of Flanders, about the year 960. (Moreri).—In the 12th century, it equipped a fleet against the Norman pirates, for which service important privileges were conferred upon it by Philip, earl of Flanders. (Enc. Meth.)—Philip of Alsace, son of Thierry of Alsace (see note p. 1016.) was earl of Flanders from 1183 to 1191. (Moreri).—P.

|||| It belonged for several centuries to the Earls of Flanders, and passed in the 15th century, to the house of Austria. It remained under the Spanish branch of that house a considerable time, but changed masters more than once during the wars in the Low Countries, previous to its final purchase by Louis XIV. in 1662. (Ed. Enc.)—Dunkirk was held either immediately by the earls of Flanders, or as a fief dependent on them, from its foundation in the tenth century till the 14th, when it passed to the house of Burgundy, by the marriage of Philip II. with Margaret of Flanders in 1369, and in the 15th to the house of Austria, by the marriage of the archduke Maximilian (afterwards the emperor Maximilian I.) with Mary of Burgundy in 1477. Charles V. left it with the Low Countries to Philip II. of Spain, and it continued in the possession of the Spaniards with some interruptions, till 1655, when it passed into the hands of the English, and in 1662, by purchase into those of France.—P.

§§ It was taken from the English in 1558, and was ceded to Spain by the treaty of Chateau-Cambresis in 1559. (Enc. Meth.)—The French under Marshal De Termes took it in 1558. (Moreri).—P.

¶¶ "Cateau-Cambresis." Chateau-Cambresis, Cateau-Cambresis—a small town five leagues S. E. of Cambrai.—P.

*** A. D. 1559.

††† Then Duke of Enghien.

|||| A. D. 1652. (Moreri.)

||||| The Downs (*les Dunes*)—the coasts of Flanders between Dunkirk and Newport, where Marshal Turenne gained a victory in 1658. (Enc. Meth.)—The battle of the Downs was fought between the French commanded by Turenne and assisted by the English auxiliaries furnished by Cromwell, and the Spaniards commanded by the Prince of Condé and Don John of Austria, also assisted by the English Royalists. (Guthrie and Gray's Hist. of the World, vol. XII. p. 25.)—P.

§§§ By treaty with Cromwell, the same year, 1658.

¶¶¶ A. D. 1662.

**** Livres.—Louis XIV. purchased it in 1662, for the sum of five millions (Moreri)—£209,000 (Ed. Encyc).—P.

†††† March 31, 1713.

††††† This was effected, in a considerable degree, in 1713, but Louis XIV. immedi-

ately cut a canal from Mardike (1 league S. of Dunkirk,) which gave the port almost all its former advantages. England, however, obliged him to shut the canal, and to abstain from any similar works within two leagues of Dunkirk; but in 1720, during the reign of Louis XV., the sea having broke through the bar formed across the harbour's mouth, it became again accessible to ships, and England being at war with Spain, France took advantage of this circumstance to reconstruct the jetties and fortifications; and though by the treaties of Aix la Chapelle (1748) and Paris (1763) the destruction of these works was stipulated, the execution was always eluded. (Tuckey, vol. II. p. 11, 12. Ed. Enc.)—P.

||||| See note †††.

§§§§ The British under the Duke of York opened the trenches before Dunkirk, Aug. 24, 1793. The works were carried on, though with trivial effect, till Sept. 6, when the covering army, commanded by the Hanoverian Field Marshal Freytag, was unexpectedly attacked and defeated by the French General Houchard; a successful sortie was at the same time made by the garrison, and the besieging army was compelled to retreat with the loss of all its heavy artillery. (Ed. Encyc. art. Britain.)—P.

¶¶¶¶ Dunkirk was declared a free port by Louis XIV. after his purchase of it in 1662, and continued so till 1793. (Tuckey, vol. II. p. 11.)—This privilege was restored in 1816.—P.

a "Nearly 67,000,000 francs" (£2,826,562).—P.

b Literally, to preserve them from the complete dilapidation with which they are threatened.—P.

"Governments."—France before the revolution was divided into 32 general governments or provinces. These were properly military governments, and were each of them under the immediate administration of a governor in chief, and included one or more lieutenant-generalships. (Enc. Meth. 1782.)—When the king assembled the States-General, the ancient order was to assemble them according to twelve principal governments (*prefectura generales*.) viz. Picardy, Normandy, Isle of France, Champagne, Brittany, Orleannois, Burgundy, Lyonnois including Auvergne, Provence, Dauphiny, Languedoc and Guienne. Moreri, 1725. Hubner, 1736.—P.

^b "Countries (*pays*)" dependent on each government."

* Not properly cotemporary divisions or subdivisions of the government, but anterior divisions of the kingdom included within its limits.—P.

^c "Flanders (*Flandre*)."—The government, as a part of France, was known simply as the province of Flanders, but the territory included in it was called French Flanders, in distinction from Austrian Flanders, Flanders in this sense being a common appellation for the Catholic Netherlands (now Belgium); but Flanders in its strict historical sense, is confined to the old county of Flanders, divided into French, Austrian and Dutch Flanders. See note ^a p. 1016.—P.

^d Maritime and Walloon Flanders here embrace French Flanders properly so called, or that portion of the county of Flanders annexed to France—Maritime Flanders comprehending the western part on the coast, and Walloon Flanders the eastern part, including the former chatellanies of Lille, Douay and Orchies. Walloon Flanders also extended into Belgium (the former Austrian Flanders,) including the country around Tournay. Taking Flanders in its more enlarged sense for the whole of the Catholic Netherlands, Walloon Flanders included Artois, Hainault, Walloon Flanders proper, Namur, Luxemburg, Cambresis, and according to some, Liege, or all that part of the country occupied by the Walloons, by whom a dialect of French was spoken, while in the rest of the Netherlands, the inhabitants spoke dialects of the Low Dutch.—P.

^e Picardy was divided into Upper, Middle and Lower—the first including Vermandois and Thierache; the second, Amienois and Santerre; and the third, the *Pays Reconquis*, Boulonnais, Ponthieu and Vimeux.—P.

^f St. Quentin the capital. ^g Amienois. ^h Peronne the capital.

ⁱ The district including Calais and Guines, (here styled Calaisis,) was called *Le Pays Reconquis* (the Reconquered Country,) from its having been reconquered in 1558 from the English, who had held it since 1347, when it was reduced by Edward III.—P.

^j Sec note ^b p. 1011. ^k m Abbeville the capital.

^l Vimeu.—St. Valery the capital.

^o Normandy was divided into Upper and Lower—the former including Caux, Bray, Vexin, Roumois, Ouche, Liévin and Auge; the latter, the Marches, Bessin, the Bocage, Houlme, Cotentin and Avranchin.—P.

^p "Le Pays de Caux." See p. 1008.

^q "Le Pays de Bray" (Brai)—a small district east of the Pays de Caux, including Neufchatel and Gournay.—P.

^r "Vexin Normand."—Gisors the capital.—P.

^s Roumois or Romnois, Lat. *Ager Rothomogensis* (Moreri)—a small district between the Rille and the Seine. Quillbecuf the capital.—P.

^t "Le Pays d'Ouche," Ouche (Vosgien)—including Conches and Bernay.—P.

^u Lat. *Ager Lexoviensis*—including Lisieux, and Honfleur (Moreri).—P.

^v "Le Pays d'Auge," La Vallée d'Auge (Vosgien.) Auge (Enc. Meth.)—including Pont-l'Evêque and Honfleur (Enc. Meth.)—P.

^w "Les Marches" (the borders or marches)—included in the bailiwick (*bailliage*) of Alençon (Hubner).—P.

^x Bayeux the capital. ^y "Le Bocage" (the wood.)—Vire the capital.—P.

^z "Le Pays d'Houlme," Houlme (Vosgien)—a small district between Domfront and Falaise.—P.

^{aa} See note ^a p. 1004. ^{bb} See note ¹ p. 1004.

^{cc} "Ile-de-France." ^{dd} See note ¹ p. 992.

^{ee} Laonnois (Vosgien).—Laon the capital.—P.

^{ff} Soissonnois (Enc. Meth.)

^{gg} "Vexin Français" (François. Moreri)—Pontoise the capital.—P.

^{hh} Goelle (Vosgien.) Goelle (Hubner).—Dammartin the capital.—P.

ⁱⁱ Isle of France proper (Enc. Meth.)—including Paris. A distinction is made between the Isle of France proper, or simply France, and Paris; the former including the country around St. Denis, to the north of Paris, as far as Montmorency, and the latter, that in the immediate vicinity of Paris. All the places in the former are surnamed *en France* (in France.) as St. Denis en France. (Moreri. Hubner).—P.

^{jj} Formerly a dutchy.—Crespy the capital.—P.

^{kk} Mantois.—Mantes the capital.

^{ll} Hurepoix (Vosgien)—including Corbeil and Dourdan, and according to some, Fontainebleau and Melun (Enc. Meth.)—P.

^{mm} "Brie Française."—Brie, a country in France, partly in the government of Champagne, and partly in that of the Isle of France; the former called Brie Champenoise, and the latter, Brie Parisienne or Brie Française. It was also divided into Upper Brie (*Haute Brie*)—Meaux the capital; Lower Brie (*Basse Brie*)—Provins the capital; and *Brie Pouillouse*—Chateau-Thierry the capital. These three towns are situated in Brie Champenoise; Brie-Comte-Robert and Melun (Moreri) were included in Brie Française. (Enc. Meth.)—P.

ⁿⁿ "Gatinais Français" (Gâtinois Français Enc. Meth.)—Gâtinois (Gastinois, Lat. *Vastinium*. Moreri) is derived from *gastine*, an old French word signifying a clearing in a forest, or waste land, from the Latin *casto*, Fr. *gaster*, *gâter*. The country of Gâtinois included the forests of Fontainebleau and Montargis, and was divided into Gâtinois François and Gâtinois Orleanois; the former including Nemours, Moret and Fontainebleau, and the latter, Montargis. (Enc. Meth. Moreri).—P.

^{oo} Champagne is divided into Upper on the S. and S. E. and Lower on the N. and N. W.—P.

^{pp} Rethelois, Retelois—including Rethel, Rocroy, Charleville and Mezieres (in the Ardennes.) (Enc. Meth.)—P.

^{qq} Remois (Enc. Meth.)—including Reims (the capital,) Epernay and Ay.—P.

^{rr} Brie Champenoise. See note ^{mm}.

^{ss} Pertois (Enc. Meth.)—including Vitry le François (the capital,) St. Dizier, Vassy and Joinville (Moreri).—P.

^{tt} Bar sur Aube the capital.

^{uu} Bassigni (Enc. Meth.)—divided into Bassigni proper, in Upper Champagne, (Chaumont the capital; including also Langres and Andelot,) and the bailiwick (*bailliage*) of Bassigni, inclosed in Barrois, (Vaucouleurs the capital.) The bailiwick included, however, in its jurisdiction, several towns properly belonging to Barrois: viz. Gondrecourt, La Motte, Bourmont, La Marche, Chatillon and Confans.—P.

^{vv} Senonais (Enc. Meth.)—forming the northern half of the department of the Yonne; Sens the capital.—P.

^{ww} Champagne Proper should also be added to this list. It included Troyes, Chalons and St. Menchould.—P.

Ancient Provinces or Military Governments.	Capitals.	Divisions in each Government.	The Departments formed from them.

^b "Luxembourg Français"—a strip of land along the southern frontiers of the dutchy of Luxembourg, ceded to France by the treaty of the Pyrenees (1659), including Thionville and Montmedy.—P.

^c Before the revolution, the dutchy of Bouillon (Buillon. Moreri).—This dutchy, with the principality of Sedan, belonged to the house of La Tour d'Auvergne, previously to 1651. The dutchy was, however, at that time in possession of the bishop of Liege, but claimed by the house of La Tour. In 1651, Frederick Maurice, duke of Bouillon, ceded to France his sovereignty over Sedan, reserving to himself all his rights to the dutchy of Bouillon, and requiring that it should be restored to him, in case it should be wrested by France from the bishop of Liege. Louis XIV. having conquered the dutchy in 1676, restored it to Godfrey Maurice, then duke, in 1678. It continued in possession of the family till the revolution. Prince Charles de Rohan possessed it (1822) under the sovereignty of the king of the Netherlands.—P.

^d Dutchy of Bar, or Le Barrois (Enc. Meth.)—situated on both sides of the Meuse on the confines of Champagne, and including Bar le Duc, St. Mihiel, Longwy, Pont à Mousson and Varennes, in the three jurisdictions of Bar, St. Mihiel and Clermont, and several towns in the bailiwick of Bassigny. See note ^{uu} p. 1018.—P.

^e Lorraine Proper, or the dutchy of Lorraine, should be added to the list. It included Nancy, Luneville and Epinal.—P.

^f Orléanois, Orléannois. (Enc. Meth.)

^g Beauce, Beaulée or Beausse (Moréri)—situated between the Isle of France and Orleanois Proper; Chartres the capital. (Enc. Meth.)—Under the name of Great Beauce, the Pays Chartrain (Beauce Proper), Gâtinois, Puyssaye, Orleanois Proper, Sologne, part of Blaisois near the Loire, and even Vendômois and Dunois, were included by some authors. (Moréri.)—P.

^h "Le Gatinais Orléanois"—Orleanois Gatinais. See note ^{uu} p. 1018.—Orleanois Proper is not mentioned in the original, although a place would seem to be given it by the mistake of the translator. It included the country around Orleans on both banks of the Loire; that on the north, called Upper, and that on the south, Lower Orleanois.—P.

ⁱ Puyssaye (Enc. Meth.) Puyssaye (Moréri)—a small country in Gatinois Orleanois, on the confines of Auxerrois and Nivernois; including St. Fargeau, in the department of the Yonne, and St. Amand, in that of the Nièvre.—P.

^j Situated on both sides of the Loire, west of Orleanois Proper—Jois the capital.—P.

^k Situated south of the Loire—Romorantin the capital.—P.

^l Dunois and Vendômois should be added to the list—Chateaudun, the capital of the former, and Vendôme, of the latter; also Perche-Gouet (see note ^u.)—P.

^m Berri (Enc. Meth.)—divided into Upper and Lower by the Cher; the former on the east and the latter on the west of the river.—P.

ⁿ Nivernois (Enc. Meth.)—Nivernois was divided into eight cantons or districts, two of which are worthy of notice: viz. Morvan, a mountainous country on the eastern limits, partly in Burgundy, including Corbigny and Chateau-Chinon, and Bazois, at the foot of the mountains of Morvan on the west, including St. Saulge and Decize.—P.

^o Bourbonnois—divided into Upper and Lower; Moulins in the latter.—The small district of Combrailles is by some included in Bourbonnois; by others in Marche (Auvergne. Enc. Meth.)—Evaux (Evaon) the capital. It is now included in the department of the Creuse.—P.

^p La Marche—divided into Upper and Lower; Gueret in the former

and Bellae in the latter. The province of Marehe is partly comprehended in the department of the Upper Vienne (arrondissement of Bel lac.)—P.

^q Limosin—divided into Upper and Lower by the Vezere; the former on the north, the latter on the south of the river—Limoges, the capital of the former; Tulle, of the latter.—P.

^r Divided into Upper and Lower—the former on the south (Aurillac the capital); the latter on the north (Clermont the capital,) including Limagne. Part of Auvergne is included in the department of the Upper Loire (arrondissement of Brioude.)—P.

^s "La Limagne" (Limane)—a fertile country in Lower Auvergne, extending along the Allier, including Clermont, Riom and Issoire.—P.

^t The government of Maine was formed by the old province of Maine and Perche; the former on the west, the latter on the east. The province of Maine, or Maine Proper, was divided into Upper and Lower; the former on the east, (Le Mans the capital;) the latter on the west, (Laval the capital.)—P.

^u Perche was divided into Upper Perche or the County of Perche, and Lower Perche or Perche-Gouet; the latter annexed to the government of Orleanois. The former occupied the contiguous portions of the departments of the Orne and the Eure and Loir, including Nogent le Rotrou, Mortagne and Belesme, and also the district of Thimerais, on the confines of Normandy and the Pays Chartrain—Chateaufort the capital. The latter, situated to the south of the former, occupied contiguous portions of the departments of the Eure and Loir and the Sarthe, including Montmirail, Bazoches and Brou.—P.

^v Anjou was divided by the Loire into Upper and Lower—the former on the south, (Saumur the capital); the latter on the north, (Angers the capital.) (Moréri.)—The Enc. Meth. reverses the order, placing Angers in Upper Anjou.—P.

^w Saumurois, a country in France, including certain districts in Anjou and Poitou, formed into a separate military government by Henry IV.—Saumur the capital.—P.

^x The province of Brittany (*Bretagne*) included nine bishoprics, before the revolution: viz. Rennes, Nantes, St. Malo, St. Brieux, Dol, Vannes, Cornouailles (Quimper-Coentin,) St. Pol de Leon and Treguier; the five former occupied Upper Brittany on the east, (Rennes the capital;) the four latter, Lower Brittany on the west, (Vannes the capital.) The military government of Brittany was divided into two lieutenant-generalships; one including the County of Nantes or the Pays Nantais; the other, all the rest of Brittany (Upper and Lower.)—P.

^y Situated on both sides of the Loire; the southern part (*d'outre-Loire*) originally in Lower Poitou; the northern (*en deça la Loire*.) in Upper Brittany. The whole was, however, included in the military government of Brittany.—P.

^z Poietou (Moréri)—divided into Upper and Lower; the former on the east, (Poitiers the capital;) the latter on the west, including La Vendée, (Fontenay le Comte the capital.)—P.

^{aa} Le Pays d'Aunis—the smallest province in France, including La Rochelle, Rochefort, and the Isles of Rhe and Oleron; now included in the department of the Lower Charente.—P.

^{bb} Saintonge or Xaintonge (province)—divided into Northern and Southern by the Charente; St. Jean d'Angely capital of the former; Saintes, of the latter.—P.

^{cc} A small province, forming with that of Saintonge, the single general government of Saintonge-Angoumois (Enc. Meth.)—Angoulême the capital.—P.

^{dd} A small district in Saintonge, on the coast S. of the Charente, annexed to the government of Aunis. (Enc. Meth.)—P.

22 Alsace ^a	Strasbourg	Sundtgau ^b	{ Upper Rhine, Lower Rhine.	24 Burgundy ^f	Dijon	Auxerrois, ^g Bailiwick of La Montagne, ^h Auxois, ⁱ Dijonnais, ^j Autunais, ^k Chalonnois, ^l Charolois, ^m Maconnais, ⁿ Principality of Dombes, ^o Bresse, ^p Bugey, ^q Gex ^r and Valromey. ^s	Ain, Cote d'Or, Saone and Loire, Yonne.
23 Franche-Comté ^c	Besançon	{ Bailiwicks of Amont, Aval, Besançon, and Dole. ^{d e}	{ Doubs, Jura, Upper Saone.				

^a The government or province of Alsace was formerly a part of the German Empire, and was ceded to France by the treaty of Munster in 1648, with the reservation, however, of its imperial immunities; but by the treaty of Ryswick in 1697, a final cession was made to France in full sovereignty. While a part of the German Empire, it included the territories of Alsace (Germ. *Elsass*, Lat. *Alsatia*) and Sundgau; the former divided into Upper and Lower (called the Upper and Lower Landgraviates of Alsace)—Colmar, the capital of the one, and Hagenau, of the other. The greater part of the Lower Landgraviate was possessed by the bishop of Strasbourg, and most of the remainder of the two Landgraviates, by the house of Austria. Besides these, the province included the imperial abbey of Murbach and Munster in Gregorienthal, the bailiwick or prefecture (*landvogtey*) of Hagenau, comprehending the ten united imperial cities of Hagenau, Colmar, Schlettstadt, Weissenburg, Landau [now in Rhenish Bavaria,] Obernheim, Rosheim, Munster in Gregorienthal, Kaisersberg and Turkheim, and also the free imperial city of Strasbourg.—P.

^b The territory (*landschaft*) of Sundgau or Suntgau (Suntgaw or Sundgaw (Enc. Meth.)—Suntgaw or Sundgow (Moreri)—Suntgov (Hubner)—one of the *gous* (Germ. *gauen*, Lat. *pagi*) or districts, into which the country on the Upper Rhine was divided in the middle ages) included that part of the province of Alsace, south of the Upper Landgraviate. It belonged chiefly to the house of Austria, and was originally possessed in a great measure by the counts of Pfirt (Fr. *Ferrette*); it also included the free imperial city of Mulhausen, and the towns of Altkirch, Befort and Huningen.—P.

^c Formerly called the County of Burgundy (Fr. *Comté de Bourgogne*) or Upper Burgundy. It was originally governed by counts of its own, but in 1369 it came into the possession of Philip the Bold, duke of Burgundy, by marriage with Margaret heiress of the county, and again in 1477, along with the Netherlands, into that of Maximilian I. then archduke of Austria, by marriage with Mary, daughter of Charles the Bold, duke of Burgundy. In 1512, Maximilian I. erected it, along with the Netherlands, into a tenth circle, that of Burgundy, under the protection of the empire, but not subject to its charges nor to the sovereignty of the emperor. Charles V. who had annexed to it the duchy of Lorraine, ceded this circle with Spain to his son Philip II., in whose family Franche Comté remained till 1674, when it was conquered by Louis XIV., and finally ceded to him by the treaty of Nimeguen in 1678. Formerly Besançon (Germ. *Bisanz*) was reckoned a free imperial city, and the archbishop of Besançon and the abbot of Lure (Germ. *Ludders*), princes of the empire. These were immediate states of the empire of early date, (the city of Besançon from the 10th century,) and were included in the circle of the Upper Rhine.—P.

^d "Dôle."—See note ^a p. 966.

^e Franche-Comté was divided into three parts, called great bailiwicks (*grands bailliages*), viz. the upper or that of Amont (*à mont*), the middle or that of Dole, and the lower or that of Aval (*à val*). (Moreri. Enc. Meth.)—It was divided into three upper-bailiwicks, viz. those of Amont, Dole, and Besançon or Salines. (Hubner.) This division does not correspond with the former, since Besançon was not included in the great bailiwick of Aval, but in that of Dole.—Frache-Comté was also divided into fourteen bailiwicks (*bailliages*) or subdelegations, viz. Vesoul, Gray, Dolc, Lons le Saulnier and Poligny, in the Low Country (*pays uni*), and Pontarlier, Orgelet, Salins, Ornans, Beaume, St. Claude, Quingey, Arbois and Besançon, in the High or Mountain Country (*pays de montagnes*). (Enc. Meth.)—P.

^f The term Burgundy (*Bourgogne*) has several significations in history and geography. The government of Burgundy included not only the province of Burgundy (Burgundy Proper,) but also Bresse, with Bugey and Valromey, and the country of Gex. The province of Burgundy included the duchy of Burgundy proper, with its dependencies, the counties of Charolois, Mâconnois, Auxerrois and Bar sur Seine. The duchy proper included Dijonnois, Autunois, Châlonnois, Auxois, and the *Pays de la Montagne*. (Enc. Meth. Moreri.)—Burgundy in its more enlarged sense, included Franche-Comté, called Upper Burgundy or the County of Burgundy, as well as the Province or Duchy of Burgundy, called also Lower Burgundy.—The first kingdom of Burgundy was formed by the Burgundians (*Burgundiones*) in the 5th century. It included the duchy of Burgundy, Franche-Comté, Provence, Dauphiny, Lyonnais, Savoy and Switzerland. It was annexed to France in 534 by the sons of Clovis. The kingdom of Burgundy on this side the Jura (*Burgundia Cisjurana*), founded in 855 in favour of Charles, third son of the emperor Lothaire I., included Provence and the duchy of Lyons. (Enc. Meth.)—The kingdom of Arles or Provence, which was held by Charles, third son of the emperor Lothaire, consisted of Provence, Dauphiny, and part of the ancient kingdom of Burgundy; it terminated before 864, on the death of Charles. (Guthrie and Gray, vol. X. p. 406, 408.)—The kingdom of Cisjurane Burgundy, or the first kingdom of Arles, comprehended the countries situated between the

Saone, the Alps and the Sea; it was usurped by Boso, son in law of the emperor Louis II., in 879, and was ceded in 929 to Rodolph II. king of Transjurane Burgundy. (Moreri.)—The kingdom of Burgundy beyond the Jura (*Burgundia Transjurana*), founded by Rodolph, son of Conrad, count of Paris, in 888, included at first only Switzerland, and Chablais (in Savoy.) Rodolph II. his son, united the two kingdoms of Cisjurane and Transjurane Burgundy, and formed the second kingdom of Arles (also called Transjurane Burgundy.) Rodolph III. his grandson, dying without issue, left it in 1032, to the emperor Conrad the Salic. (Moreri. Enc. Meth.)—The duchy of Burgundy never formed part of either of these two kingdoms of Cisjurane and Transjurane Burgundy, but was governed by its dukes, who held of the crown of France. Philip the Bold, the first of the last line of dukes, acquired by marriage, Franche-Comté and part of the Netherlands, and afterwards the remainder of the Netherlands were annexed to the domains of the family, rendering it one of the most powerful in Europe; but on the death of Charles the Bold without male issue, in 1477, these estates were dismembered—Louis XI. seizing the duchy of Burgundy as a male fief, since which time it has remained in the possession of the crown of France, and the other possessions passing to Maximilian I. by marriage. (See note ^c.)—The circle of Burgundy is described in note ^c.—P.

^g Comprehending the N. W. corner of Burgundy Proper; possessed by its counts till 1371, then united to the crown, and in 1435 transferred to Philip duke of Burgundy by Charles VII.—Auxerre the capital.—P.

^h "Le Bailliage de la Montagne" (Le Pays de la Montagne or La Montagne—so called from its hilly surface)—a small country on the northern frontier of Burgundy, projecting into Champagne. It extends along the Seine, and includes Châtillon sur Seine and Bar sur Seine.—Bar sur Seine, originally a county in Champagne, by which it is entirely surrounded, was ceded to Philip of Burgundy in 1435, by Charles VII.—P.

ⁱ Between Dijonnois and Auxerrois—Semur en Auxois the capital.

^j Dijonnois—including Dijon, Auxonne and St. Jean de Losne.

^k Autunois—bordering on Nivernois; including Autun the capital, Bourbon-Lancy and Semur en Briennois.—Briennois or Brionnois, a small district, extending along the Loire on the confines of Bourbonnois.—P.

^l Châlonnois, Châlonnois—divided into two parts by the Saone; that on the west, called Châlonnois Proper or La Montagne, situated in Burgundy, (Châlons sur Saone); that on the east, (exclusive of the district between the Saone and the Doubs (Verdun)—in Burgundy,) called Bresse Châlonnoise, situated in Bresse, (Louhans).—P.

^m Charolois—a hilly country west of Châlons and Mâcon, traversed by the canal of the Centre, and including Charolles and Digoin; at first a county held in fief of the dukes of Burgundy, but purchased by Philip the Bold in 1390, and annexed to the duchy of Burgundy.—P.

ⁿ Mâconnois, Masconnois—on the west of the Saone, by which it is separated from Bresse; including Mâcon, Cluny and Tournus—originally a county; united to the crown in 1238, and ceded by Charles VII. to Philip of Burgundy in 1435.—P.

^o Situated on the E. bank of the Saone below Mâcon—Trevoux the capital: erected into an independent sovereignty about the commencement of the 11th century, with which title it continued in the hands of different families till 1762, when Louis XV. purchased it and annexed it to Bresse.—P.

^p Bresse, in its more enlarged sense, included Bresse Proper, the sovereignty of Dombes, and the countries of Bugey, Valromey and Gex, and was bounded by the Saone on the west, the Rhone on the south and south-east, Switzerland on the north-east, and Franche-Comté and Burgundy on the north.—Bresse Proper included that part of Bresse between the Saone, the Rhone, the Ain and the Seille, exclusive of Dombes—Bourg the capital.—Bresse Châlonnoise, north of the Seille, was annexed to the duchy of Burgundy in 1289. (See note ^l.)—Bresse Proper, Bugey (including Valromey,) and Gex, belonged to the house of Savoy, previous to 1601, at which time they were ceded to Henry IV. in exchange for the marquisate of Saluzzo in Piedmont.—P.

^q A small country between the Ain and the Rhone, including Belley, Seissel and Nantua. (See note ^p.)

^r "Pays de Gex."—Bailiwick (*Bailliage*) of Gex. (Moreri.)—A small district in Switzerland in the Pays de Vaud, situated between Mount Jura on the north and the Rhone and the Lake of Geneva on the south; ceded to France in 1601 by the duke of Savoy. (Enc. Meth.)—P.

^s Marquisate of Valromey—a very small district in Bugey on the Rhone; Seissel the capital.—P.

27 Roussillon ^h	Perpignan	{ Valcspir, Capsir, French Cerdagne. ⁱ	{ Eastern Pyrenees.				

^a Lyonnais, Lionnois.—The government of Lyonnais included the three provinces of Lyonnais Proper, Forez and Beaujolais—the former containing Lyons (the capital,) Condrieux and St. Genis-Laval.—P.

^b That part of the government extending along the valley of the Loire, on the west of Lyonnais and Beaujolais—divided into Upper and Lower; the former on the south, including Feurs, St. Etienne and St. Chamont; the latter on the north, including Roanne and Montbrison.—Forez was united to the crown by Francis I.—P.

^c Beaujolais.—That part of the government north of Lyonnais Proper—situated between the Saone and the Loire, and including Villefranche (the capital,) Beaujeu and Belleville sur Saone.—P.

^d Languedoc, considered as a government, included Languedoc Proper, Gevaudan, Velay and Vivarais, the three last of which were comprehended under the general name of the Cevennes.* Languedoc Proper was divided into Upper and Lower—the former on the west, included the country of Toulouse (*Le Toulousain* or *Tolosain*.) also called Upper Languedoc Proper; Albigeois on the north, (Alby the capital;) Lauraguais on the east, (Castelnaudary the capital;) and the county of Foix on the south (see note i)—the latter on the east, along the Mediterranean, included the three quarters of Narbonne, Beziers and Nismes. (Moreri.)—Languedoc is generally said to have been derived from *langue d'oc* (the language of *oc* (yes)—that word having been used by those who spoke the Tolosan language, while in the north of France, *oi* was used for the same purpose—whence the distinction between the countries of the *langue d'oc* and the *langue d'oi*.) Languedoc in this original sense, comprehended most of the country to the south of the Loire, viz. Languedoc, Guienne, Limousin and Auvergne; but it was early restricted to the province of Languedoc, which was annexed to the crown in 1361.—P.

* Languedoc was divided into three parts, viz. the Upper, the Lower, and the Cevennes. The Cevennes (*Serennés*), considered as a division of the government of Languedoc, comprehending only Gevaudan, Velay and Vivarais, did not include the whole of the mountains called by the same name, which extended into Lower Languedoc, and occupied a considerable part of the dioceses of Alais, Uzès and Lodève. (Enc. Meth.)—P.

^e Givaudan (Moreri)—formerly Gabauldan, from the ancient *Gaba-li* (Enc. Meth.)—Situated to the west of Velay and Vivarais; including Mende (the capital,) Châteaufort de Randon and Florac.—P.

^f A mountainous country, bounded by Gevaudan, Vivarais, Forez and Auvergne, and now included in the department of the Upper Loire—Le Puy the capital.—P.

^g Vivarez (Moreri)—extended along the west bank of the Rhone between Lyonnais Proper and Lower Languedoc; Viviers (the capital.)—Divided into Upper and Lower; the former on the north, (Annonay the capital;) the latter on the south, (Villeneuve de Berg the capital.)—P.

^h The government of Roussillon comprehended Roussillon Proper, the small countries of Valespir, Confent (Conflans) and Capsir, and French Cerdagne, all of which were conquered from Spain by Louis XIII. and ceded to France by the treaty of the Pyrenees in 1659.—Roussillon Proper, of which the three small countries above mentioned were appendages, extended along the Mediterranean from Lower Languedoc to Catalonia—Perpignan the capital. Its name was derived from the ancient city of *Ruseino*, near Perpignan, of which only a tower remains, called the Tower of Roussillon (*Tor Rossello*, in the language of the country.) It was originally a county, possessed by the counts of Roussillon and Ampurias (Ampurdan,) but in the 12th century was united to the crown of Arragon. It continued in the possession of Spain till it was annexed to France as above mentioned.—Confent (originally a county) and Capsir were situated in the north-western part of Roussillon, towards the Pyrenees; Villefranche, the capital of the former, and Puy-Val d'Or, of the latter.—Valespir included Collioure and Port Vendre on the southern frontier of Roussillon (Hubner.)—P.

ⁱ "La Cerdagne Française."—Cerdagne (Sp. *Cerduña*—Cerdaigne or La Cerdagna. Moreri,) a small country in the Pyrenees to the west of Roussillon, (originally a county,) part of which belongs to Spain (Puycerda the capital,) and part to France (ceded in 1659—Mont-Louis the capital.)—P.

^j This government included the county of Foix, properly so called, (united to the crown of France by Henry IV.,) the country of Donezan* (*Pays de Donezan*), and the valley of Andorre. (See for the latter, the description of Spain, at the end.)—P.

* Donnezan or Donnezan—a small country in the Pyrenees, united to the government of Foix; Quercit the capital. It includes several passes from Catalonia to Foix. (Dict. Trevoux.)—P.

^k See note i*.

l "Guyenne."

^m The government of Guienne, (here called that of Guienne and Gascony,) was divided into Upper and Lower; the former, on the east, the latter, on the west. Lower Guienne included Bordelais, Périgord, Agenois, Condomois, Bazadois, the Landes, Gascony Proper, and the countries of Soule and Labour; Upper Guienne, Quercy, Rouergue, Armagnac, Comminges, Couserans and Bigorre. Guienne Proper included Bordelais, Medoc (that part of Bordelais between the Gironde and the sea—Leparré the capital,) Buch (*Capitulat de Buch*—a small district of Gascony on the bay of Arcachon,) and the country between two seas (*Pays d'entre deux mers*—see note n.) (Enc. Meth.)—Guienne, a province of France, with the title of duchy, [Guienne Proper,] including Bourdelois, L'Entre-deux-mers, Medoc, Bazadois, Agenois and Condomois. Guienne in its more particular meaning (*Guienne particulière*) included only the *Senchaussée* of Bordeaux. Guienne is said to be a corruption of Aquitaine (first contracted into *Quienne*), and not to have been used till the 13th century. (Moreri.)—Gascony (*Gasconne*), a province of France, forming part of the government of Guienne. Gascony Proper included the Landes, Chalosse, Tursan, Marsan, and the Pays d'Albret; Gascony, improperly so called, also included the Pays des Basques, Bearn, Bigorre, Comminges, Armagnac, Condomois, Bazadois and Bourdelois. (Enc. Meth.)—The province of Gascony included the Landes, Chalosse, Tursan, Marsan, Bigorre, Comminges, Armagnac, Couserans, Gabardan, Lomagne, Astarac, Riviere-Verdun, Nebouzan, the Four Valleys (*Quatre Vallées*), the Pays d'Albret, Condomois, and part of Bazadois. (Vosgien.)—Tursan, including Aire (the capital) and Miremont.—Marsan, originally a viscounty under the dukes of Gascony—Mont de Marsan the capital.—Pays d'Albret, (so called from the small town of Albret or Labrit,) originally a viscounty, then a duchy; Nerac the capital.—Lomagne or Laumagne (Lectoure the capital,) and Astarac or Estarac (Mirande the capital,) were districts in Armagnac.—Riviere-Verdun, a district in Armagnac along the Garonne, including Grenade (the capital) and Verdun.—Nebouzan, a small country on the Garonne, adjoining Comminges; St. Gaudens the capital.—*Les Quatre Vallées*, a district in Armagnac, now in the department of the Upper Pyrenees, consisting of the four valleys of Magnoac, Aure, Neste and Barouse.—The Duchy of Guienne and Gascony (consisting of Guienne Proper and Gascony Proper) was united to the crown of England in 1152, by the marriage of Henry II. with Eleanor, heiress of the duchy; it continued in the possession of the English till it was annexed to France by Charles VII. in 1453.—P.

ⁿ Bourdelois.—The country in the vicinity of Bordeaux (the capital,) sometimes called Guienne Proper; including also Blaye, Libourne, Bourg, Rions and Cadillac, (the latter the capital of the country between two seas (*Pays d'entre deux mers*)—that part of Bourdelois between the Garonne and the Dordogne.) (Moreri.)—P.

^o Bazas the capital.

^p Agennois. (Moreri.)—Originally a county; then united to the duchy of Guienne.—Agen the capital.—P.

^q Province, with the title of county; united to the crown of France by Henry IV. (Moreri.)—Divided into Upper or White Périgord on the Ille (Perigueux the capital,) and Lower or Black Périgord on the Dordogne (Sarlat the capital.)—P.

^r Quercy (Moreri;) formerly Cahourcin, from the ancient *Cadurci* (Enc. Meth.) A province of France in the government of Guienne; ceded to England by John, in full sovereignty; restored to France by Charles V.—divided into Upper and Lower by the Lot; the former, called Causse, on the north (Cahors the capital;) the latter on the south (Montauban the capital.)—P.

^s Province in the government of Guienne; united to the crown of France by St. Louis (1258)—divided into the County (County of Rodez. Moreri,) including Rodez (the capital,) Entraigues and St. Geniez de Rivedolt; the Upper Marche, including Millau (the capital,) St. Afrique and Severac le Château; and the Lower Marche, including Villefranche (the capital) and Sauveterre.—P.

^t "The Landes (*Les Landes*)," sometimes called *Landes de Bordeaux*—a country of France in Gascony, extending along the sea coast from Guienne Proper to Bearn and the Pays de Labour; including Dax (the capital,) Tartas and Peyrehorade.—The term Landes is also

^{u v w x y z aa} See next page for these notes.

^x A province of France, with the title of county—divided into Upper (eastern) and Lower (western,) and including Auch (the capital,) Mirande and Lectoure.—P.

^y A province of France, with the title of county (Vosgien;) united to the crown by Henry IV. (Moreri)—situated at the foot of the Pyrenees, between Bearn and Comminges, and divided into the Mountains (*Montagnes*) on the south, containing the two principal valleys of Lavedan and Bareges, the Plain (*plaine de Bigorre*) north of the former, extending from Bagneres and Lourdes to Vic de Bigorre, and including Tarbes (the capital,) and Rustan on the north-east, bordering on Astarac (a district in Armagnac—Mirande the capital.)—P.

^z Comminges (Vosgien.) Cominge, Cominges (Moreri.)—A province and county of France, finally united to the crown in the 16th century—situated on the Garonne at the foot of the Pyrenees, between Bigorre and Couserans; divided into Upper Comminges on the south (St. Bertrand de Comminges the capital,) and Lower Comminges on the north (Lombez the capital.)—A small part of the diocese of St. Bertrand de Comminges, included in Languedoc, was called Little Comminges.—P.

^{aa} Conserans or Couserans (Vosgien.) Coserans (Moreri.)—A small country with the title of viscounty (*vicomté*.) situated at the foot of the Pyrenees, between Comminges and the County of Foix, (St. Izier the capital)—united with the county of Bigorre 1257, whence it passed to the house of Navarre, and was annexed by Henry IV. to the crown of France.—P.

^a The government of Bearn included Bearn Proper and Lower Navarre, both of which belonged to the house of Navarre and were united by Louis XIII. to the crown of France in 1620.—Bearn Proper, or the Principality of Bearn, was bounded by Bigorre on the east, the Pyrenees on the south, Soule and a part of Lower Navarre on the west, and Gascony Proper and Lower Armagnac on the north, and included Pau (the capital,) Oloron and Orthez.—P.

^b "Basse-Navarre."—The kingdom of Navarre consisted originally of the Spanish province of Navarre (Upper Navarre) and Lower Navarre in France. It was divided into six bailiwicks (*merindades*), five in Spain, and the sixth consisting of Lower Navarre (the only part of the kingdom that remained to John D'Albret, after his possessions in Spain had been usurped by Ferdinand in 1512.) Lower Navarre was separated from Upper Navarre by the Pyrenees, along which it extended between Soule and Labour, and also on the north of the former to the Principality of Bearn. It included St. Jean Pied de Port (the capital) and St. Palais.—P.

^c Dauphiny (*Dauphiné*) was divided into Upper and Lower—the former including Gresivaudan, Briançonnais, Embrunois, Gapeçais, Royannez and the Baronies; the latter, Viennois, Valeninois, Diois and Tricastin. It was part of the second kingdom of Burgundy (founded by Boson in 879) till its extinction in 1032. The counts of Albon, who in the 12th century took the title of dauphins, then acquired the greater part of it, viz. Gresivaudan, Viennois, Embrunois, Gapeçais and Briançonnais. Humbert II., the last of these dauphins, ceded his territories in 1349, to Charles V., then grandson of Philip of Valois, on condition that he and his heirs should bear the arms and title of dau-

phin, and that the country should be possessed as a particular sovereignty and not incorporated with the kingdom. Since then the eldest sons of the kings of France have born the title of dauphins.—P.

^d "The Baronies (*Les Baronnies*)"—a mountainous country in the southern part of Dauphiny (diocese of Gap—department of the Drome,) consisting of the two great baronies of Mevillon (Mevillons. Moreri) and Montauban.—P.

^e Gapeçais (Enc. Meth.) Gapançois (Moreri)—formerly a county; Gap the capital.—P.

^f Embrunois, Ambrunois (Moreri)—Embrun the capital.—P.

^g Briançonnais, or Bailiwick of Briançon. (Moreri.)—P.

^h Gresivaudan (province of Grenoble.) (Moreri.)—Graisivaudan (territory of Grenoble.) (Enc. Meth.)—A mountainous country extending along the Isere and the Drae; Grenoble the capital—bounded W. and N. W. by Viennois, N. and N. E. by Savoy, E. by Briançonnais, S. E. by Embrunois, S. by Gapeçais, and W. by Valeninois.—P.

ⁱ "Royanes."—Royanez (Enc. Meth.)—A small country in Dauphiny, in the diocese of Die; Pont de Royan (Pont en Royans (Vosgien)—7 or 8 leagues S. W. of Grenoble) the capital.—P.

^j A country in Dauphiny, in the environs of St. Paul-Trois-Chateaux (*Augusta Tricastinorum*.)—P.

^k A country on the Rhone (originally a county,) ceded with Diois to Louis XI., then dauphin, in 1446, and annexed to Dauphiny—divided into Upper and Lower (the former extending from the Isere to the Drome, and the latter, from the Drome to the county of Venaissin,) and including Valence (the capital,) Romans, St. Marcellin and Montelimart.—P.

^l A country on the Drome, between Gresivaudan, Gapeçais and Valeninois—originally a county, annexed to Valeninois in 1189; Die the capital.—P.

^m Situated between the Rhone and the Isere—Vienne the capital.—P.

ⁿ Provence, which had been governed by its counts, was united to the crown of France by Charles VIII. in 1487. It was divided into Upper (on the north) and Lower (on the south,) and included within its limits, besides the county of Provence, properly so called, the county of Forcalquier (annexed to the county of Provence in 1193, whence the kings of France, as taking the place of the counts of Provence, were styled in all provincial acts, counts of Provence and Forcalquier,) Avignon and the county of Venaissin, which belonged to the Holy See, the county of Nice (detached from the county of Provence in 1358, and annexed to Savoy, now Sardinia,) and the Principality of Orange,* which belonged to the princes of Nassau, and was finally ceded to Louis XIV. by the treaty of Utrecht in 1713, when it was annexed to Dauphiny.—P.

*The Principality of Orange, (5 leagues long by 3 broad,) was enclosed in the county of Venaissin. It was originally a county, but took the title of principality about the beginning of the 12th century; in 1531, it passed into the house of Nassau-Orange, which terminated in the person of William III. of England in 1702. It was then claimed by Frederick William I. of Prussia, who ceded his right to Louis XIV., by whom it had previously been occupied, in 1713.—P.

^o The island was not included in any of the ancient provinces ["—in any of the 32 great provincial governments."]

^p The County of Venaissin (*Le Comtat Venaissin*;) also called Venaissie (Moreri)—situated between Provence, Dauphiny, the Rhone and the Durance, and including Carpentras (the capital,) Venasque (the former capital, from which it derived its name,) Cavaillon and Vaison. It belonged to the counts of Toulouse till 1228, when it was ceded to the Holy See by the agency of St. Louis; the popes, however, yielded it again to the counts of Toulouse in 1243, but it was finally restored to the Holy See by Philip the Hardy in 1273.—P.

^q The County of Avignon (*Le Comtat d'Avignon*)—consisting of the city and territory of Avignon and the *bourg* of Mauriere (Moreri.) The city of Avignon formed itself into a kind of republic in the 11th century, holding in common of the counts of Provence and Toulouse. In 1290 the sovereignty was vested entirely in the counts of Provence, of whom it was purchased in 1348 by Clement VI. and thus came into the possession of the Holy See. The two counties of Venaissin and Avignon formed the papal sovereignty of Avignon.—P.

^r These two small countries were not ceded to France by the papal government, as has been already remarked, till 1791.

STATISTICAL TABLE,

EXHIBITING

^a "Royal roads"—great roads supported by the nation, in distinction from those supported by the communes.—P.

^b "Prefectures." ^c Arrondissements.

^d The sign † denotes the capital of a bishopric, and the sign ‡, an archiepiscopal town.—[The whole number of archbishops and bishops marked in this table, is fourteen of the former, and sixty-six of the latter, corresponding with the numbers in the Table of the Clergy in 1828 (p. 1032).—Before the revolution, there were eighteen archbishops in France, (exclusive of Avignon,) and 114 bishops. (Enc. Meth. 1782).—By a decree of the National Assembly in 1790, the number of archbishops was reduced to 10, (called metropolitan bishops,) and that of bishops to 83, one for each department. By the concordat of 1801, the number of archbishops in France proper was fixed at 10, and that of bishops at 51. (Ed. Encyc.)—In the *Almanach Imperial* of 1813, the number of archbishops in France proper is stated at nine: viz. Paris, Besançon, Lyons, Aix, Toulouse, Bordeaux, Bourges, Tours and Rouen; that of bishops, at 41. In the *Almanach Royal* of 1822, the number of archbishops is stated at twelve: viz. Paris, Besançon, Lyons, Aix, Toulouse, Bordeaux, Bourges, Tours, Rouen, Reims, Sens and Avignon; that of bishops, at 44. Among the bishoprics marked in this table, the following are not

contained in the list of 1822: viz. Belley, Moulins, Gap, Viviers, Pamiers, Rhodéz, Marseilles, Tulle, St. Claude, Aire, Blois, Le Puy, Chalon, Langres, Verdun, Nevers, Beauvais, Tarbes, Perpignan, Montauban, Frejus and St. Dié; and among the archbishoprics, those of Auch and Alby. These bishoprics and archbishoprics all existed, however, before the revolution, except that of Moulins.—P.]

^e The metre is equal to 39.371 English inches. Tr.

^f The Hectare is nearly equal to two English acres. Tr.—[The Hectare is equal to 11,960.46 English square yards, or 2 acres, 1 rood, 35.4 rods, nearly.—P.]

^g "Revenu territorial"—returns from the soil. The total of these sums amounts to 1,578,288,515 francs, (the department of the Doubs not included.)—In a memoir on the commerce of France and her colonies, published in 1789, the value of the produce of agriculture was estimated at 1,826,000,000 livres. (Ed. Encyc.)—The value of capital vested in agricultural pursuits is estimated at 37,522,061,476 francs; the gross annual produce at 4,678,708,885 francs; the expenses of cultivation at 3,334,005,515 francs; and the nett profits at 1,344,703,370 francs. (Enc. Amer.)—P.

^h Viviers is not the capital of a subprefecture. (Alm. Royal.)—P.

TABLE,

EXHIBITING THE DISTRIBUTION OF THE SURFACE IN FRANCE, ACCORDING TO THE USES TO WHICH EACH PART IS APPLIED.

	Hectares.
Arable Land	22,818,000
Vineyards	1,977,000
Kitchen Gardens	328,000
Gardens and Orchards	687,000
Miscellaneous Culture	780,000
Olives	43,000
Hops	60,000
Chestnuts	406,000
Parks, Groves, Nurseries	39,000
Woods and Forests (Bois)	6,521,000
	<u>33,659,000</u>

	Hectares.
Amount brought up,	33,659,000
Willows and Alders,	53,000
Pastures	3,525,000
Meadows	3,488,000
Waste Lands (<i>Terres incultes</i>)	3,841,000
Turbaries	7,000
Mines and Quarries	28,000
Buildings	213,000
Canals (navigable and for irrigation)	9,000
Ponds	213,000
Marshes	186,000
Roads, rivers, mountains, rocks	6,555,000
Total	<u>51,777,000</u>

[The superficial extent of France has been recently estimated by Baron C. Dupin at 53,533,426 hectares, or 132,694,000 English acres (Enc. Amer.)—P.]

^a The Royal Courts (*Cours Royales*) have original jurisdiction, both civil and criminal, and are also courts of appeal from the inferior tribunals (*Tribunaux de première Instance—Tribunaux de Commerce*), both in civil and criminal cases; they correspond to the Circuit Courts in the U. States.—There are in France: I. the Court of Cassation, or Supreme Court; II. the Court of Exchequer (*Cour des Comptes*); III. the Royal Courts (27 in number, as in the table); IV. the Inferior Tribunals (*Tribunaux de première Instance—District Courts*), both civil and criminal in their jurisdiction, of which there is one in each *arrondissement*; V. the Justice Courts (*justices de paix*), of which there are one or more in each of the cantons, into which the *arrondissements* are subdivided; and VI. the Commercial Tribunals (*Tribunaux de Commerce*), established in different towns (*villes*)—213 in number in 1822 (Alm. Royal).—P.

^b Education (Public Instruction) in France is under the general direction of the Council of Public Instruction, acting under the authority of the Minister of the Interior. (Under the Imperial government, public education was subject to the general control of the Grand Master and Council of the University. The University, which included all the schools in the empire, was divided into as many Academies as there were Imperial Courts.) The number of the Academies now corresponds to that of the Royal Courts, with one exception. These Academies have a Rector and Inspectors, who exercise a supervision

over the schools of every grade in their district. These are: I. The Faculties, of which there were in 1822, six of Catholic, and two of Protestant Theology, eight of Law, three of Medicine, seven of the Sciences, and six of Letters: II. the Royal Colleges (Lyceums, under the empire), of which there were 38, including five in Paris; III. the Secondary Schools, auxiliary to the Faculties, as the Secondary Schools of Law and Medicine; IV. the Institutions (High Schools) and Boarding Schools (*Pensions*); and V. the Primary Schools. To these may be added different Special Schools, supported by the government, such as the Normal School, the Polytechnic School, the Military and Veterinary Schools, &c.—P.

^c Agen is the seat of the Royal Court—Cahors, that of the Academy, in the district.—P.

^d The Royal Courts of Aix and Bastia [Corsica. Alm. Royal] form two districts, both under the jurisdiction of only one Academy [that of Aix.] M. B.—There was an Academy at Ajaccio, under the Empire. (Alm. Imp. 1813).—P.

^e Colmar is the seat of the Royal Court—Strasburg, that of the Academy.—P.

^f Riom is the seat of the Royal Court—Clermont, that of the Academy.—P.

COMPARATIVE BUDGETS OF FRANCE

IN 1789, IN 1802 (YEAR XI.) AND IN 1830.

STATE OF THE FINANCES OF THE KINGDOM PRESENTED BY NECKER TO THE STATES-GENERAL, IN 1789.

	RECEIPTS.	Francs.
General revenue, ^g	-	150,107,000
Of the Posts, ^h	12,000,000	134,240,000
Different Conveyances, ^h	1,100,000	
Excise and customs, ⁱ	50,220,000	
Domains and forests, ^j	50,600,000	
Lotteries, ^j	14,000,000	
Casual revenues, ^j	3,000,000	155,655,000
Marc d'Or, ^k	1,500,000	
Powder and saltpetre, ^j	800,000	
Certain fixed revenues,	1,620,000	
Ordinary impost ^l , poll tax, and twentieths, ^m	-	

^a "Heckled (*peignés*)" ^b "—in coin and bullion (*brut.*)"
^c "Rock salt (*sal-gem*) and that from salt works (*salines.*)"
^d "Linen and hempen stuffs (*tissus de lin et de chanvre.*)"
^e This must be a mistake—the litre being a measure for liquids. It is probably intended for kilogrammes, as under woollens, silks and cottons.—P.
^f "Quincaillerie"—hardware in general.
^g "Ferme générale" (General farm or lease).—Certain branches of the revenue leased to a company of farmers-general, for a certain sum, during a certain term of years. This company were bound to account for the sum engaged, and to bear all the losses and expenses of collection, and were entitled to all the profits they could realize above the sum stipulated. Among the branches of revenue annexed to the *ferme générale*, were the monopolies of salt and tobacco, duties on the entrance, issue and circulation of merchandise (*droits de traites*), stamping (*marque*) of iron, and of gold and silver, &c. By a decree of Jan. 9, 1780, a new distribution was made; the revenues intrusted to the *ferme générale*, being confined to the duties on imports and exports, and to those arising from the peculiar privileges or monopolies to be protected on the frontiers of the kingdom, at the barriers of the capital, and on the limits of the provinces reputed or treated as foreign, whilst those from the excise were intrusted to the *regie générale*, and those from the domains, including stamp duties, to the *general administration* of the domains. The number of the farmers-general, previous to 1756, was 40; it was then increased to 60. The number in 1789 was 44.—P.
^h "Ferme des postes—Ferme des messageries" (Farms of the Post-Office and the public conveyances).—The revenue of the Post-Office, and that of the public conveyances, were each leased to a company for a certain fixed sum.—P.
ⁱ "Regie des aides et droits réunis."—Certain branches of the revenue intrusted to a company, called the *Regie Générale* (general administration or direction,) the members of which, called *regisseurs* (directors,) were bound to collect and account for the revenue faithfully, for which they received certain salaries and commissions, the govern-

	EXPENSES.	Francs.
King's household, Children of France, ^q	25,000,000	
Princes of the blood	8,240,000	
Foreign Affairs, Swiss Lines ^r	7,480,000	
War department	99,160,000	
Navy and Colonies	40,500,000	
Roads and bridges ^s	5,680,000	
Royal studs	814,000	
Perpetual and life-rents ^t	162,486,000	
Different interests	44,300,000	
Salaries of the different offices in the financial department	14,692,000	

ment sustaining all unavoidable losses, and providing for the expenses of collection. The revenues, so collected, were certain branches of the excise and internal duties.—P.
^j "Administration (*Regie*) of the domains and forests—of the lotteries—of the casual revenues [such as arose from the duties paid on the transfer of property dependent on the royal domains]—of the *marc d'or* [tax on offices, grants, commissions, &c.]—of gunpowder and saltpetre."—Each of these branches of the revenue formed the subject of a particular administration (*regie*).—P.
^k The *Marc d'Or* is a sum paid to the king by a person appointed to an office. Tr. [Whenever an individual received any grant, permission, office or commission from the king, he was obliged to pay a certain tax called the *marc d'or*, before he could enjoy the privileges of the one, or perform the functions of the other. (Enc. Meth. Finance.)—P.]
^l "Impositions."—The taxes in France were divided into two classes. viz. *impositions* (direct taxes) and *perceptions* (indirect taxes); the former including the *tailles* (taxes on real estate, and on personal profits and income), the poll tax (*capitation*) and the twentieths (*vingtièmes*).—P.
^m Twentieth (*vingtième*)—an income tax, amounting to the twentieth of the income (*revenu*) of those subject to it.—There were three twentieths in operation in 1789; the first imposed in 1749; the second, in 1756; and the third, in 1782.—P.
ⁿ "Impositions des pays d'état."—The provinces, called *pays d'état*, retained their provincial estates (nobility, clergy and towns,) which, however, had only the privilege of distributing and providing for the collection of the taxes imposed upon them. These provinces were Artois, Bearn, Brittany, Burgundy, Walloon Flanders, Languedoc, Provence, Bigorre, Foix, Labour, Marsan, Nebousan, Soule, and the Four Valleys (Quatre Vallées.) They, however, enjoyed different degrees of exemption; as for instance, Burgundy was subject to the monopoly of salt (*gabelle*), and to that of tobacco; Brittany and Bearn were subject to the monopoly of tobacco, but not to that of salt; while Artois was subject to neither.—P.
^o "Profits on coinage and forges."—The profits on coinage amounted to 500,000 livres; those on the royal forges, to 80,000 livres. (Taylor's Statistics of France, p. 255.)—P.
^p "Caisse du commerce"—Commercial bank.
^q The king's children.
^r "Lignes Suisses."—This is doubtless a typographical error for *lignes Suisses*, Swiss leagues. (See Enc. Meth. Dict. Fin. t. II. p. 144, and Taylor's Statistics, p. 255.)—Capitulations or treaties were entered into between the king of France and the different Swiss governments, for the regular supply of the Swiss troops in the service of the former. These amounted in 1784 to 15,500 men. (Enc. Meth. Dict. Econ. Pol. t. I. p. 669.)—P.
^s "Ponts-et-chaussées"
^t "Rentés perpetuelles et viagères"—Perpetual and life annuities.—P.

BOOK CXLVII.

EUROPE.

Europe continued.—Description of the Scandinavian Peninsula.—First Section.—Kingdom of Norway.

AT the northern extremity of Europe, in those regions where winter, characterised by long and severe frosts, and losing the grey complexion which it presents in temperate climates, covers the ground with a dazzling carpet of snow, and adorns itself with the brilliant fires of the Aurora Borealis; where the long days of summer, even hotter than under the sky of Italy, are indebted to the scorching rays of the sun for the blessings of a vegetation which unfolds itself with surprising rapidity, there lives a people, which, in the bosom of an advanced civilization, has religiously preserved the laws and manners of its ancestors. This people is the Norwegian.

Descended probably from the same source, the Norwegian speaks a language, which has the same origin with that of the Swedes and Danes.^a In the eighth century one dialect formed of them only one great family, and in this dialect were composed the songs consecrated to the mysteries and mythological creed of the Scandinavians. The brilliant fictions which still enliven our poetry, appear to have been, if not produced, at least tastefully coloured under the beautiful sky of Greece; yet we find a part of their lustre in the ancient Edda,^b the most valuable collection we possess of Scandinavian poems.^c Let us open one of these poems, the *Voluspá*, or the Oracle of the Prophetess *Völva*,^d in which the creation of the world, and its destruction, are described in glowing language. We there read that in the beginning a vast chaos reigned over the universe; the gods themselves slumbered in the repose of a long and dark night. At last appeared the giant *Ymer*, with his brothers, in the midst of that ocean of vapours which filled the immensity of space, and framed a world, gigantic indeed, but without proportion, and as yet enveloped in darkness. But *Odin*, the god of

light,^e accompanied by his two brothers *Ve* and *Vile*,^f extended his reign over this universe, still shapeless and rude: then the sun, hitherto wandering in space, drew the other stars after him around our planet; the seasons succeeded each other with regularity; *Ymer* fell under the blows of *Odin*, and in his blood the giants his brothers were drowned, one excepted, who, more fortunate than the rest, took refuge in the mountains, where he propagated a race destined one day to embroil the earth with blood.

Odin, intent upon beautifying the universe, created man and woman from the trunk of a tree thrown by the waves upon the shore. Does not this incident conceal a philosophical idea? May we not discover in this wreck, tossed upon the ocean, and which becomes the origin of the human race, the cause of the stormy life that attends man in this world? Whatever there may be in this, the deities hastened to adorn this new race of beings with the finest qualities: the earth presented the image of happiness; innocence and knowledge reigned in it; the arts diffused themselves; and gold became the most common of metals. But the daughters of the giants descended from their mountains; one of them, *Gullveiga*,^g or the *Weigher of Gold*, spread among men avarice and the love of gain; thrice the gods delivered her over to the flames, and thrice she revived from her ashes. She still lives: she it is who first caused human blood to flow, and, through her influence, it will never cease flowing.

Asagard^h is the Scandinavian Olympus. There, amidst surrounding clouds, rises, resplendent with light, *Valhalla*,ⁱ or the palace of *Odin*, the abode of the gods, and the asylum destined for those mortals, who by their virtues have rendered themselves worthy of it. There the hero slain in battle is admitted to the banquet of the gods. There *Freyja*, the daughter of the god of the sea,^j as *Venus* is of the foam,

^a The Danish, Swedish and Icelandic are three dialects of one great division of the Gothic family of languages, viz. the Scandinavian. This, before the discovery of Iceland (in the ninth century,) was common to all the Scandinavians. The Icelandic approaches nearest to this old language, of the three written languages; the High Norse, still spoken by the peasants in the remoter districts of Norway, is also nearer to it than the Danish and Swedish. These languages are characterized by two remarkable peculiarities, by which they differ essentially from the Teutonic languages, although very many of their words are closely allied to the corresponding words in the latter. These peculiarities are: 1. the possession of two definite articles—one separate and prefixed (Dan. and Sw. *den*, masc. and fem. *det*, neut.) and the other a suffixed syllable (*en* or *n*, masc. and fem. *et* or *t*, neut. in Dan. and Swed. —*enn* or *nn* and *ed* or *d*, in Icelandic); 2. the formation of the passive verb by simply suffixing *s* to the active, in Dan. and Swed. (e. g. *elske*, to love, *elskes*, to be loved,) and *st*, in Icelandic, (as *gefa*, to give, *gefust*, to be given.)—P.

^b The poetical or elder Edda; called also *Sæmund's Edda* (*Edda Sæmundar hins Froda*, Edda of *Sæmund the Wise*.) from *Sæmund Sigfuson*, an Icelander, by whom it was compiled about the beginning of the twelfth century.—The prose or younger Edda (*Snorro's Edda*) is said to have been compiled in the 13th century, by *Snorro Sturleson*, also an Icelander.—P.

^c "Scaldic poems"—poems of the Scalds (Scandinavian bards.)—P.

^d *Völuspá*, the prophecy (spæ) of the *Vala*.—The *Valas* were the Northern Sybils, prophetesses inspired by the *Nornir* or Destinies. (F. Q. R. No. III.)—They were of the race of giants (*Jotun*).—P.

^e *Odin* was called *Alfader*, the father of all the gods (*Aser*). The *Aser* (celestial deities) were opposed to the giants or evil genii (*Jotun*). *Odin*, the leader of the former, corresponds to the Persian *Ormuzd*, representing light, and *Loke*, the leader of the latter, to *Ahriman*, or darkness. In this sense, *Odin* may be called the god of light; but he was not the Northern *Apollo*. *Balder* (the vernal sun,) and *Freyr*, the sun-god, the brother of *Freyja*, the moon-goddess, better correspond with that deity. *Odin* is compared by *Finn Magnusen*, to the Grecian *Zeus*, the father of gods and men.—P.

^f *Odin*, *Vile* and *Ve* constitute one of the Northern Trinities (the cosmogonic trinity of the prose Edda.) *Odin* is regarded by *Magnusen* as the air, *Vile* as light, and *Ve* as fire.—P.

^g *Gullveig*, gold matter. (For. Qu. Rev. No. III.)—P.

^h *Asgard*—*Aser-yard*, the city of the gods (*Aser*).—P.

ⁱ "Valhal."—*Valhall*. (For. Quart. Rev. Nos. III. and VII.)—P.

^j *Freyja* was the daughter of *Niörd*, a deity who presided over the wind, to whom travellers and mariners addressed their prayers. (For. Q. Rev. No. VII.)—P.

adorns herself with all the charms of youth. She is the goddess of love and of beauty, and, under the name of *Vanadis*, also the goddess of hope. She shares with Odin the empire of the dead,^a because it is often unsuccessful love which hurries its victims into the heat of battle. *Frigga*, the chaste spouse of Odin, the Ceres and Juno of the Scandinavians,^b receives, after death, such wives as have been distinguished by a heroic fidelity; while *Thor*, her eldest son, who, with his club, terrifies the giants, and makes them retire within the limits of *Jotunheim*,^c the prison reserved for them, in like manner rewards after their death faithful slaves. In the palace of the immortals, *Bragor*, the god of the arts and of music,^d charms the ears of the deities with the notes of his golden harp. *Idunna*, his wife, distributes among the inhabitants of heaven the apples which perpetuate their immortality. *Forsete*, another son of Odin,^e has for his employment the preserving peace among mankind; and the goddess *Vara* presides over the sacredness of oaths. Without this hallowed mansion, the god *Uller*, gliding on his sparkling skates, cuts the air with the rapidity of lightning, surpassing the winds in swiftness; while the watchful *Heimdall*, a sentinel ever attentive to the motions of the evil genii, guards night and day that aerial arch, the seven colours of which are so often seen by men. But the object beloved by all the gods is *Balder*,^f the son of Odin, the most amiable and the most brilliant of the immortals, endowed by destiny with every good quality of the heart, with every intellectual gift, and with every physical advantage. Nothing equals his beauty: his eyes shine with a lustre more radiant than that of the morning star. To him alone belongs the power of appeasing tempests. A stranger to the passions which agitate the other gods, to their warlike projects, and their obstreperous mirth, he seldom appears at their assemblies, living peaceably in a palace, whose site is pointed out by that white belt, which during clear nights shines in the vault of heaven.

But this world, organized by Odin, will one day fall in ruins, and again become part of the empire of chaos: the death of Balder has been predicted, and Odin has read this terrible secret in the Book of Fate.^g *Siona*, the goddess of sympathy and love; *Snotra*, who bestows prudence and moderation; *Lowna*, who presides over conjugal fidelity; the three *Nornies*, who regulate the destiny of mortals;^h the twelve *Valkiries*,ⁱ nymphs who accompany heroes to battle; in short, all the gods tremble in the knowledge of the future that threatens them. All these deities have compelled the parts of nature, which are subject to them, by an oath to furnish no arms fatal to the life of Balder.^j Fire, water, vegetables and rocks are bound by this oath; one parasitical plant,

the mistletoe, was alone forgotten. *Loke*, the genius of evil, has discovered the fatal omission, and he will employ this contemptible vegetable to accomplish the decree of fate. Assured that all the elements respect his life, Balder, amidst the warlike exercises of Valhalla, feels a pleasure in presenting his invulnerable breast to the darts thrown at him by the gods; but Loke, at one of these celestial assemblies, will engage *Hoder*,^k the son of Odin, to take part, although blind, in the tournaments. Putting into his hand a branch of the mistletoe, and directing his arm, the genius of evil will see his wishes accomplished by an unintentional fratricide. Loke will then assemble the giants his sons; he will open the gates of *Nastrond*, a frozen hell, where rivers of poison alone preserve their fluidity, and he will bring from thence perjurers and assassins, and the dreadful *Hela*, the goddess of death. *Surtur*,^l the genius of fire, will at the same time escape from *Muspelheim*, his abode of flames. Then all these monsters and their attendants will attack the gods; the serpent *Jormungandur*^m will crush the earth in his immense folds; the wolf *Fenris* will devour the sun and the valiant Odinⁿ; the stars will fall from the azure vault; the two celestial armies will perish, annihilated by each other; and the universe, disorganized by so many opposing struggles, will present only a vast collection of elements confusedly mixed.

The predictions, however, of the sybil Vola,^o do not terminate with this frightful catastrophe. She invokes a deity greater than all those who are to perish in the general conflagration. This Being, superior to all others, will appear to establish eternal laws; a new earth will proceed from chaos, in the splendour of youth; the climates of the north will no longer have either ice or frost, but a perpetual spring will reign there, and Balder, the god of peace, raised again from the dead, will gather around him all virtuous men.^p

In this exposition of the Scandinavian mythology, we perceive resemblances to the writings of Plato, and many fictions similar to those which distinguish the philosophical systems of the Slavonians, Persians, and Indians. Do these different points of analogy prove, that in every climate man has given the same form to his religious ideas, as an author of merit supposes?^q Or, do they not rather point out to us, that the ancient dogmas of the north derive their origin from the sacred reveries, which are regarded as having had their birth in India? Or, lastly, have they not rather been carried from the regions of the north even as far as the east? The study of such monuments as have survived the destruction of ages, the knowledge of the ancient languages of the north, and a comparison of them with those of India, have probably not yet thrown sufficient light upon these questions. It is difficult not to recognise the striking resem-

^a "She shares the dead equally with Odin."—When she goes to the battles of men, one half of the slain fall to her and the other to Odin. (For. Q. Rev. No. VII.)—P.

blance that exists between the Normanno-Gothic,^a the language of the Scalds, and that in which the two poems of the Edda and Voluspa^b are written, and the Sanscrit. The Runic alphabet, which resembles the Phœnician characters, and those of the ancient inscriptions at Persepolis, had been in use in the north from time immemorial.^c Shall we admit, with certain modern authors, that the conqueror, who, under the name of Odin, was deified in the humid and icy regions of Scandinavia, where he founded a new creed and a new empire, proceeded from Asiatic Tartary, when a crowd of traditions and monuments prove, that the Scandinavian worship, or that of Odin, had been, when the Romans penetrated into Germany, established there from the remotest antiquity? Does not history present to us, in every country of the globe, the people of the north subduing the nations of the south, and the latter only here and there, through an instinct of self-preservation, re-acting upon the north, in order to keep back the masses ready to pour in upon them? If the affinity^d of languages is not a chimera; if the first language, if the first alphabet, if the first arts adopted by every people, are not the natural and universal results of the physical and moral organization of man; if they do not resemble each other for the same reason that in every country the drawings sketched by a child, or by an uneducated man, bear an identical character: we would say, that in order to ascend to their origin, we must advance towards the north rather than the south, because it is not natural that people should quit warm or temperate regions for northern ones, which have not even sufficient attractions to retain the natives, as is proved by the frequent migrations sent by the North to more favoured climates. It appears to us then difficult to prove that the Scandinavians are not descended from a primitive race, indigenous to the countries which it still inhabits.^e

Under the name of *Scandia*, the ancients designated all the countries which now comprise Norway and Sweden. Pliny calls it *Scandia insula*.^f The origin of this appellation arises from this circumstance, that in the time of the Roman naturalist, they were only acquainted with that part of the country called *Skanen* or *Skonen*,^g and that merely through the report of some Germans. This is the former province of *Schonen* or *Scania*, the most southern of Sweden.^h The name was afterwards changed to *Scandinavia*.

The Scandinavian tribes were much more addicted to the chase, and to fishing, than to agriculture. These occupations formed the principal guarantees of their independence. With them the representative form of government seems to have originated. They obeyed chiefs or kings who were at once judges and high-priests, but whose power was limited by the national assemblies composed of free men. The sov-

ereign authority was partly hereditary and partly elective, and this mixed organization was long preserved in Sweden. Their habitations lay dispersed, and to them, like the Germans, the confinement of a city would have proved an insupportable prison. Their manners were severe. With them, hospitality was the first of duties; cowardice and adultery were the two greatest crimes. They interred their warriors in such parts of the sea-beach, as were alternately covered and abandoned by the waves: "These tribes," says an author, whose testimony has already been referred to, "imagined that the shades of heroes preferred the majestic noise of the billows to the silent repose of a valley or a plain, and that their ghosts, rising amidst the obscurity of the evening, loved to contemplate the sons of Odin returning from their foreign expeditions, and repeating the warlike songs with which they had inspired them."ⁱ

The respect which they had for their women was carried much farther than even that of the Celts and Germans. At their festivals, at their public meetings, and at their feasts, the women always occupied the place of honour. They, on the other hand, rendered themselves worthy of the respect of the men, by their virtues, and by their attachment to their husbands. Often they accompanied them to battle, perished with them, or re-assembled the troops to avenge their death. Sometimes, but this was not a general custom, they immolated themselves on their husbands' funeral pile. The deep regard which the Scandinavians had for chastity, formed the principal safeguard of their morals; the women did not live apart from the men; the young women might receive into their apartments their relations, and even their future husbands. If, during a journey, two individuals of different sexes, and unmarried, were obliged to sleep upon the same bed, the man placed his naked sword between the woman and him, and it formed a more secure barrier than modern bolts. The education that women of rank received, proves also the respect with which they were treated. They were taught to read and to engrave the Runic characters, a knowledge interdicted to slaves; music and poetry formed also their employment, and the *Sagas*, or ancient historical relations, cite a great number of princesses who aspired to the title of poet. The women alone practised medicine and surgery; they alone dressed the wounded. They excelled also in the art of interpreting dreams, of predicting the future, and discovering the character of individuals from their features and physiognomy. Yet this superior education did not exclude domestic occupations; even their queens were acquainted with sewing, embroidery, baking, and brewing.

If the religion and manners of the ancient Scandinavians

^a See note ^a p. 1036.

^b This is a mistake. The Edda (poetical Edda) and Voluspa are not two distinct poems. The poetical Edda is a collection of mythological songs or poems, one of which is the Voluspa.—P.

^c The Runic characters are so called from the old Latin word *runa* (a javelin)^{*}, because they are of a sharp or pointed form; the Persepolitan writing is formed of letters which are called wedge-shaped (*cuneiform*), from their resemblance to a wedge or an arrow-head.

The Runic characters, which also resemble the Samaritan, the ancient Greek, and the Celtiberian, are in number sixteen.

^{*} Runic is derived from *run*, signifying in the old Scandinavian language, line or stroke, and in the old northern tales (*sagas*,) speech, song, and also letter and writing. In Ulpilas it signifies secret, and is thence used in the northern tales for a mysterious spell, song or letter. (For. Rev. No. II.)—P.

^d "Filiation"—affinity by descent or derivation.—P.

^e "God hath made of one blood all the nations of the earth." Paul, in Acts XVII. 26.—*Translator's Note*. ["God—hath made of one blood all nations of men for to dwell on all the face of the earth." Acts XVII. 26.—This is not the first time that the local, or rather *autochtho-*

nous, creation, we might say spontaneous production, of the different tribes or races of men, has been more or less distinctly stated in the original—a doctrine generally considered in English science, as equally opposed to religion and philosophy. Aside from the express declarations of scripture to the contrary, and the general conformity of the different races of men, in their physical, intellectual and moral constitution, there are certain circumstances connected with the doctrine of animal species, which render the opinion in the text, extremely improbable, if not absolutely groundless.—P.]

^f *Scandia, insula*: in the index; not in the text.—Sunt qui et alias [*insulas*] prodant, Scandiam, Dumniam, Bergos: maximamque omnium Nerigon.—Plin. Nat. Hist. l. iv. c. 16.—The author should have said, Pliny calls it an island.—P.

^g "*Skane* or *Skone*."—*Skanen* or *Skonen* is merely the word with the definite article *en* suffixed. See note ^a p. 1036.—P.

^h Sweden was formerly divided into provinces, but at present is divided into prefectures. (See Statistical Tables.)—P.

ⁱ Ch. Coquerel, Résumé de l'histoire de Suède.

present a picture interesting from the view it gives of the Norwegians and Swedes before their acquaintance with Christianity, that which they now present equally merits our attention. Let us begin with Norway. In spite of the vague ideas which the ancients entertained of the northern countries of Europe, it cannot be doubted that the country which Pliny^a calls *Nerigon*^b is Norway. Many geographers^c have asserted that the name signifies the *Way to the North*;^d but its true etymology is *Nor-Rige*, Kingdom of the North,^e or rather, perhaps, assuming the word *Nor* as signifying *Gulf*, Kingdom of Gulfs, because in effect its coasts are much more indented than those of Sweden. We thus see that the name of *Nerigon* has much more analogy with that of *Norrige* than with that of *Norweg*, which at the first glance appears to be the origin of the modern name.

The petty sovereignties, into which Norway was divided, were, from times the most remote, independent, acknowledging, however, a kind of supremacy in the kings of Sweden and Denmark, till about the year 940, when Harold Harfagre (the *Fair-haired*),^f after long fighting, formed one kingdom of all these principalities. Olof Trygvason,^g known also by the name of Olaus, whose bold adventures astonished the North, and possessor of the Norwegian throne in 991, endeavoured, by violence and cruelty, to extirpate the worship of Odin in his new states. But another Olof,^h at the commencement of the eleventh century, surpassed his predecessor in tyranny, and in zeal for the church, or in other words, for the clergy. In return, the church made a saint of him: even at Constantinople they erected temples to his memory, and his tomb was visited by pilgrims, not only from the North, but from all Europe. Down to the fourteenth century, many kings, whose vices and virtues we shall not even sketch, succeeded one another in the midst of political storms. Towards the close of the fourteenth century, the three kingdoms of Sweden, Denmark, and Norway were united under one sovereign, Margaret, daughter of Waldemar of Denmark. In the lifetime of Margaret, she appointed her grand-nephew, Eric, surnamed of Pomerania, her successor, who, on the death of Margaret, in 1412, succeeded to the three crowns, as Eric II. of Norway, IX. or X. of Denmark, and XIII. of Sweden.^j After various attempts had been made on the part of the Swedes, the oppression and cruelty of Christian II. led to a final separation of Swe-

ⁱ Olaf II. the saint, 1014—1030. (Pinkerton.)

^j It is altogether a mistake in the original to say that Eric XIII. reigned in Sweden only. He was the same person who was Eric II. in Norway, and Eric IX. or X. in Denmark.—Tr.

^k Gustavus Vasa excited the revolt in Dalecarlia in 1520, but did

not complete the restoration of Sweden till the capture of Stockholm in 1523. (Pinkerton, vol. I. p. 366.)—P.

den in 1520,^k under the renowned Gustavus Ericson (Vasa,) but Norway and Denmark remained under one sceptre till their separation in 1814, when Norway was united to the crown of Sweden.^l

It is known, that the Norwegians were opposed to the separation from Denmark and union to Sweden that took place after the downfall of Napoleon's empire in 1815.^m To compensate Sweden for the loss of Finland, to reward her for her assistance under Bernadotte, then crown prince of Sweden, in the important campaign of 1813, and at same time to punish Denmark for her adherence to Napoleon, or rather her neutrality in what was considered the common cause of Europe, the allies, in the plenitude of their power, determined upon the violent separation of two states that had been united for ages, and the junction of Norway with a state that had for ages been considered her natural enemy. It was in vain that the Norwegians remonstrated, and attempted resistance: they were threatened with starvation by a blockade of their ports; and they at last agreed to the union, on condition of being allowed to choose a constitution of their own. The constitution they made choice of was eminently popular, indeed democratic. All orders of nobility were abolished, with this exception, that those who possessed titles under the old regime, were allowed to retain them during their lives, and their children who were born, previous to the new order of things, are allowed to succeed them, but with them the title of nobility expires. The king is chief magistrate, but no taxes can be imposed, or laws passed, without the consent of the *Storting*,ⁿ or great council of the nation, which meets every three years, in the month of February, except in extraordinary cases, when it may be assembled, without regard to the ordinary time. It is composed of seventy-seven deputies, twenty-six from the towns, and fifty-one from the country. A spirit of independence runs through all the proceedings of the *Storting*, which has led to continual differences between them and the Swedish government, the latter accusing the Norwegians of an unreasonable and factious opposition, while they, on the other hand, charge the government with attempts to innovate upon and change the constitution. A traveller who lately (1827) visited Norway, was present at a meeting of the *Storting*: "There were," he says, "about fifty members present, some of whom had come from the

not complete the restoration of Sweden till the capture of Stockholm in 1523. (Pinkerton, vol. I. p. 366.)—P.

^l "In 1350, Norway, Denmark and Sweden were united under the same sovereign; Eric XIII., however, some years afterwards, reigned alone in Sweden, and the two other kingdoms remained almost continually under the same sceptre, until the definitive union of Norway with Sweden in 1814."—The marriage of Hakon VI. king of Norway, with Margaret daughter of Waldemar III. king of Denmark, A. D. 1363, produced the memorable union of the crowns of the north. On the death of her young son (Olaus,) Margaret ascended the throne of Denmark and Norway in 1387, and that of Sweden in 1389. (Pinkerton, vol. I. p. 341.)—The three kingdoms were not formally united, till the union of Calmar in 1397. (Ed. Encyc. art. Denmark.)—The crowns of Denmark and Norway were united by the marriage of Hakon and Margaret; the two countries, however, continued separate so far as to have distinct constitutions and codes of law, and were not formally conjoined as one kingdom till the year 1537. (Ed. Encyc. art. Norway.)—Eric of Pomerania, who succeeded Margaret in 1412, reigned 26 years after her death, when he was compelled to abdicate, A. D. 1448.—P.

^m Qu. in 1814, or rather after his expulsion from Germany in 1813. The king of Denmark was compelled to sign a treaty at Kiel, Jan. 14, 1814, by which he ceded Norway to Sweden in exchange for Swedish Pomerania and the island of Rugen. The Norwegians, however, resisted the union with Sweden, but in an assembly at Christiania, Oct. 1814, it was agreed that Norway should be permanently governed by the same king as Sweden, but as an integral state, and with the preservation of its constitution and laws.—P.

ⁿ *Stor*, great, and *ting* (Dan. *ting*.) court or tribunal.—P.

unfrequented parts of the country, and surprised us by the patriarchal simplicity of their appearance. They were drest in the coarse grey woollen cloth of the peasants, with long hair reaching to their shoulders, and their whole costume reminded one of the fashions of other centuries; they seemed beings of a different era from ourselves." "Were not," the writer adds, "the senators of Rome, when virtuous and poor, somewhat such men as these?" By an article of the constitution, the king must pass some time every year in Norway, unless prevented by urgent circumstances; and by another, public employments are conferred only on Norwegian citizens, who profess the established religion, which is declared to be the Lutheran. Jews, by an express article, are prohibited from entering Norway.^a

In a country where man seems to have always enjoyed his rights, and preserved the exercise of his dignity; where the peasant, far from being subjected to that kind of moral and political non-existence, under which he has been everywhere else oppressed, lives a free-man, and is represented by deputies in the national assemblies; where the rich proprietor is, so to speak, merely a rich peasant; where the order of nobility is almost unknown; and where large estates and mansion-houses corresponding, are less frequent than in any other country; the epoch of the reformation would naturally be an era for consolidating the institutions dear to a population jealous of its liberty, and thus Protestantism was easily established in Norway in the year 1525. The Norwegian clergy, no less charitable and virtuous than those of other Christian countries, are superior to them in information. It is amongst this respectable class that the peasantry find well-informed teachers, indulgent reprovers, assiduous comforters, and models of behaviour. Every plan which is conducive to the general interest, public utility, and the prosperity of the country, finds wise appreciators of its value in the simplest country curates. It is thus to their advice and to their influence that government is anxious to have recourse, when it is intended to establish granaries, to repair bridges and roads, or to introduce some new mode of cultivation. It is rare not to find among the clergy well informed mineralogists, economists, botanists, and agriculturists. There have been amongst them many sufficiently acquainted with astronomy to find pleasure in diffusing the knowledge of this science, and so zealous, as at their own expense to erect observatories furnished with every necessary instrument. They have been even known to introduce among their parishioners the art of making watches and clocks.

In travelling through Norway, we at this day discover the truth of what has been said above of the taste of the Scandinavians for detached habitations: a village is often composed of houses scattered here and there, and forming an entire parish extending over a space of several leagues. On Sundays the roads are seen covered with light carriages,^b which transport the peasant, with his whole family, in their best array, to church to assist in divine service; the churches, although large, can rarely contain the crowds eager to listen to the voice of their pastor. After sermon the whole population give themselves up to the amusement

of the dance, to games, and to various gymnastic exercises. The young men often meet together to go through military manœuvres. At a fixed time every year, the youth, who, still inheriting the warlike inclinations of their ancestors, voluntarily enrol themselves in the militia, assemble together under the command of their officers, and form disciplinary camps, where they are instructed in the manual exercise and in military evolutions.

Industry and frugality, the sources of the civil virtues, form prominent features in the Norwegian population: intelligence and education strengthening these valuable qualities, shelter it from corruption of manners, and maintain in all hearts the sacred fire of the love of independence. Christmas is the only time of the year, when the assembling of families, and the accompanying festivities, make the Norwegians deviate from their simple and frugal habits. It is also about the same time, and during the month of January, that the peasant, trusting to the swiftness of his sledge, travels to the towns, to exchange the produce of his crops for country implements and for different articles of manufacture suitable to his wants and inclinations. The aptitude of the Norwegians to imitate every thing is such, that during the long winter-evenings, they are seen in every family, assembled around the fire-place, the men employed in making knives, spoons, shoes, and buttons for their clothes, and the women, in preparing linen and woollen stuffs for their dress, and even in dyeing them with the colouring lichens in which the country abounds. The skill which distinguishes the population in some districts is even such, that it transforms every habitation into a little manufactory, the products of which are exported into the less industrious districts.

In Norway there are few great proprietors, but, on the other hand, extreme poverty is unknown. Nothing is more uncommon than to meet with a beggar. If age or infirmities disable some unfortunate creature from working, he finds assistance and generous attention in the bosom of his family or his parish. Compassion towards indigence and misfortune is with the Norwegian rather an ancient virtue, than the effect of Christian charity. It is the same as to hospitality, which with him is a sacred duty. To these personal qualities there is joined great quickness of apprehension, a character lively and frank, and unflinching fidelity. He loves with enthusiasm his country and his sovereign, and respects his superiors, but refuses them slavish homage. His manners are gentle, polite and affectionate; his mien is noble, his gait easy, and his dress always neat. The costume of the females is simple and graceful; at home they wear a plain morning gown, with a linen chemise of a dazzling whiteness, plaited around the neck and fastened by a collar.^c A complexion of the lily and the rose, beautiful flaxen hair, and a person tall and well-shaped, give them a peculiar grace, which a stranger would be tempted to take for coquetry, if Scandinavian modesty and pride did not betray themselves in their look and behaviour. A few districts situated in the mountains have preserved some remains of the old Scandinavian costume; such as that of Valvers,^d where the inhabitants are no longer seen, accord-

^a The above paragraph is added by the translator.—P.

^b "Carrioles"—a kind of small chaises. For an account of them, see Conway's Journey through Norway, Sweden and Denmark (Constable's Misc.) p. 41.—P.

^c "While employed in their household, they wear simply a petticoat with a chemise, &c."—The women of the lower order wear a jacket, with a shining black apron over their petticoat, and a turban handker-

chief upon the head, beneath which appears a clean laced mob tied under the chin; but while employed in their household affairs, they frequently wear nothing more than a petticoat and a shift, with a collar reaching to the throat, and a black sash tied round the waist. (Ed. Enc.)—P.

ing to an ancient custom, fighting with the knife, after being tied together by their girdles;^a that of Tellemark, where mutual trust and good faith leave them in ignorance of the use of locks; and the valleys, in fine, where some families of peasants, that marry only with one another, pretend to be descended from the ancient kings of the country.

Such are the manners of the peasantry; the morals of the inhabitants of the towns are, it is true, less irreproachable and less pure; some seeds of corruption may be already remarked there, but there is nothing at all resembling the depravity which we see in the cities in other parts of Europe.

Let us now cast a glance at the physical state of Norway. The mountains which traverse this kingdom and Sweden form of themselves a range^b which we may call the Scandinavian, and which is divided into three groups. That of the *Kælen* mountains,^c the most considerable from its length, extends from the northern extremity of Lapland, to its junction with the *Dovre* mountains, near the source of the small river *Nidelv*.^d Strictly speaking this forms but one great chain, but the branches it throws off to the right and to the left, the mountainous isles of *Lofoden*, which are merely the summits of some of its branches, and the mountains which terminate near *Lake Enara* in Russian Lapland, merit for it the name of group. That of *Dovre* or *Dovrefield*^e may be considered as forming with the mountain of *Snæ-Hættan*^f to the west, and with those of *Seveberg*^g and *Svuku*^h which terminate in plateaus in southern Sweden, a second group. Lastly, this group is separated by the course of the *Vog*, from that which is composed of the mountains of *Langfield*,ⁱ *Soynfield*^j or *Sunnanfield*, and *Hardangerfield*, and the branches which they send out to the west, the east and the south. This last group occupies all the southern part of Norway.^k

^a This may be rendered: while holding each other by the ends of their girdles.—P.

^b "Form a single system—"

^c The mountains of *Kolen* (Pinkerton)—of *Kiolen* (Ed. Enc.)—properly, of *Kiølen* (*kiøl-en* (Dan.) *kæl-en* (Swed.) the keel.)—From *Dovrefield*, a long branch, decreasing in elevation as it proceeds, stretches northward between Norway and Swedish Lapland, forming at its farthest extremity the mountains of *Kiolen*. (Ed. Enc.)—The chain of *Kolen* extends from the north of lake *Oresund* (where the *Dofrafall* terminates) and the vicinity of the copper mines of *Roras*, between Norway and Swedish Lapland. (Pinkerton.)—P.

^d *Elv*, in Danish and Norse, (*elf*, in Swedish,) signifies a river.—In Norway, as in Sweden, the largest rivers are called *Elven* or *Elben*. (Pinkerton.)—*Elven* is the word in the singular with the definite article *en* suffixed. *Niddven* consequently signifies the *Nidelv*, or the river *Nid*. The *Nid* passes by *Drontheim*.—P.

^e *Dovrefield* (Ed. Enc.)—*Dofrafiell*, *Dofrafiell* (Pinkerton.)—*Dovrefield* (Dan.) *Dofrafiell* or *Dofrafiell* (Swed.)—*Fiel* [*fiell* or *fiell*. P.] in the Swedish, and *fielt*, in the Norwegian language, [*field*, in Danish. P.] properly denotes those elevated summits, where vegetation entirely ceases; but it is a common denomination for all lofty mountain ridges. (Ed. Enc.)—*Fjall*, a ridge or chain of mountains. (Widegren's Swedish Dict.)—The *Dovrefield*, or *Dofrine* chain, extends east and west from the province of *Romsdal*, where the *Langfield* terminates, to the commencement of the chain of *Kiølen*.—P.

^f *Sneehattan*, height 8115 Eng. feet. (Ed. Enc.)—*Sneehatta* [without the article.] Lat. 62° 18' N. (Morse.)—*Sneehatten* (Dan.) *Snæhattan* (Swed.) the snow cap, from *sne*, *snæ*, snow, *hatte*, *hatta*, cap, and the article *en*.—P.

^g A branch from the eastern termination of the *Dovrefield*, extends to the south-east, forming the common boundary between Norway and Sweden, and is sometimes called *Seveberg*. (Ed. Enc.)—*Pontoppidan* calls this central chain, *Seveberg* or the seven mountains. (Pinkerton.)—*Sve* (Dan.) *sju* (Swed.) seven; *bjerg* (Dan.) *berg* (Swed.) mountain.—Some writers regard the *Seveberg* as the same with *Pliny's Sevo*, which was in Germany. (Pinkerton.)—The *Sevo mons* of *Pliny*, which it is thought accords with the *Riphæan* mountains, (said to have been near the source of the *Tanais* or *Don**) can be no other than the great chain of Norway. (D'Anv.)—P.

* Perhaps the Ural mountains, or the ridge of *Waldai* in central Russia.—P.

The average distance of the summit of the *Kælen* mountains from the sea-coast of Norway being only about twenty leagues, the rivers proceeding from them and running into the North Sea,^m can be of no great length. The most important is the *Namsen*, which, from its exit from the lakes that give rise to it, has only a course of thirty leagues. Other more considerable streams descend from the mountains of *Dovrefield* and *Sunnanfield*: these are the *Glommen*, the *Drammenselv*,ⁿ and the *Lougen*,^o which empty themselves into the strait of *Skager Rack*,^p separating Denmark from Norway. The *Glommen*^q is a river of one hundred and fifty leagues in length, the principal tributary of which, the *Vormen-elv*,^r has a course of not less than fifty leagues. The *Glommen* has a great many falls, and on the melting of the snows, or after great rains, it acquires a frightful rapidity, and its inundations desolate the fields. One of these falls is at *Hafslun*, about ten miles distant from *Fredericstadt*. Here the *Glommen*, about the size of the *Thames* at *Richmond*, "gradually contracts itself with more hurried current, till it arrives at the deep gorge formed by the projecting rocks, and then bursts headlong into the abyss beneath. The fall is not quite perpendicular. Some idea may be given of the body of water that descends, from the circumstance that a three-masted ship was loading at some distance below." The height of the fall is seventy-two Norwegian feet. A melancholy catastrophe occurred here on the 5th February 1702. The family seat of *Borge*, situated over against *Hafslun*, together with every thing in it, sunk down into an abyss of a hundred fathoms deep, the gap being instantaneously filled up by a sheet of water of between three and four hundred ells long, and half the breadth. The house was doubly walled; but of these, as well as several high towers, not the least trace was seen; fourteen persons and two hundred head of cattle

^h *Swukku*, *Swuckustoet* (Pinkerton)—one of the highest of the Norwegian mountains, near lake *Fæmund*.—*Seucku* is the name of the mountain, and *Seucku-stat* (*Svucku* Peak,) that of its summit. (W. Hisinger, *Anteckningar i Physik och Geognosi under resor uti Sverige och Norrige*, Första Häftet, p. 51.)—P.

ⁱ *Langfield*. (Ed. Enc.)—*Langfiell*, the Long Mountains. (Pinkerton.)—*Langfield* (Dan.) *Langfiell* (Swed.)—Long Mountain.—P.

^j *Sognefiell*. (Pinkerton.)—P.

^k It extends south and south-west towards the *Naze*, from the western termination of *Dovrefield*.—P.

^l For the height of these mountains, see Table of European Altitudes, Book XCIV. vol. II. p. 366.

^m Properly, the Northern Ocean.—The term North Sea, is generally limited to the German Ocean, south of the latitude of the *Shetland* Islands.—P.

ⁿ *Drammenelv* (Ed. Encyc.) *Drammen* (Conway.) The *Dramme* (Pinkerton.)—Flows into the west side of the bay of *Christiania*.—P.

^o Among other rivers in the south of Norway are the *Louven* [*Louve*.] Conway. Pinkerton—*Louven*. Tuckey) and the *Laugen*. (Ed. Enc.)—The *Louven* passes by *Kongsberg*, and enters the sea at *Laurvig*, west of the entrance of the bay of *Christiania*.—It may be here remarked, once for all, that the termination *en* or *n*, in Scandinavian names, does not, in general, belong to the name itself, but merely expresses the definite article, as *Glommen*, *Louven*, the *Glomme* and the *Louve*. It is therefore as improper to say the *Glommen* as the *La Seine*.—P.

^p *Skagerack* (Tuckey.) *Scaggerac* (Ed. Enc.) Called also the *Sleeve*.—The *Skager Rack*, which derives its name from the reef or sand-bank (the *Skagen-rack*) that surrounds the north point of *Jutland* (called *Skagen*, the *Skag*, by the Danes, and the *Scaw*, by English seamen,) is properly the strait extending north-east, at the entrance of the Baltic, and is succeeded by the *Cattegat* (a Dutch word signifying *Cat-Channel*), which stretches south and terminates in the *Sound* and the *Belts*.—P.

^q The *Glom* or *Glomen* [properly, *Glomme* or *Glommen*. P.] called also the *Stor Elv*, or great river. (Pinkerton.)—*Glommen Elv* (Conway.)—It rises in *Lake Oresund* in 62° N., in the angle formed by the *Dovrefield* and *Seveberg* mountains, and enters the sea at *Frederickstadt*.—P.

^r The *Worm*. (Ed. Encyc. Pinkerton.)—*Vormen Elv*, the river *Vorm* (Conway.)—P. ^s *Everest's Journey through Norway, &c.*

perished. The cause of this melancholy occurrence is attributed to the Glommen having undermined the foundation.^a The declivity of the surface does not admit of the lakes of Norway being equal in magnitude to those of Sweden. The largest is the *Miasen*,^b twenty leagues long by two in breadth, which is traversed by the Vormen-elv. The most important waterfalls are those of *Fciumfos* near Lister, six hundred feet in height, and *Røgenfos*,^c in the province of Tellemark, eight hundred and fifty feet in height.

The geological constitution of Norway is, in general, primitive. In the Hardangerfield mountains, the summit of Vetta-Kelden is composed of red porphyry, which, at the depth of from twenty to thirty feet, assumes all the characters of the rock called sienite. In the highest mountains of the group, gneiss predominates; from the mountain of Lic to the rivulet called the Totak, we find on the contrary micaceous schistus; in all that mountainous region, schistus^d shows itself at every step, and supplies slates which readily split into long and narrow plates, or else, as in the neighbourhood of Groven, furnish quarries of whetstones. On the banks of the Totak the surface is strewn with blocks of stone from thirty to forty feet in height; the position which they occupy is too far from the mountains to explain their origin; however, they can only be the result of alluvions formed at one of the latest geological epochs by currents of fresh water proceeding towards the sea.^e At all times these blocks have been objects of wonder to the natives of the country; according to a mythological tradition, it was the god Thor who broke them with his hammer, and who afterwards having let fall that instrument, threw them about on all sides in seeking it. A geologist breaking specimens from these stray blocks, might, even at this day, be taken by the inhabitants for a worshipper of Thor. Near Bergen, in the island of Hiertoen,^f there appears above the waves, a mass of black and porous lava, from twenty to thirty feet in thickness. The whole southern part of Norway has frequently experienced earthquakes. A naturalist^g maintains, that the mass of lava just referred to, may have been thrown up from the bosom of the waves; it is even said, that fifteen leagues to the south of Bergen, at the bottom of the bay of Bukfiord,^h fire sometimes issues from a crevice, in a precipitous rocky shore formed of gneiss.

All the mountains, and especially those of the south, contain a great number of minerals, sought after in collections, and of metals in use by man: the environs of Drontheim, at the foot of the Kœlen mountains, and of Raraas,ⁱ at the base of the Dovrefield mountains, contain copper of the best quality; the best iron mines are wrought in the district of

^a The above account of the fall at Hafslun [that of Sarpen, above 60 feet perpendicular,] and of the destruction of Borge, is added by the translator.—P.

^b The lake of Miøss. (Ed. Enc. Pinkerton.)—Lake *Miosen*. (Conway.)—Properly, *Miasen*, the Mies, or *Miasen Sø*, the Mies lake.—This must not be confounded with the *Mios-Vand* (Conway) or *Mios Mias* Water, west of Kongsberg.—P.

^c *Fos* signifies a waterfall, in Danish—*Røgenfos*, the smoke fall, from *ag*, smoke, in Danish.—P.

^d "Schiste"—Argillite.—P.

Arendal. The abundance of these metals in part indemnifies Norway for the diminished wealth of the silver mines of Kongsberg, the working of which has, however, been revived since 1815.^j In other places there are found lead, cobalt and plumbago. Different kinds of marble are dug from the sides of several mountains; some of them are employed in the arts, principally in the environs of Bergen.

In southern Norway the mountains are, many of them, surmounted with rounded summits, crowned with wood; in the north, on the contrary, the mountains, although less elevated, are almost always covered with snow, and consequently destitute of vegetation, but the hills, most generally composed of sand, give birth to many cryptogamous plants. Those whose surface is formed of mould are covered with different species of saxifrages, and other plants scattered here and there: here the *Diapensia lapponica* presents its evergreen tufts; there the elegant andromeda (*Andromeda cærulea*, Linn.) rises in small thickets by the side of the trailing azalea (*Azalea procumbens*), whose creeping branches preserve their freshness in the midst of the rigours of winter. At the foot of these hills, the birch, a tree whose sap, collected by the Norwegians, is used in making a liquor which resembles sparkling white wine, waves in the breeze its light and flexible branches, and often forms with the maple, the pine, and the fir, forests of an immense extent. The pyramidal form of these resinous trees is in harmony with the pointed rocks which serve them for a base, and with the icicles, which, during several months, load their branches with elegant stalactites. The fir attains a height of a hundred and sixty feet. It is much in request for masts and carpentry work. After being cut down, it is thrown from the top of the steep summits into the little rivers which descend from the mountains to the sea. Hurried along by the rapidity of these streams, it rushes over the cataracts, and does not stop in its progress till it reaches the ranges of piles^k fixed at a short distance from the creek or bay, where it becomes an object of commerce. In the low lands, the creeping strawberry-tree,^l the scarlet-flowered camarina^m (*Empetrum nigrum*), and the dwarf birch, whose seeds, concealed under the snow, are sown after during the winter by the ptarmigan,ⁿ rise amidst the lichens which form the food of the rein-deer. In the central provinces^o the aspen grows vigorously; in the environs of Drontheim, beyond the sixty-third degree of latitude, the oak begins to appear, and near Christiania, we see it flourishing, but it is only in the southern provinces that there are fine forests of this tree. In the south of Norway, apples and cherries arrive at perfect maturity; near Drontheim they do not ripen, but the mild

^o "Middle region"—between the northern and southern extremities of Norway.—P.

influence of the sea, which we have already had occasion to remark, is so sensibly felt in the island of Touterœe, two degrees and a half from the polar circle, that these fruits ripen there without difficulty. In some gardens in the south, the peach, the apricot and the melon are cultivated, and succeed perfectly; and it seems even probable, that when horticulture shall have made some progress among the peasantry, they will be able to naturalize many plants of our temperate climates. Even now they cultivate with much care and success flax, hemp and hops, and the culture of the potato has shown, that it would be always easy for Norway to avoid the scourge of famine, by multiplying this vegetable so as to supply the place of grain. There is little wheat raised; barley is more abundant; but oats is of all other grains that which succeeds best in this country,^a where agriculture has a thousand obstacles to surmount, where the low lands are frequently exposed to inundations, and where the heights are rendered sterile at one time by cold, and at another by heat.

The increase of population has caused in Norway a diminution in the number of wild animals. The elk is now very rarely to be met with; the bear, rearing upon his hind feet, still attacks the hunter who awaits him armed with his knife; the wolf continues to be the terror of the herds and flocks; but whilst the bear takes refuge in the woody mountains, the wolf seems to dread the woods and hedges, and establishes himself in the open country, and even sometimes upon the ice.^b Different kinds^c of foxes inhabit the shores washed by the Icy Ocean, and the lemming descends in troops from the Kœlen mountains, and marching in close columns, ravages the cultivated fields. A multitude of birds inhabit the shores of the ocean, and Norway furnishes the greater part of the eider-down on which our delicate dames rest during their frequent headaches. Nothing is more dangerous than the manner in which the Norwegian goes to collect upon the rocks which border the sea, this down sought after by the effeminate. Suspended above the waves, he hoists himself up by the aid of a rope in order to reach the clefts and cavities where the birds build their nests.^d If the cord should give way, or if the staff on which he leans should break, the unfortunate adventurer, thrown from the top of the precipice, finds a frightful death amidst the rocks and reefs below. The Norwegian rears in his valleys numerous herds and flocks. His horses are small, but lively and sure-footed, like all those of mountainous countries: his horned cattle feed at liberty in the islands that border the western coast; there they often become so wild, that they are obliged to shoot them. His sheep are formed like deer, with long legs and small muzzles.^e Numbers of goats are also kept on the hills. Fish abound in the seas, lakes and riv-

^a Oats are the most generally cultivated in Norway; barley and rye hold the next rank; but wheat, buckwheat, and peas, are far from being common. (Ed. Enc.)—P.

^b In the long twilights of the winter season, the wolves become formidable to travellers, especially on the extensive lakes, where they assemble on the ice in great numbers. (Ed. Enc.)—P.

^c "Species."—In Norway, there are white, red and black foxes. (Ed. Enc.)—The common European red fox, and the cross fox, from the north of Europe, characterized by a black line along its back and across its shoulders, both belong to the same species (*Canis vulpes*.) The white fox (*Canis lagopus*—Isatis or blue fox, its colour being bluish grey and sometimes white,) is a distinct species.—P.

^d The common mode of gathering the down and eggs from the nests, is as follows. An individual seated on a stick, attached to a rope, with a guiding staff in his hand, is lowered over the edge of the precipice by others, and in this way is raised or descends, or advances along the shelves, according as is necessary in prosecuting his search.—P.

^e This sentence is added by the translator.—P.

ers, and the bold Norwegian derives considerable profit from his fishing.

The climate of Norway presents more variety than is generally believed: it is not everywhere equally cold and severe; towards the east, and in the interior, the winter is longest, and the cold the most intense. This season is the most favourable part of the year for the mutual intercourse of the people, and the interchange of commercial transactions. It is also the season for those parties of pleasure so little known in milder climates. At that time there take place, in the neighbourhood of the towns, splendid races^f upon the snow, where the elegance and richness of the sledges, the splendour of the harnessing, and the beauty of the horses, which, swift as the wind, make the air resound with the clear sound of their little bells, surpass by their lustre and their speed the brilliant assemblies of equipages at Paris, Vienna, and London. The spring announces itself by the sudden and terrible ravages occasioned by the melting of the snows.^g During the month of April, and the greater part of May, the country is impassable, and in the mountains, travelling is impracticable till about the month of September, when the snows that cover them are in a great measure melted, and the heats of the summer have lost their force. At Bergen the length of the longest days in summer is about nineteen hours, whilst in the neighbourhood of Drontheim, it is not less than three weeks. The average temperature of the year is at Christiania, five degrees above zero of Reaumur's thermometer, while at Petersburg, under the same latitude, it is only three degrees. Near the southern coast, the temperature in certain districts allows them to have two crops of grain, and in warm summers they have even three. Generally the climate is healthy. But towards the western coast the country assumes a different aspect: the saline exhalations from the sea are injurious to vegetation; the bays never freeze; the cold is not felt, except when the east wind prevails, which crosses the high mountains, on the north, which comes from the Icy Ocean; fogs, rains and tempests extend their pernicious influence, one of the effects of which is to favour the ravages of the scurvy.^h

We see from the preceding statements, that, situated between the fifty-eighth and seventy-first degrees of latitude,ⁱ and in length more than four hundred leagues by a breadth of about twenty in the northern and eighty in the southern parts,^j Norway presents an aspect, in some parts, of the most pleasing, and in others, of the wildest description. Here, dark forests of resinous trees rise on the confines of ravines frightful from their depth; perpetual glaciers bear sway, and the loud cry of the eagle alone interrupts the silence of the desert.^k There, dwellings covered with red tiles,^l and placed on the sides of hills, isolated spires reflect-

^f "Courses"—drives.

^g "—by the *débâcles*"—breaking up of the ice in the rivers.

^h See Excursion to the Fieldstuen Mountains, by W. M. Carpelan, published in Sweden in 1824.

ⁱ It extends from the Naze in 57° 58' N. to the North Cape in 71° 11' 30".—P.

^j "—by a breadth of about twenty leagues north of 64°, and of eighty south of that latitude."—It extends about 950 miles from north to south. Its breadth, in the southern provinces, is between 150 and 240 miles, but beyond the 67th of north latitude, does not exceed 60, nor in some places even 30 miles. (Ed. Enc.)—The breadth of Norway diminishes very considerably about the latitude of Drontheim, between 63° and 64°.—P.

^k "—perpetual glaciers predominate [i. e. the country is, in general, covered with perpetual snow and ice,] and the roaring of the north-wind (*aquilon*) alone disturbs the silence of the desert."

^l The roofs of the houses are frequently covered with tiles, but more commonly with planks, upon which is laid the bark of the birch tree with a coat of turf above all. (Ed. Enc.)—P.

ed on the surface of the lakes, and forges and mills hanging over the torrents, announce a country where civilization and industry advance without opposition in the march of improvement. On the coast, arms of the sea surrounded with rocks succeed each other with the most melancholy sameness. But on entering them the scene all at once changes, presenting at the bottom of these bays and creeks, whose narrow and gloomy entrance is often dangerous, towns of a cheerful appearance. Let us notice some of the most important of these, beginning at the north and proceeding to the south.

Hammerfest, near the North Cape, is a thriving little place. The Spitzbergen trade is its principal support. Small sloops, from thirty to forty tons burden, are usually fitted out for expeditions to that quarter. This trade has given Hammerfest a more enterprising set of seamen than any port in Norway. Drunkenness is very prevalent among the Laplanders here. *Tromsø*,^a farther to the south, with its eight hundred inhabitants, is, says a traveller already quoted, "quite the pride of the North." It lies on an island covered with birch shrubs, and carries on some trade with the Russians from Archangel.^b

Drontheim or *Trondhiem*^c lies at the bottom of an arm of the sea of great extent. It is a walled city,^d but its walls and its two forts^e are falling in ruins. It is built of wood, but the frequent fires, to which it has been subject, have led to the erection of tastefully constructed houses, in room of the old habitations, and to the substitution of wide and straight streets, in place of narrow and crooked lanes. It was founded in 997 by Olof Trygvason upon the site of the old Scandinavian city of *Nideros*.^f At the distance of half a league from its walls, the church of *Hlade* covers the ground where stood the temple of Thor and Odin destroyed by Olof. Drontheim was long the residence of the Norwegian kings: the ancient throne of these princes is still to be seen in the palace, now used as an arsenal. Drontheim formerly possessed a magnificent cathedral, compared by the Norwegians to St. Peter's at Rome; but in 1719, it was destroyed by a frightful conflagration. It has been replaced by a church, less

magnificent indeed, but still remarkable for its extent, its ornaments, and its marble columns.^g By the treaty of union, this church enjoys, as the former building did, the privilege of being the basilicon,^h where the kings of Norway are crowned.ⁱ The most considerable buildings, after the cathedral, are the government house,^j and that of the Society of Sciences,^k the last of which contains a good library, and a cabinet of natural history. The environs of Drontheim have an agreeable aspect, being adorned with neat and pleasant villas that rise here and there in the country, and on the borders of the bay. They are, besides, embellished by two beautiful waterfalls, called the great and the little *Leerfos*.^l

Bergen, also at the bottom of a long bay, bristled with reefs, and surrounded by rocks, carries on a great trade in timber, spars, hides, and especially dry and salted fish. Seven mountains rise in a semicircle around the town, which is defended by batteries fronting the sea, but has no regular fortifications.^m The old castle built in 1070, by king Olof Kyrre, served as a residence to the sovereigns of Norway, until the celebrated epoch of the union of Calmar, about the end of the 14th century; it is now used as a prison, a store-magazine,ⁿ and a habitation for the governor^o of the place. Bergen, as a town, cannot be compared with either Drontheim or Christiania. In place of the wide streets crossing each other at right angles, which we find in both these towns, in Bergen you are involved in a labyrinth of narrow lanes, and a stranger who once quits sight of his own door, is fortunate if he has not to hire a man to show him the way home again.^p Amongst its 3000 houses, which are almost wholly of one story and painted on the outside, there are to be seen several of stone. There are in Bergen four churches, many schools, amongst others a Lancasterian school, where 350 boys and girls are instructed, and several charitable institutions. A museum is forming under the care of some individuals of the place, and the collection has enlarged so as to fill a handsome room: its principal riches are ancient remains of the country.^q It was the native place of Eric Pontoppidan,^r who became its bishop, and founded its university.^s It was also the birthplace of Lewis Holberg,^t an author

district. It is a large palace, which overtops the other buildings, built of wood, in a simple and noble style of architecture. (Ed. Enc.)—P.

^k A Society of Sciences was established at Drontheim in 1700, and sanctioned by the king in 1767. Its meetings are held in a large and beautiful stone edifice, recently erected, partly occupied by the society, and partly by the high school and its teachers. (Ed. Enc.)—P.

^l See note c p. 1042.

^m "It is defended by several fortifications and by high walls."—This must be a mistake in the original, and besides contradicts its own statement respecting Drontheim. It has probably mistaken the mountains, with which the town is surrounded, for walls.—Bergen is built in the form of a crescent round a gulf of the sea, and is defended by seven lofty mountains, and by several fortifications, particularly that of Fredericksburg. (Ed. Enc.)—It is situated in the centre of a valley, forming a semicircle round a small gulf, and is defended on the land side by high mountains, and by several fortifications towards the sea. (Pinkerton, Tuckey.)—The town is protected by the castle of Fredericksburg, which defends it towards the sea, and by very high mountains towards the land. (Enc. Meth.)—P.

ⁿ "Magasin d'approvisionnement"—store-house for public supplies.—P.

^o "Commandant."

^p The two last sentences are added by the translator. In place of it, in the original, it is only stated that Bergen is irregularly built.—P.

^q This sentence, and the account of the Lancasterian school, are added by the translator.—P.

^r Eric Pontoppidan, bishop of Bergen, and author of a natural history of Norway, was born at Aarhus in Jutland, 1698. (Gorton's Biog. Dict.)—P.

^s "College."—There was no university in Norway, previous to the establishment of that at Christiania.—There is an academy or high school at Bergen, as well as at Drontheim. (Ed. Enc.)—P.

^t *Ludvig Holberg*. (Dan.)

Properly, Tromsøe or Tromsøe.—Tromsø (Tuckey.)—P.

^b The above paragraph is added by the translator.—P.

^c *Heim* (Gerin. Dn.) *hicia* (Dan.) and *hem* (Swed.) signify home, and in the names of towns are the same as *ham* (Eng.)—P.

^d "It is the only walled town (*ville fermée*) in Norway."

^e The town is protected by the fort of Christianstein, and by the castle of Munkholm, situated on a rock in the harbour. (Ed. Enc.)—P.

^f It was anciently called *Nideros* (mouth of the *Nid*.) whence its Latin name, *Nidrosia*. (Tuckey's Mar. Geog. vol. I. p. 196.)—It is situated on a small gulf on the south side of the river *Nid*, from which it received the name of *Nideros* [*Nidaros*. Pinkerton.] or the outlet of the *Nid*. (Ed. Enc.)—P.

^g The cathedral, dedicated to St. Oluf, was formerly a magnificent building of marble; but it was burnt down in 1530, with the exception of the choir, which still forms part of the present cathedral. This cathedral is still the finest and largest edifice in Norway. (Ed. Enc.)—The cathedral, founded by St. Oluf, was of marble, and exceeded in size, as well as in magnificence, every thing of the kind in the north. It was almost entirely burnt in 1530, the choir alone remaining, which now serves as the principal church of the town. (Tuckey, vol. I. p. 197.)—P.

^h "Basilique"—Basilic (Lat. Ital. *Basilica*.) a church; properly, a large church, or one of royal foundation. The term *Basilica* is applied to several of the larger churches at Rome, such as St. Peter's and St. John of Lateran. *Basilicon* is the name of a well known plaster, but, we believe, is not applied to a church.—P.

ⁱ Reise durch das westliche Schweden, Norwegen und Finnland, von Fried. Wilh. von Schubert.—[Travels through the western part of Sweden, and through Norway and Finland, by Fred. Wm. Von Schubert.]

^j "Hôtel du gouvernement."—The town-house (*Stiftsamthaus*) is now the residence of the chief magistrate and the public bodies of the

distinguished as a historian and writer of comedies. During the middle ages, Bergen was a factory of the Hanseatic League; its harbour is large and well fortified. From this city, 1003 electors send four representatives to the *Storting*^a of Norway.^b

Christiansand, on the southern coast, is the fourth city in the kingdom. It was founded in 1641, by Christian IV. king of Denmark, who wished to make it the principal station for his navy. In 1807 it was destroyed by the English. Its harbour has been repaired: it is deep, and well fortified, and forms the principal refuge of vessels that have suffered damage in the dangerous passage of the Cattegat. The cathedral is the finest edifice in the city. Half a league from the coast, a quarantine establishment is erected on an island. *Arendahl*^c is a small but neat town, built on rocks that project into a channel of the sea, and is inhabited by merchants and fishermen. Ships lie close to the houses.^d *Frederikstadt*,^e at the mouth of the Glommen, carries on a considerable trade in timber. Batteries erected on several islands, and two forts which communicate by a subterranean passage, defend the entrance to its harbour. It is the only city in Norway which is built of stone. *Kongsberg*, celebrated for its silver mines and its manufacture of children's toys, is watered by the Lauven,^f which flows in a deep and wild valley.

Twelve leagues to the east of Kongsberg, the gulf of Christiania branches out into many bays. The length of this gulf is twenty-two leagues from south to north; its greatest breadth is five leagues, but in the narrowest part only a league and half.^g It is surrounded by high mountains, and studded over with islands, some of which are pretty large. Several small towns rise on its shores; amongst others that of *Moss*, where was concluded, on the 14th of August 1814, the convention which led the way to the union of Sweden and Norway. *Christiania*,^h the capital of Norway,ⁱ stands at the extremity of this gulf, and its houses and gardens, grouped in a circle around the harbour, seem to rest upon an amphitheatre of rocks and forests. The appearance of

this capital is pleasant, as well as majestic; its streets are broad and well paved, and, if it contained fewer houses of wood, it would be one of the finest cities in the North. Its suburbs are considerable; one of these, called *Old Opslo*, is all that remains of the ancient capital of Norway, founded by Harold the Fair-haired, in the eleventh century,^j and destroyed by a fire in 1624.^k The modern capital bears the name of Christian IV. its founder. Its regular buildings increase from day to day with the population. The finest edifices are the cathedral, the government palace,^l the new town-house, the military school, the new exchange, and the university, the number of students at which is about 120. The number of professors is 15, whose salaries are paid in corn. In the hall of this establishment are annually held the sittings of the constitutional assembly, called the *Storting*. Founded in 1813, it was intended as an university for the kingdom. Its library already contains many thousand volumes;^m it possesses, besides, a fine cabinet of natural philosophy, an observatory, a botanical garden, and a collection of natural history. Christiania is an episcopal see, the incumbent of which enjoys a revenue of £700 sterling.ⁿ There are in Christiania many benevolent institutions, and, among others, two orphan houses: one for those born in the city, and the other, called the house of *Anker*,^o for the reception of orphans throughout the whole kingdom. The latter, the most important of them all, gives assistance to the modest poor, and to indigent families, and furnishes instruction, free of expense, to those children whose parents have not the means of educating them. Christiania enjoys a considerable foreign trade.

To the east of the mouth of the Glommen, near the frontiers of Sweden, *Frederikshall*,^p whose harbour can receive large vessels,^q has joined to its ancient name of *Halden* that of Frederic, given to it by Frederic III. in 1665, on account of its courageous defence against the Swedes. This is a neat town, with paved streets: the houses are of wood, and painted of different colours, as in Sweden. It stands prettily in a valley surrounded with rocks, on an arm of the

sea, and carries on a considerable trade in timber.^a At the foot of its fortress, called *Frederiksteen*,^b Charles XII. of Sweden was killed by a cannon-ball^c on the 11th of December 1718. In 1814 the Swedes raised a pyramid^d on the spot where this great captain expired. Charles XII. has been styled a *great* man,^e but certainly with little propriety, if men understood their true interests aright. Has the experience of nearly 6000 years not yet convinced the world, that men such as Alexander of Macedon, Julius Cæsar, Timur, Charles XII., or Napoleon, whose only merit lies in the satisfying their own ambitious desires at whatever expense, have no claim to the name of great? and that it is only rightly bestowed when conferred on an Alfred, a Washington, a Granville Sharp, or a Howard—on men who, in some shape or other, have truly benefited and not destroyed their fellow-creatures?^f

The Norwegian Isles may be comprised under the denomination of the *Norwegian Archipelago*,^g and divided into three groups: those of Bergen and Drontheim, washed by the North Sea, and that of Lofoden,^h in the Icy Ocean.ⁱ The first commences at the gulf of Bukfiord^j on the south: its principal islands are *Carmoé*^k and *Fidjé*,^l where, it is said, Harold, the first king of Norway, long had his residence. On a small island, part of this group, stands a stone cross of silver-white mica slate, about twelve feet high and four in breadth. Nothing is known of its history, but that it has stood there for centuries.^m In the group of Drontheim, three islands are remarkable for their size, namely, *Smølen*, *Averoen* or *Frojen*,ⁿ and *Hitteren*, the latter the largest of the three; but the most celebrated are the small islands of *Vigten*,^o from whence departed, for the conquest of Normandy, the Norwegian or Norman chieftain Rolf, better known by the name Raoul or Rollo. The group of the Lofoden Isles occupies a length of sixty leagues; the most considerable are the long *Andæn*, the irregular *Langæn*, *Hindæn*, the most important of them all, *Mageroe*, in which the North Cape is situated, *Seyland*, where there is to be seen a peak of great elevation, *Soroe*,^p deeply indented by a

great number of bays, and *Ost-Vaagen*, the central point of the important expedition, which, every year, during the months of February and March, assembles in these latitudes more than 20,000 fishermen.^q Between *Varoe* and *Mosken Moskenæsøe*^r lies the dangerous whirlpool of *Mal-Strøm*,^s so dreaded by navigators.

The principal branch of Norwegian industry is undoubtedly the fishery: the annual exportations which the kingdom makes in herrings and cod, are valued at from six to seven millions of francs. In 1827 there were sent to England more than 1,100,000 lobsters. A recent traveller informs us that the trade with London in these creatures is so great, that, all the way from Stadt Land^t to Lindenoës,^u an Englishman and a devourer of lobsters are almost synonymous terms. There is an English Lobster Company, and their agents are busy all along the coast. Twice or thrice a-week their packets sail from Christiansand.^v The merchant of Bergen supplies Spain and Italy with the immense quantity of fish that is there consumed during lent. During the winter the Norwegian feeds even his cattle with the entrails of fish. By the sale of his iron, he purchases in the ports of the Baltic, the quantity of corn necessary for his consumption; the British merchant buys up the masts and planks of Christiania; the firs of Drontheim, less esteemed, are carried off by the Irish. With these articles, and many others of less importance, the inhabitant of Norway procures for himself not only the comforts of life, but also the enjoyments of luxury: the women of the most retired valleys wear around their necks the handkerchiefs of Masulipatam; in the Dovrefield mountains, the hospitals are always abundantly supplied with tea, sugar and coffee; while the rich cover their tables with the wines of Bordeaux and Cyprus, with oranges from Malta, and with raisins from Corinth. In fine, in this country, which is regarded as so poor, mahogany furniture, valuable porcelain, and curious eatables, are not more rare under the hospitable roof of the merchant of Bergen and Christiania, than in the house of the rich merchant of London, or the magnificent banker of Paris.

^a The two last sentences are added by the translator.—P.
^b "*Frideriksteen*"—properly, *Frederiksteen* (Dan.) Fredericksteen (in English authors.)—P.

^c In the original, it is simply: fatal ball. It has been disputed whether Charles XII. was killed by a cannon or a musket or pistol ball. Voltaire says, a half pound shot. Those who assert he was killed by a musket or pistol ball, attribute his death to assassination.—P.

^d An obelisk—by command of Bernadotte; with only this inscription—"In the fight against Frederickshall." (Conway, p. 274—5.)—P.

^e In the original.
^f These remarks on the character of Charles XII. are added by the translator.—P.

^g M. Ad. Balbi first proposed this name and division.

BOOK CXLVIII.

EUROPE.

Europe Continued.—Description of the Scandinavian Peninsula.—Second Section.—Description of Sweden.

THE character of the inhabitants of Sweden, and in some respects the physical constitution of the country, present more than one trait of resemblance to the people and climate of Norway. The *Laplanders*, who inhabit the northern parts of the Swedish monarchy, have been represented as men of short stature, with a swarthy or yellowish complexion, and a disagreeable physiognomy; but the view thus given of them is far from being correct. In the northern parts of Norwegian and Swedish Lapland, they are taller than in the south, yet their height does not exceed five feet and two or three inches: their copper complexion is rather the result of a habitual residence in smoky huts than a character of the race. The mountain Laplanders, who live almost always in the open air, have a skin slightly dark; the greater part of the females are even tolerably fair; and among both sexes there are seen figures as agreeable as among other nations. Their temper is always equable; never does their cheerfulness forsake them. Their honesty is proof against every temptation; robbery and murder are crimes almost unknown amongst them. They are laborious and naturally temperate, but they cannot resist the temptation of drinking strong liquors.^a Travellers tell us, that in *Westro-Bothnia*,^b physical strength and beauty distinguish both the sexes, while an unbounded hospitality towards strangers, a cheerful temper, and an enterprising disposition, are qualities common to the whole population, which extends to the polar circle. The people of *Jämtland*^c have the light shape, the agility of body, and the fair hair of the Norwegians. The *Helsingian*^d is brave: in attacking the bear, he displays as much intrepidity as the mountaineer of Norway; even the young shepherdess has been frequently known to defend her flock with success against one of these animals: it is true, however, that, according to an old superstition, the bear can do nothing against a virgin. The people of *Nericia*^e have a melancholy and taciturn air: their character is a mixture of honesty and pride, distrust and obstinacy. In the provinces of

Upland, *Westmania*^f and *Dalecarlia*,^g the population, renowned for its bravery, still preserves the physical characters of the most northern tribes: dark hair, sunk eyes, a look somewhat fierce, but full of expression and vivacity, muscles strongly marked, prominent bones, and a stature almost gigantic. In *Westro-Gothia*,^h and above all, in *Gothia*,ⁱ fair hair, blue eyes, a middle stature, a light and slender figure, and a physiognomy indicating frankness, gentleness, and a certain sentimental elevation of mind, especially among the fair sex, are predominant. The people in the other provinces partake of these different physical and moral qualities.^j

Sweden is separated from Norway by the mountains of *Kalen*, *Svuku* and *Seveberg*.^k The distance between these mountains and the sea being much greater than in Norway, the surface has less declivity, the rivers are considerably larger, and the lakes more numerous and of greater extent; yet none of the Swedish rivers surpass in length the Norwegian river *Glommen*; ^l the largest scarcely traverse a course of 100 leagues. One of the most considerable is the *Tornea*, which issues from the lake of that name, situated at the foot of the *Kælen* mountains, and which, among the rivers received by it, reckons the *Muonio*, the natural barrier that separates Sweden from Russia, as far as its junction with the *Tornea*, after which the *Tornea* forms the boundary between the two states. The *Lulea* and the *Umea* do not yield in length to the preceding. All these rivers, and many others that we do not name, traverse lakes of a great extent of surface, and throw themselves into the gulf of *Bothnia*. The most important lakes of the Scandinavian peninsula are, in the order of their size, the *Wener*,^m 35 leagues long by 20 broad; the *Mælmar*,ⁿ 25 leagues in length, and from 9 to 18 in breadth; the *Wetter*,^o 24 leagues in length, and from 6 to 7 in breadth; and the *Hielmar*, 16 leagues in length by 4 in breadth. All four are situated in southern Sweden, and the first (the *Wener*) is, after lakes *Ladoga* and *Onega* in the Russian empire, the largest lake in Europe. It gives rise to the *Göta*,^p a small river, which, after making its way through

steep rocks, forming frightful cataracts, throws itself into the Cattegat.^a

There is no country in which it is more easy to form canals than in Sweden, and, since the reign of Charles XI.,^b the Swedish government has profited by the disposition of the ground, to multiply the means of water communication. The canal, which bears the name of the river *Arboga*, conducts its waters from lake Hielmar to lake Mølar; the canal of *Södertelge*,^c finished in 1819, unites the waters of the Mølar with those of the Baltic; the canal of *Woodden*^d shortens the navigation from the Gulf of Bothnia to the Baltic, by avoiding the dangerous arm of the sea situated between Sweden and the isles of Åland; and that of *Ålmar-Stæk*, finished in 1823, establishes a ready communication between Upsal and Stockholm.^e Other canals have been begun or executed, with the view of making several rivers navigable, and of rendering more valuable the immense forests situated in the northern provinces; but the most important of these works is the canal of *Göta*, now almost completed, which, by the aid of several small lakes, will open an easy passage between lake Wetter and the Baltic Sea.^f It may be noticed here, that the roads in Sweden are admitted by travellers to be excellent, and inferior to none in Europe.^g

In the Baltic Sea Sweden possesses two important islands, namely, *Oeland*^h and *Gothland*. The first is separated from the main land by the strait of Calmar. It is thirty leagues in length by from three to five in breadth. Its soil is composed of schistous, siliceous and calcareous rocks. Its valleys are pleasant and well watered. It is rich in pasturage and meadow-ground, and supports much cattle. Its population is numerous. *Gothland*,ⁱ much more considerable than the former, being 25 leagues in length and 10 in breadth, is a calcareous and sandy plateau from 150 to 200 feet in height, on which there rise hills, whose bare and dry summits have nearly the same elevation; one of these hills, called *Hoborg*,^j contains a great number of caverns. *Gothland* is watered by several lakes and rivers; one of the latter, called the *Lunnelund*, issues from the small lake of *Marteboe*, flows for some time in a subterranean canal, and

again issuing from an opening 12 feet in breadth, throws itself into the sea. The climate is much milder than that of those parts of Sweden lying in the same latitude. The island is rich in forests and in game, in arable land and in cattle; merinos are there perfectly naturalized, and goats attain a great height. Agriculture is susceptible of great improvements; but as the island possesses no noble families, and is divided into many small properties, the inhabitants live in easy circumstances and procure colonial merchandise, wine and other objects of primary necessity, in exchange for their wood, tar, marble, fish and cattle, and the excellent turnips which they cultivate. *Huen*,^k a small island at the entrance of the Sound, is chiefly remarkable for having been the residence of the celebrated Tycho Brahe, who there constructed the observatory, to which he gave the name of *Uranienborg*.

The physical constitution of Sweden has been the subject of the observations of several distinguished naturalists, one of whom, in a work drawn up with much precision and distinctness, gives us just a view of it, that we can in a few words trace its principal characters.^l We have already seen that gneiss and granite predominate in the mountains, which we consider as forming the Scandinavian range.^m Wherever these two kinds of rock are seen, they alternate with each other, the one passing insensibly into the other, as if they had been formed at the same time, but the first always occupies an extent much more considerable than the second. Granite, however, appears chiefly by itself on the banks of the Muonio, on the coasts of the Baltic to the north of Calmar, and in the provinces of Upland, of Westmania, and of East and West Gothland. The richest veins of iron, copper, and argentiferous lead,ⁿ that are worked in Sweden, are contained in the gneiss; this rock contains a much greater number of strata of other rocks than are to be found elsewhere; in the mountains they are generally inclined from north-east to south-west. The oldest formations containing organic remains are, in Sweden, much more extensive in proportion to their thickness, than in the other countries of Europe; we there see succeeding each other, strata of compact limestone, enclosing the spoils of

^a The Götha, besides some lesser falls and rapids, is precipitated over the great falls of Trollhatta [*Trollhatta*—with the article, *Trollhattan*,] a height of about 130 feet. (Conway.)—The descent of the Trollhatta falls is 114 feet. (Ed. Enc.)—P.

^b Canals were constructed in Sweden at a very early period, particularly side cuts on the rivers. A canal was opened from Upsal to the Baltic in 1030. The Arboga canal was constructed in 1632, during the minority of Christina. These, and various other works, were anterior to the reign of Charles XI. That monarch began to reconstruct the Arboga canal in 1691, and completed it in 1701. He, however, followed the channel of the river, instead of cutting an artificial canal along its banks.—P.

^c Södertelje (Ed. Enc.) Södertelge, a town 16 miles W. S. W. of Stockholm. (Morse.)—Swed. *Säder*, south, and *Telje* or *Telje*.—P.

^d "The canal of *Wadden*."

^e Consult the Summary of the Reports made to the king of Sweden and Norway, upon the public works executed in 1823: *Revue Encyclopédique*, 1824.

^f The canal here mentioned, by the name of the canal of *Göta* (*Götha* or *Götha*), is the line of inland navigation across Sweden, from the Cattegat to the Baltic, by the river Götha, and the lakes Wenern (the Wener,) Wiken, Wetteren (the Wetter,) Boren and Roxen, to the town of Söderköping (*Söderköping*). It is intended for the passage of smaller vessels, and has consequently 10 feet depth of water. The navigation of the Götha to the lake Wener is perfected by the lock at Akerstrom and that at Edit, the canal at Trollhatta (with nine locks,) and the locks at Karlsgraff. The remainder of the route was surveyed by Mr. T. Telford, at the expense of Count Platen, in 1808; a company was then formed, and a charter granted by Charles XIII. in 1810. The operations have been since carried on with much assiduity and success, and a considerable portion of the canal rendered navigable. The

length of the route from the Wener to the Baltic, including lakes, is about 120 miles; that of the artificial canals is about 55 miles. The ascent from the Wener to the summit, or surface of lake Wiken, is 162 feet; the descent to the Baltic, 307 feet. The number of locks is to be 56.—Gustavus I. projected in 1526, a different line of inland navigation across the kingdom, by the lakes Mølar, Hielmar, Skager and Wener; but the Arboga canal, between the Mølar and the Hielmar, was the only part executed.—Besides the canals already mentioned, there are others in Sweden, particularly the Strömsholm canal, between the Mølar and the province of Dalarne, (60 miles in length, partly natural water courses,) completed in 1795. (Ed. Enc.)—P.

^g There is nothing with which one is more struck, in travelling through Sweden, than the excellence of the roads. Macadamized Regent Street is not smoother, and scarcely even broader, than the whole of the road for upwards of 200 miles, from Fredericksshall to the Sound. (Conway, p. 278—9).—P.

^h "Oeland."—Oland or Oeland (Pinkerton,) Oeland (Tuckey,) Oeland (Guthrie, Morse.)—Oeland is the proper orthography. The island abounds in freestone, called Oeland stone (*Olands sten*), by the Swedes.—P.

ⁱ Gothland or Gottland (Morse.) Gottland (Tuckey.)—Those who believe that this island was the cradle of the Goths, write Gothland; but most of the Swedes write *Gottland* (good country.) (Tuckey, vol. I. p. 278.)—*God* or *godd*, good, in Swedish.—P.

those marine animals, with multilocular shells, called *orthoceratites*, argillaceous schists containing the small organized bodies to which Linnæus first gave the name of *graptolithi*, and which belong to the same family as the preceding, and lastly, sandstones and different kinds of rocks formed of various agglomerated substances.^a Dalecarlia, Jemtland,^b Nericia and East Gothland^c are covered with these older deposits.^d In Scania we begin to perceive more recent formations, comprehending the coal formation and the older shell limestone,^e called *muschelkalk* by the Germans, to which succeed, in the order of their formation, sandy and calcareous strata,^f as well as thick beds of chalk. In this province, rocks which bear the marks of an igneous origin, traverse the different formations, and appear on the surface. It is in this province, that one of our savans^g has recognised in the vast diluvial deposits, (*terrains de transport*), composed of sand, rolled pebbles, and enormous blocks of granite, (the accumulation of which forms here and there, in the environs of Upsal, on the borders of Lake Wener, and as far as the Sound, those hills called *ose* in Swedish,^h) the origin of the deposits of the same nature which cover the dutchy of Mecklenburg, Pomerania, and the Russian Provinces, as far as the mouth of the Neva. Thus, from Norway and Sweden have been conveyed by immense currents of water, those masses of *debris* which one is astonished to find on both sides of the Baltic, and which undoubtedly were there deposited, when that sea had as yet no existence, or when the country, more covered with forests than at present, and consequently colder, beheld the Sound and the other straits covered with ice, and presenting during the rigours of winter, a ready passage to these eruptions. In conclusion, one word will suffice to give an idea of the richness of the Swedish iron mines. They are wrought in the open air like stone quarries, and it is calculated, that they can scarcely be exhausted in fifteen centuries.

From the similarity of climate, it is to be expected, that the animals which are found in Norway, will also be found in Sweden, and, accordingly, this is the case. The bear and the wolf have their abode in Sweden, as well as in Norway, and the latter especially is destructive,

^b "Jentie."—See note ^c p. 1047.

^c "Ostro-Gothie."—Lat. *Ostro-Gothia*. Oster-Gothland (*Ester-Gathland*, Swed.)—P.

^d If a line be drawn across Dalecarlia (*Dalarne*) from south-west to north-east, through the parishes of Malung and Venjan to Siljan, and thence through the parishes of Rättvik and Ore to the borders of Hel-singland, and if the same line be continued northward through Jemtland, leaving Herjedalia (*Herjedalen*) and a part of Jemtland on the north, and southward, from Trandstrandfiäll, through Norway, passing by Tryssild and the Os and Miæs lakes (*Osen-Sæ—Miæsen-Sæ*), and then along the western side of the gulf of Christiania to Skeens-fjord (about 40 miles S. W. of Christiania,) it will form a dividing line between the primitive region on the south, (consisting chiefly of gneiss, in which are included, however, subordinate beds or strata of hornblende, compact felspar, granite, limestone, mica-slate, and hornblende slate, and also different metals, particularly iron and copper,) and the transition region on the north, in which the prevailing rocks are sandstone, greenstone, porphyry, grauwacke and limestone. North-west of this transition region is another primitive region, (occupying the high ridge of mountains between Drontheim and Jemtland, and indeed the great range of Norwegian mountains, extending along the western coast to the south point of Norway,) in which the prevailing rock is mica-slate, including talcose and chlorite slates, and flanked on either side by argillite. The transition region thus forms a trough between two primitive regions, extending along the great valley of southern Norway and through the provinces of Dalecarlia (north-western part,) Herjedalia and Jemtland in Sweden. See Physical and Geognostical Observations during journeys in Sweden and

attacking not only the feebler animals, but sometimes man himself. The elk has become a rare animal, but is still met with; and the rein-deer exists in abundance, in the northern parts of the country, especially among the Laplanders. The domestic animals are in general small, but strong and useful. Fish in great variety and abundance are to be found in all the waters. The eagle and falcon are frequent in the northern and more inaccessible parts; and domestic fowls, and the smaller birds, are to be met with, as in Great Britain.ⁱ

What we have said of the vegetation of Norway, applies to that of Sweden. We will add, however, after the researches of a learned botanist,^k that the primrose (*Primula elatior*),^l which flourishes in our woods in the early days of spring, is common in Scania; that the common maple (*Acer campestre*), the smallest of this genus, grows by the side of several of our forest trees; that the humble asarabacca (*Asarum Europæum*) is found creeping on the surface of the ground in sandy soils; that the St. John's-wort (*Hypericum*) shows itself with its yellow flower in the sands of Bleking; and that the almond-leaved willow (*Salix amygdalina*), with its flexible branches, abounds in moist grounds, and sees growing at its feet the lively mouse-ear,^m with flowers of the most beautiful blue. Towards the 62d or 63d degree of latitude, fruit-trees cease to prosper; the cherry-tree becomes there a sorry shrub; but nature has multiplied from that latitude to the northern extremities of Sweden, along with several wild small fruitsⁿ known to the rest of Europe, two species, whose delicious fruits would be tasted with pleasure, even in our own climates. The one is the *Rubus arcticus*; its refreshing berry, of a sweet and aromatic flavour, holds a place between the strawberry and the raspberry. It has been in vain attempted to cultivate it in the south of Sweden: it may be said to have been given to northern Bothnia, in order to indemnify it for the want of fruit-trees. The other, (the *Rubus chamæmoris*),^p more widely diffused, descends to the 60th degree. It supplies the Swedes with a kind of lemonade both pleasant and wholesome. The abundance of these berries, and the benefit derived from them, have prodigiously increased their use.^q

^q "The abundance of these berries, and the necessity of employing them, have greatly multiplied their use."—Does the original mean by

All that part of Sweden, lying between the Sound and the course of the Dalä,^a has made within the last twenty years great progress in agriculture; it produces wheat, rye, barley, oats, and farinaceous vegetables,^b in considerable abundance. In Dalecarlia, in Jemteland,^c and in Angermania,^d they cultivate everywhere flax, hemp and potatoes; but to the north of these provinces, the insufficiency of the crops compels the inhabitants to mix with their grain the bark of the *Pinus sylvestris* (Scotch fir), in order to procure a greater supply of food.

The climate of Sweden, generally less severe than that of Norway, is always a subject of astonishment to a stranger. In Gothland, the mildness of the temperature, and the fertility of the soil, have so favoured reproduction, that although this province is scarcely equal to a fourth of the whole kingdom, its population forms nearly two thirds of it. At Stockholm, the German from the shores of the Baltic, does not find those fogs, which extend over a great part of Germany; the Frenchman does not regret the climate of the north of France; he does not even feel those sudden and frequent changes, which lessen the pleasure of an abode at Paris. In the capital of the kingdom, the longest days and nights are eighteen hours and a half. At Calix, near the northern frontier, the winter lasts nine months, and the summer three, the latter terminating with the month of September; the sun never quits the horizon during the period of the longest days, and never shows itself during that of the longest nights. In general the air of Sweden is pure, and the ravages of contagious diseases are never experienced. The beauty of a warm and dry summer, which, in its short duration, sees the frost disappear all at once, and almost immediately the vegetation adorned with leaves and flowers, makes it a matter of indifference that spring is there unknown. Southern Europe, it may be said with justice, knows nothing of the mild clearness of a Northern morning or evening, the slow disappearance of the rays of the sun reflected in an ocean of purple clouds, and the nights that are embellished by the feeble glimmer of twilight, even till the moment when the dawn of morning shows itself in the east.

Let us now survey Sweden in all its extent; let us visit its cities, and sketch the manners of its principal provinces; and when, after having arrived at the southern extremity of the Scandinavian peninsula, we shall have examined its institutions, its industry and its commerce, the reader will be prepared to appreciate the Swedish monarchy, in all its relations.

The cities of Sweden are in general thinly peopled, nor ought this to astonish us. That crowd of idle people, who spend in the heart of towns their pensions, or the revenue of their lands, is unknown in Sweden. The

the necessity of employing them, that arising from the want of other fruits merely, or does it refer to their salubrious qualities? These fruits are considered valuable as antiscorbutics, and are very generally used in the north of Europe, as an article of cookery.—P.

^d "Angermanie"—Lat. *Angermania*; Angermanland.—P.

^e Luleo—also Piteo, Umeo and Tornco. (Tuckey.)—The termination in *o*, or in *a*, pronounced as *o*, [the Swedish *å*,] signifies river. (Tuckey, vol. i. p. 273).—P.

^f Population 1000 (Stat. Tab.) 700 to 900 (Tuckey).—P.

^g "Proletaires" (*proletarii*), dependents, labourers—that class who live on the frontiers, in a state of dependence on the Swedes.—In the Ed. Enc. art. Lapland, the Laplanders are distinguished into the mountain Laplanders, who live by their herds of rein-deer; the mari-

proprietors of land, and even the nobility, enjoy in the country, and in the bosom of their family, all the sweets of domestic life and rural occupations, abandoning the towns and sea-ports to manufacturers and merchants. *Lulea*, or *Luleo*,^e in Northern Bothnia, is a small town of not more than 4000 inhabitants,^f whose port, at the mouth of the river of the same name, carries on some trade with the Laplanders. The alluvions formed by this river have led to the abandonment of the old town of Lulea, now too far distant from the sea. *Pitea* is of still less importance than Lulea. *Umea*, in Westro-Bothnia, with 1100 inhabitants, supports a society of agriculture and a school; like the two preceding towns, it is situated at the mouth of a river, whose name it bears.

Northern Sweden, whose three principal towns we have just enumerated, is peopled by Laplanders and Swedes. Of the Laplanders, four classes are distinguished, namely, mountaineers, inhabitants of the forests, fishermen, and beggars.^g The first live by the produce of their herds of rein-deer; they spend the summer upon the mountains, and the winter in the plains; their nomadic life obliges them to transport with them their families, their animals, and their dwellings.^h The Laplanders of the second class are stationary;ⁱ their herds of rein-deer are less numerous than those of the former; they lead them into the forests, or rather suffer them to feed at liberty, while they themselves are occupied with the cultivation of their lands. The Lapland fishermen have still fewer animals than the preceding; they intrust them to their countrymen of the forests, or while they are themselves employed in fishing in the different lakes, they send their wives and children to take care of the herds on the mountains. The begging Laplanders live, as their name indicates, by begging, or by hiring themselves out to the Swedish peasantry.^k Some of them, after having witnessed the destruction of their flocks by the attacks of wolves, or other untoward events, employ themselves in making wicker panniers and baskets. The rigour of the climate, the misery which the Laplanders frequently suffer, and the unfruitfulness of their women, prevent the increase of their population. The Westro-Bothnians, and the other Swedish inhabitants of the same regions, animated by the love of labour, and united by the most friendly cordiality, live happy in their families, where order and neatness reign. Their women heighten their natural charms by a certain elegance in their dress. These northern provinces contain few nobles and merchants; the clergy form the most respectable, the most influential, and also the happiest class of society, because they owe the consideration in which they are held to the gratitude which the people feel for the benefits conferred by them.

Hernæsand,^l more considerable than the cities of the

time Laplanders, who live by fishing; and those who inhabit the woody country bordering on Sweden.—P.

^h The mountain Laplanders have no fixed habitations, but live in tents, which they move from place to place, in quest of food for their rein-deer. These tents are constructed of poles nearly meeting at the top, and covered with the cloth called wadmål. (Ed. Enc.)—P.

ⁱ The mountain Laplanders are continually moving from place to place to procure food for their rein-deer. The maritime Laplanders change their habitations only twice in the year, namely, in spring and autumn. Those who inhabit the woody region, are more stationary. (Ed. Enc.)—P.

^k "The Laplanders of the fourth class (*Lapons prolétaires*) live by begging, or hire themselves out to the Swedish peasantry."—See note ^g.—P.

^l Hernosand.

north,^a bears the name of the small island of *Hernæn*,^b on which it is situated. Its position, at the mouth of a bay,^c gives importance to its harbour; it is the seat of a bishopric, is regularly built, contains several manufactures, and possesses a university,^d a botanic garden, and a printing office, which publishes works in the Lapland tongue. *Gefle*, at the mouth of a small river called *Gefle-An*,^e has irregular, but broad and well paved streets, a tolerably good harbour, two docks for ship-building, sundry manufactures, several schools, and a celebrated academy.^f At *Falun*,^g situated in a valley, and divided into two parts by a small river, which connects lake *Varpan* with that of *Rums*,^h they manufacture cloths, ribbons and tobacco-pipes; several manufactories of chemical products, and others for the spinning of cotton and wool, have been also established there. Its school for miners enjoys some reputation. In the environs of this town are situated the most valuable copper-mines in the kingdom, besides several mines of gold and silver. About 500 workmen are there employed.

The Dalecarlians carry on a great trade with Norway. In the depth of winter they cross the mountains, and carry their productions to the markets of Drontheim. These journeys are made by caravans of from 300 to 400 men, and more than 1000 horses. It is a singular spectacle to witness these peasants making the air resound with their merry songs, mounted on light sledges, gliding with the rapidity of the wind over the snow, or over the surface of lakes rendered firm by the frost. The Helsingians, inhabiting a maritime country, enjoy a climate less severe than the Dalecarlians; their soil is not fertile, but by means of labour and industry, the province which they inhabit is perhaps one of the most flourishing in Europe. They cultivate enough of grain for their subsistence; their herds and flocks yield them abundance of butter and excellent cheese; their forests are peopled with game of the best quality; their rivers are full of fish and delicate salmon; and their exports in iron and hemp are considerable. Their habitations are commodious, substantial, and furnished with every thing necessary; among the rich, one apartment is ordinarily full of more linen and clothes than the family could use in a century. Order and foresight are the leading virtues of this people.

In approaching *Upsal*, we perceive on a rising ground a castle built by *Gustavus* (*Vasa*) I. *Upsal* or *Upsala*, formerly called *Æster-Aros*, is watered by the small river *Fyrisa*.ⁱ It is celebrated for its university, founded in the fifteenth century,^k in which there are sixty professors, and more than 800 students.^l Its situation in a fertile plain, fifteen leagues from *Stockholm*, is favourable

to an establishment of this kind, which, as far as possible, ought to be placed at a distance from the objects of temptation always to be found in a capital. *Linnæus*, *Cronstedt*, *Bergman*, *Wallerius*, and several other great men, have filled chairs in *Upsal*. The buildings occupied by the university are, without contradiction, the finest in the city. The *Gustavian* academy, erected by *Gustavus Adolphus*, contains a library of 80,000 volumes, besides a valuable collection of manuscripts. In the hall allotted for this purpose, there are to be seen two coffers deposited there by *Gustavus III.*, and to be opened fifty years after his death. In 1842,^m that time will have arrived. The same building contains an anatomical amphitheatre: to the observatory, which is finely situated, there is annexed a considerable library, composed of astronomical works; the chemical and physical laboratory, the museum of natural history, and the new botanic garden, are very rich collections. The university buildings also comprehend fencing and dancing halls, besides a magnificent riding-school. The present crown prince of Sweden, *Oscar*, received his education at *Upsal*, and resided while there in the palace of the archbishop.ⁿ The city likewise possesses other useful establishments: the society of sciences,^o founded in 1712 by *Eric Berzelius*,^p at first librarian and afterwards archbishop of *Upsal*; the cathedral school, a kind of secondary school, in which are taught literature and the sciences; Sunday schools, which are held in one of the halls belonging to the sacristy of the cathedral; a school for the poor; a house of voluntary labour for the indigent; a private institution for the relief of persons of distinction, principally females, the victims of the vicissitudes of fortune; an hospital for invalids, of which one part serves as a house of correction, and lastly, a Bible society. *Upsal* is the seat of an archbishop, with a revenue of upwards of £1000 sterling. The house and garden of *Linnæus* are still shown to travellers.^q

The houses of *Upsal* are built, some of stone, and others of wood; the finest have gardens, from whence there is an extensive view of the neighbouring country. The streets are broad and straight, particularly those which lead to its large and superb square. The cathedral is the largest and most magnificent church in the Swedish monarchy: its gothic architecture resembles that of *Notre Dame* at *Paris*. It was begun in 1258, and finished in 1435. It is covered with sheets of copper. Its length is 330 feet, its breadth 140, and its height 105. At the entrance of this church, we see the figure of *St. Olof*, king of Sweden, trampling under foot a monster, the symbol of idolatry; and in the nave, the

^q The two last sentences are added by the translator.—P.

Swedish sovereigns were formerly crowned, and assumed the title of kings of Upsal.^a The interior of this edifice is filled with tombs and other objects of still greater interest. Near the altar, repose the ashes of Olaus Petri, the Swedish reformer; a little farther off, a monument of alabaster incloses the remains of Gustavus Vasa and his three wives. Here we see the silver coffin of Eric IX., and the sarcophagi of several Swedish kings; there, the magnificent marble monument erected to the memory of Baron Charles De Geer, the historian and naturalist,^b presents itself: another monument, that of Linnæus, erected in 1798 by the friends of that great man, is remarkable for its simplicity. In the two sacristies, other objects strike the eye: one contains the portraits of the most celebrated Swedish ecclesiastics; in the other we see the dress worn by the unfortunate Nils Sture, so unjustly accused of treason by Eric XIV., and poignarded by the hand of that prince in the castle of Upsal; the whetstone, three feet in length, sent in derision by Albert of Mecklenburg, king of Sweden, to Margaret, queen of Denmark,—an intimation to lay aside her sword, and attend to sharpening her needles; and the colours which she sent him in return, patched with bits of her shifts. It is known that Albert called Margaret *the breechless queen*, and that this epigrammatic war terminated in the battle of Falkøping,^c in which victory placed the crown of Sweden upon the head of Margaret. Another apartment contains several objects of great value, such as a gilded cross,^d containing a piece of the wood of the true cross sent by pope Alexander III.; a golden cup^e seventeen inches in height, enriched with diamonds, which was taken at Prague by Kœnigsmarck; and an old wooden idol, representing the god Thor. Gustavus Vasa erected a magnificent palace at Upsal, the greater part of which was consumed by fire in 1702, leaving only one wing habitable, where the king resides when he visits this city.^f

Nature, munificent in her gifts, has collected with so much prodigality in the environs of Stockholm situations the most diversified, that this city appears as if placed in the midst of a large and magnificent garden. On one side rise majestic mountains adorned by the dark foliage of the pine-tree, mixed with the leafy branches of the elm and oak, while, on the other, a pleasant valley opens to the view. Here the lake Mælar spreads out its surface irregularly indented by bays and promontories, and covered with a multitude of granite rocks, some of them steep and bare, others decorated with villas and clumps of trees; there rises a forest on a declivity adorned with verdure; farther off the eye rests on distant hills or islands. Palaces, the summer-residences

of the royal family, country-houses and gardens, animate the landscape. The capital of Sweden is in a singular and romantic situation, which strikes all strangers with surprise. It occupies two peninsulas, and several islands,^g washed by the Mælar, at the bottom of the gulf where that lake discharges itself into the Baltic Sea; and hence Stockholm has been called the Venice of the north. Canute, son of Eric the Holy,^h laid the foundations of Stockholm towards the close of the twelfth century,ⁱ in a spot which then contained only a few miserable huts of fishermen, with the view of making it a place of defence against the attacks of pirates. *Norrmalm* and *Sædermalm*,^k its two principal suburbs, occupy several islands, and are partly built upon piles. Its ten divisions^l are separated by different arms of the Mælar and by the sea, but they communicate with each other by thirteen large stone bridges, besides several others of wood; many houses are surrounded by gardens, the walls of which rise from the water's edge; others, as in *Sædermalm*, are built against rocks which, higher than the roofs, rise like walls in the midst of these islands. Stockholm is irregularly built; the greater part of it is of stone and brick, but many of the houses are of wood painted red. Its twenty public squares are small and inelegant; *Norrmalm* contains the broadest and finest streets, the longest of which is the *Drottninggata*,^m adorned by the fronts of several palaces. The harbour, defended by two forts, is difficult of access, but within it is spacious and safe; the water is clear as crystal, and so deep that the largest ships can go to its very extremity in the centre of the city, and unlade their cargoes on the quay, which is bordered by elegant mansions and vast warehouses. Many streets in the city rise in a circuit,ⁿ one above another, on the declivity of a hill, and form a fine amphitheatre crowned by the king's palace. This building, from its foundation to the sixteenth century, was merely a fortress. It has been since repeatedly rebuilt, the date of the last rebuilding being 1753. It is a square building, four stories in height, flanked by two wings, and built in a superb style, and is filled with rich furniture and collections of so great a value, that it may be compared to the finest regal abodes in Europe. There are many curiosities preserved in this place: amongst others, the cradle and small garden-carriage of Charles XII., with the clothes, stained with blood, worn by him when he fell at the siege of Fredericstein^o in Norway, his hat pierced with a musket-shot,^p and his walking cane; the masquerade costume worn by Gustavus III. on the night of his assassination; the clothes of the great Gustavus Adolphus, with the swords of several of the Swedish

monarchs.^a The chapel is a very splendid one: there every year, on the 20th of December, they celebrate a festival in honor of Gustavus Adolphus, in order to keep up the remembrance of the noble perseverance, with which that monarch fought for the liberty of the protestant communion. The royal library contains 40,000 volumes, besides numerous manuscripts, and possesses the prayer-book of the emperor Ferdinand the Second, one of the trophies of Gustavus Adolphus during the thirty years' war, and the copy of the Vulgate Bible, which belonged to Luther, with notes in his own handwriting. The collection of paintings is composed of different works of the great masters of the Italian school, and of the best Swedish painters. The museum of antiquities is rich in Grecian statues and in medals. At the foot of the platform occupied by the palace, stands the statue of Gustavus III. erected by the burghesses of Stockholm; and in the square of Riddarholmen,^b there is a bronze statue of Gustavus Vasa. The square of Gustavus Adolphus is decorated with a bronze statue of that prince on horseback; and in the Royal Garden, we see that of Charles XIII. cast at Paris in 1821. The beautiful church of St. Nicholas, that of *Riddarholmen* (the Knights' Island,) decorated with 5000 foreign standards, and inclosing the ashes of several kings, and of the most celebrated Swedish generals, and the great church or cathedral, called *Storkyrka*,^c are buildings of the first order. The last is the most ancient: it has been used for the coronation of the Swedish kings, since that ceremony ceased to be performed at Upsal.^d Its altar, incrusting with gold, silver and ivory, representing the birth of Christ; a chandelier of silver, weighing 78 pounds; and the plume and spur of St. Olof, are only a few of the curiosities to be seen there. Join to these edifices, the magnificent building of the exchange, the opera-house, where Gustavus III. was assassinated, the town-house, the mint, the immense building where iron is stored, the artillery-park, the docks and the admiralty, the palace of the princess Sophia, sister to Gustavus III., and, at the northern extremity of the *Drottninggata*, on an isolated rock, the beautiful building of the observatory: and is it not a matter of regret, that the greater part of the private buildings in the city are so little in harmony with the beauty of these public monuments? Our limits oblige us to pass by the central veterinary institution, and the forest institution, intended for forming able scholars, the scientific collections, the learned societies, such as the academy of sciences^e and that of belles-lettres,^f and the schools of medicine and of mineralogy,^g and others no less useful. Among the philanthropic institutions, supported by the wisdom

of government, and by the zeal of individuals, we can only mention the society "Pro Patria," the object of which is to promote virtue amongst all classes; for this purpose, distributing silver medals, as a reward for the long and arduous labours of teachers of primary schools, the services of midwives, the good behaviour of workmen, the fidelity of servants, and the attention of the farmers and peasantry in endeavouring to improve and bring agriculture to perfection.

The commerce of Stockholm is of great importance. This city, sheltered from the violence of winds, ought apparently to be healthy, yet the mortality is greater, in proportion to its population, than in any other capital in Europe; the cause can only be ascribed to the exhalations from the waters and from the marshy grounds that surround it. We have spoken of the royal palaces that are seen in approaching its walls: that of *Drottningholm*^h is the finest; it presents some resemblance to that of Versailles, but its position on the northern point of the island of Lofse, in Lake Mælär, the beauty of its gardens, and the abundance of its waters, render it much more remarkable. *Carlsberg*, on the borders of the lake, is distinguished also as a royal dwelling, but especially for its military school, which contains 200 pupils. *Haga*, a small lodge surrounded by enchanting prospects, is the ordinary residence of the king during the fine season. Lastly, the beautiful residence of the *Botanical Villa* is that to which he prefers inviting strangers who are presented to him.

After quitting the borders of Lake Mælär, we see *Örebro*ⁱ near the Hiemar, and *Carlstad*, on the banks of the Wener. These two, which are places of note, but with a population of from only 2000 to 3000 souls,^k possess, like the greater part of the Swedish cities, more educational establishments than are to be seen in larger cities of France. *Örebro* is occasionally the place of meeting of the Swedish Diet,^l and contains, besides other schools, a normal school, and an agricultural society. *Carlstad* is a pretty town, and possesses, like *Örebro*, an agricultural society, besides an academy, an observatory, and a cabinet of natural history.^m *Wenersborg*, at the southern extremity of Lake Wener, is one of the principal marts for iron. It is a small, but neat town, with a spacious square. The houses are of wood, and painted, as in many Swedish towns, of different colours. The Lake Wener presents here the appearance of a sea, and like the sea is ruffled with tempests, and the navigation often dangerous.ⁿ *Nyköping*,^o with a small harbour on the Baltic, exports cannon and bullets. In its old castle, a part of which is used for a prison, Birger king of Sweden, who showed himself an able prince, but whose talents formed no apology for his

crimes, caused, in 1318, two of his brothers to be imprisoned, and starved to death. *Linköping*,^a in the midst of one of the most fertile plains of East Gothland, is regularly built; several fairs, well frequented, are held there; its academy^b possesses a fine library, besides a museum of natural history and antiquities; its cathedral is, next to that of Upsal, the largest and finest in the kingdom. *Jenköping*,^c well built upon the southern shore of Lake Wetter, possesses several regular streets, which have been laid out since the period when it was almost entirely destroyed by fire in 1790. *Gottenburg*, or *Gotheborg*,^d is reckoned the second city in Sweden, but from its situation and the excellence of its harbour, with the actual extent of business carried on, may probably, in a commercial point of view, be regarded the first. It lies in the province of West Gothland, near the mouth of the river Göta or Gøtha,^e in the Cattegat, and was once strongly fortified, but its fortifications have fallen into disrepair. It is built, partly on a rocky eminence, and partly on a marshy plain: the streets are in straight lines, and in the principal ones a canal generally runs through the middle, large enough to admit vessels of considerable size, which can thus be unloaded close to the houses of their owners. Four bridges connect one part of the town with another, and in many of the streets trees are planted, creating altogether a resemblance between this city and those in Holland. The population exceeds 20,000.^f *Gottenburg* has at different times suffered severely from fire arising from the houses having been built chiefly of wood. Since 1746 almost all the new buildings have been of stone or brick, but even subsequently to that year destructive fires have taken place. One fire in 1804 consumed two hundred houses, and another in 1813 one hundred. In general the houses are two or three stories in height. The principal buildings are the cathedral, the town-house, and the governor's house. It is a bishop's see, and the revenue is about £750 sterling per annum. The burial-grounds here are at some distance from the town, and tastefully laid out in walks planted with trees. The foreign trade of *Gottenburg* is considerable: iron and timber are the principal articles of export, and the herring fishery is carried on to a considerable extent. Six newspapers are published here. Many English and Scotch merchants are settled in *Gottenburg*.^g *Uddevalla*, to the north of *Gottenburg*, is a neat, clean town,

beautifully situated on a bay, with an extensive amphitheatre of rocky hills in the back ground, and carries on some trade in timber.^h *Halmstad*,ⁱ situated, like *Gottenburg*, on the borders of the Cattegat,^k would be a place of importance, were not its harbour choked with sand and pebbles. *Lund*, near the hill of Lybers, on which the ancient Goths elected their kings, possesses a university. *Malmö*,^l the principal town in Scania, is peopled by Germans and Swedes; it possesses some fine houses occupied by merchants, and one of its two churches, dedicated to St. Peter, is large and magnificent. There is, in that church, a superb monument erected to the merchant Tullström, who bequeathed one half of his property for the building of an organ, and the other for the support of several benevolent institutions. *Christianstad*, a handsome town, and the capital of a prefecture, at the bottom of a gulf in the Baltic,^m is regularly fortified, but its trade is inconsiderable. It was founded in 1614 by Christian IV. king of Denmark. Its church is very neat: a part of it was built by the subscriptions of the inhabitants, who, having learnt with joy, in 1814, that Norway and Sweden were united, caused to be engraved upon the church the arms and names of the different members of the royal family, namely, Charles XIII., Charles John,ⁿ Francis Oscar,^o and Eugenia Bernardine.^p *Carlsrona*^q is the principal station of the Swedish navy. Its harbour is capable of holding more than one hundred ships of war. For its defence a strong fortress has been recently constructed,^r and with the view of forming sailors, a school for ship-boys has been founded. The town is well built, but, with the exception of those in the neighbourhood of the admiralty,^s almost all its streets are deserted. The old basin or dock is deserving of notice, being dug out of the rock:^t it is eighty feet in depth, and two hundred in breadth;^u it is easily rendered dry, when necessary to repair vessels. The new dock,^x constructed in the same way, is not inferior to the preceding; it is in part covered with a roofing of copper. The arsenal, no less remarkable, contains models of ships of all classes and of all nations: in the armoury is preserved a variety of armour used by the ancient Goths; the sabres of these ancestors of the Swedes are not less than four inches in breadth. The church of the admiralty, which is built of wood, is not the finest in the city; it is, however, very large, being capable of containing five thousand persons.

(Tuckey, vol. i. p. 269.)—The new docks consist of a basin divided into four divisions from the centre to the circumference, each division having separate receptacles for five vessels. They were begun in 1757, during the reign of Adolphus Frederick, but the work was soon neglected; it was afterwards warmly patronised by Gustavus III. and again allowed to languish; so that only one of the four divisions has been executed, and that not fully completed. (Ed. Enc. 1814.)—P.

^y "Basin."—See note ^u.

On the coast of the strait formed by the Isle of Öland and the main land,^a stands *Calmar*, regularly built, although the greater part of its houses are of wood. Its finest edifice is the cathedral, erected in the centre of a large square, and whose lofty arched roof is supported without pillars. Its old castle, situated in the suburbs,^b was formerly esteemed one of the keys of the kingdom; it is celebrated in the history of Sweden for the Congress of July 20th, 1397, in which the fatal act of union was agreed to, which placed Sweden and Norway under the power of the Crown of Denmark. The hall where this congress assembled serves as a reserve store-house; and the rest of the building has been transformed into a house of correction and industry. Opposite this building floats the flag of the united kingdom of Sweden and Norway, announcing the happiness of two friendly nations, and the wisdom of a prince, who has accomplished a union better compacted than that of Calmar. Calmar has several tanneries and cloth manufactories, but it formerly possessed a trade much more considerable than at present: its harbour, small but secure, is sheltered on the south by Cape Stensöe, where Gustavus Vasa landed in 1520, to deliver his country from a tyrannical yoke. Louis XVIII., during his exile, fixed himself some time at Calmar, where his misfortunes and his affability gained him all hearts. A worthy admirer of the virtues that distinguished the Swedish hero, he caused a stone, bearing an inscription written by himself, to be erected to the memory of Gustavus on Cape Stensöe.^c

The Island of Gothland, which of itself forms a department, has for its capital Wisby, the only town in the island, the whole manufacturing industry of which consists in its marble-works, and the whole trade by sea in a few small vessels. Many antiquities found in its environs, and in other parts of the island, give room to believe that it was inhabited by those warlike Goths, who made themselves masters of the finest provinces of the Roman empire, and who, also inhabiting Gothland proper,^d or Southern Sweden, sent out those armed colonies, which founded several kingdoms in the south of Europe.^e

The philosopher of Geneva has said, that we ought to visit the south in summer and the north in winter. The capital of Sweden presents, during the latter season, a scene of activity difficult to describe: we have already seen, that the commencement of frost is the signal for the inhabitants of the interior of the Scandinavian Peninsula immediately to resort to the cities. The society of Stockholm, at all times animated by the most cordial politeness, and the most unaffected cheerfulness, but in general not numerous, becomes so when the long frosts have recovered their empire. Entertainments and pleasure-parties succeed each other day after day; the borders of Lake Mælar are covered with sledges, which in circuitous courses wander in long files over the frozen

waters, or the snow that whitens the fields; military music attends these joyous companies, which, after dinner, return to the city by torch light. In the evening, crowds repair to the theatre, to witness the representation of some national drama. On the first of May, a stranger sees with astonishment the promenades around the capital covered with a triple row of brilliant equipages, which remind one of the splendid retinues that, during the three last days of Passion-week, frequent the road from Longchamp to Paris. During the summer, a select society assembles at the waters of *Ramlosa* in Scania, and at those of *Medevi* in East Gothland, or the attraction of a military spectacle, a powerful one to a people naturally warlike, draws the curious to the camps where the national troops are exercised. These meetings do not resemble any of those that take place in our climates: an eye-witness of these festivals tells us, that dinners under tents and balls in the open air succeed the military evolutions; the sound of the violin mixes itself with the rolling of the drum; valour and beauty there divide empire.

The Scandinavian-Peninsula, much more enlightened than France, surpasses in information not only Prussia but the British isles: in Norway, the system of mutual instruction is spread over the remotest parts of the country; saving-banks are established in every province; granaries for the surplus grain are to be found in different places; and an improved prison discipline has brought back to honourable sentiments, those unfortunate beings who would otherwise have been hardened in crime. In Sweden every peasant can read, all know their rights, all join to a reasonable attachment to their religion, an attachment no less ardent to a form of government, which has for centuries protected their liberty. There is thus little depravity of manners, especially out of cities, and no need for those restraining measures, which, under the guise of securing tranquillity, are too often made use of to render legitimate the abuse of force, when we ought only to have in view the maintenance of order and justice. The security of the roads is not intrusted to gendarmes: that military police is in Sweden unknown, because it is there useless: at intervals we meet with peace-officers, to whom the inhabitants lend their aid when necessary. The recruiting of the army is done by publishing in the churches the names of those who ought to make part of the militia, and this simple appeal is enough to lead the youth to complete the number wanted.^f The taxes are levied in the same way, by announcing from the pulpit the quota of each citizen: these burdens, which press equally upon all, do not amount to more than five per cent. on income indirect taxes are unknown. The Swedish navy occupies the third rank in Europe; it draws its recruits from the merchant service, and, although not considerable, because government is not sufficiently rich to increase the materiel, yet, to give an idea of its merit, it is suffi-

the point where the canal across Sweden meets the Baltic, are places of considerable commerce.—P. ^d "Gothia."

^e Wisby is celebrated in the history of commerce, for a maritime code, compiled by its merchants and burgesses in the 12th century, called the laws of Wisby. (Azuni's Maritime Law. vol. i. p. 381—5. Eng. Trans.)—P.

^f Medewi [Medevi.] (Rees' Cyc.)—P.

^g Men from twenty to twenty-five years of age are obliged to serve. They form five classes.

cient to say, that in battle a Swedish ship of equal force has the advantage over a Russian.

The laws are wise, clear, and precise. With the exception of some modifications adopted under Gustavus III. (who abolished the torture) and under the successors of that prince, the code in use is that which was drawn up in the early part of the eighteenth century, during the reign of Frederic I. The punishment of death is not abolished, but the application of it is rare, because there are fewer murders committed in Sweden than elsewhere, and also because this punishment is not pronounced except when the accused makes confession of his crime. In civil cases, the two parties bear each their proportion of the expense: he who loses is never condemned to pay the costs. A new code of laws is about to be discussed by the Diet.^a

The constitution established during the reign of Gustavus III., in consequence of the revolution which baffled the plans of the senate and nobility, serves as the basis of the Swedish government. The monarchical power is hereditary, but females are excluded. The king of Sweden is perhaps, of all the constitutional monarchs in Europe, the one whose power is most limited. He does not attain majority till twenty-one; from his eighteenth year to that age, he may sit in the different councils, but he has no deliberative voice; if he place himself at the head of the armies, or if he quit the kingdom from any other motive, he must confide the administration to a regency, composed of four members of the council of state and of the minister of justice. If his absence lasts more than a year, or if any indisposition prevents him during the same space of time from attending to public affairs, the Council of State convokes the Diet (*Ständerne*)^b or States General, which must adopt some measure for the security of the country. Until this is done, the foreign ambassadors cannot approach within twenty-four leagues of the place where the States are assembled. The Senate or Court of Peers is composed of twenty-two members. Twelve counsellors of the crown form a council corresponding to the Council of State in France;^c it gives its advice, and the king decides. The king appoints to all offices and employments, and has the right of conferring pardons, but he cannot make any new laws, or interpret old ones, levy taxes, or declare war, without the consent of the states, which he alone has the power of convoking. No judgment can be given by a warrant. The law guarantees the rights and property of the citizens. The liberty of the press is among the number of fundamental laws, which cannot be modified without the participation of both monarch and states. The States have under their management the public debt and the national

bank. They are composed of four orders, namely, the nobility, in which order each family has its representative;^d the clergy, represented by the bishops, as well as by pastors chosen in each chapter;^e the burgesses, whose deputies are chosen by the principal towns in the kingdom;^f and the peasantry,^g who choose their own representatives in their assemblies. Each deputy must be 25 years complete, must belong to one of these orders, and profess the protestant religion. The deputies of the nobility are the most numerous, an inconvenience modified by an important regulation, which does not admit of voting individually, but by orders. The States assemble usually every five years, unless in case of extraordinary circumstances. The kingdom of Norway participates in the advantages presented by this constitution, which in time the progress of intelligence will doubtless improve, but it has only one legislative chamber (*Storting*),^h whose members enjoy no distinction one above another.

Industry is but little developed in Sweden, and still less in Norway. There are reckoned in Sweden only 7000 manufacturers of all kinds, and 3000 traders.ⁱ The government has for several years made the greatest efforts to encourage the manufacture of steel and of cloth, of glass and of china,^k but the amount of these is far from supplying the consumption of the country, an unanswerable argument against the partisans of the prohibitory system. It would be more advantageous for Sweden to abandon several branches of manufacture, which are only supported by a system of severe custom-house regulations, and to give fuller scope to the working of her mines of iron, copper and cobalt; to her trade in timber, which may be regarded as a source of inexhaustible wealth, if the reproduction of the forests is attended to; to the manufacture of mathematical and philosophical instruments, for which Stockholm enjoys some celebrity; to her tanneries, and the manufacture of gloves, a branch of industry in which the Swedes have few rivals; to her founderies, which procure for her so great advantages; to her cordage manufacture, in which the town of Fahlun excels; to the making of vases and other ornamental articles in porphyry, which occupies a part of the population of *Elfvédal*,^l in the prefecture of Stora Kopparberg;^m to the productive fishery of the cod and the herring; and lastly, to the building of ships, so much in request by foreigners. The extension of these different branches of industry would present to her the means of augmenting her trade, already so important, and would procure her a multitude of articles which she cannot fabricate at the same price with other nations. By this means she might renounce the prohibition of wine, tea, rum, and other commodities

^a "At the next session." (M. B. 1829.)

^b Swed. *stand*, rank, class, order—plur. *ständer*, states, estates—*Ständerne*, the States—*Rikens Ständerne*, the States of the Kingdom.—P.

^c *Sveriges och Norriges Calendar för året 1829* (Almanack of Sweden and Norway for 1829.)

^d There are reckoned to be in Sweden 1300 noble families: the eldest of each family sits in the diet, under the name of *caput familie* [Swed. *familiens hufvud*.] The nobility is divided into three classes, viz. that of counts and barons, that of knights [*riddarer*] or ancient gentlemen, without titles, and that of esquires [*srenner*], comprehending all untitled gentlemen who have obtained letters of nobility since the reign of Charles XI. (Catteau.)—The diet of 1786 consisted of 48 counts, 136 barons, 188 knights, and 396 gentlemen [*srenner*], besides 51 ecclesiastics, 94 burgesses, and 165 deputies of the order of peasants. (Pinkerton.)—P.

^e The fourteen prelates of the kingdom, namely, the archbishop of Upsal and the thirteen bishops, are *ex officio* members of the diet, and each archdeaconry deposes one or two representatives. (Catteau.)—P.

^f The citizens are represented by the deputies of cities. Stockholm has ten; cities of the second class have two or three, and the rest send only one. Sometimes, for the sake of economy, two small cities are represented by the same person. (Catteau.)—P.

^g "The order of peasants."—Farmers who cultivate lands belonging to them and their descendants, as long as they fulfil their engagements with the crown, constitute in the diet, the order of peasants. Each balliwick appoints a deputy, and defrays his expenses. (Catteau.)—P.

^h "*Storting*."—See note ^a p. 1039, and note ³ p. 1045.—P.

ⁱ "7000 manufactories (*fabriques*)—and 3000 merchants (*negocians*)."—

foreign to her climate, a prohibition which has no other advantage than to keep up bands of smugglers; by this means she might also find, in her more extended relations, the means of increasing the productions of a soil, in which agriculture is perhaps more advanced than in any other agricultural country, and which even exports corn; and by this means, too, she might increase the advantages which she derives from transporting in her vessels, to different ports of Europe, as well as to her own, the merchandise of foreign nations.^a But the Swedish nation may expect every thing from the future; the accomplishment of her wishes has nothing to fear from Gothic prejudices; the States are unanimous in their desire to secure the public prosperity. The stubborn partisans of commercial restrictions have not been able to prevent the reduction of the duties on colonial commodities imported by the North Americans;^b freedom of trade is on the eve of being proclaimed in Sweden.

^a That is, from the carrying trade.—P.

^b "The United States."

^c "Government favors everywhere the employment of vaccination, the division of landed property, the draining of marshes, the establishment of colonies for the improvement of lands recently brought under cultivation, and also that of nurseries for the propagation of the oak, and of farms (*bergeries*) for ameliorating the breed of sheep."

^d "—have just been adopted" (1829.)

^e In Norway the conscription has been several years established; the duration of military service is from five to seven years.

VOL. III.—NO. 54 48

The government favours everywhere the use of vaccination, the division of lands, the draining of marshes, the establishment of colonies to render useful the lands newly brought under culture, the cultivation of the oak, and the ameliorating the quality of wool.^c Canals and roads are multiplying; measures are adopting^d to render more equal, and consequently more supportable, the burden of military service;^e the organization of the communes and departments is undergoing the changes desired by the people;^f the lands are almost all of them registered;^g steam-vessels establish frequent communications between the maritime towns;^h lastly, the increase of population since 1821 has been such, that in 61 years it will be doubledⁱ—an evident proof of general prosperity. We may then say with confidence, that the people of Sweden and Norway enjoy, under the protection of a government strictly constitutional, a happiness guaranteed by the present generation to posterity.

BOOK CXLIX.

EUROPE.

Europe continued.—Description of Denmark and of the Færoe Isles.^a

WHAT sublime recollections are connected with the history of the small Peninsula, which, bathed on the west by the north sea, on the east by the strait of the Cattegat, and on the north by that of the Skager-Rack, and flanked on the east by large islands, and on the west by a small archipelago, is interposed between Sweden and Norway! The cradle of the formidable *Cimbri*, the ancients called it the Cimbric Chersonese (*Chersonesus Cimbrica*.) From this country there issued, about 100 years before our era,^b those tribes which, joined by several others inhabiting the borders of the Baltic, ravaged Gaul and Helvetia, made Italy tremble, several times defeated the Romans, and were at last themselves defeated by Marius. The same people, under the name of Jutes and Angles,^c some centuries afterwards,^d invaded England, and, being hardy navigators, contributed to swell that swarm of pirates from Norway and Sweden, which, confounded during the middle ages under the name of Normans, were the terror of the rest of Europe for a period of several centuries.^e

Jutland, which comprehends the whole peninsula, inhabited by the Jutes, whose name it bears; the dutchy of *Sleswick*, an isthmus, which, with *Holstein* and the dutchy of *Lauenburg*, adjoining to it, was peopled by the Angles; and the islands of *Funen*, *Zealand* and *Laaland*, together with several others of less importance, form the kingdom of Denmark, and present an outline of more than 1500 leagues of coast.

At the sight of these countries, which are separated by several straits, dangerous from their shoals as well as from their inconsiderable breadth, such as the Sound, and the Great and Little Belt, one is tempted to broach a question that has been more than once agitated, and the solution of which divides in opinion several literary men, who, inhabiting the borders of the Baltic, are favourably situated for verifying known facts and making new observations.—Is it a fact that the level of this sea is subsiding? Olof Dalin says, that on the coast of Sweden, it annually loses half an inch; Andreas Celsius

has calculated that its diminution is four inches five lines every hundred years; Pontoppidan has made the same observation on the coast of Denmark;^f Bergman regarded this fact as incontestable. After a careful examination, we have arrived at the conclusion, that this diminution is very unequal; that in the Gulf of Bothnia, it may be estimated at four feet in a century, while it is only two feet on the coast of Calmar, and still less on that of Denmark. The inhabitants of the islets in the northern part of the Baltic, persuaded of this change of level, attribute it, not to the diminution of the waters, but to the elevation of the soil. Many geological facts prove, it is true, that the older rocks have been raised at a very remote period, by a force acting from the centre of the earth towards its surface; but it is not very probable that such elevations occur at this day.^g Besides, although it is natural to think that the accumulation of the remains of marine animals, and other causes equally slow, ought to contribute, in the course of ages, to diminish the depth of seas, yet after all, the diminution of the waters of the Baltic, a sea without either flux or reflux, may be a mere illusion. The alluvions which the larger and smaller rivers bear thither, drive back, as in other seas, its boundaries in some places; and the retiring of its waters, after having been raised by the violence of the winds, also favours the idea of its diminution. In one place, cities, formerly on the coast, are now at a distance from it; elsewhere, rocks, covered at one time by the highest waters, are now visible: these facts seem to confirm a diminution of the level,—a theory which, upon the whole, is more probable than the contrary hypothesis, in spite of the opinion of certain old observers, that the waters of the Baltic are higher than those of the Ocean.^hⁱ

Denmark is only a prolongation of the vast plains which, to the east and south, border this sea. The highest inequalities of the surface in the dutchies of *Holstein* and *Sleswick*, do not exceed 1000 feet. It is the same in the Danish islands; the mountains of *Funen*, and those in the centre of *Zealand*, being only hills. The soil, even to a very considerable depth, is

quake that occurred a few years since on the coast of Chili. Rocks that had before been submerged, were permanently elevated above the surface of the sea.—P.

^b “Here, towns, formerly situated on the coast, are now at a distance from it; there, rocks, covered by the highest waters, and at other times visible, appear to establish a change of level, so much the less probable, however, as it is false, notwithstanding the opinion of some of the earlier observers, that the waters of the Baltic are more elevated than those of the Ocean.”

ⁱ Consult the Observations of Mr. N. Brunrona on the Diminution of the Baltic Sea, accompanied with Remarks by Mr. Høllstrøm Memoirs of the Academy of Stockholm, 1823, 1824.

^a See note ^k p. 1075.

^b The *Cimbri* left their country A. C. 115, and having been joined by the *Teutones*, first entered Italy A. C. 109. The *Teutones* were defeated by Marius near Aix in Provence, A. C. 102, and the *Cimbri*, on the river Adige, A. C. 101.—P.

^c Lat. *Jute* and *Angli*.

^d The Jutes first invaded England A. D. 449, and the Angles, A. D. 547. (Pinkerton.)—P.

^e In the 9th century, these words were added to the Litany: *A furore Normannorum libera nos, O Domine*.

^f In his Geography, entitled: Danish Atlas.

^g A very obvious elevation of the soil was observed, after an earth-

composed of sand and clay, consisting merely of alluvial deposits which every where cover a chalky substratum. The clay supports the sand: in the former, which is ordinarily of a bluish colour, are found a great number of marine shells, which have in part preserved their original colours, and many of which are similar to shells now found in the sea, as if to prove to the observer, that this clay is one of the most recent formations that has been distinguished in geology. On some parts of the coast, this formation contains trunks of trees half decomposed, and not only impressions, but entire strata of plants of the family of *Aroideæ*, several individuals of which perfectly resemble the *Zostera marina*.^a The upper sand is sometimes mixed with reddish clay, and remains of plants are found there, which would seem to have been carbonized. In Northern Jutland, this diluvial sand does not appear to contain any remains of the bones of those large animals, so frequent elsewhere in similar deposits; but in several other parts of Denmark, these remains are found in the same sand. The savant who has furnished us with these remarks,^b asserts that he has never found, but in one place, those rolled blocks of granite, which are supposed to have been torn from the Norwegian mountains. Another savant^c is of opinion, that these masses of rock have been conveyed to Denmark by the ice, as is still to be seen in some countries farther to the north. What proves that this sand belongs to another period than that of the clay which it covers, is, that, even when the clay presents an irregular or undulated appearance, the sand is always in a horizontal position. In the *Vindsyssel*,^d in place of the sand there are strata of peat or turf of a great extent, which, on the borders of the sea, are covered by the sand of the downs. This peat forms a good article of fuel. The island of Funen presents the same geological organization as continental Denmark; thus, while the upper marine sediments,^e represented by the blue clay in Jutland, develop themselves in Holstein in such a manner as to present in the hilly part of that duchy, beds of stone fit for building, in the same way, chalk, clay, coarse limestone^f proper for building, and peat, may be found in Funen. In Zealand, the chalk appears to have again undergone the action of water since its first formation. The island of Bornholm, which is much nearer Sweden than Denmark, differs from the latter country and its islands; there, granite rocks sup-

^a The genus *Zostera* was arranged by Jussieu, in his *Genera Plantarum*, in the family of *Aroideæ*; it is at present arranged in the family of *Flurinales* (*Naiades*, Juss.) See Lindley's *Introd. Nat. Syst. Bot.* p. 257. Amer. Edit.—P.

^e "Sédiments marins supérieurs"—Tertiary marine formations. The French geologists call the tertiary formations, upper sediments (*sédiments supérieurs*), or formations of upper sediment (*terrains de sédiment supérieur*), in distinction from the secondary formations, which they call lower sediments (*sédiments inférieurs*), or formations of lower sediment (*terrains de sédiment inférieur*). The tertiary deposits here referred to, viz. blue clay (London clay) and coarse limestone (*calcaire grossier*), belong to the lower tertiary marine formation; the upper tertiary marine formation consisting of marles, sands, and sandstones. Of the deposits found in Funen, the lowest or the chalk, also the substratum in Jutland, is the uppermost of the secondary formations; the clay and coarse limestone belong to the lower tertiary marine forma-

tion, (the sand above the clay in Jutland, belonging probably to the upper tertiary marine formation;) while the peat is an alluvial or rather lacustrine formation.—P.

port deposits of different periods, even including those which belong to the commencement of the chalk formation.^g After the view we have just given of the geological constitution of Denmark, it will excite no surprise to learn that it does not contain any metals in sufficient quantity to be wrought. We have already observed that the straits which divide the Danish isles, present a difficult navigation; we may also observe that shallows, rapid currents, and short and precipitous waves, concur to render the whole coast very dangerous, especially that of Jutland. The rivers of Jutland, and of the duchies of Sleswick and Holstein, are inconsiderable, but the country is compensated for this loss by the narrow arms of the sea^h which penetrate into the country to a great distance, and render more commodious the sea-ports established there. The Danes call them *Fjords*.ⁱ Some years ago, the most important was the *Lym-Fiord*,^k in the northern part of Jutland: its entrance was into the Cattegat, and it terminated at a neck of land washed by the North Sea; but this narrow isthmus could not resist the violence of the waves; in February 1825, a breach was made in it, and the Lym-Fiord, which towards the west takes the form of a large lake, in the midst of which rises the island of *Mors*,^l now open to the east and west, has transformed the northern extremity of Jutland into a long and irregular island. The opening which has been thus made is unfortunately of no commercial advantage: it is not navigable, and probably never will be so, for it would occasion an expense too considerable to finish what nature has begun. The most important of the other inlets of the sea^m are the *Ringkøbing-Fiord*ⁿ and the *Nissum-Fiord*, on the western coast of the Peninsula; the *Flensburg-Fiord*^o and the *Schley*,^p on the eastern coast of Sleswick; the *Odensee-Fiord*,^q on the north side of Funen; and lastly, the *Ise-Fiord*^r and the *Ræskilde-Fiord*,^s on the north side of Zealand. There are a great number of lakes in continental Denmark, and in its islands. Jutland contains twenty-five, Sleswick one, and Holstein three; in the island of Zealand they count at least twelve, and several are also to be seen in Funen. It is calculated that the lakes and marshes cover a one and twentieth part of the surface of Denmark, and that a seventy-eighth part is occupied by the channels of rivers; so that, without counting the bays, inlets of the

tion, (the sand above the clay in Jutland, belonging probably to the upper tertiary marine formation;) while the peat is an alluvial or rather lacustrine formation.—P.

sea^a and canals, the waters form one sixteenth of the surface of the kingdom, computed at 2865 leagues, of which 2210 belong to the continent, and 655 to the islands. The three principal canals in Denmark are, that of *Odensee*, which, although of small extent, is important to the commerce of that town, from its opening a communication with the Great Belt; that of the *Steckenitz*, which by the junction of that branch of the Trave with the Delvenau, a feeder of the Elbe, connects the latter river with the Baltic;^b and the canal of *Sleswick-Holstein*, the largest of the three, which, conveying the waters of the Eider^c to the gulf of Kiel, unites the North Sea with the Baltic. Other canals are projected, with the view of forwarding the commercial relations of the kingdom.

The length of the continental provinces, from the course of the Elbe, which forms in part the southern limit of the duchies of Holstein and Lauenburg, to Cape Skagen on the north, which separates the Cattegat from the strait of Skager-Rack,^d is 107 geographical leagues; their greatest breadth is 38 leagues, and their smallest breadth 11. In the widest part of the Danish Peninsula, there is no place more than 14 leagues distant from the sea; whence it happens, that, in spite of its situation, at the northern extremity of the northern temperate zone, the climate of Denmark is warmer than its latitude indicates. The abundance of its waters, and the proximity of the sea, cover the country with vapours and humid fogs; during the winter, the thermometer descends from 3 to 11 degrees, and during the summer it rises from 12 to 18 degrees;^e the winds, whose force is not arrested by any mountains, usually disperse the exhalations and mists. Under this foggy sky, spring does not adorn itself with those charms, which, in more temperate regions, announce the revival of nature: during this season, the weather is by turns humid, tempestuous, or frosty.^f Summer, almost always very variable, lasts only from June to the middle of August: to the heat of the day, the longest of which is 17 hours, succeeds the coolness of the night. Autumn is the finest of the seasons, but its duration is short: the cold weather returns in October, and the month of November passes in cold rains and in storms. Winter, subject to almost incessant snow or rain, especially in the months of January and February, rarely however sees the coasts covered with ice: the shortest day lasts about seven hours.

The constant humidity of the atmosphere favours vegetation in Denmark, but the violence of the tempests opposes the growth of forest-trees; a wind from the north-west, called *skai*, whose pernicious breath is especially felt in May and June, withers the tops of the trees, whilst the

west wind is sufficiently frequent to give them a very marked inclination. Of the dark and gloomy forests, which, in the tenth and eleventh centuries, covered the peninsula of Jutland, there now only remain long and narrow belts along its whole eastern coast; Holstein has only preserved a few fragments in the midst of its heaths; Lauenburg, to the south of Holstein, contains the forest of Saehsenwald, formerly much more extensive. In these three provinces, the woods are composed of the ash, the alder, the oak, and especially the birch: the pine and the fir are rare. The island of Funen is interspersed with small woods; the north-east part of Zealand, next the borders of the Sound, and the island of Falster, still contain several; and in that of Bornholm, there are to be seen forests of birch. The whole of the woods of Denmark form a surface of 130 square leagues. Their improvident destruction near the sea-coast has exposed the soil to invasion from the sands.^g On the coasts grow the common glass-wort (*Salsola Soda*);^h the juniper, the myrtle,ⁱ the bramble, and several other berry-bearing shrubs, border the high-ways and the skirts of the woods; a plant which the Danes call manna (*Festuca fluitans*, Linn.)^k throws out spontaneously its useful shoots in several of the islands, and especially in that of Laaland: the grain of it yields very good meal. Several other indigenous vegetables are found useful in medicine, and also in dyeing. The meadows of Denmark present a verdure as fresh as those of England: for a long time the cultivator of the ground has been in the practice of increasing its value by draining the marshes and multiplying artificial meadows.^l There are, however, on the western coasts of South Jutland and Holstein, pasturages naturally so rich and so fertile as to render all culture superfluous. In Holstein, Sleswick, and Jutland, they cultivate flax and hemp; but although the soil there has been found to suit these plants, they are yet much neglected. In Jutland they also raise tobacco, and sow a good deal of buck-wheat.^m The different kinds of grain succeed everywhere; the produce, estimated at seven millions of tons,ⁿ or at 1,300,000,000 kilogrammes, exceeds the wants of the population. The oats of Bornholm, the rye of Jutland, the wheat of Laaland, and the barley of Zealand, Sleswick and Holstein, are everywhere esteemed. Potatoes, cummin and mustard, as well as other useful plants,^o are much cultivated; and the kitchen-gardens abound in artichokes, cauliflowers, asparagus, and melons, of an excellent quality. These plants are also cultivated in the fields, but less extensively than in France and Germany. The grape does not ripen except in hothouses; but in the orchards, if peaches and apricots are rarer than in France, the inhabitants find an ample compensation

^a "Gulfs."

^b The Trave has a communication with the Elbe by the canal of Steckenitz, which unites the little river of that name, falling into the Trave, with the Devenau, a rivulet emptying into the Elbe at Lauenburg. (Tuckey, vol. i. p. 254.)—P.

^o "Plantes économiques"—plants used in domestic economy.—P.

in the culture of the plum, the cherry, the pear, and especially the apple: the apples of Gravenstein in Sleswick are much celebrated; fruits form an article of considerable export, especially to Sweden and Russia.

In losing their vast forests, the Danish territory and its islands have witnessed the extinction of the tribes of the larger wild animals: the wolf, which formerly ravaged this country, has entirely disappeared;^a the wild boar has become very rare; the stag and the fallow deer exist only in parks; the fox, the martin,^b the polecat,^c the rat, and several other small quadrupeds, are the only ones that do injury to property, from the circumstance of their existing in great numbers. Game is everywhere abundant, especially on the coasts of Jutland; hares are in demand as agreeable food;^d wild geese and ducks, partridges, snipes, and thrushes, people the marshes and the fields; swans live at freedom in the gulf of Lym-Fiord and on the islands of Amak and Bornholm, which they do not quit till compelled by the severity of the frost; the duck known under the name of eider-duck, lines with its soft down the nests which it makes in the clefts of the rocks and precipices;^e the eagle and the other large birds of prey are seldom seen; they seem to despise a country, which offers no heights sufficiently elevated for their dwelling.

Domestic animals form the principal riches of Denmark: geese and other fowl afford a considerable profit to those who breed them.^f The Danish horses are of two kinds:^g the one, small but vigorous, abounds in the islands; the other, large, strong, and elegantly shaped, is peculiar to Jutland and Holstein, and sought after by strangers. Horned cattle are also smaller in the islands than on the mainland; their great number, as well as that of sheep, whose breed has undergone the most important amelioration during the last twenty years, by crossing them with the breeds of Spain and England, attest the progress of agriculture. The swine of Jutland, sent in considerable herds into Holstein, form, in that dutch, a double branch of industry, being fattened and salted for foreign export. Lastly, Denmark has long supplied the Continent with that race of dogs called Danish, renowned for their strength and their fidelity, and also with the small black-muzzled dog called by the French *carlin*,^h so much sought after in France during the last twenty-five years.

Although not so well supplied with fish as those of Norway, yet the seas that wash Denmark amply reward

^a "—appears to have entirely disappeared." The wolves are reduced to a very small number. (Ed. Enc.)—P.

^d "The hares are esteemed for their delicate flavour."

^e "Falaises"—bluffs.

^f Poultry are raised in great numbers in Denmark, particularly geese and ducks, whose feathers form an important article of commerce.—P.

^g "—belong to two races" (breeds.)

^h "The small black-nosed pug-dogs (*carlins*)"—Qu. The small Danish dog, leopard, or spotted dog.—P.

ⁱ Seals (*Phoca ritulina*).—P.
^k In the river or bay of Slie [the Sley or Schley, on which Sleswick is situated. See note ^p p. 1062] and the gulf of Flensburg, are taken a small species of herring of excellent quality. Besides what are consumed in the country, they export annually of the herrings taken here, nearly 1000 tons to Germany and Copenhagen. (Ed. Enc.)—P.

^l "Guden-Aae"—Guden river.—*Aae* (J. Baden, Ordbog.) *Au* (L. Hasse, Handlex.) signifies river, in Danish.—P.

^m See the work of J. Collin, counsellor of state, entitled: "For historie og statistik især Fædrelandets [Contributions to History and Statistics, particularly to those of Denmark,]" vol. ii. Copenhagen, 1825.

the active fisherman. They not only furnish a supply of food to the greater part of the inhabitants, but afford a surplus for exportation: the plaice (*Pleuronectes platessa*), which is taken in the neighbourhood of Cape Skagen, is sold in a dried state to the Lubeckers, who pack it up neatly and send it as far as Italy; the western coast of Sleswick and Jutland is supplied with beds of oysters; on the shores of the Categat they catch abundance of lobsters; porpoises and sea-dogs¹ are frequently caught in the nets which they at the same time injure by their size; the small river Slie in Sleswick furnishes a species of herring which is in high estimation,^k and that of Guden-Aa,^l the most considerable in Jutland, excellent salmon.

The Dane thus finds a certain means of subsistence in the produce of the soil, in the animals which he rears, and in the fish of his lakes, rivers and seas. He exports grain, cheese, wool, salted provisions, tallow, horse and ox hides, feathers, and fish. His manufacturing industry supplies besides, as articles of trade, coarse pottery, hosiery, lace and cotton stuffs; but the greater part of these exports have been diminishing for several years back, owing, in part at least, to the restrictions which custom-house duties impose upon commerce, and to the obstacles which indirect taxes present to the development of industry. Government ought to encourage the culture of hops, woad and oleaginous plants, the rearing of bees, the improvement of wool, and the making of cheese.^m

With the exception of a few thousand Jews, the greater part of whom are established at Altona and Copenhagen, the inhabitants of Denmark descend, as has been already said, from one of those ancient nations, whose assemblage forms the Germanic stock. The idiom which is spoken in Jutland, Sleswick, and the Danish archipelago,ⁿ is a dialect of the Scaldic or Scandinavian language;^o that of Holstein, and that of the small archipelago lying near the western coast of Sleswick,^p are two dialects of the old Saxon. It is in these idioms that we find the signification of the names given to the islands and provinces which compose Denmark. The name of this country signifies *low lands*;^q *Fionia*,^r *a beautiful country*; *Laaland*, *low country*; and *Zealand*, *a country surrounded with water*.^s *Belt* means *a girdle*.^t and in point of fact, the two Belts are long and narrow. The name of Jutland appears to be merely a corruption of the word *Gothland*.^u it too was a country of the Goths.

ⁿ A German or Low Saxon dialect is spoken in a part of Sleswick, and a Frisian dialect on the western coast of that province, and in the adjoining islands. In the rest of Denmark Proper, the language is Danish.—P.

^o See note ^a p. 1036.

^p The popular language of Holstein is Low Saxon (Germ. *Platt Deutsch*).—The language of the islands here mentioned, and of parts of the adjacent mainland, is a dialect of the Frisian language, other dialects of which are spoken in East and West Friesland. See note ^a.—P.

^q From *dalm*, low, and *mark*, fields. ["From *dann*, below [Eng. *down*.] and *mark*, fields."—*Dann* is not a modern Danish word. *Mark* signifies field, sing., in Danish.—Denmark is said to be derived from *dann* or *dann*, signifying lowlands. (N. Am. Rev. No. 62.)—P.]

^r "Fionie"—Funen (Dan. Fyen.)—Dan. *fin*; Swed. *fin*; Icelandic, *fen*; Eng. *fine*.—P.

^s The ancient name of this island was *Sia-Lund*, which signifies *a forest in the sea*; from *sia*, sea, and *lund*, forest. [The present Danish name is *Sjeland* (See note ^a p. 1077)—The present Danish word for sea, is *se* (Swed. *sjæ*.) *Lund* now signifies rather a grove than a forest.—P.]

^t Dan. *belte*, *bælte*, a girdle.—P.

^u Rather a corruption of *Jutland*, from the Jutes, its original inhabitants. See p. 1061.—P.

Holstein, which the Hibernian chronicles^a call *Holsaturland*, is *Holsatia* or *woody Saxony*.^b The Danish language, as spoken by persons of education, is soft and harmonious: what distinguishes it chiefly from the Swedish, is the substitution of *e* in place of *a* in the greater part of words.

The climate of Denmark is not injurious to the health of the inhabitants, as is proved by the proportion which the population bears to the surface of the country. Possibly, however, the humidity of the atmosphere, and the quantity of salted meat and fish used by the Danes, may have contributed to render their character dull, patient, and difficult to move. "Formerly an insatiable conqueror, now brave but pacific; of little enterprise, but laborious and persevering; diffident but proud, hospitable but not officious; cheerful and open with his countrymen, but somewhat cold and ceremonious towards strangers; loving his ease more than show; more economical than industrious, and that too sometimes from vanity, and sometimes from laziness; an imitator of others, a judicious observer, a profound thinker, but slow and minute; indued with an imagination more strong than rich; constant, romantic and jealous in his affections; capable of great enthusiasm, but rarely of those flashes of intellect, or sallies of wit, which, by their unexpectedness, demand and obtain victory and applause; strongly attached to his native soil, and to the interests of his country, but caring little about national glory; accustomed to the calm of monarchy, but the enemy of slavery and arbitrary power; such is the portrait of the Dane."^c The inhabitant of Holstein would not recognise himself in this portrait, because in effect he differs in many respects from the inhabitant of Denmark; he is economical and industrious like the Hollander, and not less bold in his commercial views. The Dane is generally middle-sized, well-made, fair, and of a mild and agreeable physiognomy; the native of Holstein rarely displays in his features the nobleness and delicacy of northern countenances. In both nations, private virtues, morals more severe in reality than in appearance, and manners polite rather than refined, distinguish the higher ranks; among the lower ranks, the love of order is not a rare quality, excepting with the seaman, who, by his kind of life, is led to adopt the vices of different nations. The peasant is laborious; he dresses himself with neatness, loves to sing and to dance,

and appears to be happier than in the rest of Europe, and especially than in France. He has become a proprietor, as in the latter country, by the advantage which the disposal of seignorial lands in small portions offers to their proprietors. The personal services due by the peasantry to their landlords^d have been long since abolished, or an annual payment substituted in their place; and many farms are let on perpetual leases,^e a circumstance which has contributed not a little to the advancement of agriculture.

There is much more education in Denmark than in France. It is rare to meet a peasant, or any other of the lower class, who cannot read. In 1822, government permitted the introduction of the system of mutual instruction into the elementary public schools: the succeeding year, the number of schools which had adopted this method amounted to 244, and in the beginning of 1829, it was about 2500. At that date there were reckoned in all more than 4500 primary schools, of which 400 were private. This rapid progress is due to the zeal of the *Society for Elementary Instruction* established at Copenhagen. In Denmark, this instruction is not confined, as in France, to reading, writing, arithmetic, and religious instruction; it comprehends also history, geography, and natural history.^f The higher studies enjoy the same favour as the earlier branches of education.

Many learned men and writers of distinction have added celebrity to the Danish nation. Holberg, a comic author, has enriched the national literature with a heroi-comic poem, regarded as classical by his countrymen;^g his comedies have procured for him the surname of the Plautus of the North.^h Pram has made himself known by a fine epic poem, and by some good tragedies.^k Thormodus-Torfeus,^l Gram,^m Langebeck,ⁿ Schjonning,^o and some others, have employed the resources of a vast erudition in the study of the history and antiquities of the north. Malling, among the historians, has distinguished himself by the elegance of his style. We are indebted for several philosophical treatises to Boye, Gamborg and Treschow, the last of whom has refuted the opinions of Kant. Among the men who have cultivated with success the physical and natural sciences, Laurensberg, Steno, and Gaspard Thomas, have left valuable works on mineralogy;^p Erasmus Bartholin^q discovered the double refraction of that variety of carbonate of lime, call-

^p Qu. Should not this read: "Laurenberg, Steno, and Caspar (*Gaspard*) and Thomas Bartholine, have left valuable works on medicine."—Steno and the Bartholines are well known as medical writers, particularly as anatomists. There were three physicians of the name of Laurenberg (Peter, John and William,) of some note for their writings, particularly Peter Laurenberg. I cannot find any notice of any such mineralogical writers as are mentioned in the text, in which the translator has faithfully followed the original. I merely find it stated that William Laurenberg wrote an historical description of the eagle-stone (*aitiles*), then celebrated for its magico-medical virtues, (*Descriptio historica aitilis*), that Caspar Bartholine wrote a dissertation on the nephritic stone and the most remarkable amulets (*Dissert. de lapide nephritico et præcipuis amuletis*), that Thomas Bartholine, father and son, each wrote a paper on the Iceland crystal, and that Steno wrote a treatise on myology (*Myologia Specimen*).—P.

^q Lat. *Bartholinus*—Bartholine, in English authors.—P.

cd Iceland spar;^a Pontoppidan, bishop of Bergen in Norway, has made us acquainted with the minerals of Denmark and Norway; Brünnich first composed in Danish a manual of mineralogy;^b Abildgaard, a learned physician, wrote on minerals and animals; Winslow passes for the founder of descriptive anatomy; Borch,^c at once a physician, chemist and philologist, has left numerous writings; Thomas Bartholin,^d the author of a multitude of works, was considered the first physician of his age; Fabricius, so celebrated as an entomologist, has carried the torch of his genius into many questions of natural history and political economy. If so many distinguished names are not enough for the glory of Denmark, let us remember that the name of Tycho Brahe alone throws a lustre on this country. It is less rich in celebrated artists, a natural consequence of the small number of large fortunes in Denmark; several Danes, however, more alive to glory than to the favours of fortune, have obtained a name in painting, engraving and sculpture.

Previous to the year 1660, the constitution of Denmark was, like that of Norway and Sweden, a limited and elective monarchy. The sovereign was elected by the States-General, consisting of the nobility, clergy, and commons,—the last including burgesses and peasantry. This has been admitted by all historians, and the memorable answer of Waldemar III. in the fourteenth century to the Pope's nuncio, who was attempting to assume authority in the kingdom, may be here quoted to show the opinion of royalty itself in a matter, where, had not the fact been indubitable, silence would have been preserved. "Our nature," says the prince, "we have from God, *our kingdom from our subjects*, our wealth from our parents, and our religion from the Church of Rome, which last we are willing to renounce, if you envy us the felicity it brings." The king was in general chosen from the royal family, but without regard to hereditary succession; and, if he conducted himself in opposition to the laws and constitution, the States made no difficulty of bringing him to trial, and deposing, banishing, imprisoning, and even putting him to death, if occasion required. The laws required that frequent convocations of the States should be held, and by them

all matters connected with government were transacted, questions as to peace or war, the imposition of taxes, the enactment of new laws, and abolition or alteration of the old. It was the duty of the king to see the laws well administered, and justice done impartially to all, to command the army in time of war, and to prevent one order in the State from usurping power over the other orders. He had no support from the people, and his revenue arose entirely from his own estate, from the crown lands, as they might be called. But since 1660, Denmark has been a hereditary monarchy, submissive to the most absolute authority that exists in Europe, having no other limits than the will of the prince. The revolution took its rise from the usurpations of the nobility, and the advantage taken by the reigning prince of the discontents that arose out of these usurpations. The States, which ought to have been frequently called together, were seldom convoked, and the nobility, who had taken advantage of this circumstance to increase their own privileges, and inroach upon those of others, were not anxious that assemblies should be called, which might reduce, or attempt to reduce the power they had unjustly acquired. The grand cause of offence was their having contrived, in the imposition of taxes, to lay the great burden of these taxes upon others, and to free themselves almost entirely from that burden, under the pretext of the peculiar privileges of their order. To perpetuate this state of things, partial assemblies of the States were convoked, and the clergy and commons came to be considered as mere cyphers in the government, the whole power falling into the hands of the aristocracy, and some creatures of the court. The Senate, for so it appears was the States-General called,^e which exercised without responsibility, what, under the circumstances mentioned, became an usurped power, lost with time the imposing character which had long drawn to it the respect of the nation.^f It is in a political crisis, such as this, that we can judge of the real strength of a government. When it has not for its foundation the interests of the whole, it resembles a frail scaffolding, which a breath of wind can overturn. The war declared against Sweden by Denmark [in 1657] drew upon the latter kingdom the disasters of an inva-

^d See note ^a p. 1065.

^e The Senate was a body entirely distinct from the States-General, as is stated in the original. (See note ^f.) It was in fact an executive council, in which, with the king, the executive authority was vested. As it had by the constitution, no legislative authority, which, together with the right of electing the sovereign, was vested in the States, the right which it assumed of voting the laws, during the discontinuance of the assemblies of the States (diets,) as stated in the original (see note ^f), was obviously an usurpation.—Before the revolution in 1660, the right of electing the sovereign, and the supreme legislative authority, resided in the three estates of the kingdom, the nobles, the clergy, and the commons, assembled in a diet by means of representatives. The executive power was vested in the king and senate, the latter composed of the principal nobles. The king was little more than president of the senate, and commander of the army, the royal prerogative being circumscribed by the charter of rights, always ratified by the sovereign at his accession. It was the custom also for the states to communicate their plans or wishes respecting the subjects on which the diet was convoked, to the king through the senate; but this was disregarded, during the diet that brought about the revolution, by the clergy and commons, who then communicated directly with the king.

(Ed. Enc.)—When the Christian religion was established in Denmark, the clergy were admitted, not only to be an order of the states, but also to have seats in the senate. (Guthrie.)—After the reformation, the estates of the clergy having been annexed to the royal domains, they of course lost much of their temporal influence, and being commoners by birth, were no longer admitted to the senate, which at the time of the revolution was monopolized by the nobility.—P.

^f "Denmark had, for several centuries, like Sweden and Norway, been an elective monarchy, in which the power of the sovereign was restricted by a national assembly; but since 1661, it has been an hereditary monarchy, subject to the most absolute authority that exists in Europe, since it has no other limits than the will of the prince. Before the revolution by which this change was effected, the government resided in the States-General, composed of the nobility, the clergy, the citizens (burgesses,) and the peasantry, and in the royal authority; but the States were rarely convoked, and the nobility, careless of the public interests, did not desire that an assembly should be called together, in which they exercised but a limited influence. The senate became then, in fact, the only depository of a part of the authority. Its members, who were nearly all dispersed in the provinces as governors, assembled once a year to vote the laws, in concert with certain court personages. This senate, which exercised without responsibility, and without any legal right, an usurped authority, lost in time the imposing character which had long secured to it the respect of the nation."—This is all, in the original, that corresponds to the preceding part of the paragraph.—P.

sion, [in which Copenhagen was twice besieged^a by Charles Gustavus,^b king of Sweden, and only saved from destruction by the heroism of Frederick III., and the sudden death of the king of Sweden.] Peace was soon concluded, but several provinces were lost,^c the public treasury was greatly in debt, the fields were desolated, industry and commerce had received a fatal blow, the collection of the taxes was embarrassed, the troops demanded the arrears of their pay, and the navy stood in need of urgent repairs: discontent was general. It was in this state of matters, that, towards the end of the year 1660,^d an assembly of the States was convoked. That, at this time, the court meditated a great change, is proved by the fact that the order of the peasantry was not represented in this assembly, which was made up of deputies from the clergy, nobility and burgesses. The nobility renewed their old pretensions to supremacy; the clergy, jealous of the nobility, vowed to see that order humbled; the burgesses of Copenhagen, proud of the confidence which had been expressed towards them by the government,^e and full of hope in expectation of future favours, manifested their devotion to the crown. They called to mind the dangers which the monarch [Frederick III.] had encountered during the sieges^f of the capital, and the traits of character by which he had acquired a great popularity. While his subjects were in this state of mind, the prince affected to know nothing about what was in agitation, but the agents of the court took their measures in secret. Already some influential men in the three orders had been gained, when the assembly undertook to examine the means of remedying the calamities which overwhelmed the country. The nobility proposed a tax upon articles of consumption, in which they consented to bear their part, but with so many restrictions, that the burden would have been insupportable by all classes, themselves excepted:^g this was the signal for dissension.^h While the discussion was going on between the nobles and the clergy, the latter, in conjunction with the burgesses, drew up memorials, in which, for the first time, transpired ideas of hereditary

monarchy, which found partisans among the public, but especially in the court. The proposal of a stamp-dutyⁱ increased the confusion; murmurs were heard from amongst all the three orders; one of the influential deputies of the burgesses ventured to propose hereditary succession, "with a view," he added, "that the king might be master;" the same motion was made amongst the clergy, and it was adopted by these two orders. At first the nobility refused their concurrence, but writings being circulated in which their privileges were vigorously attacked, in the end they gave their consent to this important change.^k The making the succession to the crown hereditary nullified the agreement^l which the king had signed on his coming to the throne; besides, great alterations became necessary in the relations that were to exist between the Crown and the States, and the burgesses were anxious to rise above the state of political nullity, in which, by means of the assemblies having been convened only at remote intervals, they had hitherto been held. In the mean time their minds were too much agitated to be able to examine, with the necessary prudence, the questions relative to a new constitution; it was therefore decided that this important matter should be intrusted to a committee, and, in order that the nomination of this committee might not be influenced by the general agitation, the appointment of the members was left to the king. This committee, unanimous as to the nullity of the oath that had been taken by the king, could not, whether under a pretext, or from a real difference of opinion, come to any agreement as to the terms of the new constitution;^m the bishop of Zealand, one of the members gained by the court, then moved that the decision of a question, in which those interested found so much difficulty in coming to an agreement, should be left to the impartiality of the king.ⁿ The three orders approved of this motion; they put a new oath into the hands of their now hereditary monarch,^o and in order to give more solemnity to this imposing ceremony, the order of the peasantry was convoked, but merely to join

^a Copenhagen was thrice besieged by Charles Gustavus. Although the Danes defended themselves with great energy, the first siege was, however, raised by the mediation of Cromwell's envoy, Meadows, and the two latter by the Dutch fleet. Advantage was taken of Charles' death, which occurred soon after the last siege was raised, to conclude a treaty (March 1660).—P.

^b Charles X.

^c The provinces of Scania, Halland, and Bleking, at the southern extremity of the Scandinavian Peninsula. Trans. [By this treaty (1660), the island of Rugen, and the provinces of Bleking, Halland and Schonen, were ceded to Sweden.—P.]

^d Sept. 8th, 1660.—P.

^e Several of the rights of nobility had been granted to the citizens of Copenhagen, as a reward for their patriotic and gallant behaviour during the siege. (Ed. Enc.)—P.

^f "Siege."—Here, as in the passage quoted from the Ed. Enc. (note ^c), no distinction is made between the different sieges of the capital, but the whole are considered as one. In fact, the Swedish army remained, during the whole time, on the island of Zealand, and the sieges were raised only by foreign intervention. They may indeed be considered only as three acts of the same drama.—P.

^g They offered to contribute equally to this tax; but when their offer was explained, it was found in fact to amount to almost nothing. They consented to pay this tax only when they were in town, and not at all while they resided on their own estates; nor would they subject themselves to it, even with this limitation, for a longer period than three years, while they insisted that the farmers (peasantry) should pay it as a permanent tax, and to its full amount. (Ed. Enc.)—P.

^h "The senate made common cause with the nobility, and thus completely destroyed the last remains of its popularity."—This is

omitted by the translator, as not agreeing with his mistaken notion of that body. See note ^e p. 1066.—P.

ⁱ "—of an edict for levying a stamp tax."

^k The nobility having farther irritated the other orders, by materially altering a tax bill which had been sent to them, the bishop of Copenhagen immediately proposed to his order to sign a declaration, making the crown hereditary in the royal family. This proposal was readily accepted; the declaration was signed by the clergy, sent to the representatives of the people, who as readily gave their sanction to it, and on the very same day transmitted to the speaker of the nobles, to receive the concurrence of that order. The nobles, being now alarmed, proposed to Frederick, that the crown should be hereditary in the male line only; but this proposal was rejected by the king. On the next day, this order found itself under the necessity of acceding to the declaration. (Ed. Enc.)—After the clergy and the citizens had formed their resolution, they went in a body to the hall of the nobles, where John Nansen, chief of the order of citizens, after enumerating the evils of the state, and the important services rendered by the king, proposed that the crown should be hereditary in his family.—P.

^l "Capitulation."—The Danish kings signed a capitulation or charter on their accession to the throne—a species of contract between the king and the people, defining and limiting his power, and determining the privileges of the different orders. (Ed. Enc.)—P.

^m "—as to the form of a new capitulation."

ⁿ In the midst of the clamorous debates, arising from the difference of opinion as to the terms of the capitulation, the bishop of Zealand (Copenhagen) suddenly proposed, that the crown should be made hereditary, without any stipulation or condition; this was agreed to, only with the exception, that the right of primogeniture, and the indivisibility of the monarchy, should be guarded. (Ed. Enc.)—P.

^o "They took a new oath to the new hereditary monarch—"

their oath to that of the other orders. To the pomp of festivals and great entertainments succeeded the deliberations of the States upon the privileges which they ought to preserve; the agitation, the hesitation and the exasperation of the parties were greater than they ever had been, and at last, worn out or corrupted, the States renounced their rights. A solemn act of January 10th, 1661, declared that the king was invested for ever with absolute power.^a [It is remarked by an old writer, "that this is the only legal absolute monarchy, perhaps, in the world; the king being declared so by the States of the kingdom, who had that power by the constitution." Was this deed irrevocable?^b]

Four years after this extraordinary event, the reigning sovereign (Frederic III.) issued a decree, bearing date 14th Nov. 1665,^d regulating the order of the succession, and declaring what the new constitution of the kingdom was. One article of this decree declares, that "the hereditary kings of Denmark and Norway shall be, and indeed ought to be, looked upon by all their subjects as the only supreme chiefs which they have upon the earth. *They shall be above all human laws*; and shall acknowledge, in all ecclesiastical and civil affairs, no other judge or superior than God alone." By another, it is declared, "the king alone shall have the right of imposing taxes, and of raising contributions of all kinds; since it is clear that we can only defend kingdoms and provinces with armies, and maintain troops, *by means of supplies which are levied upon the subjects.*" It is also declared, that "the king shall not be obliged," on coming to the throne, "to take any oath, or to make any engagement, under whatever name or title it may be, since in quality of a free and absolute monarch, his subjects cannot impose on him the necessity of an oath, or prescribe any conditions which limit his authority."^{e f}

In terms of the same decree, the king is major on completing his 13th year.^g He presides in the council of state, which takes special cognizance of all matters

^a On the 16th of October 1660, the three estates annulled, in the most solemn manner, the capitulation or charter signed by the king at his accession, absolved him from his engagements, cancelled all the limitations imposed on his sovereignty, and on the following day, closed the whole by the public ceremony of doing homage, and of taking the new oath of allegiance; but the three orders did not sign a separate act, consenting that the crown should be hereditary, investing the sovereign with absolute power, and giving him the right to regulate the succession and the regency, till the 10th of January 1661, nor even after this, was the new constitution explained or sanctioned by any promulgated law, till the accession of Christian V. in 1670. This law, called the royal law, was drawn up by the bishop of Zealand and Count Griffenfeld, and received the king's sanction on the 14th of November 1665, but was kept in the royal archives till the period above mentioned [1670.] (Ed. Enc.)—It is well known that this revolution was brought about by the clergy and commons, for the purpose of punishing the insolence and oppression of the nobility, and of compelling them to bear an equal part in the burdens of the state. It was the intention and expectation of the lower orders that the power deposited with the king, should have been restored, with a more equal distribution of rights, to the people. In this, however, the monarch proved too crafty for his subjects; but as if in return for their surrender of authority, he and his successors have so administered affairs, as to have rendered themselves, perhaps, the most popular sovereigns in Europe. The liberation of the peasants (1787) the encouragement of learning and general education, particularly the recent extension of the system of mutual instruction, and in general, the mild and equitable administration of the laws, are so many proofs that the government has not forgotten the source from which its absolute authority is derived.—P.

^b By one of the articles of the royal law, the king may annul all laws, which either he or his predecessors shall have made, excepting this royal law, which must remain irrevocable, and be considered as the fundamental law of the state. (Ed. Enc.)—It is obvious, however,

of consequence. The different ministerial functions are exercised by colleges or councils with presidents:^h the college or council of the *chancellorship*ⁱ has the administration of justice, general police, the church, public instruction, and all that regards the interior of the kingdom; that of the *finances* lays on taxes,^k watches over all the pecuniary affairs of the state, and has under its administration the exchequer, the revenues, crown lands, &c.;^l the college of *economy and trade* has under its care manufactures and whatever regards industry.^m The bailiffs have nearly the same power as the prefects in France;ⁿ a supreme court, in which the king himself sometimes presides, determines civil and criminal causes in the last resort: the punishment of death is very rarely pronounced.

The clergy do not form a separate order: the only distinct classes in the state are the nobility, the burghesses, and the peasantry. Every royal functionary belongs to the class of nobles. The counts and barons enjoy great privileges: these titles, and some others, are subjected to a tax, called the tax upon rank; and the honour of being styled *his excellency* is given to those who choose to pay for it. The nobles have preserved many peculiar rights, which, however, vary in the Danish and German provinces;^o thus, in Holstein and Lauenburg, where their ancient constitution has been guaranteed by the Germanic diet, the noblesse exercise supreme power in their own domains; on the other hand, the Frieslanders of the islands which border the western coast of Sleswick,^p and the inhabitants of the city of Altona in Holstein, enjoy a very ample liberty. [Till 1787 the peasantry on the estates of the nobility were in a most degraded condition. They and their posterity were unalterably fixed to the estates on which they were born; and, when it was sold, the peasants, with their wives and children, were transferred along with it. These abominable chains were broken in the year above mentioned, through the exertions of the present king of

to present ideas, that this whole system of absolute authority is easily revocable by the will of the people.—P.

^c The passages in the above paragraph, inclosed in brackets, are inserted by the translator.—P. ^d See note ^a.

^e See copy of this decree in Travels, by William Rae Wilson, Esq. in Norway, &c. App. No. xvi. London, 1826.

^f The above paragraph is added by the translator.—P.

^g "By a royal decree [the Royal Law of Nov. 14, 1665.] the king is of full age at fourteen."—P.

ⁱ "The college of the chancery—"

^k "—proposes taxes." See note ^m.

^l "—the treasury, the public debt (*rentes*, funds,) the domains, &c."

^m The king is assisted in the exercise of his royal functions by a privy council [council of state,] in which the laws are proposed, discussed, and receive the royal sanction, and all the important affairs of government are transacted. The business is prepared in the different colleges or chambers to which it more immediately belongs, and through which all applications to the council must come. These different offices of government are: 1. the Chancery of Denmark and Norway; 2. the Chancery of Germany, for Sleswick and Holstein; 3. the Office of Foreign Affairs; 4. the College or Chamber of Revenue; 5. the Chamber of Customs; 6. the College of Finances; 7. the College of General Economy and Commerce; 8. the War Office; and 9. the Admiralty Office. (Ed. Enc. 1817.)—P.

ⁿ Denmark is divided into seven provinces, or grand bailiwicks, called *Stifts-ampts* [Dan. *stiftamt*, sing.] each of which is governed by a *Stifts-ampts-man* [Dan. *stiftamtmand*.] These are subdivided into districts or bailiwicks, called *ampts* [Dan. *amt*, sing.] under the superintendance of inferior governors, called *ampts-men* [Dan. *amtmand* sing.] (Ed. Enc.)—P.

^o The nobility of Sleswick and Holstein form a distinct body, and enjoy more extensive privileges. (Ed. Enc.)—P.

^p See note ^p p. 1064.

Denmark,^a then crown prince, by the issuing an edict which restored them to their liberty.]^b Finally, the Danish government manifests a paternal spirit in the exercise of its power, and is very tolerant in regard to religion: the confession of Augsburg^c is the predominant religion; but Roman Catholics, Calvinists, Mennonites,^d and even Jews, are admitted without distinction to public employments and dignities. His German provinces constitute his Danish majesty a member of the Germanic confederation, to which he furnishes a corps of 3000 men; they give him also a voice in the Diet.^e

We have neglected nothing to give a correct view of this country as a whole; an excursion through the principal cities and towns still remains to be made: it will be short, because they are not numerous. The coasts of Denmark are as pleasant and well cultivated as those of Sweden are barren and wild: their thick groves, says a traveller,^f the gentle declivities of their hills, the meadows which descend softly to the very border of the sea, and the emerald green, which, during the fine season, forms the general colour of this agreeable landscape, produce an enchanting coup-d'œil. We cannot see the strait of the Sound,^g covered with vessels of every nation submitting to a duty^h which brings in two or three millions of francs annually to the crown of Denmark, without being astonished that a power of the fifth order should have been able to render tributary all the nations which trade to the Baltic. The first commencement of this impost is unknown: it is certain, however, that in the 15th century it rested upon a very ancient custom. It is probable that it had for its origin the expense of the building and maintaining several light-houses placed by the Danes on the coast for the benefit of navigators, and which, according to stipulations now forgotten, they consented to defray the expense of, by a toll imposed on every ship passing the Sound.ⁱ

Copenhagen, the capital of Denmark, called in the language of the country *Kiøbenhavn*,^k occupies, in the Sound, the bottom of a gulf in the island of Zealand, besides a part of the northern extremity of the small island of *Amak* or *Amager*. Its foundation is attributed to bishop Axel, who, in 1168, obtained from the reigning king of Denmark the concession of a small piece of ground occupied by a hamlet of fishermen, and protected it by raising fortifications.^l In less than a century it had become considerable enough to obtain the privileges of a city, and in the 14th century, it became the residence of the court.^m Its buildings were originally of

wood, but having been consumed by destructive fires in 1728, 1794 and 1795, were replaced by elegant buildings and regular streets. It was regarded as one of the finest cities in Europe, when, in 1807, surprised in time of peace by a British squadron, it endured a dreadful bombardment, which destroyed its cathedral, and a part of its university, mutilated several of its principal edifices, and destroyed several hundred houses.ⁿ Its fleet, and the greater part of the military stores of all kinds, accumulated in its magazines and arsenals, were carried off to England. It was thus that Great Britain repaid the refusal given by Denmark to enter into the coalition against France. On the 18th of November 1824, a dreadful hurricane drove the waters of the sea into the city, and caused great destruction. In spite of disasters so recent, Copenhagen, defended by 24 bastions, by fosses filled with water, and by a strong citadel, is still one of the finest capitals in Europe. There are in the city 10 public squares and 5 markets, 3 royal palaces, 9 parish churches, a Roman Catholic chapel, 3 convents, 1 Moravian meeting-house, 5 Jewish synagogues, 14 hospitals, including one for foundlings,^o and 30 houses for the reception of the poor.^p Seen from the narrow entrance of the harbour, which is capable of containing 500 merchant ships, besides the royal navy, it presents a magnificent appearance; its three quarters, the old town, the new town, and Christiansavn,^q which formerly bore the peculiar characters of their more or less ancient origin, owe to contemporary repairs their modern elegance. The old town, or Copenhagen properly so called,^r separated from the new town by the new canal, is not surpassed by it: it is even larger and more populous; its houses, though built of brick and wood, have a fine appearance: there is here seen the large square of the new market,^s the irregularity of which almost disappears in presence of the buildings which ornament it, such as the palace of Charlottenburg, formerly the residence of the court, and now occupied by the academy of fine arts, and by a superb gallery of paintings,—the artillery depot, the theatre, and the equestrian statue of Christian V.^t On the side of the harbour stand the exchange and the bank. The old town also contains the palace of prince Frederick; the arsenal, in which may be seen the royal library composed of 250,000 volumes, and the Arabic manuscripts of Niebuhr; the university, which possesses a fine library; several scientific collections, a botanical garden, and an observatory established in a tower of a singular construction.^u The finest part of the new town is that which is called Fred-

^a Frederick VI.

eristadt.^a The two principal edifices in this quarter are, the old royal castle of Rosenburg, which contains a fine collection of antiquities, and the magnificent hall in which the king opens the sittings of the high court of justice, and whose garden serves as a public walk; and Amalienburg, a group of buildings composed of four distinct palaces, namely, those of the king, his son and his brother, and the navy school, ranged around an octagonal square, the centre of which is occupied by the equestrian statue of Frederick V. In the isle of Amak, Christiansavn,^b which bears the name of Christian IV., its founder, presents regular and well-built streets; its squares are large and elegant; it contains docks for ship-building, the large warehouse of the India Company,^c the port for ships of war, and the church of the Saviour, the finest in Copenhagen: that of the Trinity, the dome of which contains the university library and the large globe of Tycho Brahe,^d cannot, notwithstanding its beauty, be compared with it.

Copenhagen possesses a great number of literary establishments and academical societies; the most important of these are, the royal society of sciences, and those of natural history, medicine, oriental languages, and Scandinavian literature, a branch of which last mentioned institution is established at Reikiavik in Iceland.^e Till a very recent period, Copenhagen might be considered as the centre of the industry and trade of the kingdom. In 1826, there were reckoned in Copenhagen about two hundred and forty distilleries, fifty breweries, twenty-nine tanneries, thirty manufactories of tobacco, twenty of woollen cloths, fifteen of cotton goods, eighteen of hats, twenty-four of gloves, thirty of linen, and various others, which together employed more than 11,000 people, or nearly one-tenth of the population. It was at that time calculated that more than 5000 vessels entered the port; but the prohibitory system has since that date brought upon this city the results which, sooner or later, are to be expected from it; strangers no longer come to Copenhagen to seek the spirits distilled there;^f its other products can no longer support foreign competition, and the English and Americans have, by their rivalry, given a mortal blow to its commercial relations with the East Indies. Its commerce is now reduced to the single branch of home consumption, and the whole business of Denmark is concentrated at Altona, which has been long a free port. The ruin of industry has considerably lowered the value of houses at

Copenhagen: very recently indeed, proprietors of houses have been known to sell them, from inability to pay the taxes.

The police of this capital is under the superintendence of a special establishment; the public safety is intrusted to the garrison, and to the national guard; companies of fire-men are distributed through the different quarters; a commission of physicians and surgeons has the charge of watching over the public health, a duty so much the more necessary, as the air of Copenhagen is moist and unwholesome, the water bad, and the mortality greater than in the other towns of the kingdom.

The following are among the most remarkable places in the environs of Copenhagen. *Frederiksberg*, a magnificent castle, the usual summer-residence of the king, is built upon a height; the public enjoy the splendid sight of its fine gardens, which are open to them.^g *Frederiksborg*, another royal castle, is a fine specimen of the architecture of the seventeenth century;^h the hall of the knightsⁱ is deserving of much attention. *Ræskilde*,^k a small city of 2000 souls, formerly the capital of Denmark, now receives the mortal remains of her kings. *Jægers-Preis*^l is still a royal residence, where repose the ashes of the ancient heroes of the North, and of many celebrated men;^m we see there the tomb of the great Bernstorff and that of Tycho Brahe. *Elseneur*, in Danish *Helsingør*,ⁿ is situated on the coast, eight leagues to the north of Copenhagen. It is a well built town, but many geographers speak erroneously of its harbour; it has no harbour but a small roadstead, where the ships that pass the Sound cast anchor, to take in supplies and to pay the toll, to which all vessels are subjected, and which amounts to one per cent. on the value of merchandize belonging to privileged nations, and one and a fourth in regard to others and even the Danes themselves. Near *Elseneur* rises on the coast the fortress of *Kronborg* or *Kronenburg*,^o where was confined, in 1771, the unfortunate queen of Denmark, Caroline Matilda of England, the sister of George III., the victim of intrigue and calumny. A royal mansion, not far from *Kronenburg*, is pointed out to strangers as the spot where, in olden time, stood the palæe or castle, the scene of Shakspeare's play of *Hamlet*.^p

The island of *Bornholm*, situated thirty-two leagues from that of *Zealand*^q in the Baltic sea, is peopled by 20,000 inhabitants; it contains seven towns and twenty-one parishes; the capital is *Rønne*,^r known for its

^e The principal literary societies in Copenhagen are, the Royal Academy of Sciences, founded in 1743; the Royal Economical Society, in 1768; the Medical Society, in 1772; the Society for Icelandic Literature, in 1779; and the Board of Longitude, in 1784. (Ed. Enc.)—In 1779, a society was instituted at Copenhagen for aiding the literature of Iceland, and bettering the condition of the inhabitants. In 1790, a project was formed for transferring the society to Iceland, which occasioned such dissensions as suspended all the proceedings, and the society now exists only in name. A second Icelandic society was established in the island in the year 1794, by the present chief justice Stephansen; but various occurrences, particularly the war between Great Britain and Denmark, occasioned its almost total extinction. A new society was established in 1816, by the exertions of Mr. Rask, the celebrated philologist. (Ed. Enc. art. Iceland. 1818.)—P.

^f In 1800, the distilleries in Copenhagen consumed 287,824 tons of grain, which yielded 2,347,850 gallons of spirits. (Ed. Enc.)—P.

potteries and clock and watch making:^a it annually exports watches to the value of about 13,000 rix-dollars. The little isle of *Mæn*,^b at the southern extremity of Zealand, containing 7000 inhabitants, has for its chief town *Stege*,^c in which the only manufacturing establishment is a tannery. The island of *Funen*,^d in Danish *Fyen*, between Sleswick and Zealand, is eighteen leagues in length by twelve of average breadth, and has 154 of surface and 110,000 inhabitants. *Odensee*, its capital, was first named *Othins-Ey*,^e that is, the domain of *Odin*. It stands in the centre of the island, in the midst of a large plain. Gloves, soap and woollen cloths are manufactured there. Its cathedral is handsome; it has a university^f and two libraries, and is one of the neatest towns in Denmark. *Svendborg*^g has tanneries and stocking-manufactures, and carries on a great trade in the exportation of rye. The island of *Langeland*,^h which signifies *longland*, extends from south-east to north-west,ⁱ between Funen and Laaland, and contains 11,000 inhabitants; *Rudkiæbing*,^k its principal town, also exports rye. *Laaland* or *Lolland*,^l peopled by 4000 souls,^m has for its chief town *Mariebæ*,ⁿ which is enriched by its trade in grain. The small island of *Falster*, to the east of Laaland, numbers 16,000 inhabitants: *Nikiæbing*,^o its chief town, is magnificently situated; the king possesses there a fine castle, formerly the abode of the queens-dowager of Denmark. *Sam-Sæ*,^p *Fanæ*,^q *Anholt*, where there is a light-house,^r *Lysæ*,^s and other small islands, are too unimportant to be particularly noticed.

In the Danish peninsula, *Aalborg*,^t in North Jutland,^u the seat of a bishopric, is a city surrounded by moats, and contains soap-works, an academy,^x schools and libraries, an hospital and two alms-houses. Its harbour, in the *Lym-Fiord*, receives annually 500 vessels,^y which

export grain and herrings. *Viborg*,^z one of the oldest cities in Denmark, was formerly of more importance than now; there is still held there, about the end of June, a fair which attracts a great number of strangers. *Aarhus*,^{aa} on a gulf of the eastern coast,^{bb} has manufactories of tobacco, and of woollen and cotton cloth, with a small harbour from which grain and cattle are exported. Its cathedral, a Gothic monument, is said to be the loftiest in Denmark. *Randers*,^{cc} on the *Guden-Aæ*,^{dd} possesses manufactures similar to those of Aarhus. The finest horses and the best cattle in Denmark come from the environs of this town. *Ripe* or *Ripen*,^{ee} at the mouth of the *Nibes*,^{ff} on the western coast, carries on a great trade in cloth,^{gg} and contains a cathedral, in which are to be seen the tombs of several Danish kings. *Fredericia*,^{hh} which wants a good harbour to render it of importance, stands upon a promontory commanding the northern entrance into the Little Belt. There is collected here a duty on all the vessels which pass through this strait.ⁱⁱ In South Jutland,^{kk} *Sleswick*^{ll} is the capital of the dutchy to which this city gives its name, whose true orthography is *Schleswig*,^{mmm} because it is situated at the extremity of the arm of the sea called the *Schley*,ⁿⁿ on the border of which it rises in the form of an amphitheatre. The finest of its buildings is the castle of *Gottorp*,^{oo} the residence of the Governor-General of this dutchy, and of that of Holstein. *Flensburg*^{pp} or *Flensborg*, six leagues to the north of Sleswick, is a neat and well built town; its public squares are adorned with fountains; the town-house, exchange and theatre are handsome buildings. It is the most flourishing town in Jutland; it contains 10 sugar refineries, besides soap-works, oil-mills, and tobacco manufactories. Without its ill-preserved walls, there is a brass-foundry^{qq} and

^{qq} "Copper foundry."

extensive tile-works. Its harbour, situated at the western extremity of *Flensborg-Fiord*,^a is frequented annually by more than 800 vessels, 250 of which belong to the place. The territory lying between Flensborg and Sleswick still bears the name of *Angeln*.^b It is highly probable that this was a part of the country of the *Angli*, a people who perform so important a part in history, but who, according to the learned Weddegen, were only a colony of the *Angrivarii*, who occupied Holstein and a part of Westphalia.

Husum, at the mouth of the Hever;^c *Tondern*,^d on the Widau; *Apenrade*,^e whose small harbour, at the bottom of a gulf, carries on a considerable trade; and *Hadersleben*,^f on the eastern coast; small towns which we cannot entirely omit, because they are the capitals of bailiwicks, present nothing particular. Nor ought we to forget the small islands which border the western coast. *Fanwe*, more considerable than the island of the same name, which lies in the Little Belt,^g is inhabited by fishermen and builders of small merchant vessels: *Rømø*^h is less industrious: *Sylt* rears cattle, and produces good seamen: *Fahr*,ⁱ peopled by 6000 souls, is frequented for the purpose of sea-bathing, and possesses a bed of oysters, of which it sends a vast quantity to Hamburg; it is the rendezvous of so great a number of wild ducks, that it is estimated more than 100,000 are taken annually.^k *Nordstrand* possesses a valuable breed of horned cattle; its cows give each day 22 pints of milk: *Pelworm*,^l without the strong dikes that protect it, would be swallowed up by the sea; it forms, with *Nordstrand* and several small islets, the remains of a large island, the greater part of which disappeared under the waves in 1634.^m Near the eastern coast, *Alsen*, 7 leagues in length, and 2 in breadth, with a population of about 16,000 souls, is, from its woods, its small lakes, and its high state of cultivation, one of the most agreeable islands in the Baltic. *Sonderborg*, its chief town, possesses a royal castle,ⁿ a good harbour, and an academe-

my.^o *Arræ*,^p consisting of lands fertile in grain and kitchen vegetables, supports more than 8600 inhabitants.^q *Femern*,^r not less rich than the preceding, is better peopled;^s its inhabitants have preserved their ancient and simple manners. *Burg*, an ancient town which stands in the centre of the island, is the capital of a bailiwick.

The duchy of Holstein has several subdivisions, namely, Holstein properly so called, *Dithmarschen*,^t the lordship of *Pinneberg*, the county of *Randzau*,^u and the territory of the thirty parishes of the nobility.^x The capital of this feudal assemblage is *Gluckstadt*.^y It is regularly built on the right bank of the mouth of the Elbe;^z many canals intersect it, but drinkable water is so scarce, that the inhabitants are obliged to collect rain water in cisterns. It was founded in 1617, by Christian IV. *Kiel* is the most ancient town in Holstein, being mentioned in history as early as the eleventh century. It is distant about four miles from the Baltic, at the inland extremity of a small gulf, called the *Kieler Fiord*,^{aa} justly celebrated for its beauty. The harbour is secure, and well situated for trade: more than 500 vessels annually enter it. There is no extensive manufacture but that of hats. Kiel is a handsome town, and stands in the midst of delightful scenery. The borders of the firth are eminently beautiful, being lined with gentle rising grounds clothed with woods sweeping down to the edge of the water, while the lands around are in a high state of cultivation. Along the shore are several little villages, which enliven the prospect; and among the hills glides the river Swentin,^{bb} till it loses itself in the firth. On a hill, in the environs of the city, is seen a handsome royal palace built by the inhabitants. The church of St. Nicholas is a fine old building. The university, which was founded in 1665 by Christian Albert, duke of Holstein, is a plain and not very capacious building, affording no accommodation for the residence of students, nor even a sufficiency of apartments

^u Rantzow (Hubner.)—County of Barmstadt or New Ranzaw (Morse.)—The county of Pinneberg formerly belonged to the counts of Schaumburg. The line having become extinct, the county of Pinneberg was divided between the king of Denmark and the duke of Holstein-Gottorp, the latter taking the two parishes of Barmstedt [Barmstadt] and Elmshorn. This division was acquired in 1649, by the counts of Rantzow, in exchange for Rantzow and other possessions, [whence the county of Barmstadt or New Ranzaw.] (Hubner, p. 389—90.)—P.

^x Holstein, under the empire, was divided into Holstein Proper (Lat. *Holsatia Propria*), on the north—Rendsburg, capital of the royal, and Kiel, of the ducal portion; Wagerland (Lat. *Wagria*) on the east—Ploen, in the royal, and Rantzow and Eutin, in the ducal portion; Stormar (Stormarn. Lat. *Stormaria*) on the south—Gluckstadt, capital of the royal, and Trittow, of the ducal portion; and Dithmarsh (Lat. *Dithmarsia*) on the west—Meldorf (Meldorf,) capital of the royal, and Lunden, of the ducal portion. The greater part of Holstein was divided between the king of Denmark and the duke of Holstein-Gottorp. There were besides, the county of Barmstedt (see note ^u), the jurisdiction of the four cities (Kiel, Rendsburg, Itzeho and Oldeslo,) the two imperial cities of Hamburg and Lubec, &c. (Hubner.)—P.

for the professors' use, many of whom (thirty in number)^a give lectures in their own houses. It is particularly distinguished for medical science, and the number of students is upon the increase. In 1806, they amounted to only 100: in 1820, they had increased to 270, of whom 50 were students of medicine.^b The opening of the new year is celebrated by the students in the following manner. Before midnight, they assemble in the market-place within a circle formed of torches, and when the clock has struck twelve, they sing Voss's celebrated hymn, beginning, "The year's last hour;" after which a general huzza hails the entry of the new year. They then go round the streets with their torches, halting at the professors' doors; while a deputed select body enter and present the students' congratulations. After receiving the professors' answers, a bonfire and hymn to liberty close their proceedings. The library of the university contains 60,000 volumes. The tone of society in Kiel is decidedly literary; and the university contains among its professors names of distinguished literary eminence. English literature is held in high estimation. Besides the university, it contains a celebrated Latin school,^c an orphan-house, a poor-house, two infirmaries, and a botanic garden; besides valuable private collections of pictures and antiquities.^d

Rendsburg^e is probably the best built city in Holstein; it stands upon the banks of a canal which unites with the Eyder. It is important on account of its arsenal, its magazines, its barracks, and above all, its fortifications. It is the principal fortress of continental Denmark, since the fortifications of Gluckstadt were razed. Rendsburg is interesting, as being the ancient limit of the Roman empire, notified by an inscription on one of the gates. *Heyde*^f is a small town only interesting from its schools. *Preetz*,^g upon the river Swentin, some miles to the south-east of Kiel, contains about 400 houses and 3000 inhabitants, and carries on some trade in the making of shoes and of soap. It contains what was originally a convent, but now converted into a sanctuary for the daughters of the Sleswick and Holstein nobility.^h It possesses also an orphan and a poor house; and the pastor's library, as it is called, founded in 1681 by a Hamburg clergyman, a native of Preetz, contains 9000 volumes. The *Probsty*ⁱ of Preetz is a district to the eastward of Kiel, and on the east side of the Fiord, containing a population of 6000 souls, occupying twenty-four towns or villages. The name is as old as the thirteenth century; and the people, who have lived during several centuries secluded from their neighbours, are believed to be a colony of the Wendians^k or Van-

dals, who inhabited the borders of the Baltic Sea, towards the mouths of the Oder and the Vistula. They are large in stature, with a physiognomy essentially distinct from both Danes and Germans; and their dress and manners also differ materially from the people around them, retaining, at their marriages and other great occasions, a variety of customs and ceremonies peculiar to themselves. Till within the last 40 or 50 years, the Probststeiers had no intercourse with strangers: it was positively forbidden, and the young people that married out of their own tribe were excluded from the society; but this state of seclusion is gradually wearing away, and probably, before the lapse of another half century, they will be completely mingled with the surrounding population. They are an agricultural people, and many of them in the harvest season go to a considerable distance for employment. They are also skilful in thatching, in plaiting of straw and similar works, besides weaving and spinning. The coast of the Baltic here is subject to great changes, and severe injury has been done by tempests and inundations, large tracts of land having been overflowed, and villages overwhelmed or insulated. The town of Preetz is the residence of the *probst* or provost of the *Probsty*.^l

To the south of Preetz lies the small town of *Ploen*,^m romantically situated on a stripe of land between two lakes, so narrow as scarcely to afford room for a single street. The southernmost of these two lakes is particularly beautiful, being adorned with overhanging woods and highly cultivated hills, with an island finely wooded. The town is crowned with a castle built on the summit of a steep hill, rising from the end of the principal street. About ten miles to the north of Gluckstadt, and on the river Stör or Stöer,ⁿ stands *Itzehoe*,^o anciently *Essefeld*, sheltered on the north by considerable woods. The streets are handsome, and many of them are planted, as usual, with trees. It is a town of some importance, and has ships employed in the Greenland trade. It has two churches. As early as 809, a strong castle was built here by Charlemagne. Near Itzehoe, on a sandy heath to the south, are to be seen a variety of green hillocks. These are artificial, are called *Hünengraber*,^p and are monuments of the old warriors of the North. They are not uncommon throughout Holstein. Many of them have been opened, and an apartment, rude enough, is generally found within, containing, besides an urn, an old sword, axc, or other weapon. Near Albersdorff, on the confines of Sleswick and Holstein, in what is called *De Brut-Kamp* (the "*Spouse's Plain*"),^q an oblong field inclosed with hedges and

^c College—established in 1768. (Ed. Enc.)—P.
^d "Kiel, a handsome town, in the midst of delightful scenery, is important from its literary and charitable institutions. The library of its university contains 60,000 volumes. It is built on a tongue of land, at the extremity of a gulf of the Baltic, and has a secure harbour and a flourishing commerce; more than 500 vessels enter its port annually. On a hill in the neighbourhood of the town, is a handsome royal castle^l built by the inhabitants."—This is all the account of Kiel in the original.—P.

^e The commerce of Kiel has been much facilitated by the canal of Kiel, which unites the North Sea with the Baltic. It commences on the gulf of Kiel, three miles north of the town, and terminates at Rendsburg in the Eyder, which is navigable to its mouth in the North Sea. It admits vessels of 120 tons. (Ed. Enc.)—P.

^f The castle, which is finely situated, has an observatory. (Ed. Enc.)—P.

nearly encompassed with trees, is to be seen an immense mass of granite supported by five much smaller stones, and forming a kind of circular chamber within. All round the bottom of the hillock, on which this stone stands, grow oak-trees, thorns, sloe-trees, &c. In appearance it is similar to the cromlechs or Druidical altars, as they are supposed to be, which abound in Ireland, and their origin is probably similar. To the south of Itzehoe, in the middle of an elevated sandy plain, the famous obelisk is erected, which, according to popular tradition, was built by Henry, Count Ranzau,^a in the 16th century, in consequence of a wager he laid with Frederic II. of Denmark. "The conditions of this wager were, that the Count should build on his estate in one night a pyramid or obelisk, the top of which should be higher than that of the steeple of Krempe, a neighbouring village.^b He accordingly chose the loftiest situation he could find; and, assembling a number of workmen, raised within the limited time, and on the summit of the hill of Nordho, a low and rude obelisk of granite, supported by a square base, the top of which was thus more elevated than that of the steeple."^c The obelisk still remains; but the steeple and church of Krempe were blown up in January 1814, when employed by the Swedes as a powder-magazine. The obelisk has several curious inscriptions upon it. Henry, Count Ranzau, was a man of eminence in his age, attached to literature, and himself an author. In his castle of Wardsbeck^d did the celebrated Tyeho Brahe find an asylum, when, persecuted by his enemies, he withdrew from the island of Huen, and there did he remain, till invited to Prague by the emperor Rodolph II., where he died.

Elmshorn^e is an extensive and handsome town, lying on the banks of a small river, along which its streets sweep in a direction nearly circular. Some of the houses are very old, with pious sentences inscribed upon them. *Pinneberg* is a pretty little town, situated on the skirt of a forest, and watered by a small river. The approach to it is lined with oaks. *Oldesloke*,^f another handsome town, is situated on the river Trave, and is distinguished for its baths and salt-works. These last were established in the twelfth century by Count Adolphus II. of Holstein. *Altona*,^g on the right bank of the Elbe, at a short distance from the great trading city of Hamburg, is the second city in the Danish dominions. Its trade is considerable, and it carries on different manufactures, besides embarking deeply in the herring and whale fisheries: but the contrast is striking between the constant stir and bustle of the one city, and the comparative quiet and silence of the other. Altona seems a desert when compared with the never-ending activity that prevails in Hamburg. It is built partly on the declivity of a hill, and the streets are for the most part wide and airy. The *Palmaille* (Pall Mall) is a fine street of considerable length, with handsome houses, and along the middle of it runs a shady walk, bordered on each side by a double row of lofty trees—oaks, lindens, and

acacias. Altona was founded about the time of the Reformation by refugees of the old religion, who did not enjoy in Hamburg all the liberty they wished and were entitled to. Its vicinity to that city excited jealousy in the Hamburgers, and when it was burnt down in 1547, an ineffectual exertion was made to prevent its being rebuilt. Frederic III. of Denmark took it under his especial protection, and conferred upon it many favours.^h Notwithstanding its original inhabitants were Roman Catholics, Altona has ever been noted for religious toleration; and at this moment there are to be found in it all classes of religious parties, with perfect freedom of worship. There are in it churches or chapels belonging to the Lutherans, German and French Reformed, Roman Catholics, Mennonites, German and Portuguese Jews. The most remarkable event in the history of Altona, is its destruction by the Swedes on the 9th January 1713, a blot in the history of that honourable people. Voltaire relates it in his usual lively manner. The Danes had burnt Stade, a city in the duchy of Bremen, then part of the Swedish dominions. After the victory obtained by Steinbock,ⁱ the Swedish general, at Gadebusch in Mecklenburg, over the Saxons and Danes, he determined to avenge the loss of Stade by the destruction of Altona, then a flourishing city. "Arriving in sight of Altona," says the historian, "he by a trumpet commanded the inhabitants to withdraw from the place with what they could carry with them, as he was determined to destroy it from the foundations. The magistrates threw themselves at his feet, and offered one hundred thousand crowns in name of ransom. Steinbock demanded two hundred thousand. The Altonese begged time to send to their correspondents in Hamburg, and promised payment by the day following. The Swedish general replied that the money must be instantly paid, otherwise Altona would be set on fire. The soldiers were already in the suburbs with torches in their hands; and the city was without defence, except a wooden gate and a ditch completely dry. On the 9th January 1713, during an exceedingly cold season, and in the middle of the night, these unfortunate people were compelled to fly. A violent wind from the north, while it increased the cold, helped to spread the flames throughout the city, and to render more insupportable the sufferings to which the people were exposed in the open fields. Men and women, bending under the burden of such moveables as they were able to take with them, hurried along, weeping and lamenting, towards the neighbouring rising grounds, at the time covered with snow. Some people were to be seen carrying on their shoulders the aged and paralytic. Several women newly accouchées escaped with their infants, only to die of cold on the rising grounds, from whence they beheld their homes in flames. The inhabitants had not all of them left the city, when the Swedes set fire to it. The houses were almost wholly of wood, and so quickly did the flames perform their work, that next day it would scarcely have been known that a flourishing city

had stood there! To add to the misery of these poor people, thus ferociously driven from their homes,—when the aged, the sick, and the women of feeble constitutions dragged themselves to the gates of Hamburg, and begged admission, it was refused, on the pretext that there had been in Altona contagious sickness, and that they durst not expose their own city to the risk of infection!"^a How true are the words of the English poet:

"There is no flesh in man's obdurate heart;
It does not feel for man!"

COWPER.

The remains of Klopstock lie in a burial-ground at *Ottensen*, a village, which, from its proximity, may be reckoned a suburb of Altona.^b Between Altona and Hamburg are the cemeteries belonging to the latter city, remarkable for their neatness and simplicity, being laid out in compartments, intersected by avenues, and planted with the black poplar, weeping ash, lindens, &c. The fishing-village of Blankenese,^c on the banks of the Elbe, below Altona, is deserving the attention of the traveller from its cleanness and picturesque situation.^d

The small dutchy of Lauenburg formerly made part of the French department of the Mouths of the Elbe; by the treaty of 1815 it fell to Prussia, and was by that power exchanged for Swedish Pomerania, which had been given to Denmark by Sweden in exchange for Norway. This dutchy is divided into two bailiwicks. *Ratzeburg* is its capital, picturesquely situated in an island on a lake to which it has given its name, and communicating by two bridges with the opposite shores. The town itself is built entirely of red bricks, and the houses are roofed with red tiles, so that to the eye it presents a clump of red brick dust. It is a place of great antiquity, the church having been erected in 1157.

^a Voltaire, *Histoire de Charles XII.* liv. 7.

^b Altona was originally a village in the parish of Ottensen. (Ed. Enc.)—Ottensen was one of the parishes, constituting the old county of Pinneberg, that fell to the share of Denmark, after the extinction of the house of Schaumburg in 1640. See note ^u p. 1072.—P.

^c Blankenese (Morse.)—Blankennie (Tuckey.)—P.

^d "Rendsburg may be considered the best built town in Holstein; it is situated on the banks of a canal which unites with the Eyder.* It is a place of importance from its arsenal, its magazines, its barracks, and especially its fortifications. It is the principal fortress in continental Denmark,† now that the fortifications of Gluckstadt have been razed. Heyde and Preetz are small towns, interesting only from their schools. Pinneberg is merely a village, but Altona, on the right bank of the Elbe, is, next to Copenhagen, the largest city in the kingdom, and the only one that carries on a flourishing commerce; it also possesses the most important manufactures. It contains all the useful institutions and places of amusement that distinguish opulent cities, and it is extensively engaged in the herring and whale fisheries."—This is all the account, in the original, of the towns in Holstein, from Rendsburg to Altona, inclusive.—P.

* Rendsburg is situated at the point where the canal of Kiel joins the Eyder.—It is divided by the Eyder into the old and new town; the former in Sleswick; the latter in Holstein. (Tuckey.)—P.

† Its garrison is usually 3000, but it has accommodations for 15,000. (Tuckey.)—P.

^e "Ratzeburg is its capital, it is situated on an island in a lake, to the last of which it has given its name. By means of the small river Wackenitz, it carries on an active communication with the port of Lubeck. But what is peculiar to Ratzeburg, is the circumstance that two of its quarters, called *Domholt* and *Palmberg*, belong to the grand duke of Mecklenburg-Strelitz." M. B.—The town of Ratzeburg originally belonged in part to the county of Ratzeburg, and in part to the bishopric of Ratzeburg; the greater part to the former, and the cathedral (*domkirche*), with the quarter called *Palmberg*, in its vicinity, inhabited by the principal families dependent on the bishopric, to the latter. The bishopric possessed only this part of Ratzeburg, and the bailiwick (*amt*) of Schönberg, not far distant, in the direction of Lubeck. The county of Ratzeburg afterwards fell to the dukes of Lauenburg, and the bishopric to the dukes of Mecklenburg, whence the present division of the town.—P.

^f "Faience"—delft.

The small river of Wackenitz forms a means of active communication between Ratzeburg and the port of Lubeck. But the greatest peculiarity about Ratzeburg is that two of its quarters, called *Domholt* and *Palmberg*, belong to the grand-duke of Mecklenburg-Strelitz.^e *Lauenburg*, the capital of a bailiwick, is the most southern city in Denmark; it stands upon the right bank of the Elbe, at the point of junction of that river and the canal of Steckenitz. It contains soap-works, breweries, and manufactories of common Dutch-ware:^f the toll established upon the Elbe brings in 75,000 florins per annum. Lauenburg derives its name from an old castle, of which the remains are still seen, built by Henry the Lion, and named in honour of him, *Læwenburg* (Fort of the Lion.)^g In this castle was signed, in 1803, the treaty by which Hanover was given up to France.

Situated between the Shetland Islands and Iceland, the archipelago of *Færoe*^h is attached to the government of Iceland. However, this small archipelago, which rises in the midst of the Atlantic Ocean, belongs to Europe; whilst Iceland, considered in a physical relation, is a dependency of Greenland, a country which forms part of America.ⁱ The *Færoe* or *Færøer* Islands^k were discovered during the ninth century by the Norwegians, who formed a settlement there.^l They gave them the name of *Færøer*, from the word *faar*, which, in the Scandinavian language, signifies *sheep*, because that animal was found in sole possession of the islands.^m These islands are thirty-five in number, seventeen of which are inhabited.ⁿ The total population is about 6000 souls.^o *Strømæø*^p is the largest; it is thirteen leagues in length by five in breadth: *Asteræø*, to the west,^q and *Suderæø*, to the south,^r are the next in importance: the others, namely, *Sandæø*, *Waargæø*, *Bordæø*, *Winderæø*,^s dimin-

^g Literally, Lion-Fort or Castle.—P.

^h This is probably intended for *Færoe* [*Færøer*?]—at least, it is so arranged in the Index to the original.—See notes ^k and ^m.—P.

ⁱ Iceland is described, book lxxvii.

^k Faro or Ferro Islands (Guthrie.)—Færoe (Ed. Enc.)—Færoe or Færøer Islands (Morse.)—Færoe Islands (Tuckey.)—Færo, Fære, Faro, or Færøer (Enc. Meth.)—Fero, Ferro, or Fære; Lat. *Insulæ Glessariæ*. (Hubner.)—See note ^m.—P.

^l The Færoe Islands appear to have been resorted to long before Iceland was discovered [Iceland was discovered about the year 860, by a Norwegian pirate named Naddodur, who was accidentally driven on the coast while on a voyage to the Faro Islands;] and the same cause, the subjugation of the petty states of Norway by Harold the fair haired, led to the colonization of both in the ninth century. [Iceland was colonized from Norway, in the year 874.] (Ed. Enc.)—The Færoe (*Færoer*) Islands were discovered about the year 861, and between 860 and 872, three navigators visited Iceland. (Malte-Brun, *Hist. Géog.* p. 390.)—P.

^m The proper Danish orthography, according to this etymology, is *Færøer* (Sheep Islands.) from Dan. *faar*, Swed. *får*, sheep, and Dan. *øer* (plu. of *ø*), islands.—Their name is thought to be derived from *faer*, a sheep, and *ø*, an island, or from *fær*, feathers, or finally from *fiær*, distant, as relative to their position with respect to Norway. (Tuckey, vol. iv. p. 408.)—These words, in Tuckey, are not all in the Danish. *Fær* should be *faar*, and *fiær*, *fiærn*, in that language.—P.

ⁿ The group consists of 22 islands,* of which seventeen are inhabited. (Ed. Enc. Tuckey.)—P.

* 25. (Morse.)—24; 12 large, and 12 small. (Vosgien.)

^o 5,500, in 1827. (Stat. Tab. 5500.)—5209, in 1812, by census. (Ed. Enc.)—4409, in 1782. (Tuckey.)—P.

^p Dan. *Strømæø* (Stream Island); the central island of the group.—*Stromø* (Tuckey.)—*Stromøe* (Ed. Enc.)—*Stromoe* (Morse.)—P.

^q This should be *Esteræø* (Dan.) Eastern Island.—*Osterø* (Tuckey.)—*Osterøe* (Ed. Enc.)—*Osteroe* (Morse.) It is situated to the east of *Strømæø*, from which it is separated by a narrow channel.—P.

^r *Suderæø* (Southern Island), the southernmost of the group.—*Suderø* (Tuckey.)—*Suderøe* (Ed. Enc.)—*Suderoe* (Morse.)—P.

^s *Sandæø* (Sand I.)—*Vaagæø* (Waargæø is erroneous)—*Vaagøe* (Ed. Enc.)—*Vaagæ* (Tuckey.)—*Bordæø* (Table I.)—*Videræø* (Farther I.) is the correct orthography, not *Winderæø*—*Viderøe* (Tuckey.)—P.

ish gradually in size, and are surrounded by twenty-eight still smaller islands, the extent of some of which is less than a square league. The greater part of these islands are covered with mountains of igneous origin, which rise from 1800 to 2000 feet above the level of the sea; the decomposition of the rocks of which they are formed, produces a gravelly and blackish earth, which is covered with pasturage so much the richer from its being watered by numerous rivulets; bays deeply indented surround these islands, and increase the dangers presented by a navigation full of rocks and rapid currents. The climate is not so cold as the latitude would seem to indicate;^a the frosts last little more than a month, and the winter is seldom rigorous enough to cover the bays with ice. Summer, however, continues only during the two months of July and August; but by one of those compensations which the wisdom of nature presents, the furious storms which desolate these

^a They lie between 61° 20' and 62° 30' of north latitude, and between 7° 55' and 10° 25' of west longitude from Paris. [They lie between 61° 20' and 62° 25' N. and between 6° 15' and 7° 43' W. long. from Greenwich. (Ed. Enc.)—P.]

^b "Legumes."—This may signify vegetables cultivated for their roots or leaves, such as turnips, potatoes, cabbages, &c. as well as pulse or leguminous plants.—Barley and rye are the only cultivated grains, and carrots and potatoes the only vegetables. (Tuckey.)—The inhabitants being regularly supplied from Denmark with barley and rye, and sometimes with pease, the cultivation of grain is carried to a very small extent. Barley, turnips and potatoes are the principal crops cultivated. (Ed. Enc.)—P.

^c This might be translated very fine (*assez fine*).—In the Shetland Islands, is a breed of sheep, running wild among the hills, remarkable for the fineness and softness of its wool, which is chiefly employed for knitting gloves and stockings. Some of the stockings have been knit so fine as to sell at 40 shillings the pair. This breed is also found in the mountainous parts of Sweden and Norway. Its wool is short and very fine, like down, intermixed with some long hairs. The Argali or wild sheep, to which it approaches nearest of any breed appropriated by man, has the same fine close down, particularly in winter, under a covering of coarse hair. Ed. Enc. art. Shetland. Rees' Cyc.

islands purify the air, by dispersing the pestilential miasmata which otherwise would threaten the inhabitants. Wheat rarely ripens, but barley, rye and leguminous plants^b succeed well. However, the rearing of cattle is much more attended to than agriculture. The horse, the ox, and other domestic animals, are of a good breed, but small size; the sheep are covered with a tolerably fine fleece.^c The whale and herring fisheries, and the pursuit of aquatic birds,^d bring great profits to the inhabitants. The knitting of woollen stockings is also beneficial;^e they export about 120,000 pairs per annum. The Færoe Islands are divided into six districts and seventeen parishes,^f the government of which is confided to a bailiff^g who resides at *Thorshavn*,^h the only town in the islands. It is situated on the eastern side of the island of Strømøe; a small fort defends it, and a church, an academy,ⁱ a Latin school, and an hospital, are its principal edifices.

art. Sheep. Sinclair's Stat. Acc. Scot. vol. i. p. 394 (Delting,) vol. v. p. 188 (Unst.) and vol. x. p. 198 (Bressay).—P.

^d Bird-catching is extensively pursued on the rocky coasts of these islands, in a manner similar to that mentioned in the account of Norway, p. 1043.—P.

^e "The knitting of woollen stockings is, next to these, the most profitable employment."—Stockings and knit jackets are at present the chief articles of export. (Ed. Enc. 1817.)—P.

^f There are seven parishes, and 39 places of worship, in the islands. The religious establishment is under the superintendance of a provost. (Ed. Enc.)—P.

^g The civil establishment is under the direction of a military officer, commanding 30 men. Under the commandant are, the *landfoged** or treasurer, who also performs the duties of high-sheriff, and the *sysselment* or governors of districts. The commandant and the *landfoged* both reside at Thorshavn (Ed. Enc.)

* Dan. *lund*, and *foged*, bailiff or judge.

† Dan. *sysselmand*—*syssel*, a district, and *mand*, man.

^h Dan. *Thorshavn*.—Eng. *Thorshaven*. (Tuckey.)—P.

ⁱ "Gymnasium."—It contains a Latin school, and a wooden church covered with slate. (Tuckey.)—P.

BOOK CL.

EUROPE.

Europe Continued—Belgium, or the Netherlands.^a

THE country inhabited by the different tribes of the *Belgæ*, from whom Belgium takes its name, was of much greater extent than the modern territory which goes by that name. From the general description given of it by Cæsar, and a comparison of the particular districts, (so far as it can be ascertained,) inhabited by the tribes forming the nation of the *Belgæ*, its bounds seem to have extended from the mouth of the Seine in the English channel to, or nearly to, the banks of the Rhine, the Seine (*Sequana*) and the Marne (*Matrona*) forming the southern boundary, and thus to have embraced not only the Netherlands or Belgium properly so called, but the whole province of Picardy, and such parts of Normandy, the Isle of France, Champagne and Lorraine, as lie within the above line, besides part of the Prussian States, lying to the westward of the Rhine. In this country lay the immense forest of the Ardvenna (*Silva Ardvenna*, Cæsar, l. 5.)^b embracing, it appears, great part of the country lying between the Meuse and the Rhine, and the remains of which are still extant in the Forest of the Ardennes. The *Belgæ* distinguished themselves by their bravery and their determined opposition to Roman encroachment and usurpation. Cæsar styles them "the bravest of all the Gauls," and he assigns, as reasons for this, their distance from the civilization and politeness of Roman Gaul, their thus little intercourse with their more civilized neighbours, and their frequent wars with the Germans on the other side of the Rhine.^c It is obvious from his own account, that he had but little to boast of in his wars with these high-spirited tribes, but ultimately they were borne down under the overwhelming pressure of the gigantic power of Rome, and compelled to acknowledge her authority. Yet it would appear, that, all along, some of the tribes upon the coast, as well as their maritime neighbours on the north side of the Rhine, yielded but a nominal subjection to the supremacy of Rome, and maintained, till the fall of that empire, a considerable share of inde-

pendence. When Rome, in the fourth and fifth centuries, fell by its own weight, and through the incessant attacks of the northern nations, the Belgian provinces became the prey of these intruders, principally of the Saxons and Franks. Without attempting, where in point of fact history gives but little information, to trace the early history of Belgium, suffice it to say, that it formed part of the great empire of Charlemagne, but during the feeble reign of his successors both in France and Germany, it fell under the power of independent chieftains, with territories more or less extensive. During the same period, many of the cities acquired not only immense wealth in the pursuit of commerce, but privileges amounting almost to independence of their local sovereigns. In the fourteenth and fifteenth centuries, Belgium fell under the power of the powerful house of Burgundy, from which it passed by marriage to the house of Austria about the commencement of the sixteenth century, and at the division of the Austrian family into two branches, the Spanish (the elder branch) and German, it became part of the immense possessions of the Spanish branch. From various causes, it failed to acquire its liberty when the seven more northerly provinces threw off the Spanish yoke, and remained part of the Spanish monarchy till the war of the succession in the beginning of the eighteenth century, when, at the peace of Utrecht, Belgium became part of the possessions of the German branch of the house of Austria. With that family it continued till conquered by the French in 1794 and 1795, and with them it remained as a part of the French empire, till the downfall of Napoleon's power in 1814. In opposition to the wishes of the people, who utterly disliked an alliance or union with the Dutch, Belgium, by the fiat of the allied powers, became part of the new kingdom of the Netherlands under the Orange family.^d

Let us now cast a glance on the political organization of what *was* the monarchy of the United Netherlands.^e According to a constitutional law promulgated on the

^a This and the following Book are greatly modified by the translator, in order to adapt them to the present state of Holland and Belgium. The title of the Book, corresponding to this in order, in the original, is: Description of the Kingdom of the Netherlands.—Section First.—Dutch Provinces;—that of the Book, corresponding to the next, is: Description of the Kingdom of the Netherlands.—Section Second.—Belgic Provinces, and the Grand Duchy of Luxemburg.—The term Netherlands, here given as synonymous with Belgium, properly includes all the Low Countries, and is so used in the expression, Kingdom of the Netherlands. Indeed, Low Countries (Fr. *Pays-Bas*) is only a translation of Netherlands, the Teutonic form of the word (Du. *Nederlanden*; Germ. *Niederlande*.) When the people of the Netherlands revolted against Spain, the seven Northern Provinces, having united under a confederacy, and also having embraced the Protestant religion, were called the United Netherlands (United Provinces, or United States,) and also the Protestant Netherlands, while the ten

Southern Provinces, remaining under the power of Spain, and adhering to the Catholic religion, were called the Spanish Netherlands (afterwards, having passed under the House of Austria, and partly into the possession of France, the Austrian and French Netherlands,) and also the Catholic Netherlands. The term Netherlands has, however, though improperly, been confined to the Belgic Provinces, and is so employed by Pinkerton, while the term Holland, properly the name of a single province, has in like manner been extended to the whole of the Dutch Provinces.—P.

^b *Sylva Ardvenna*, Cæsar. Bell. Gall. lib. v. § 3.—P.

^c Cæsar. de Bel. Gal. lib. I. c. i.

^d The above paragraph is added by the translator.—P.

^e "—on the political organization of the Netherlandish monarchy (*monarchie netherlandaise*)"—kingdom of the Netherlands. (See note ².)—The original was published in 1829.—P.

24th of August 1815, it was governed by a king, who, sharing the legislative power with the States General divided into two chambers, alone had the right of making peace or war, of concluding alliances, and of ratifying treaties. There was, however, an obligation upon him to advise with the States,^a whenever the interest or the safety of the country demanded it. The sovereign disposed of civil and military employments, conferred the order of nobility, and governed at his pleasure the colonies. He proposed laws to the Chambers, but they, on the other hand, had also the power of submitting propositions to him which he might adopt or reject. The crown was declared hereditary in the male line, following the right of primogeniture; but females might be called to the throne, after the complete extinction of the male line. The nation was divided into three classes, viz., the nobility or equestrian order, the order of the citizens or mercantile order, and that of the inhabitants of the country or landed and agricultural interest.^b The order of the nobility was represented in the States General by the Upper Chamber, composed of from forty to sixty members, whose prerogatives, conferred by the king, were not hereditary, but for life merely. The Lower Chamber comprehended 110 deputies, nominated by the provinces, one half by the Belgian, and the other half by the Dutch provinces. These two Chambers, forming the national representation, were assembled every year. In each province, questions of a more immediate or local interest were submitted to the deliberation of deputies from the three orders, who formed the Provincial States, and whose members enjoyed equal rights, equal independence, and equal freedom. These States assembled as often as the king called them together, but at least once a-year.

There are perceivable, in the ensemble and in the details of this organization, advantages not possessed by either the English constitution or French charter.^c But the parliamentary debates of the Low Countries revealed to Europe the vicious tendency of many laws then in force, and certain alterations were imperiously called for, such as an alleviation in the burden of taxes, and the introduction of various institutions indispensable to the happiness of the nation, viz. the entire freedom of the press, the establishment of juries, and the irremovability of judges. The punishments attendant upon delinquencies of the press, were of a severity not proportioned to the present state of things. One law allowed judges to inflict, for the repression of certain offences, arbitrary punishments, and those of the most degrading nature, such as branding and whipping. It cannot be said that the government of the United Netherlands^d was altogether opposed to the necessities of the country; several abuses were redressed, and the new methods of instruction were not, as in France, through the instigation and clamours of a stationary but powerful faction,^e stigmatized as both immoral and dangerous. Hence the number of scholars has been, in Belgium,

nearly twice the number of that in France, in proportion to the population of the two countries.^f

It has been already remarked, that the people of Belgium were not consulted, when the Belgian provinces were, along with the seven Dutch provinces, formed into one kingdom. The object of the great European powers, who took upon them to model the smaller states as they thought proper, in carrying through this union, was to form, in a quarter which had always been open to French attack, and presented no proper barrier of resistance, a state sufficiently powerful, especially when supported by Great Britain and Prussia, to repel aggression on the part of its southern and powerful neighbour, and prevent Belgium from becoming what had been so often the case, a mere arena of contention between France and Austria. There were many things, however, that tended to make this union disliked by the Belgians. There existed strong feelings of aversion to the Dutch, arising from different causes, among others, the difference of their religion, the Dutch being of the Reformed religion, while the Belgians were bigoted Roman catholics. Besides, having been for twenty years united to the French empire as an integral part of it, and finding a ready market there for their internal productions, their interests, and their habits and predilections were all French. This was particularly the case in the southern provinces, and in the grand dutchy of Luxemburg. In such a state of things, much wisdom and deep and continued attention to the interests and feelings of the different parties, was on the part of the rulers necessary, to reconcile conflicting opinions and prejudices on one side and another. To give consistency, and insure duration to a body formed of such heterogeneous materials, it became necessary that a paternal government should guarantee to all, by means of the advantages of a representative system, liberty civil and religious, showing impartiality in the conferring the rewards of the state, and taking care not to shock the prejudices of the Roman catholics in Belgium, who were naturally jealous of a protestant sovereign, and of the predilections which he might be supposed to have towards his Dutch and Protestant subjects.

There is too much ground to believe that the Belgians had just cause of complaint against the government of the King of the Netherlands. The severe measures which were adopted to check, as was said, the licentiousness of the Brussels press, with the manifest partiality of the government towards its Dutch subjects, combining with other causes of complaint, and with the dislike that had all along been felt towards the union with Holland, produced a spirit of almost universal dissatisfaction throughout all the Belgian provinces; and the revolution at Paris in the close of July 1830 was the signal for another at Brussels in the month of August following, which has ended in the separation of Belgium from Holland. It appears that the allied powers have consented to this, but difficulties have arisen in the final

^a "—to communicate his measures to the States."—The person of the king was inviolable, but his ministers were responsible.—P.

^b "The nobility or equestrian order," the order of the towns, and the order of the country"—the last corresponding to the order of peasants in the Swedish diets.—P.

^c In all the nations on the continent of Gothic origin, the nobility is called the class or order of Knights (Germ. *Ritterstand*, Du. Dan. *Ridderstand*, Swed. *Riddarstånd*).—P.

^e This has a reference to the state of things in France previous to the revolution in 1830.—*Trans.*

^d "Pays-Bas"—Netherlands or Low Countries.—See note ^a p 1078.—P.

^e "A powerful stationary party"—party opposed to the progress of improvement.—The royalists and liberals, in France, in relation to this circumstance, are called the stationary and moving parties (*parti stationnaire—parti du mouvement*).—P.

^f This statement, in the original, refers to the whole kingdom of the Netherlands in 1829.—"The number of scholars, in proportion to the population, is nearly double that in France."—P.

settlement of the Belgian affairs and the choice of a sovereign, in consequence of the opposition expressed in Belgium to any member of the Nassau family occupying the throne, and the offence that may be given to the great powers of Europe in the object of their choice. A short time will decide a matter, it appears, intimately connected with the peace of the world.^a Let us now proceed with our description of the country.^b

In Belgium the asperities of the ground are merely small mountains, so small indeed that they may well be considered simply hills: they belong to a group of the Alpine range which predominates in France, and which we have called the Franco-Celtic.^c In like manner, those which extend into the grand duchy of Luxemburg and province of Liege, are merely a prolongation of the chain to which we have formerly given the name of the *Cevenno-Vosgian*.^d The branch of the Ardennes, which belongs to the same chain, extends into Hainault, and the provinces of Namur and Limburg.

The Low Countries are, by the smallness of their rise above the level of the ocean the rendezvous of several rivers which flow majestically across the sandy plains of this flat country. The *Scheld* (*L'Escaut*),^e on quitting the French territory, traverses part of Hainault, forms on the east the boundary of West Flanders, divides East Flanders into two parts, and forms the line of demarcation between East Flanders and the province of Antwerp. It then divides itself into two principal branches, which, in falling into the sea, form the islands that compose the province of Zealand. The *Meuse*, by the Belgians called *Maas*,^f takes its rise in Lorraine,^h

^a The allied powers have agreed by protocol to acknowledge the independence of Belgium, as a kingdom, and have guaranteed its political existence as such, and the integrity of its territory. The boundaries between Belgium and Holland are to be such as they were between the Seven United Provinces and the Austrian Netherlands, previous to the French revolution. The Belgian Congress have elected Prince Leopold of Saxe-Coburg for their sovereign, who now (Nov. 1831) occupies the throne as king of Belgium. The Dutch have recently invaded the country, and been driven back by the troops of France. The line of boundaries with Holland remains yet unsettled, and also the position of Luxemburg, the province having sent deputies to the Belgian Congress, and being claimed by the Belgians as a part of their territory, while the fortress of Luxemburg is held by the Dutch troops, and the duchy is claimed by the German Diet as a part of their confederacy, vested under their sanction in the king of the Netherlands, and reversible to the duke of Nassau, one of their confederates, consequently inalienable without their consent. (See note c p. 1062.)—Since writing the above, a treaty for the settlement of Belgium has been formed by the Allied Conference at London, which was immediately accepted by Belgium, and soon ratified by Great Britain and France. The other powers delayed their ratification, but the most recent accounts have stated its ratification by Austria and Prussia; its ratification by Russia, and acceptance by Holland, remaining still undecided. (May 1832.)—P.

^b The two last paragraphs are added by the translator.—P.

^c Description of France, p. 878.

^d Ibid.

^e "In Belgium, the greatest inequalities of the surface ought rather to be considered as hills than as mountains: they belong to that group of the Alpine system, which extends through the interior of France, and to which we have given the name of the *Franco-Celtic*. Consequently, those which extend into the grand duchy of Luxemburg and the province of Liege, are merely a prolongation of the chain which we have styled the *Cevenno-Vosgian*."—It should be recollected that *system*, *group*, *chain*, and *branch*, form the series of divisions, according to which mountains are arranged in this geography. The *Franco-Celtic* is a group of the Alpine system; the *Cevenno-Vosgian*, a chain of the Franco-Celtic group; and the Ardennes, a branch of the Cevenno-Vosgian chain.—P.

^f "The *Escaut*, called the *Schelde* in the dialect of Brabant (*Brabancon*)"—Scheldt, in most English authors; Scheld (Pinkerton); Germ. *Du. Schelde*; Fr. *Escaut*, *Escault*; Lat. *Scaldis*.—P.

^g Du. Germ. *Maas*—*Maase* (Kilian, 1642); Fr. *Meuse*; Eng. *Maes*, *Maese* or *Meuse*; Lat. *Mosa*.—P.

^h This statement is added by the translator.—The Meuse rises in the

and seven leagues from the frontiers of France, at the city of Namur, is joined by the *Sambre*; it then, after watering the provinces of Namur, Liege and Limburg separates North Brabant from Holland, and, uniting itself to the *Waal*ⁱ or the Rhine, takes its course to the German Ocean. After this junction, a popular error gives the usurped name of the *Maas* or *Meuse* to the united stream, proceeding upon the mistaken notion that the *Waal* or Rhine, the greater river, throws itself into the lesser river, the *Meuse*; whilst it is the *Waal*, the principal arm of the Rhine, which conveys the united waters to the ocean. Other arms less considerable preserve the name of the Rhine, and disappear amidst the sands near Leyden and in the gulf of Zuyderzee.^k

In Belgium there is no lake of any importance: the marsh called the *Peel*, in the provinces of Limburg and North Brabant, covers a great extent of ground.

A geological examination of the different formations in Belgium,^m exhibits in the most elevated part of it, namely, in the mountains of the grand duchy of Luxemburg, deposits of argilliteⁿ which extend towards the north, surrounded by granitic rocks,^o and on which there repose, towards the east, reaching as far as the Moselle, the older limestones^p containing organic remains; to the west, on the contrary, in descending towards Brussels, the argillite forms a great basin, filled with limestones containing anthracite,^q the combustible of the older formations, next with sandstone, and lastly, with all the rocks of the coal formation.^r What is most remarkable about these deposits, thus imbedded in the midst of the schists^s from whence the slate^t is taken, is, that the rocks

department of the Upper Marne in Champagne, and then flows through the departments of the Vosges and the Meuse in Lorraine, and that of the Ardennes also in Champagne, before it enters Belgium.—P.

ⁱ "Wahal."—Du. *Waal*—*Wael* (Kilian); Lat. *Vahalis*.—P.

^k Usually called, the *Zuyder Zee* (Southern Sea).—P.

^l See p. 1093 of this vol.

^m These remarks in the original refer to the whole kingdom of the Netherlands. They, however, apply chiefly to Belgium, Holland consisting almost entirely of alluvium, or at most of tertiary deposits.—P.

ⁿ "Schistes ardoisiers"—literally, roof-slate schists (clay slate, argillaceous schistus, or argillite).—P.

^o Argillite sometimes occurs in beds in gneiss and even in granite, it is then considered primitive, and furnishes some of the finest roof slates. The most extensive deposits of argillite, however, are transition, surrounding and overlaying the gneiss and granite, and associated with graywacke. Transition argillite also furnishes roof slates.—P.

^p "Calcaires anciens"—transition limestones.—In the country lying between the Ardennes on the west, and the Moselle on the east, and pervaded by the chain of the Eifel, noted for its extinct volcanoes, the fundamental rock is chiefly clay slate, associated with graywacke, and saccharoid magnesian limestone, containing trilobites, consequently transition, and covered in a few places with horizontal layers of new red sandstone. (Daubeny on Volcanoes.)—In the account of the Prussian province of the Lower Rhine in this geography (Book cxx.) the limestone in the same district is called transition (*intermediaire*).—P.

^q Anthracite is more frequently imbedded in clay slate or graywacke, but some of the black transition limestones contain imbedded masses of anthracite, of which there are examples in the north of France. (Ed. Enc.)—P.

^r The following is the translation of the above sentence, copied literally as it stands in the English edition. The reader may consider it as a fair sample of the manner in which the translator has treated matters of science. "A geological examination of the different earths (*terrains*) in Belgium shows us, in the most elevated part of it, viz., in the mountains of the grand duchy of Luxemburg, quarries of slate-stone which stretch towards the north, surrounded by granitic rocks, and above which there lie towards the east, as far as the banks of the Moselle, ancient limestone strata with organic remains; towards the west, on the contrary, descending towards Brussels, the schisti form a great basin filled with limestone and containing anthracites, the combustible of ancient earths, then sandstone, and lastly all kinds of rocks of carbonized earth."

^s Argillite.

^t "Roof-slate (*ardoise*)."

which compose them, in place of presenting themselves in inclined beds, rise vertically to the surface of the soil, and hence the immense coal-mines in the environs of Namur and Mons must be worked by means of shafts.^a What convulsions must have been necessary in order to give to these strata, originally horizontal, the disposition which they now present, whether we seek the cause of this disturbance in frightful sinkings of the ground, or in elevations from beneath proceeding from the terrible action of subterranean fires! Above the deposits thus reposing on the argillite, other more recent deposits, covered by the chalk formation, and this again by the clay and sand belonging to the tertiary formations, extend over the greater part of the Low Countries, from the frontiers of France to the mouth of the Ems, while the older formations occupy, beyond a line which may be traced from Tournay to Maestricht, all the country extending as far as the Moselle.

This country^b is furrowed by a great number of valleys and dales. "This irregularity of surface," says a Belgian savant,^c "the existence of a multitude of small streams, and the mixture of naked rocks with meadows, arable lands and small forests, give it a very picturesque appearance; but, as is the case in almost every country where the primitive formations predominate, the soil is unfruitful, with the exception, however, of the parts situated to the north of the Sambre and the Meuse, over which loose deposits of secondary formation have spread themselves; consequently, agricultural and mineral riches are there found united, which has led to the remark, that the miner and the mineralogist, accustomed to inhabit barren mountains, were astonished to find themselves, in Hainault, in the midst of plains covered with a brilliant vegetation, and where cultivation is carried to the highest pitch of perfection." The same observer has remarked, that, on the right bank of the Meuse, the disposition of the valleys presents two distinct modifications. Some of these valleys are straight, wide, and of little depth, bordered with gently sloping declivities, and extending from north-east to south-west; but they are intersected by irregular valleys of greater depth, running in every direction, and serving as beds to rivers:^d a disposition arising from the geological constitution of the country. The other valleys have no relation to the nature of the soil: they have not made their way through the hard rocks, and are stopped by arenaceous deposits. They appear to demonstrate that the excavation of valleys cannot be attributed to the erosive action of water,

^a "Pits (*puits*)"—not levels.—P.

^b That occupied by the older formations (primitive, transition, and older secondary).—P.

^c M. J. J. d'Omalus d'Halloy, *Mémoires pour servir à la description géologique des Pays-Bas, de la France.*

^d —serving as outlets (*écoulement*) to rivers."

^e There is to me an obscurity and a degree of contradiction in these remarks on the two classes of valleys, which I have not been able to remove. Is it not intended to state that the long, regular valleys, extending from north-east to south-west, are those which intervene between the ridges formed by the outgoings of the different formations, and that the irregular and deeper valleys, are those which cross these ridges? Such is the arrangement of the valleys in England between the tertiary basin of London, and the slate mountains of Wales; the different secondary formations from the chalk downwards, particularly those between the chalk and the new red sandstone, forming by their outgoings, long parallel ridges, from north-east to south-west, between which intervene valleys or troughs, of equal length and parallelism. These ridges are crossed by irregular secondary valleys, evidently of posterior formation, and apparently, from the rolled pebbles with which they are strowed, and which abound at their outlets, of

but to the disruptions that have taken place in the hardest rocks, of which the waters have taken advantage to make themselves a passage.^e

The quartzose rocks, and those which contain amphibole and form strata in the midst of the slate formation,^f are quarried to a great extent for the purpose of paving roads: in the formation which contains anthracite is found that great variety of marbles, constituting an important part of the mineral riches of the Low Countries, and especially that kind which derives from the numerous remains of marine organized bodies imbedded in it, the name of small granite (*petit granite*.) The same formation also contains in abundance rich ores of iron and lead, and gives birth to the celebrated thermal waters of Chaudfontaine^g near Liege. In the midst of the schistose rocks^h on the right bank of the Meuse, a country either barren or covered with forests, there are quarried those whetstonesⁱ which are sent to every part of Europe, and those schists charged with alum^k which are sold under the name of carpenters' pencils;^l lastly, from the same slate formation proceed the mineral waters of Spa, which have acquired in Europe so great celebrity.

In regard to climate, the provinces of Belgium differ from each other chiefly in their being subject to a greater or lesser degree of humidity. In the dutchy of Luxemburg, the climate is healthy and temperate, but rather moist than cold. The oak, the ash and the beech predominate in the extensive forests of that province; horned cattle find abundant pasturage; the vine is there cultivated to some extent, but produces an indifferent wine; fruit-trees are rare; wheat succeeds with difficulty, but the inhabitants derive great advantage from the cultivation of rye and oats, and particularly the potato. In the province of Liege the atmosphere is often lazy; its valleys, fertile and well cultivated, especially that watered by the *Ourthe* and the *Embeve*, yield, in addition to the productions of Luxemburg, wheat of excellent quality, and its territory is equally rich with the other in forests, in game, in swine, and in horned cattle. The air in the province of Namur is sharp and healthy; the soil, extremely various, readily admits of cultivation; the sheep have a finer wool, and their flesh is much more succulent, than in the two other provinces. In Hainault an air equally healthy is breathed, they enjoy a climate equally temperate, the same fertility is observable, and the forests, although more scattered, produce timber excellent for

aqueous formation, and frequently serving as passages for rivers, which commencing in one of the parallel valleys, and running for some distance in the line of its course, turn abruptly, without being obstructed in their direct progress by any solid impediment, and cross one of the ridges by a secondary valley into the next trough, and so on to the lowest. The corresponding formations in Belgium are arranged in the same way, the longitudinal ridges and valleys are the same, and the course of the rivers is similar; hence, I infer that the two classes of valleys are such as I have mentioned.—P.

^f Argillite.

^g Chaud-fontaine (For. Qu. Rev.)—Chaufontaine—in a valley, two leagues from Liege. (Vosgien).—P.

^h Argillite.

ⁱ "Hones (*pierres à rasoir*)"—novaculite. Generally found in argillite; the striped variety occurs in the vicinity of Namur.—P.

^k Aluminous Slate—a variety of argillite; employed in the manufacture of alum.

^l "Carpenters' crayons"—black chalk, drawing or marking slate; a variety of argillite. It occurs usually in the vicinity of alum slate, and is very nearly allied to it; but it contains more carbon, and less iron pyrites. (Ed. Enc.)—It is from the decomposition of the pyrites that the alum in these slates is formed.—P.

carpentry-work.^a West and East Flanders lie under the influence of a humid climate which frequently gives rise to dangerous fevers; the summer is hot but rainy, and the winter cold; the north-west winds often render the winter formidable in West Flanders, by the inundations which they occasion. Both these provinces rear horses, too heavy, indeed, for riding, but well adapted for the draught. The other domestic animals are remarkable for their fine condition, and for this they are indebted to the excellence of the pasturage. The vegetables which succeed best in Flanders are tobacco, hemp, madder, and, above all, flax, the principal riches of the country. Destitute of forests, but possessing abundance of peat, they make great use of this as fuel. The provinces of South and North Brabant, and Antwerp, are healthy, although moist; the soil is particularly fertile, except in the northern part of North Brabant, where heaths and forests of pine still cover some sandy wastes, and where peat accumulates at the bottom of extensive marshes. Yet, doubtless, here, as has been done in the territory of Antwerp, assiduous labour might transform useless plains into fruitful meadows. Limburg, no less marshy, is occupied to great advantage in the rearing of cattle and bees. The province of North Brabant, noticed here from its immediate proximity to South Brabant, belongs to the kingdom of Holland.

In general, it may be remarked,^b with regard to the agriculture of the Netherlands, that it has long been distinguished both for its productiveness and variety; and that the excellence of the Flemish system of manuring, their disuse of fallows, and skill in the rearing of cattle, have been noticed and recommended by the most experienced British agriculturists. The farms in East and West Flanders are in extent commonly about ten, and seldom exceed twenty hectares,^c while, in what are called the Walloon Provinces,^d they are usually from two to three hundred hectares. The industry of the Flemings, without the use of the wheel plough or strong English harrow, has within two hundred years converted a tract of land, originally a barren and sandy heath, into a rich and beautiful garden; and the produce of wheat here is often not less than 32 bushels to two of seed,—of oats 60 bushels to three,—whilst scarcely in any part of Great Britain does wheat yield more than from eight to 10 times. Considerably more grain is produced than the population requires. The total value of the capital employed in agriculture, in both the Belgian and Dutch provinces,^e has, from apparently accurate tables, been estimated at £433,153,333 sterling, and the gross annual produce of agricultural industry at £50,095,166 sterling, and deducting two-thirds of the gross produce, to defray the price of seed and manure, of labour, of repairs of buildings, and farming utensils, loss arising from the mortality of cattle, and the cost of the food of men and beasts, the net yearly produce is £16,698,389 sterling.

^a “—produce excellent timber (*bois de charpente*.)”

^b The Editors [English] beg to notice that, for most of what follows regarding the agriculture, manufactures, &c. of the Belgian States,[†] they are indebted to a very able article in the “Foreign Quarterly Review,” No. X, Vol. v.

^c * Included in this, and the five following paragraphs.—P.

^e A hectare is equal to two and a-half English acres. Eng. Ed. [2 acres 1 rood 35.4 rods.—P.]

^d The Walloon dialect is spoken in Liege, Namur, Hainault and South Brabant. (Malte-Brun, t. viii. p. 819.)—P.

Mines of iron, lead, copper, and coal, are worked in the provinces of Liege, Namur, Hainault, and Luxembourg, and in these provinces, there were in 1822, 93 great furnaces, 206 forges, 68 martinet houses (for hammering), 19 founderies, 17 laminaires or rolling houses, and 12 tin factories. Excellent bar and sheet iron, axletrees and nails, machinery and implements of all kinds, are there manufactured. Articles of steel, copper, and bronze, are made in Hainault and Namur: the cutlery of Namur is excellent, and the hardware of Liege of the best quality. The woollen manufacture is carried on briskly at different places, and the Netherlands cloths are much sought for, both from their quality and price, and are exported both to the north of Europe and America. The manufacture of linen, of sail-cloth, of ticking, and of thread both for sewing and lace, is carried on to some extent in a great variety of towns, both in Brabant and Flanders. In East Flanders there are 31,697 looms employed in weaving flax, 6124 for cotton, and 639 for mixed stuffs. The lace trade has not much increased of late years, but the laces of Brussels and Mechlin retain all the delicacy and richness for which they have so long been famed. The cotton trade, both in the spinning and weaving departments, is carried on to a considerable extent. The spinning establishments are principally in East Flanders and Brabant; and stuffs of all kinds are made in abundance at Ghent, Brussels, Antwerp, Courtray, Bruges, Ypres, Lokeren, and St. Nicholas. At Ghent, in particular, this trade flourishes, as may be judged by the fact of its containing 68 steam engines for spinning and weaving, while 25 years ago there was not one in all Flanders, the first having been erected in 1805. Ghent imports annually 40,000 bales of cotton wool, and the new canal, intended to communicate with the Scheldt at Terningen,^f will give additional facilities for procuring the raw material. There are considerable breweries at Louvain, at Brussels, and at Mechlin. The breweries at Louvain brew about 4000 tuns monthly.^g There are sugar refineries at Ghent and its neighbourhood; but no distilleries in Belgium of any importance. By a recent calculation,^h the annual amount of the manufacturing industry of the Netherlands, embracing both Dutch and Belgian provinces, is 675 million francs, or £28,125,000 sterling, and the profit to the manufacturer on this is said to be 184 million francs, including the interest upon his capital and stock.

The foreign trade of Belgium is carried on almost entirely from Antwerp, and, it would appear, is greatly on the increase. In the year 1822 the number of ships that entered this port was only 580, while in 1829, they amounted to 1028, and its imports in a recent year (1827) exceeded, in all great articles of consumption, excepting tea and tobacco, the two great sea-ports of Amsterdam and Rotterdam.

In this growing country new roads are making, and

^e The estimates were made before the Revolution in 1830, which has separated these provinces.

^f Terneuzen (For. Quart. Rev. No. X. vol. v.)—Ter Neuze (Hubner.)—Terneuse (Vosgien.)—Situating on the West Scheldt, 12 miles S. E. of Flushing.—P.

^g There are between 30 and 40 breweries in Louvain which make about 4000 tuns each monthly. (For. Qu. Rev. *loc. cit.*)—P.

^h See Table at end of Book CLI, page 1111.

some of those lately made are not inferior to any in Europe. In addition to the numerous old canals, which tend so much to facilitate commerce and promote intercourse among the people, two canals are on the point of completion, viz. one from Ghent to Ternengen,^a which will connect that city with the mouth of the Scheld; and another from Charleroi^b to Brussels, and round its whole circuit, so that coals may be brought by water to every part of the city. A third, of far greater magnitude, is in execution, to connect the Meuse and the Moselle, by a course of fifty leagues, from Liege to Wasserbillig, with two subordinate branches.^c This is expected to be finished in 1835.

In place of entering into any details here on the important subjects of education, literature, &c. the reader is referred to the Tables which are placed at the close of Book CLII, and which refer, it will be seen, to both divisions of the late kingdom of the Netherlands. These tables convey all the information which it would be warrantable to introduce into a work necessarily so general in its nature as the present.

It has been already observed, that the great bulk of the Belgians are of the Roman Catholic persuasion. Under the recently dissolved kingdom of the Netherlands this conferred no peculiar privileges: no religion was considered as being that of the state; all enjoying the same rights, and equal liberty. The newly established state of Belgium has recognised the same principle. It is deserving of notice here, that, under the United Kingdom, the charges for religion, which supplied the spiritual wants of the whole community, excepting the Jews, did not on the whole exceed £252,056 sterling, for a population of six millions. The revenues of the church of England are four millions sterling!

It may be remarked that the Belgic provinces assimilate in some respects both to Holland and France. Their soil, higher than that of the Dutch provinces, but less elevated than that of the neighbouring French departments, is not so humid as the former, and better cultivated than the latter. The towns in Belgium are better built than in France, and equally neat, equally clean with those in Holland.^d The inhabitants present several points of resemblance with the two nations between which they are situated. The Belgian is as honest, and as much a friend to independence as the

Hollander; but by his gaiety, his politeness, his generosity, and his love of luxury and show, he closely resembles the Frenchman.

Let us commence our description of the cities and towns of Belgium with *Antwerp* (Flem. *Antwerpen*, Fr. *Anvers*)^e on the eastern bank of the Scheld, which deserves our attention, both from the recollections of two memorable epochs, and from its own actual importance. After having been, as is believed, the city of the *Ambivareti*,^f a people of whom Cæsar speaks, and after having survived the ravages of the Normans in the 9th century, it went on, increasing in greatness, till the 16th century, at which time it was regarded as one of the richest and most flourishing cities in Europe, possessing a population of more than 200,000 souls.^g The Dutch, after they had thrown off the Spanish yoke, ruined the commerce, and destroyed the prosperity of Antwerp, by sinking vessels loaded with stones at the mouth of the Scheld, thus interrupting the navigation of the river, excepting to vessels of small burden.^h Become, after the union of Belgium with France, the capital of the department of the Two Nethes,ⁱ under the fostering care of Napoleon, who saw its importance in different respects, immense labours raised Antwerp, almost immediately, to the rank of one of the principal maritime cities of the French empire. Its cathedral is the wonder of the Low Countries, and one of the finest Gothic buildings in Europe; it is 500 feet in length, 230 in breadth, and 360 in height; its arches are supported by 125 pillars, forming 230 arcades.^l Several paintings of Rubens and other great masters decorate the interior; marble pillars of different colours ornament the choir, the chapels, and the portal; its spire rises 451 feet above the ground, and it contains one of the finest sets of bells in Belgium.^m Let us ascend to the highest gallery of this pyramidal tower, and throw a glance over the magnificent spectacle which presents itself to view. We are then placed in the centre of a panorama with a radius of fifteen leagues; we see around us in every direction the 212 streets of the city, and its twenty-two public squares; we see the town-house, famous for its fine architecture, and the houses which surround it, whose height is so great that they much surpass the highest in Paris, and whose triangular pediments, with noble flights of steps,ⁿ indicate their antiquity; the exchange, one of the finest in Europe, and the church of St. James, where is to be

^a See note ^f p. 1082.

^b Charleroy.

^c One to the Meuse above Dinant; the other to Mersch on the small river Else, which is to be made navigable to the town of Luxemburg. (For. Qu. Rev.)—P.

^d "The towns are as well built as in France, and as neat and as contiguous as in Holland."

^e Du. Germ. *Antwerpen*.—Germ. *Antorff* (Hubner).—Eng. *Antwerp*.—Fr. *Anvers*.—Span. *Amberes*.—P.

^f "*Ambivareti*"—the French orthography for *Ambivareti*, a people in Brabant. (Cæsar. Bell. Gall. iv. § 6).—The *Ambivareti* were a people in the Vivarais, dependent on the *Ædui*. (Cæsar. Bell. Gall. vii. § 69).—P.

^g This statement of the population is added by the translator.—In 1568 the trade is supposed to have been at its greatest height, and the number of inhabitants was computed at 200,000. (Pinkerton).—According to Guicciardini, the population of Antwerp, when its commerce was most flourishing, was 100,000; but Busching makes the number of inhabitants 200,000, about the middle of the 16th century. (Ed. Enc.)—The present population is 65,000.—P.

^h This sentence is added by the translator.—The Dutch fort of Lillo commanded the approach to the harbour; as to the supposed impediments, they are found to have been fabulous. (Pinkerton).—The Dutch had the complete command of the Scheldt by means of fort

Lillo; it was also agreed by Philip IV., by an article in the treaty of Munster (1648,) that no large merchant vessel should sail to this city, but that the cargo should first be unloaded in the Dutch ports, and then carried in small vessels to Antwerp. (Ed. Enc.)—P.

ⁱ "*Deux-Nèthes*."

^k So called from two rivers of that name (*Nethes*) which join the Scheld near Antwerp. Tr. [The Great and the Little Nethe (Du. *Nette*) water that part of Brabant to the east of Antwerp; they unite near Lier to form the Nethe (proper,) which itself unites with the Dyle to form the Rupel, which finally enters the Scheldt at Rupelmonde, 8 miles S. of Antwerp. The Dyle receives the Demer from the east, and the Senne from the west, before it meets the Nethe.—P.]

^l It has 230 vaulted arcades, supported by 125 columns. (Délites des Pays-Bas, t. i. p. 264. Liege, 1769).—P.

^m The tower of the cathedral is 466 feet in height, including the cross, which is fifteen; its dial-plate is 30 feet in diameter, and 90 in circumference. It has 33 large bells, and two chimées (*carillons*). (Délites des Pays-Bas, t. i. p. 264.)—P.

ⁿ "*Etagés en forme de gradins*"—rising, story above story, in the form of steps.—These houses are built in the Flemish style, with the gable to the street, and with the stories successively diminishing, till the upper part of the front, here called *fronton* (pediment,) assumes a triangular form.—P.

seen the tomb of Rubens; and, in the fine square of *Meer*,^a the former imperial palace, built by order of Napoleon. The six gates of the city, its superb quays and docks, the magnificent suburb of Bergerhout, the port capable of containing more than a thousand vessels, the extensive arsenal, and the citadel, one of the strongest in Belgium, and the Scheld, whose breadth at some distance from the port is 1600 feet, all render magnificent the appearance of this city, the birth-place of Teniers, of Rubens,^b of Van Dyck, of Jordaens, and of other celebrated men. Looking towards the north-east, there is seen, nine leagues from Antwerp, the town of *Turnhout*, where are manufactured laces and different fabrics of linen, hemp and wool; and five leagues to the south, *Malines* or *Mechlin*,^c a large and well-built city, whose ancient cathedral is a very beautiful edifice.

These boundless plains, whose rich and fertile extent the eye measures without obstacle, do not present one single rising ground; there is nothing but a succession of meadows, arable land, and woods. Towards the west East Flanders is seen stretching out, with its twenty towns, all of them rivalling each other in importance. Four leagues from Antwerp, we arrive by a magnificent road at the elegant town of *St. Nicholas*,^d rich from its manufactures; three leagues beyond that, *Lokeren* is watered by the Durme, which, rendered navigable to the mouths of the Scheld, favours the important trade carried on by this town in grain and in merchandize of every description. Still farther on, three leagues from Lokeren, shine the steeples of *Gand* or *Ghent*,^e the ancient capital of Flanders, which, in the time of Charles V., surpassed Paris in extent of ground. Its form is triangular; the Scheld, the Lys, and the two small rivers Lieve and Moere, form more than twenty-six islands,^f united by more than 300 bridges. Traces of Spanish domination are still to be recognised in traversing this city; many of its houses resemble those of Madrid in their architecture, which forms a singular contrast with the number of its canals, in which Ghent resembles Amsterdam. Magnificent quays, spacious public squares, and agreeable walks, in a walled inclosure of four leagues in circumference, place Ghent in the rank of large and beautiful cities; but the population being only about 70,000 souls, and therefore small in proportion to the extent, the aspect of the city is after all monotonous and melancholy. The citadel built by Charles V. is one of the largest in Europe; it is, however, of no great strength, and only gives the city a secondary rank among the fortified towns of the Low Countries. The cathedral, a monument of the munificence of the same Emperor, is overloaded with

^a The street called the Mere is so wide that six carriages can pass abreast. (Ed. Enc.)—P.

^b This is added by the translator.—Rubens was born at Cologne 1577. He was son of a counsellor at Antwerp, who had retired to Cologne, during the troubles in the Low Countries. He however returned at an early age to Antwerp, where he was educated and spent the greater part of his life, and where he died 1640.—P.

ornaments, but the nave is magnificent. The neighbouring tower, called the belfry, has a set of bells celebrated for their number and variety. Philanthropy, together with the arts and sciences, possesses rich and valuable establishments in this birth-place of the hellenist Daniel Heinsius, of the sculptor Delvaux, and of the astronomer Philip Laensberg,^g—in this rich and industrious city, which for thirty years was the capital of the French department of the Scheld. Charles V. was born in this city 24th February 1500.^h His being a native of Ghent did not, however, prevent the cruel usage it met with from himself in person in 1540. The crime of the citizens was the assertion of unquestionable rights secured to them by their sovereigns, the ancestors of the emperor, and their inconsiderately taking up arms in support of these rights. Sensible of their folly in attempting to resist a power so overwhelming, they sent ambassadors imploring his mercy. His answer was a terrible one. "Though he chose to enter the city on the twenty-fourth of February, his birth-day, he was touched with nothing of that tenderness or indulgence, which was natural towards the place of his nativity. Twenty-six of the principal citizens were put to death; a greater number were sent into banishment; the city was declared to have forfeited all its privileges and immunities; the revenues belonging to it were confiscated; its ancient form of government was abolished; the nomination of its magistrates was vested for the future in the Emperor and his successors; a new system of laws and political administration was prescribed; and in order to bridle the seditious spirit of the citizens, orders were given to erect a strong citadel, for defraying the expense of which a fine of 150,000 florins was imposed on the inhabitants, together with an annual tax of 6000 florins for the support of the garrison."ⁱ Ghent never recovered this blow. An old traveller^k says, "If Ghent has had the honour of giving birth to so great a prince, it was used so roughly afterwards by him, that we may say it had been better for that city he had never been born."

Alost (Flem. *Aalst*), on the banks of the *Dender*, five leagues to the south-east of Ghent, contains a town-house remarkable for its antiquity. It had formerly the title of an imperial city. *Oudenarde* (Flem. *Oudenaarden*)^l is celebrated for the battle in 1708, in which the French were compelled to yield to the numerical force of the confederated army of Austrians, Dutch and English, under the command of Prince Eugene and the Duke of Marlborough.^m It was dismantled by the French in 1745.

Satisfied with the magnificent spectacle beheld from the

^m The battle of Oudenarde was fought 11th July (N. S.) 1708. According to Tindal (continuation of Rapin), the French were superior in number to the allies; and their own accounts admitted the loss of 10,000 killed and taken prisoners, besides cannon, &c.—Translator's Note.

top of the cathedral of Antwerp, let us now traverse the province that we have just run over with our eyes; let us follow one of the fine roads that lead from Ghent, its central point, and direct our course towards Bruges, the capital of West Flanders. Whoever has travelled this country, must have remarked the freshness and beauty of the higher class of females, whose likenesses we cannot avoid thinking we have already seen in the pictures of the great Flemish masters, and the plump and cheerful countenances of the jolly village dames which the pencil of Teniers has so faithfully represented in his village festivals and tavern scenes. The cities, towns and hamlets stand so thick together in this populous country, that, astonished at the sight, one can only exclaim with Philip II. of Spain, "It is one great city."

Bruges or *Bruggen*,^a which, while Belgium remained united with the French empire, was the capital of the department of the Lys, is one of the most ancient Flemish cities. It was a fortified town in 867, and it is even possible that some parts of its walls are of as old a date as the above year. The streets are wide, but the houses with triangular gables give them a very disagreeable Gothic aspect. The principal church, dedicated to Our Lady,^b is surmounted with a very tall spire, which is seen without difficulty in coming out of the river Thames.^c This city has given birth to several great men, amongst others, to Louis Berghen,^d who invented the art of cutting diamonds. It possesses, besides an academy of painting and sculpture, several libraries and rich collections. Its harbour^e may contain more than 100 ships; but after having been, from the thirteenth to the fifteenth century, one of the first commercial cities in Europe, its prosperity has ever since been on the decline. Still, however, it maintains frequent communications with Ghent, by means of a fine canal which bears its name, and by another canal, vessels of from 200 to 300 tons, come up from Ostend. [Bruges stands in the midst of a fertile and highly cultivated country, and living is abundantly cheap; but the population, although still considerable (upwards of 30,000),^f is scanty when compared with the size of the town, and the deserted look it has, reminds the traveller that it has lost the high rank it enjoyed before the evil days of Philip II. of Spain. In the great church of Our Lady, there stands the monument of the last Duke of Burgundy, Charles the Rash,^g who was killed in the battle of Nan-

cy 1476.^h His remains were transferred from Nancy to Bruges by his great grandson, the Emperor Charles V.]

Ostend,^k with less than a third of the population of Bruges, since it contains only 10,000 inhabitants, is also threatened with the destruction of its trade; already its harbour, encumbered with sand and gravel, cannot receive large vessels, except at high water.^l We ought not to pass by here the famous siege of Ostend in the war for Dutch independence.^m Indifferently fortified, it yet resisted the attacks of the Spaniards for more than three years, (from 5th July 1601, to 20th September 1604.)ⁿ Above 300,000 cannon shot were fired by the besiegers, whose loss in killed amounted to 73,000 men, while that of the besieged is said not to have been greatly inferior.^o When at last it surrendered, it was "reduced to a mere mass of ruin. The victors marched in over its crumbled walls and shattered batteries. Scarcely a vestige of the place remained beyond these terrible evidences of destruction. Its ditches filled up with the rubbish of ramparts, bastions, and redoubts, left no distinct line of separation between the operations of its attack and its defence. It resembled rather a vast sepulchre than a ruined town, a mountain of earth and rubbish, without a single house in which the wretched remnant of the inhabitants could hide their heads—a monument of desolation on which victory might have sat and wept."^p

Nine leagues to the south of Ostend, on the banks of the Yperlee, stands *Ypres*,^q formerly the rival of Bruges in industry and commerce, but its population was then more considerable than at present. It has still manufactures of woollen stuffs and lace, but its real importance lies in the fortifications erected since the peace in 1815. If, however, we wish to see an industrious city, let us turn our steps to *Courtray*,^r divided by the Lys into two nearly equal parts; its trade is supported by its manufactures of fine cloths, napery, and lace, which equal those made at Valenciennes.^s Two considerable fairs are held there annually. *Cortryck*, its Flemish name, appears to come from *Cortoriacum*, a city of the Gauls, whose site it undoubtedly occupies. Its environs are famous in history for a great number of battles. In 1302, a French army was defeated by the Flemings in the battle called *the battle of the Spurs*, because the victors found upon the field more than 4000 gilded spurs. In 1382, Charles VI. of France avenged this defeat in

in August and September 1830, the government of Belgium has begun to clear out the harbour of Ostend, which had been neglected by the Dutch government.—*Trans.*

^l It was lately stated in the newspapers, that since the revolution

a victory obtained at Rosebecke, where the Flemings sustained a loss of 40,000 men, in which battle their leader James Artavelde, the far-famed brewer of Ghent, was killed.^a In 1791, an army of young and newly raised Frenchmen twice defeated at Courtray the old troops of the Austrians, supported by the English and Hanoverians.

On the right bank of the Scheld, Hainault contains several places memorable in the annals of war. Near Tournay, *Fontenoy* recalls to memory the victory obtained in 1745, by the French under the celebrated Marechal Saxe over the allied army commanded by the Duke of Cumberland. *Fleurus* is celebrated in the Spanish annals for the victory gained by the troops of Spain over Count Mansfeldt in 1622; for that of Marechal Luxemburg in 1690 over the imperial army; for the battle of 26th June 1794, where Jourdan defeated the Austrians under the Prince of Saxe-Cobourg, which led to the entire conquest of Belgium by the French; and for that of 15th June 1815 (three days before the battle of Waterloo), where Napoleon defeated the Prussians, and compelled them to retreat. In the environs of Mons, *St. Denis* and *Steenkerke* witnessed, in 1678 and 1692, the defeat by Luxemburg of the allied forces under the command of William Prince of Orange (king William III.); and at *Jemappe*, Dumouriez was covered with glory on the 6th November 1792. In this battle the present king of the French, Louis Philip, greatly distinguished himself. The Austrians met with a total defeat.^b

Tournay,^c two leagues from the frontiers of France, is divided by the Scheld into the old and the new town. In the latter, a superb quay planted with trees, forms the finest and most frequented promenade in the city; the houses are well built, and the streets clean and straight. The other quarter, much inferior in elegance, is the city which served as a residence to several kings of France of the first race, and which was erected into a bishopric in the fifth century. The cathedral, whose four dark spires are seen from a considerable distance, is admired for its beauty; the interior is overloaded with sculpture and the richest ornaments. It is believed to have been founded by Childeric I., whose tomb was accidentally discovered in 1655, in taking down some old houses which surrounded the church. An excavation seven feet in depth, brought to light a leathern bag

containing more than one hundred pieces of gold and as many of silver, the iron part of an axe and also that of a javelin, a sword-blade, five clasps, a case containing a steel pen or style, the hinges of two writing tablets,^d a small head of an ox in enamel,^e and two rings, one of which bore a seal with the words, *Childerici regis*. These different ornaments in gold were accompanied with several figures of bees in gold and silver, which appeared to have belonged to a royal mantle; the whole was mingled with bones, among which were distinguishable two human skulls and the skeleton of a horse, affording a proof that the Franks were accustomed to be interred with their arms, their clothes, their battle horse, their most precious jewels, and perhaps with some spoils of their enemies, for one of the two skulls was most probably that of a slave or of a vanquished warrior. Tournay, which might accommodate more than 60,000 souls, contains but little more than half that number:^f it is, however, an industrious and commercial town, and its carpeting, its cloths,^g its camlets, and its porcelain wares, are known over all Europe.

Quitting the fine road to Brussels at *Ath*,^h a small city, known from its college, and whose fortifications have never been able to resist the attacks of enemies,ⁱ we take on the right hand the road which leads to *Mons*.^k This city, which derives its principal wealth from its coal mines, is the capital of the province of Hainault. It is large, and strongly fortified, and there are few places that have suffered more from the inevitable calamities of war. In 1572, Louis of Nassau employed a singular stratagem to make himself master of it. He disguised some of his soldiers as wine-sellers, who conducted into the city several carts loaded with casks having a double covering, the outer containing wine, and the inner concealing arms. After having paid the duties, the pretended wine-sellers slew the guard and custom-house officers, and opened the gates to their commander. At the coal-mines at *Hornues*, near Mons, M. de Gorges employs 2000 workmen, for whom he has built a handsome town, consisting of 260 neat houses, with a garden to each. The streets are laid out with uniformity, and well paved; and in the centre of the village is a large square, planted with trees, in which is the ball-room for Sunday amusements, the town-hall, and the school of mutual instruction, where 400 children are gratuitously educated. The workmen have the

^a This statement respecting Artavelde is added by the translator.—James Artavelde, the far-famed brewer of Ghent, was killed in a tumult at Ghent, A. D. 1345. It was his son Philip Artavelde, who was killed in the battle of Rosebecke.—P.

^b "*Fontenoy*, near Tournay, recalls the victory at which Louis XV. was present; "*Fleurus*" is celebrated in the annals of Spain by the victory which its troops gained over Mansfeldt in 1622, and in the long series of French victories, by that in which Marshal Luxemburg defeated the imperial army in 1690, by that in which Jourdan defeated the English and Austrians, and which delivered Belgium into the power of the French, and lastly, by that two days preceding the celebrated defeat in 1815. § At *St. Denis* and *Steenkerke*, || in the environs of Mons, Luxemburg defeated the allied forces commanded by William of Orange, in 1678 and 1692, ¶ and at *Jemappes*** in the same vicinity, Dumouriez covered himself with glory on the 6th of November, 1792."

* Louis XV. is said by his firmness to have turned the victory in favor of the French. (Russell's Mod. Eur.)—P. † Fleury (Hubner.)

‡ Not Count Mansfeldt, but Ernest, natural son of Peter Ernest, Count Mansfeldt.—P.

§ This is doubtless intended for the battle of June 16th, usually called the battle of Ligny. The campaign commenced on the 15th, during which day the French drove the Prussians from Thuin to Fleurus, where the latter took a position, but were compelled to retreat again in the evening. On the 16th, the

French, with their centre east of Fleurus, attacked and defeated the Prussians at St. Amand and Ligny.—P.

gratuitous use of store-houses for all purposes, and of the luxury of baths, and appear happy and comfortable. The benefits which a great capitalist has it in his power to confer, were never more strikingly exemplified than in this village of Hornues.^a

Five leagues beyond the Sambre, which we cross near the town^b of *Merbesle*, we see on a hill the small but strongly fortified town of *Philippeville*, originally the village of *Corbigni*,^c but fortified in 1555 by order of Mary, queen of Hungary, the sister of Charles V., and to which she gave the name of her nephew Philip II.; two leagues to the south-west lies the town of *Mariembourg*,^d a fortress of still less importance, built by the same queen. *Dinant*, on the right bank of the Meuse, is defended by a good citadel, and contains several churches, one of which appears to be of great antiquity; we dare not, however, admit the truth of the tradition, that it occupies the site of a temple of Diana, which gave its name to the town.

A road alike beautiful and picturesque borders the left bank of the Meuse, and leads to *Namur*,^e built at the junction of the Sambre with that river. It is believed that this place, renowned in all the wars of the Low Countries, and become stronger than ever since the erection of the kingdom of the Netherlands, has succeeded to the *Oppidum Atuaticorum*, mentioned in Cæsar's Commentaries.^f The situation of Namur, at the confluence of two great rivers, favours its trade and industry. Its fine cutlery, and the manufacture of common pottery and leather, occupy a great number of hands; the sale of its marbles forms one of the most important branches of its trade. Nothing can be more enchanting than the environs of this city. At first, you see the river confined betwixt steep mountains, crowned with thick forests; farther on, its bed widens, its descent becomes more rapid, the ground lowers, and its waves press rapidly onwards; soon you see meadows extend along its banks; it then proceeds slowly, taking large windings, as if to enjoy longer the freshness of the beautiful verdure; its surface covered with barges, and its bed bordered by a road crowded with travellers and fields fertilized by labour, present a moving picture, which renders the variety in the landscape more interesting; but we must quit this animating scene, rise from hill to hill towards the west, and descend again into the beautiful plains of South Brabant.

The first town we pass through is *Nivelles*,^g once a place of much importance. At the commencement of the thirteenth century it was surrounded by walls. It has three suburbs, five churches, and an hospital. Forty

^h "—to enjoy the diversions of society (*des distractions de la vie mondaine*.)"—There is no sign of exclamation in the original.—This was an abbey of secular canonesses, of noble family, who had the privilege of resigning their places and marrying. They wore the religious habit in the morning, and the secular habit in the evening. (Enc. Meth. Moreri.)—P

years ago it was celebrated for an abbey of canonesses, who, in the evening, quitted the religious habit to enjoy the distractions of a worldly life!^h Their abbess took the title of Princess of Nivelles. The clock tower bears on its summit the figure of a man in iron that strikes the hours with a hammer, called in the country *John of Nivelles*. It is not, however, to this bell-man that we are to attribute the well-known proverb: "*He resembles the dog of John of Nivelles, who flies when he is called.*" This proverb arose from the following circumstance:—According to the accounts of several historians, John II. of Montmorency,ⁱ father of John, lord of Nivelles, and of Louis, baron of Fossez,^k married as his second wife Margaret of Orgemont; the two young men, who probably were not very well pleased with their stepmother, withdrew to the court of the count of Flanders, and became the origin of the two branches of the house of Montmorency. Their father summoned them in vain to return, and on their refusal, treated them as *dogs*, and disinherited them. The summons had been given to the elder brother, John of Nivelles, which gave rise to the popular saying above quoted.

Quitting the small plateau of Nivelles, let us advance into those plains where the armies of France and England, under Napoleon and Wellington, met to decide the destiny of Europe.^l *Quatre Bras*, *La Belle Alliance*, *Mont St. Jean* and *Waterloo* are before us, places which recal to remembrance the bloody struggle, which the soldiers on both sides maintained with heroic courage, in spite of the faults of the two chiefs, and in which victory, faithless to him who thought he had gained it, turned to the side of him who did not expect it. *Brussels* or *Bruzelles*,^m the metropolis of all the Belgian provinces,ⁿ and also the capital of the province of South Brabant, is only four leagues from this field of battle, which is now conspicuous from a hill raised by the art of man, and surmounted with the Belgic lion, a gigantic figure, in cast iron. The origin of this city dates from the eighth century. St. Gerius,^o bishop of Arras and Cambrai, founded a chapel in a small island formed by the Senne, and this island became the city of Brussels,^p chosen, from its agreeable situation, by Otho II. as his residence, and which afterwards became that of the dukes of Lorraine, the dukes of Brabant, and the Austrian governors. Joseph II. transformed its ancient fortifications^q into a fine promenade; it was a city surrounded merely by a wall, when, from the rank of the capital of the Austrian Netherlands, it descended in 1794 to that of the chief place of the French department of the Dyle. It is built on uneven ground, and several of its streets

are very steep. The lower part of the city, the least healthy and the least regular, contains many houses in the Gothic style; but the quarter adjoining to the Park, a magnificent promenade, ornamented with marble statues, is composed of wide streets, regularly laid out, and of houses elegantly built; some of them, however, are painted green, yellow, or grey, according to a custom prevalent in both Holland and Belgium. There are reckoned in the whole city 290 streets, 13,000 houses, 27 bridges, and 8 public squares. The finest square is the Place Royale,^a the quadrangular outline of which is formed by the fine portal of the church of St. James of Condenberg,^b by many magnificent edifices, and by four porticoes. The great square^c offers an aspect altogether different; the buildings that surround it are of various kinds of architecture, Spanish, Flemish, and Gothic; the principal is the Hotel de Ville,^d a building flanked by five hexagonal turrets, and surmounted by a steeple 366 feet in height, crowned with a statue of St. Michael,^e in gilt copper, 17 feet high, and turning upon a pivot by the slightest wind. The building of this tower took place in 1445.^f The interior of the edifice is still in the same state of decoration as when Charles V., in 1555, excited to it by the embarrassments caused by a clergy who reproached him with his pretended toleration, abdicated the sovereignty of half the world in favor of the fanatical Philip II. It is in front of this Hotel de Ville, as in front of that in Paris, that municipal ceremonies and executions of criminals take place, a monstrous conjunction, which it is painful to take notice of as existing in the nineteenth century. The great square of Sablon^g is ornamented with a beautiful fountain in white marble, representing a Minerva seated. The square of St. Michael is not of great extent, but it is planted with trees, and surrounded with buildings of elegant architecture. Among the buildings that surround the square of the mint,^h most of which are deserving of notice, the great theatre-royal is especially distinguishable. On the small rising groundⁱ called *Molenberg*, at a short distance from the great square, the ancient church of St. Gudula^k displays its imposing Gothic front; the ascent to it is by a long flight of 36 steps; the sculpture of its pulpit, in wood, highly merits attention. In the church of St. Nicholas there are valuable pictures and numerous relics. The city is supplied with water by several fountains, almost all of them adorned with sculpture, and these fountains are fed by the waters of a small lake, situated about a third of a league from the walls, towards the east. That of *Steenpoort*,^l and that of the great new street, are among the most beautiful, but they do not enjoy the

popular reputation of the *Mannekenpisse*, a child in bronze, whose name expresses the indocent way in which it throws out a stream of water. This statue, which is not very ancient, has replaced one whose origin goes back, it is said, to the twelfth century. It is called by the people *the oldest burghess of Brussels*, and on festival days they dress it in blue. Many other edifices, which we have not yet named, adorn this city; such are the palace of the States-General, the new court-house,^m and the king's palace, the last of which has been erected within these few years.

The capital of Belgium, within a circumference of two leagues and a half, is as it were an assemblage of several small cities, differing in their language, their occupations, and their manners. The quarter of the Park is inhabited by the ministers of state, the nobility, and the rich bankers, and it is also preferred by the English. In the neighbourhood of its handsome buildings resides a small colony of French, whilst towards the southern extremity of the city, a Spanish colony, escaped from the revolutionary horrors of the Peninsula, has fixed its abode. Towards the south-east, a population active and keen, but not numerous, is composed of Walloons, who are easily distinguishable by their physiognomy and language. The lower town is almost exclusively peopled by Flemings, who are attached to their own idiom and to their ancient customs. The quarter situated between the lower town and that of the Park is the centre of trade and amusements, the abode of jewellers, of mercers, and of all who support themselves by the luxury of the rich, and the point in which are assembled the finest warehouses. The Jews do not, as at Amsterdam, inhabit a separate quarter; the poorest concentrate in the meanest streets, and the more wealthy are scattered throughout the rest of the city.ⁿ The additions that are making to different parts of the city, prove that industry and trade are in a flourishing state. In effect, manufactures of all kinds are to be found in Brussels, and charitable establishments for the aged, for orphans, for strangers,^o and for the sick and the blind, are well endowed and carefully superintended. The academies of sciences and belles lettres, two royal societies of literature, one of botany, an athenæum, academies of painting and drawing, a museum, a cabinet of natural philosophy,^p a fine public library established in the old palace of the governors-general,^q a botanical garden which occupies the site of the gardens of the former court,^r and several other establishments which we pass without notice, might lead us to form a peculiarly favourable opinion of the philanthropic virtues and intellectual faculties of the inhabitants of Brussels, did

(Ed. Enc.)—P.

^r That of the governors-general of the Austrian Netherlands.—P

not our excursions both in Holland and Belgium prove to us, that the greater part of the cities in the Low Countries enjoy nearly the same advantages, in both these points of view. Among the distinguished men, to whom Brussels has given birth, the two Champagnes, painters of eminence, and Bochius,^a known by his Latin verses, ought to be placed in the first rank. Lipsius, a celebrated critic of the 16th century, was born near Brussels, and died in the neighbouring city of Louvain in 1600.^b

The inhabitants of this city, more active than those of Amsterdam, love to enjoy their fine walks. They have a *Tivoli*, which only resembles in name that at Paris. It is not so large, but is much more pleasant, and greatly more varied in the amusements to be found in it. On the banks of the canal which communicates by the Rupel^c with the Scheld, the *green walk*^d is a charming promenade composed of three avenues nearly half a league in length, of which the one in the centre is reserved for carriages and equestrians. Frequented every day, it assumes on Sunday the brilliant appearance of that of *Longchamps* at Paris. This beautiful promenade extends to the bridge of Laeken, not far from the village of that name,^e where the wealthy citizens of Brussels have their country houses, and where the king of the Netherlands possessed a park and magnificent palace,^f the place of his residence during the summer season.

We cross the Senne and the canal of Brussels at *Vilvorde*,^g a town of 3000 souls, where Joseph II. erected a bridewell (*maison de detention*)^h remarkable for the beauty of its work-shops. Four leagues to the east, we perceive on another canal, the city of *Louvain* or *Leuven*,ⁱ which possessed in the fourteenth century 4000 manufactories of cloths, whose 18,000 workmen, forced to expatriate themselves in consequence of a revolt against the Duke of Brabant, carried their industry to

England. At present it is only celebrated for the brewing of excellent beer, of which it annually exports more than 15,000 casks.^k Its canal, which admits vessels of a considerable tonnage, and the river Dyle, give activity to this branch of trade.^l Two fine institutions still confer importance on this city: the one is a hotel for invalids^m which can receive 2,500 persons; the other is the university, which was founded in 1426, suppressed by the French in 1797, and re-established since 1815.ⁿ The walled enclosure of Louvain, too large for a population of about 16,000 souls, contains fields and gardens, and streets tolerably regular, but the houses are ill built, and there are few fine edifices. It is the same with *Tirlemont*,^o which the Brabanters call *Theenen*^p Watered by the Geete,^q its ramparts are more than a league and a half in circumference, and its population is scarcely the half of that of Louvain.

We enter the province of Limburg, by the road which passing through Tirlemont, conducts to Aix-la-Chapelle. *St. Trond*,^r the first town we arrive at, carries on a trade in lace and iron-work.^s Leaving the town of *Looz*^t on the left hand, whose magnificent castle is seen in passing along, we reach the banks of the Jaar, where *Tongres* (Flem. *Tongeren*)^u is resorted to on account of its ferruginous mineral waters. This city was, in the time of Cæsar, a fortress of the *Tungri*,^x called *Atuatuca*; it was destroyed by Attila in 451, and in 881 by the Normans; at present, it contains scarcely 4000 inhabitants.

A valley stretching out before us, brings to view in the distance *Maestricht*,^y and the mountain of St. Pierre commanding it, and lying between the Jaar^z and the left bank of the Meuse.^{aa} This calcareous mountain, from which, for more than fifteen centuries, there has been taken a soft and chalky stone,^{bb} is traversed by so great a number of galleries, that there has been formed an inextricable labyrinth of about six leagues in circumference. In this

^x It does not appear that there is such a people as the *Tungri* mentioned by Cæsar. His words are, speaking of *Atuatuca*, Lib. vi. c. 30. "Id castelli nomen est. Hoc fere est in mediis *Eburonum* finibus." The *Eburones* seem to have possessed the country about Liege. Tongres is about four leagues distant from that city.—Transl. Note. [It does not appear that there is such a town as *Atuatuca* mentioned by Cæsar. The name of the town or fortress, in the passage above

quoted, is *Atuatuca*.—The *Eburones*, a people of German origin, occupied a part of the dutchies of Cleves, Juliers, and Gelders, and the country of Tongres [in the bishopric of Liege.] Their principal city was *Atuatuca*. Cæsar nearly exterminated them, in revenge for the defeat of one of his legions, stationed among them, by Ambiorix, one of their chiefs; at least, no mention is made of them by subsequent authors. The *Tungri*, also a German people, succeeded them, and gave their name to *Atuatuca*, whence the modern name of the town. (Enc. Meth. D'Any.)—Tongres is 6 [Fr.] leagues (Vosgien,) 9 miles (Morse,) N. W. of Liege.—P.]

^y *Maëstricht*.—Maestricht or Maestricht (Vosgien.)—Maestricht (Eng. authors.)—Du. *Maastricht* or *Mastricht* (Hubner)—*Maestrich* (Kilian.)—P.

^z Jeker (Enc. Meth. Ed. Enc.)—Jaar (Fr.;) Jecker (Flem.) (Dél. des Pays-Bas.)—P.

^{aa} Maestricht lies on the left bank of the Meuse, at its confluence with the Jaar, and on the north of the latter. The Jaar enters the Meuse obliquely from the south-west, and in the angle between the two rivers, rises the mountain of St. Pierre (Du. *Sant-Pietersberg*—St. Peter's Mount,) on the northern declivity of which, adjoining the south side of the town, stands the strong fort of St. Pierre, the citadel of the place. The Meuse is crossed by a bridge, and at its extremity is the small town of Wyck, a sort of suburb to Maestricht.—P.

^{bb} This soft limestone is considered by geologists as analogous to the chalk formation, inasmuch as it contains not only flints, but some of the same fossil shells, that occur in the chalk of Paris. (Ed. Enc. art. Org. Remains.)—It is probably a transition from the upper chalk to the lowest tertiary formation, few of its fossils being identical with those in the chalk, and the most remarkable being of a peculiar and more recent character. (Lyell's Geology, p. 139—140.)—The upper part of this limestone is hardest—the lower and softer part is the principal repository of the remarkable bones, which characterize it, and also of the shells and flints analogous to those in the chalk of the Paris basin. The analogy of this limestone to chalk is farther shown by its gradually changing into true chalk a few leagues south of Maestricht. (Ure's Geology, p. 215.)—P.

mass different fossil bones have been discovered of great interest to science; among others, two heads of gigantic lizards of a species which no longer exists on the surface of the globe, and which savans have agreed to designate under the name of *Mosasaurus*.^{a b} One of these heads is to be seen in the museum of Haarlem, and the other in the museum of Natural History at Paris; the length of the last is three feet nine inches, which leads to the presumption that this monstrous lizard was twenty-four feet in length. The mountain of St. Pierre, was, during the middle ages, called the Mountain of the Huns (*Mons Hunnorum*), apparently from some tradition connected with Attila's visit of destruction to this country in the fifth century, referred to above, in speaking of Tongres. It derives its modern name from the village of St. Pierre, adjacent to, and now considered a suburb of the city of Maestricht, or more properly from the church of St. Pierre, which is of greater antiquity than the village. An old tower on the summit of the mountain, has preserved the name of the "Tower of Caesar," and a little farther off, it is believed there existed a Roman camp. Let us add to these traditional names, that the Brabant name of Maestricht or Maestricht,^c is simply the translation of the Latin words, *Trajectum ad Mosam*,^d passage of the Meuse. Ought we not then to conclude, that the Romans possessed nothing here but an intrenched camp? There is no reason to suppose that Maestricht existed prior to the fourth century. The ramparts, the ditches and the bastions which defend it, as well as Fort St. Pierre,^e render Maestricht one of the strongest places in the Low Countries. It is well built; the beauty of its town-house, of its public market, and of the church of St. Gervais, are especially deserving of notice. It possesses manufactories of fire-arms, pins and cloths, and the Meuse gives activity to its commerce. After Maestricht, the other towns in the province possess very little interest. Without quitting the banks of the river, we can see *Maaseyk*,^f containing a population of only 3000 souls, and the native place of John Van Eyck,^g better known by the name of John of Bruges, who, in the beginning

of the fifteenth century, invented painting in oil. A little farther off is seen, on the left hand, the small but commercial town of *Wert*,^h the birth-place of the famous *John de Wert*,ⁱ who, from a shoemaker's boy, became a soldier, then rose to be a general, and lastly, became viceroy of Bohemia, and by the capture of several places in Picardy, during the reign of Louis XIII., carried terror to the very heart of Paris, where his name served as the burden of the song to the ballad-singers of Pont-Neuf, as in the following reign was the case with that of Marlborough. We cross the Meuse at *Venloo*,^k a city of 6000 souls, whose principal branch of industry is the manufacture of pins. In ascending the river on the right bank, there is seen, at the mouth of the Roer,^l *Ruremonde* or *Roermond*,^m the birth-place of the celebrated geographer Mercator.ⁿ

In continuing our journey in the same direction, we arrive near *Limburg*,^o the former capital of the dutchy of that name, a small city of 2000 souls, now comprehended in the province of Liege. *Verviers*, in the vicinity of Limburg, has been enriched by the sale of its woollen cloths which are much esteemed, and by means of which it has, in a few years, risen to a population of 16,000 souls.^p It lies in the midst of a rich and fertile valley, presenting an animating picture of the united results of increasing wealth and industry.^q We pass through this pretty town before arriving at *Spa*, a town known for its elegant works in varnished wood and its mineral waters, the last of which, every year to the end of May, are frequented by more than 1000 strangers, brought there as much by pleasure as by the care of their health. All the trade of the country centres at *Liege*, called *Luik* in the dialect of Brabant.^r Liege lies on the banks of the Meuse.^s Gloomy and dirty, it is yet the mart for the merchandise of the Low Countries, France, and Germany. The working of coal-mines, forges, cannon founderies, the manufacture of fire-arms, and various other kinds of industry, occupy the inhabitants. Ten suburbs,^t seventeen bridges, twelve public squares, an arsenal, an exchange, a chamber of commerce, a university founded in 1817,^u and also several schools and learn-

^a Faujas de St. Fond, Histoire de la montagne de St. Pierre de Maestricht.—Bory de St. Vincent, Mémoire sur le plateau de St. Pierre : Ann. Gén. des Sciences Physiques, tom. i.

^b Dr. Buckland first conferred on the Maestricht lizard the generic name of *Mosasaurus* (Meuse lizard.) Its lower jaw is 4 feet long, and consequently its whole length is about 26 feet. It resembles the crocodile in the proportionate length of its head, and the monitor in the general structure of its lower jaw, but differs from both in the shortness of its tail, and its palate teeth, in which last circumstance it resembles the common lizard and iguana. It has the greatest resemblance to the monitor in its general structure, but on the whole has a peculiar generic character. Its figure was compact and robust, and it was undoubtedly a marine animal, formed for swimming. (Ure's Geology, p. 216—219.)—P.

^s Liege was formerly divided into the upper or old town, and the lower or new town. The former is built on the declivity of a hill, and stretches south to the left bank of the Meuse. The latter comprehends the quarter called the Isle, situated on an island in the Meuse, and the quarter beyond the Meuse, situated on a peninsula on the right bank of the river.—Liege was formerly the capital of the bishopric of the same name, one of the principalities of the German Empire. The episcopal palace was at the foot of the mountain of St. Walburg, on which the citadel was erected.—P.

^t Liege has ten great suburbs, and two small ones. (Ed. Enc.)—P.

^u The university of Liege was created, along with that of Ghent, by the same edict (1816) which re-established that of Louvain. (Ed. Enc.)—P.

ed societies, attest the wealth and importance of Liege. Its fortifications had ceased to be kept in repair by the French government; but a vast citadel has been erected, within these few years, on the site of the old one, and Liege now ranks in the second class of fortified towns. Its public edifices possess little deserving notice, if we except its massy cathedral, and its new theatre constructed upon the model of the Odeon at Paris. Liege has given birth to several celebrated men, whose memory must be dear to her, if we may judge from the price which she appeared to put upon the possession of the heart of our inimitable Gretry.^a

At the time we are writing, there seems a strong probability that the province we are next to speak of, the farthest south of the kingdom of the Netherlands, will be separated from the Belgian States, on the ground, it appears, of its not having formed part of Belgium, but a constituent part of the Germanic empire. Whatever there may be in this, and whatever may be the destination of Luxemburg, the province in question, it is necessary to describe it here, Germany having been already described, and our continental labours closing with the following book.^b

The grand dutchy of Luxemburg, with a surface of about 230 square leagues, is peopled by 292,000 inhabitants, which makes the population equal to 1269 individuals for every square league. If we except the capital,^c this territory contains no city of importance. At the foot of the mountains which separate the Ourthe from the Lesse, we perceive the small town of *St. Hubert*, where are preserved the remains of the patron of huntsmen, whose chapel is frequently visited by such of the peasantry as wish to place their persons and their flocks under his protection.^d The position of *Bouillon*,^e in a deep and narrow defile through which the Semoy

^a Gretry, the musician, was a native of Liege (born 1741.) After his death, his heart was claimed by the city of Liege, through his relatives, to whom it was adjudged by a judicial decision. (Beauvais.)—P.

^b The above paragraph is added by the translator. ^o It is simply stated in the original (published 1820:) that the possession of the grand dutchy of Luxemburg, its southernmost province, gives the kingdom of the Netherlands a place in the Germanic Confederation. For an account of the relations of Luxemburg to the kingdom of the Netherlands, on the one hand, and the Germanic Confederation, (not the Germanic Empire—that has ceased to exist since 1806,) on the other, the reader may consult a note to the account of the dutchy of Nassau, near the close of Book CXXI.—Since the revolution in Belgium, Luxemburg has formed part of the new state, and sent deputies to its congress. Leopold, the new king, in his address on assuming the sovereignty, encouraged his people to expect such an adjustment in regard to Luxemburg, as would free it from its relations to the family of Nassau and the Germanic body, and thus allow it to remain a constituent part of Belgium. More recent accounts have stated that a

takes a winding course, gives it a melancholy but yet romantic aspect. The old castle, which commands this former capital of a dutchy,^f would prove no defence against a powerful enemy, because it is itself commanded by the surrounding mountains. In the midst of forests, upon one of the hills where the Semoy has its origin, we see the small town of *Arlon*, which carries on a trade in iron and grain; it occupies the site of an ancient city, mentioned under the name of *Orolaunum* in the Itinerary of Antonine. Frequently, when its soil is turned up, different objects of antiquity are found. In 1793 and 1794, the French, at this place, twice put the Austrians to flight.

Advancing towards the east, we observe on the banks of the small river Alzette,^g the important fortress of *Luxemburg*,^h which, for twenty years, was the capital of the French department of the Forests.ⁱ The river waters the lower town, dividing it into two quarters, which may be considered as properly the suburbs of the fortress. The latter, forming the upper town, stands on the summit of a rock in which is cut a winding road that leads to it, so steep that carriages cannot ascend it without difficulty. Ditches of great width, and not less than eighty feet in depth, would be enough for the defence of the place, and yet, besides these, a double row of exterior works defends the approach to it. It is then no exaggeration to say that Luxemburg is one of the strongest places in Europe; in a military point of view, it has been viewed as more than merely a part of the kingdom of the Netherlands, the nomination of the governor^k being subject to the approbation of the Germanic Confederation. The strength of Luxemburg alone constitutes its importance; it would be a matter of difficulty to mention, among its edifices, one single building^l worthy of the rank which this city occupies.

motion has been made in the diet at Frankfort, to consider the propriety of immediately occupying the grand dutchy of Luxemburg with the troops of the Confederation.—P.

^c "Without excepting its capital."—The original does not even consider its capital a place of importance. See the last paragraph in this Book.—P.

BOOK CLI.

EUROPE.

Description of Europe continued—Holland, or the Seven United Provinces.^a

THE early history of Holland is the same with that of Belgium,^b down to the war of Independence and Existence, as it may also be called, with Spain. In Holland, a spirit of inquiry had kept alive the ancient love of independence and liberty, in preserving from the attempts of Charles V. himself, a system of national representation which placed the principal strength of government in the Assembly of the States; and when the tyranny of his son thought it had found in the doctrines of a blind fanaticism, a solid support against the ideas of civil and religious liberty that were becoming predominant in the age, his yoke only became the more insupportable to a people possessing courage enough to be free, and sufficiently enlightened to comprehend the advantages of religious toleration. The Hollanders, by seventy years of resistance,^c conquered their independence, and founded a republic equally formidable and industrious. The treaty of Munster in 1648 drew from the reluctant Spaniards an entire recognition of the Independence of the Seven United Provinces, while the Belgic provinces, divided among themselves, and not possessed of that love of freedom, which led their more northern neighbours to overcome every obstacle, remained submissive to Spain and to the Roman Catholic church. Conquered by the French in 1795,^d it was allowed to retain a nominal independence, till Napoleon, in 1810, made it an integral part of his empire. The losses of Napoleon in the campaigns of 1812 and 1813, led to the emancipation of Holland at the close of the last mentioned year; and this was followed by the ill-assorted union of Belgium and Holland in the Nassau family, under the name of the kingdom of the Netherlands,—a union which very recent events in Belgium have broken up and dissolved.

The government of the Seven United Provinces, previous to their conquest by the French in 1795, is now a matter of past history, a tale that is told. Yet it may be right to refer to it, and a very few words will suffice. It was a confederation of seven independent republics, which were united by the bonds of similarity of manners and pursuits, and especially by the remembrance of the long-protracted and bloody struggle, which they had maintained together for liberty and life against the whole power of the Spanish monarchy, and in which, as already noticed, they at last succeeded. The States-General and Senate^e were composed of deputies from the Seven provinces, whose business it was to take charge of all matters, involving the interests of the whole, such as war, peace, the laying on of taxes, &c., but in all matters of importance no steps could be taken by these bodies, without a reference to the States of the Provinces, and these again required to consult their constituents in the cities and country.^f The Stadtholder's office was merely executive, and even that was much limited, though his rank and influence were often productive of inroads upon the constitution of the States, and induced jealousies that proved the means more than once of abolishing the office.^g

Of the government established in 1814, after the expulsion of the French and union of the Dutch provinces with Belgium, we have already spoken in our account of the Belgian provinces, and to that we beg to refer the reader. It is presumed, that so far as Holland is concerned, the same form of government will subsist, without being at all affected by the defection and separation of Belgium.

The most ancient accounts of Holland represent it as one extended swamp, alternately covered and relinquished by the advancing and retiring waters of the ocean: and yet it appears from the Roman natural his-

^a See note ^a p. 1078.—P.

^b See Book CL.

^c The revolt in the Low Countries commenced in 1566, when the people rose in many towns in Flanders, and forced the prisons of the Inquisition. William, prince of Orange, commenced military operations in 1568. The Seven United Provinces formed their treaty of Union at Utrecht, Jan. 23, 1579. A truce of twelve years was concluded, by the mediation of France and England, at the Hague, in 1609, Spain acknowledging the United Provinces as a free republic. Hostilities were not afterwards renewed, and a definitive treaty was signed in 1647, and ratified at the peace of Westphalia [treaty of Munster] in 1648, when the seven provinces were acknowledged by all Europe as an independent state, under the title of the United Provinces (United States, in old authors).—P.

^d The French took possession of Amsterdam, Jan. 18th, 1795.—P.

^e Council of State.—P.

^f The deputies to the States-General were chosen by the States of the provinces, but each province, whatever might be the number of its deputies, had only one vote in the States-General. The acts of the

States-General were merely resolutions, and did not acquire the force of law till they were sanctioned by every province, and by every city and community in that province. The Council of State consisted of twelve members, also chosen by the provinces. These deputies, however, voted personally, and not provincially, like the deputies to the States-General. Their office was to direct the armed forces and finances, and to prepare business to be laid before the States-General.—P.

^g The office of Stadtholder has always been held by members of the Orange family, but it was not declared hereditary in that family, till that object was effected in 1672 by the influence of William III. (of Orange and of England.) On his death, however, the office was abolished, nor was it revived till 1747, when it was again declared hereditary in the Orange family, in the person of William IV. When the kingdom of the Netherlands was constituted in 1814, the sovereignty was vested in the same family in the person of William VI. of Orange, the present king of Holland.—P.

torian,^a that miserable, and to all appearance uninhabitable, as a country like this was, it was not destitute of inhabitants, who, subsisting on the produce of the sea, endeavoured to find habitations on every bit of land not taken possession of by the waves. It has been a question among inquirers into matters of this kind,—at what time the inhabitants began the erection of dikes to preserve themselves from the inundations of the sea; and there is strong ground to believe that, so early as the first or second century of the Christian era, this great work was commenced, and since that time there has been a contention between the inhabitants and the ocean, which has ended, however, in the country being brought to its present state of high improvement and cultivation, and comparative safety from the attacks of its powerful assailer. A great part of Holland, it is calculated, is between twenty and forty feet below high water mark on the surrounding coast; but the inhabitants seem to have no fear of their safety. At different times, however, the ocean has burst the barriers raised to control its waters, and, on such occasions, the effects have been disastrous in the extreme. As we proceed, we shall have occasion to notice some of the most remarkable of these inundations.

In Holland, it may be said, there are no mountains: we see nothing but plains, interrupted occasionally by rising grounds, not even deserving the name of hills, and much smaller than those that are to be found in Belgium.

We must refer to our account of Belgium for an account of the principal rivers of Holland, there being few that deserve the name but those already noticed there, viz: the *Rhine*, the *Waal*, the *Meuse*, and the *Scheld*. To these may be added, the *Yssel*,^b which proceeding, by an artificial cut,^c from the Rhine above Arnheim, takes a north-east direction to Döesberg,^d where it is joined by the *Old Yssel*, the proper channel of the stream, flowing from Westphalia. It then passes by Zutphen and Deventer, and after receiving a number of smaller tributary streams, falls into the east side of the Zuyderzee, below Campen. The *Wecht* or *Vecht*^e is a river of less importance than the Yssel, which takes its rise in Westphalia, and, after uniting with several other streams, falls into the Zuyderzee not far from the mouth of the Yssel. The *Hunse* is a small river which, passing by the fine city of Groningen, takes its course to the German Ocean.^f

There are many lakes in Holland,^g especially in

^a Plin. Hist. Nat. Lib. xvi. § 1.

^b Issel (Pinkerton).—Du. *Yssel*—*Isel* (Kilian).—P.

^c Canal of Drusus—Lat. *Fossa Drusi* (D'Anv.) *Fossa Drusiana* (Enc. Meth.)—The Rhine divides itself into two branches, between Huissen and Arnhem, one of which passes by the Canal of Drusus to Doesburg, where it unites with the Old Yssel, and finally falls into the Zuider-Zee. (Busching, Aardryksbeschryving, vertaald door J. de Jongh, Deel iv. Stuk i. p. 14.)—The Canal of Drusus was dug by Cl. N. Drusus, the brother of Tiberius.—P.

^g "The Dutch provinces."

^h Du. *Haarlemmer Meer* or *Meir*—properly, Haarlem Lake.—P.

ⁱ "Gulf of the Y"—called also the river Y, and more generally, the Y (Du. *het Y*, *Ye*, or *Ie*).—It is properly an arm of the Zuyderzee.—P.

^k The two last sentences are added by the translator.—P.

^l "Nearly 20,000 arpents."

^m —into a fertile *polder*.—*Polder* is a Dutch word, signifying a tract of land drained and embanked, with a special administration for securing the embankments (*waterstaat*).—P.

ⁿ Du. *Naarder Meer* (Naarden Lake)—situated near the town of

Friesland; but the only one deserving particular mention is that which is called the *Sea of Haarlem*,^h in the province of Holland. It communicates by the gulf of Yⁱ with the Zuyderzee, is five leagues in length, by two and a half in breadth, and is everywhere navigable. Its navigation, however, is impeded by the violent squalls and storms it is subject to. In one of these did the unfortunate Frederic, Elector Palatine and king of Bohemia, when an exile in Holland, lose his eldest son and save his own life with difficulty, by the upsetting the boat in which they were crossing the lake during a dark night.^k A neck of land about two leagues broad, separates it from the North Sea. This lake was formed three centuries and a half ago by an inundation of the ocean. The Jews of Amsterdam have offered to drain it, under the condition that the property of the land should be made over to them, but other interests have stood in the way of the execution of this project, which would transform an extent of water of more than twenty thousand acres^l into fertile meadow ground.^m Among the lakes which have undergone this useful metamorphosis, chiefly in North Holland, the most important is the *Sea of Naarden*.ⁿ The *Bies-Bosch*,^o on the frontiers of North Brabant,^p is a lake of about twelve square leagues in extent, which originated in a calamity more disastrous than that which formed the Sea of Haarlem. It was produced on the nineteenth of November, 1421, by the rupture of several dikes, in consequence of which seventy-two villages and a population of about 100,000 souls were submerged. Into this lake, several arms of the Meuse throw themselves, but on issuing from it, they form only one broad stream under the name of *Hollands-Diep*.^q Among the numerous marshes of this country, the *Bourteng*, in the provinces of Groningen and Drenthe,^r covers a considerable extent of land.

Of all the gulfs which border the coast, and serve as estuaries to the principal rivers, the two most important are the *Dollart*,^s between the province of Groningen and the kingdom of Hanover,^t and the *Zuyderzee*, between Holland and Friesland.^u The first, which receives the waters of the Ems, is three leagues in breadth, and from seven to eight in length. It is the result of a dreadful inundation of the sea, which, in 1277, swallowed up several villages. The second, into which the Reest, the Yssel, and several other rivers, throw themselves, was formed in 1225 by an irruption of the sea, which covered thirty leagues of country;^x its name sig-

Naarden (Naerden) in South Holland, E. by S. of Amsterdam.—In 1628, an attempt was made to drain and embank the *Nuarter Meer*; but owing to the sponginess of the ground, by means of which the influx of the water was too powerful to be resisted, the project was abandoned (*doch wegens de voosheid van den grond, die de doorzypering van water te sterk maakte, is dit ontveerp blyven steken*.) The lake has been noted for its fish and its duck decoys (*eede-koojen*.) (Busching, vertaald door De Jongh, 1773.) The most important of the drained lakes in North Holland, are the *Zype*, (defended from the sea by an immense dyke, called the *Hondsvooud* (Hound's wood); the *Beemster* the *Purmer*, the *Wormer*, and the *Schermer*. These lakes have been drained by means of wind-mills.—P.

^o Du. *Biesbosch*—literally, a thicket of bulrushes.—P.

^p To the south-east of Dort, in South Holland, and on the northern frontiers of North Brabant.—P.

^q Eng. Holland's Deep. *Diep*, as a substantive, in Dutch, signifies a channel, or gulf.—P.

^r The Bourtang lies on the eastern frontier of these provinces, and partly in Westphalia.—P.

^s Dollart or Dollert (Enc. Meth.)—Du. *Dollaardt* (Hubner).—P.

^t East Friesland.—P.

^u Between the Dutch provinces of Holland and Friesland.—P.

^x The south part of the Zuyder-Zee was originally a lake, of com-

nifies the *Southern Sea*,^a because it is to the south of the Ocean.

The original state of Holland, as almost one extended swamp, has already been noticed. In connexion with the building of dikes to preserve it from the inroads and attacks of the Ocean, the importance of draining the land by means of canals and ditches, would naturally occur to the inhabitants, and to such an extent has this been carried, that the whole country is covered with them. They are indeed innumerable, and most useful for travelling and facilitating internal trade; and being lined with rows of trees, tend to adorn the face of this flat and naturally uninteresting country. So flat is it, that to those approaching by sea, the spires and trees appear to rise out of the water.^b

The Dutch islands form two distinct groups.^c The southern group comprehends the largest, washed by the different arms of the Scheld, the Meuse and the Rhine; these are *Walcheren*, *North and South Beveland*,^d *Tholen*,^e *Schouwen*, *Over-Flakkee*,^f *Voorne*,^g and *Beyerland*.^h The northern is composed of the islands of *Wieringen*, *Texel*,ⁱ *Vlieland*,^k *Ter-Schelling*,^l and *Ameland*, all lying at the entrance of the Zuyderzee and on the coasts of Friesland.^m

For the Geology of Holland, the reader is referred to the remarks on the geology of Belgium,ⁿ which, from the similarity of the two countries, are intended to embrace both.^o

The Dutch provinces, conquests of Man over the Ocean, derive their fogs and humidity from the mists of the sea, and the exhalations of the marshes. During the winter, however, which lasts four months of the year, and which covers the ground with hoar-frost and ice, the east wind, which blows frequently in that season, dissipates the miasmata of an insalubrious atmosphere. The industry of the cultivator multiplies cattle and pasturage. Although this country does not present the

paratively small extent, called the *Flevo*, which received the Old Yssel, and discharged itself into the ocean by the river *Flevo*. When the canal of Drusus, now the New Yssel, had become one of the principal outlets of the Rhine, the lake was enlarged, and by its encroachments, and by incursions of the sea, the extensive tract of country which separated it from the ocean, and by which West Friesland in North Holland, and the present province of Friesland, were contiguous, being separated only by the river *Flevo*, was submerged. The exact period when this occurred is not known; indeed it is probable that it took place gradually, and at different periods. The breach, that formed the inlet to the Texel (*Mars-Diep*), is said by an old chronicle to have taken place in 1170; others say as late as 1400. (Ed. Enc.)—Busching states that West Friesland and the province of Friesland were connected till the 13th century, but does not specify the period when they were disjoined. The river *Flevo* is supposed to have followed the course of the present channel called the *Vlie Stroom*. The entrance to the sea is now chiefly occupied by shallows, the only important channels being the *Texel Stroom*, and the *Vlie Stroom*.—P.

^a Du. *Zuiderzee* or *Zuider-Zee*—*Suyder-See* (Kilian;) from *zuider*, southern, and *zee*, sea.—P.

agreeable variety of an irregular surface, yet the fine season adorns it with its charms; vast meadows, dazzling with the richest verdure, are during eight months of the year covered with cattle, whose plumpness announces an abundant and healthy nourishment, and the great number of these domestic animals attests no less the wealth of their owners, than in other quarters the cultivated fields indicate the intelligence and patient attention of a laborious population. Wheat, flax, and madder, in the north, and in the south, tobacco, and different kinds of fruit-trees, cover the best lands.^p It is among the Hollanders that horticulture has made the greatest progress, and where the culture of a thousand ornamental plants, and especially hyacinths and tulips, has been carried to such a length, that the price of a single flower often exceeds what would support twenty families for a year.

The population of Holland, viewed in a religious aspect, is divided into a great number of religions, communions and sects. No religion is there considered as being that of the state; all enjoy the same rights and equal liberty. The Reformed communion^q is, however, the most numerous; the Christians of the confession of Augsburg^r occupy the next rank; Mennonites, various other sects, and Jews, much less numerous than the two first mentioned, are scattered over all the provinces.^s

In regard to the language, with the exception of the Jews, the origin of the different dialects that are spoken may be traced to the *German*.^t The different dialects spoken in Friesland and the islands of the Zuyderzee, in the province of Holland, in Gueldres, in Zeeland, and in Dutch Brabant, are all of this description. The Jews, who came originally from Portugal, have preserved the idiom which was familiar to them when they established themselves in the Low Countries.^u

The most ancient inhabitants of the country were the *Frisii*, ancestors of the Frieslanders, who occupied from

¹ Du. *Schelling*, *Ter Schelling*, or *Der Schelling*.—The hyphen should not be used in this word.—P.

² The four first of the northern group belong to the province of Holland; the last, to that of Friesland.—P.

³ Book CL.

^o This sentence is added by the translator.—The geological remarks in the original refer to the whole kingdom of the Netherlands, but they chiefly apply to Belgium. All the older formations there noticed, the valleys there described, and the particular minerals enumerated, belong to Belgium. The Dutch Provinces consist almost entirely of the alluvium occupying the deltas of the rivers, and contain besides only loose tertiary deposits.—P.

^p There is very little land under tillage in the province of Holland, and what is under tillage is almost exclusively confined to South Holland. The best wheat is produced in the neighbourhood of Grave-sande, near the mouth of the Meuse. (Ed. Enc.)—P.

^q Calvinists.

^r Lutherans.

^s These remarks on religion apply in the original to the whole kingdom of the Netherlands. It is there stated that the Roman Catholics hold the first rank in point of numbers, but are chiefly confined to the Belgic provinces, in which they predominate, and that on the contrary, the reformed communion is the predominant sect in the Dutch provinces. The others are ranked in the order in which they occur in the text.—P.

^t Not the German, but the Germanic or Teutonic stock.—P.

^u These remarks on language also apply in the original to the whole kingdom of the Netherlands. They are so mutilated and falsified in the translation, that I have thought it proper to give a closer version.—“Ethnographically considered, the population exhibits still more numerous diversities. The languages spoken belong to three great classes. The most important of these, is the *Germanic*: the people of Friesland and of the islands in the Zuyder-Zee, those who speak the Dutch language (*Hollandais*), those who retain the Netherlandish dialects of Gelders, Zeeland, and the other northern provinces, the Flemings of the northern Belgic provinces, and the inhabitants of the adjoining districts in Germany, all belong to this division. The

south to north the country comprehended between the Rhine and the Ocean. Their Latin name (*Frisii*) probably comes from an old word in the Germanic language, *frissen*,^a which signifies to grub up, to dig or drain marshes.^b They were one of the most powerful nations of Western Germany. Brave, and jealous of their liberty, they were long the devoted auxiliaries of the Romans; their independence was never disputed; we see them, after the death of Drusus, choosing chiefs or dukes from amongst themselves. The *Batavi* were, it is believed, a colony of the *Catti*, a German people; forced by a series of intestine dissensions to quit their own country, they planted themselves in the sandy and marshy country, circumscribed by the Rhine and the Meuse; their neighbours called them, for this reason, *Wattaver*,^c an appellation which the Romans changed into *Batavi*.^d When Cæsar undertook the conquest of Gaul, they were already powerful, and masters of part of the country to the south of the lower Meuse. Their cavalry was formidable; their horses were trained to swim across rivers without breaking their ranks. At the battle of Pharsalia, they decided the victory in favour of Cæsar. Their bravery and loyalty gave them the privileged title of friends and brothers of the Romans, and the honour of forming the prætorian guard. In all important expeditions, in every dangerous enterprise, the Batavians were selected. They composed the forlorn hope of the Roman army, sustained the first shock of the enemy's attack, and made the first attack with a boldness and impetuosity peculiar to themselves.^e Tacitus says, that no tribute was imposed upon them; they remained faithful to the empire till its fall. Their territory was comprehended in the province of *Germania Secunda*.

From these generalities, which it would be unprofitable

Græco-Latin comprehends those who retain the Walloon and the French Flemish, two dialects of the French, and who inhabit the two provinces of Flanders, and those of Liege, Namur, South Brabant and Hainault. The Jews belong to the *Shemite* class: having come originally from Portugal, they retain the language which was familiar to them when they established themselves in the Low Countries."

^a "*Frissen*."—Busching derives the name from *frissen*, to dig, to turn up the ground.—P.

^b The name of the *Frisii* has been derived from the Frisic word *frie* (Germ. *frey*), free, and it is stated by Alting that they have always been styled free Frisians (*frie Friescen*.) Others have derived it from *fris* (Germ. *frisch*), fresh, new, because they occupied the lands newly recovered from the sea, such lands being still called *Friesselanden*, in distinction from the old lands (*Oldelanden*.) Others, finally, have derived it from *fris*, cold, (from the root of freeze,) from the cold and damp climate which they inhabited. (J. H. Steffens, *Gesch. der alten Bewohner Teutschlandes*, p. 271. 1752.)—P.

^c In Dutch and Low German, *watt* still signifies sand bank; *ave* or *are*, low land, meadow. [In Dutch, *watte*, or *waude*, signifies a ford; *watten*, plu. flats or shoals. The word is spelt variously in Kilian's *Low Dutch Dictionary*, 1642, viz. *wat*, *wad*, *wade*, *watte*, *waede*, all rendered ford (*vadum*.) (This Dictionary includes words, not only in the Dutch proper (Hollandish,) but in the Flemish, the dialect of Brabant, and those of other provinces in the Low Countries, and also in those of Lower Germany.) *Wat* still signifies a shallow (*untiefe*) in German. Dan. *vad* or *vod*, a ford. (Baden.) Swed. *vad*, a ford. The word is from the root of the English, *wade*, Latin, *vadum*.—In German, *au*, or *awe*, signifies meadow or pasture. The same word, in Kilian, is written *awce*, and *ouwe*. The word is not at present retained in the Dutch. The corresponding word, now used in that language, is *wei*, or *weide*, (Germ. *weide*.)—P.]

^d Germ. *Platt Deutsch*, or *Niederdeutsch*, including all the vulgar dialects of the North of Germany, such as the Low Saxon, Westphalian, &c.—P.

^e The name *Batavi* (Germ. *Batt-Aer*) signifies the *Batti* (synonymous with *Catti*) of the meadows (*auen*)—so called because they inhabited the meadows on the Lower Rhine, particularly on the island included between the Rhine and the Waal (the ancient *Insula Batavorum*.) still called *Betuwe*. (Steffens.)—P.

^f These two last sentences are added by the translator.—P.

to extend farther, let us pass on to the important cities and towns of the different Dutch provinces. When these provinces rose up against the tyranny of Philip II., and bound themselves by the treaty of Utrecht in 1579, they were seven in number: the lordships of Groningen, Friesland, Over-Yssel, and Utrecht, the dutchy of Gueldres, and the counties of Holland and Zeeland, and to these may be added, the territory of Drenthe. Dutch Brabant and East Flanders, having been in their possession when peace was made with Spain, were given up to them. Thus matters continued till the invasion and conquest of Holland by the French republic in 1795. In 1798, having been called upon by the republican government of France to adopt some new organization, they took the name of the *Batavian republic*. Their political division changed; they were divided into eight departments.^f This division lasted only eighteen months, when that which recalled the good old days of Dutch independence was again resorted to, and continued till the time when Napoleon imposed a sovereign in the person of his brother, upon the descendants of those republicans who had cemented their independence by the blood of the Spanish phalanxes. Their country was then divided into eleven departments.^h United, the 9th of July 1810, to the French empire, Holland formed seven departments;ⁱ but since its erection, after the downfall of Napoleon, into an independent state, the original division has again prevailed.^k

Groningen,^l the capital of the province of that name,^m is the most important city in the north of the kingdom. Watered by the small river Hunse, and situated at the junction of three great canals, which give it a communication with several commercial cities; possessing also a port which, although five leagues from the mouth of the Ems, receives the largest merchant vessels, it is not

^f Known by the names of Delft, Dommel, Amstel, Ems, Scheld and Meuse, Rhine, Texel, and Old Yssel, from the names of the principal rivers which traversed them. [Those of Delft and Texel, the former from the city, the latter from the island of the same name, not from rivers.—P.]

^g "When these provinces, after having risen against the tyranny of Philip II., united themselves by the treaty of Utrecht in 1579, they were seven in number, namely, the lordships of Groningen, Friesland, Overijssel and Utrecht, the dutchy of Gelders, and the counties of Holland and Zeeland. The country of Drenthe was their ally * Dutch Brabant and East Flanders were their dependencies.† In 1798, the republican government of France, whose armies had invaded the territory of the Seven United Provinces, induced them to modify their organization, when they took the name of the Batavian Republic. Their political division was changed; they were divided into eight departments."^h

ⁱ The Country (*Landschap*) of Drenthe was under the protection of the Commonwealth, but had no seat in the States-General. The Seven United Provinces were alone considered as sovereign states. (Busching.)—P.

[†] The Dutch possessed, previous to the French revolution, that part of Flanders lying along the left bank of the West Scheldt, called Dutch Flanders, and including Axel, Sluys and Hulst; North Brabant, then called Dutch Brabant, including Bois-le-Duc, Breda, Bergen-op-Zoom, Fort Lillo, and Grave; Venloo and Stevenswaerd, on the Meuse, in Upper Gelderland; and a part of the old province of Limburg, on the Meuse, including Maestricht, Dalem and Valkenburg. These districts are now claimed by Holland.—P.

^h Amstelland, Brabant, Zeeland, Utrecht, Gelders, Maasland, Friesland, East Friesland, Overijssel, Drenthe, and Groningen.

ⁱ Eastern Ems, Western Ems, Friesland. Mouths of the Yssel, Upper Yssel, Zuyderzee, and Mouths of the Meuse.

^k "But when, in connection with Belgium, it was erected into the kingdom of the Netherlands, the original division again prevailed."

^l Du. *Groningen*—*Groeningen* (Kilian).—Fr. *Groningue*.—P.

^m The province of Groningen (Du. *Groningerland*) consisted of the City of Groningen and its territory, and the Ommelanden (literally, surrounding country;) forming two districts, separately represented in the provincial states. Hence the province was styled officially, the City of Groningen and the Ommelanden (Du. *Stad Groningen en Ommelanden*.)—P.

astonishing that this flourishing city has a good university, besides several schools, fine collections and scientific societies. It has given birth to several distinguished savans, among others, to Rudolph Agricola, the first introducer of the Greek language into Germany,^a to Albert Schultens, the orientalist, and to Munting, who founded there the botanical garden, at present so much admired.^b Its finest edifices are the Gothic church of St. Martin, the spire of which is 330 feet high, and the town-house, built in 1793, upon a spot^c which passes for one of the finest in Holland. One of its bridges, called *Botering-Hoog*, is regarded as a chef-d'œuvre. These buildings, and many others which might be mentioned, together with the cleanliness and regularity of its streets, rank Groningen among the finest cities in the Low Countries. It was formerly a member of the Hanseatic league. It is pretended, upon some very uncertain evidence, that it was built around the Roman fortress called by Tacitus *Corbulonis monumentum*;^d yet the first time it is mentioned in history is in the ninth century, and it was not till the fourteenth that they raised the fortifications which have been kept up ever since with much care.

Leeuwarden,^e in the province of Friesland, communicates with Groningen, and also with *Dockum*,^f *Sneek*,^g and other towns, by means of canals, and thus carries on an active trade. This pretty town^h is surrounded by a ditch and an earthen rampart; one of its twelve churches contains the tombs of the princes of Orange, and their

^a Remark of the translator.—The same remark is found in Lempriere and Platt.—Rodolphus Agricola was born at Bafflum [Bafflen] near Groningen, in 1412; he studied Greek under Theodore Gaza at Ferrara.—P.

^b Henry Munting, professor of botany at Groningen, formed a large collection of plants, of which he published a catalogue. Abraham Munting, his son and successor, also published several works on botany. (Beauvais).—The genus *Muntingia* was named from them.—P.

^c “Fronting a square (*sur une place*).”

^d *Corbulonis Monumentum*, a fortress in Germany near the country of the *Cauchi* [*Chauci*, Tac.] Tacitus relates that Corbulo, after having defeated the *Frisii*, compelled them to give hostages, and to settle in the territory he allotted to them. He gave them magistrates and laws, and erected a fortress among them. The latter is supposed to have occupied the site of Groningen. (Enc. Meth. Geog. Anc.)—His name was given to a place (*Monumentum*) in Germany, which some suppose to be modern Groningen. *Tacit. Ann.* xi. c. 18. (Lempriere's Class. Diet. edit. Anthon.)—The following is the passage referred to in Tacitus (*Annal.* xi. c. 19.) “Et natio Frisiorum post rebellionem datis obsidibus cedit apud agros, a Corbulone descriptos. Idem senatum, magistratus, leges imposuit; ac, ne jussa exuerent, presidium immunivit.”—The “*Monumentum*” is not mentioned in *Ann.* xi. c. 18.—P.

^e Du. *Leeuwarden*—*Leeuwaarden*, or *Leeuwerde* (Kilian).—Frisic, *Lieuwerden* (Busching)—*Lieuwerd* (Hubner)—Fr. *Leuwerde* (Enc. Meth.)—Leuarden (Tuckey).—Leuwarden (Vosgien).—Leuwarden, Leuwarden (Guthrie).—The name is said to be derived from *leucue*, lion, or *lieve*, dear, or the small river *Le* or *Lea*, or finally, from one *Lew*, the original proprietor, and *werd* or *waard*, an artificial mound for retreat in case of floods. (Busching.)—P.

^f Du. *Dokkum*, properly *Dokkenheim*, or *Dokko'sheim* (Busching)—*Doekom* or *Doekem* (Kilian)—situated on the river Ee, N. E. of Leeuwarden.—P.

^g Du. *Sneek*—*Sneek* (Enc. Meth.)—Frisic, *Suits*.—S. W. of Leeuwarden, on the west side of the *Sneeker Meer* (Sneek Lake), from which a canal passes through the town.—P.

^h “Capital”—of the province.—P.

ⁱ This is stated in *D'lices des Pays-Bas*, vol. v. p. 318.—P.

^k Du. *Harlingen*.—Fris. *Harlinga*; originally, *Harliga*, from a noble Frisian family of that name.—Harlingen was at first a hamlet (*buurt*) and afterwards a market town (*plek*.) gradually formed around the castles of the two noble families of Harliga and Harnis. The western side of the town was at different intervals submerged by the waves, and in the mean time a suburb, called *Almenum*, extended on the east, and was finally incorporated. Although it had earlier acquired the privileges of a city (*stad*), it was not surrounded with walls till the

palace is one of its principal edifices. Upon the site of a hamlet swallowed up by the sea in 1134,ⁱ stands *Harlingen*,^k important on account of its fortifications, and also a place of very considerable trade; near the harbour may be seen a monument erected in honour of Gaspard Robles, who, by repairing at his own expense the dikes of the province,^j merited the gratitude of his fellow-citizens.^m

Assen, the capital of the province of Drenthe,ⁿ is a handsome small town, which, by a canal, communicates with *Meppel*, a town of 4000 souls, and with the *Zuyderzee*. There have been discovered in its environs, several tombs of the ancient Germans. *Koeverden*,^o built in the form of a pentagon, is surrounded by fortifications which are by some regarded as the chef-d'œuvre of Cohorn;^p it is besides environed by a marsh,^q which renders it difficult of access.

The province of Overijssel^r contains several towns of importance: in *Zwool*,^s the capital, the church of St. Michael is remarkable for its fine organ and the sculpture upon its pulpit; *Campen*,^t upon the left bank of the *Yssel*, at a short distance from its entrance into the *Zuyderzee*, is surrounded by walls and ditches. Its trade, which has been long on the decline, is menaced with total destruction by the sand-banks which obstruct its harbour.^u *Deventer*, which boasts of its hard ware, beer and gingerbread, possesses some fine buildings; it was the native place of the philosopher Gronovius.^x

fifteenth century. (Busching).—Harlingen is situated on the sea, west of Leeuwarden, and opposite the *Vlietstroom*.—P.

^j “—by improving the dikes of the province.”—Nearly one half of the town on the west side having been formerly carried away by the sea, it became of great importance to strengthen its defences on that side, which consist not only of dikes, but of wall, pile and coffer work. The Spanish governor, Caspar Robles, having done much to promote the work, a stone column, called the Stone Man (*de Steene Man*), with an inscription in honour of him, was erected on the dike to the south of Harlingen, but afterwards removed. (Busching.)—P.

^m Franeker, formerly the seat of a university (now college or athe-næum), on the canal between Leeuwarden and Harlingen, may also be mentioned among the towns of Friesland. Under the old Dutch government, there were eleven cities in the province, having a voice in the States, including besides those already mentioned, *Bolswert* (Du. *Bolswerd*, or *Bolswaard*—Fris. *Bolward*), *Staveren* (*Starven*), *Slooten* (*Sloteu*), *Workum* (originally *Wolderkum*), *Ylst* (Fris. *Ylts*), and *Hindeloopen* (*Hindloopen*, *Hinloopen*, or *Hinloopen*). The people in the province are mostly of Frisian origin, and still retain their peculiar language, to which they show a strong attachment. It possesses many literary remains of different periods, and not a little zeal is at present exhibited in its cultivation.—P.

ⁿ Drent (Kilian. Pinkerton).—P.

^o Du. *Koeverden*—*Covorden* (Kilian).—In different English and French authors, *Coeverden*.—“*Koeverden*.” M. B.—This is a mistake, the diphthong *æ* not occurring in the Dutch language. See note ^d p. 1093.

^p “It is regarded as the chef-d'œuvre of Cohorn.”—The same expression is used in the Enc. Meth.—Bergen op Zoom was regarded by Cohorn as his masterpiece. (Ed. Enc.)—*Koeverden* is one of the strongest fortresses in Holland.—P.

^q The name of this celebrated engineer is generally written Cohorn—Coehorn (Enc. Meth.)—Du. *Koehoorn*. (Busching.)—P.

^r “By marshes.”—It is surrounded by a great marsh. (Enc. Meth.)—P.

^s Du. *Zwool*, *Zwolle*—*Swool* (Hubner)—*Swoolle* (Kilian).—*Zwool* (Tuckey).—*Z* is very often used now in Dutch, where *s* was formerly used. *Oo*, in Dutch, is merely low *o*.—P.

^t *Kampen* (Hubner).—P.

^u Its harbour is now much choked up with sand. (Morse).—P.

^x Doubtless, James Gronovius, the celebrated critic and philologist, son of John Frederick Gronovius, a native of Hamburg, also a learned critic. James Gronovius is chiefly known by his *Thesaurus Antiquitatum Græcorum*, in 13 vols. fol. He became professor of Greek at Leyden, where he died. John Fr. and Lawrence Theod. Gronovius, the first his son, and the second his grandson, were distinguished as naturalists.—P.

Gueldres or *Guelderland*,^a which has preserved the name of a city ceded to Prussia, more than a century ago,^b was formerly inhabited by the *Sicambri*, a people of ancient Germany. The first city we come to, following the course of the Yssel, is *Zutphen*,^c defended by some fortifications. English readers will connect with *Zutphen*, the renowned and gallant Sir Philip Sydney, who was killed at the siege of this town, then in the hands of the Spaniards, in 1586.^d Upon the right bank of one of the arms of the Rhine,^e stands *Arnhem*,^f not less strong, and the seat of government of the province. It was fortified by the celebrated *Coehorn*. Its ramparts are planted with beautiful elms, and form an agreeable promenade. It possesses a good harbour, its streets are straight, and the principal church contains the tombs of the ancient dukes and counts of *Gueldres*.^g Some leagues to the south of this capital, lies the much more considerable city of *Nimeguen*;^h it bore in ancient times the name of *Noviomagus*, which, during the middle ages, was changed to that of *Numaga*.ⁱ [*Nimeguen* is built on a steep rising ground, reaching down to the edge of the *Waal*, and the steepness is so great, that some of the streets are scarcely passable for wheel carriages. Most of the streets are narrow and dark; but some of them are of a tolerable breadth and well formed. The principal church is a handsome structure, and the town-house, a very old building, is also worthy of notice. From the top of an ancient tower, called the *Belvidere*, there is a most extensive view.^k "All *Holland*," says a traveller, describing it, "seemed to lie like a map

before me, presenting a flat of such extent, that the eye is almost wearied with wandering over the boundless space, and which is so intersected in every direction with rivers, canals, and swamps, that the whole country looks as if but yet half recovered from the mighty universal flood. From *Arnhem* in the north, to *Gueldres* in the south, and from *Utrecht* in the west, to the forests of *Guelderland*, and even of *Westphalia* in the east, the whole country here lies open to the view; and at a fearful depth below, is traced the broad majestic *Rhine* (*Waal*) sweeping onward in its full and steady course through this wide favouring land, to where the horizon, sinking into earth and water, terminates the scene."^l *Nimeguen* is celebrated for two treaties of peace; the first concluded in 1678, between *Spain*, *France*, and *Holland*, and the second, the following year, between the *Germanic Empire* and *Sweden*.^m

One of the arms of the *Rhine*ⁿ flows through *Utrecht*,^o a city of much more importance than any we have yet mentioned. The name of *Trajectum*, by which it is designated in the *Itinerary of Antonine*, announces it to have been one of the fifty fortresses which *Drusus* caused to be erected amongst the *Batavi*, in order to secure the navigation of the principal rivers. This rising city was several times destroyed by the *Barbarians* during the reign of *Valentinian*; *Ulpus Trajan* rebuilt it, which procured for it the name of *Trajectum Ulpium*.^p [*Utrecht* stands, what does not often occur in *Holland*, on a rising ground, and lying on the banks of the *Rhine*, and in the midst of a country, every part of it cultivated

^a "La *Gueldre*."—Du. *Gelderland*, *Gelder*—in the provincial dialect, *Gelre*—*Gelderlandt*, *Ghelderlund* (*Kilian*).—Germ. *Gelderland* or *Geldern* (the country.) *Gelder* (the town).—Fr. *Gueldre*, *Gueldres*, or *Guelderland*.—In English authors, generally written *Gelderland*, or *Gelders*; sometimes *Guelderland*. The *u*, in the French orthography, is merely used to give the hard sound of the *g*, in the Dutch and German. The *h*, in the old Dutch orthography, answered the same purpose.—*Gelderland* was originally a dutchy. North *Gelderland*, united with the county of *Zutphen*, formed one of the provinces of the Dutch confederacy, the states of which bore the title of *States of the Dutchy or Principality of Gelre* and the *County of Zutphen*. South *Gelderland* remained to *Spain* after the treaty of *Munster*, and passed to the house of *Austria* on the accession of the emperor *Charles VI.*, who ceded to *Frederick William I.* of *Prussia*, in 1713, the city of *Gelders*, and its territory. Previous to the French revolution, South *Gelderland* was divided between *Prussia*, who possessed the quarter of *Gelders*, *Austria*, who possessed that of *Roermond*, and the *Dutch*, who possessed that of *Venloo*.—P.

^b A. D. 1713.

^c Du. *Zutphen* (*Busching*)—*Zutfen* (*Hubner*)—*Sutfen* (*Kilian*).—P.

^d This sentence is added by the translator.—P.

^e The north arm, just after it sends off the *Yssel*.—P.

^f "Arnhem."—Du. *Arnhem* or *Aarnhem* (*Hubner*)—*Arnhem*, properly *Arnheim*, vulgarly *Arem* (*Busching*).—P.

^g See note ^a.

^h "Nimègue." Fr.—Eng. *Nimeguen*.—Du. *Nymegen*, *Nimwegen*, or *Nimmegen*; contracted from *Nicuw-Megen* (*Nieuweghen*, *Kilian*), the translation of its Latin name (See note ⁱ;) which is said in old German to signify new town (*magen* or *megen*, Lat. *magum*, a town or city.) (*Busching*).—P.

ⁱ Ancient name, *Noviomagus Batavorum* (*D'Anv.*)—in modern Latin, *Noviomagus* or *Neomagus* (*Busching*).—P.

^k The finest view in *Nimeguen* is from a projecting angle of the city wall, at the extremity of a walk planted with trees, called the *Kulcebosch*. The Duke of *Parma*, governor under *Philip II.*, gave to this spot the name of *Belvidere*, and a lofty building, used as a place of amusement (*speelhuys*), has been erected there. (*Busching*).—P.

^l The sentences inclosed in brackets are added by the translator.—P.

^m A separate treaty of peace and commerce was concluded between *France* and *Holland*, at *Nimeguen*, Aug. 10, 1678; a joint treaty of truce, between *France*, *Spain* and *Holland*, in the camp at *Mons*, Aug. 19, 1678; and a separate treaty of peace, between *France* and *Spain*, at *Nimeguen*, Sept. 17, 1678. A treaty of peace, between *France* and the Emperor *Leopold*, was concluded at *Nimeguen*, Feb. 5, 1679; VOL. III.—NO. 55

another, between the Emperor and the King of *Sweden*, in which *France* was included, of the same date; and a treaty for the execution of peace (definitive,) between the Emperor and *France*, July 17, 1679. (*Fr. Leonard. Recueil des Traitez*, t. iii. iv. v. 1693.)—P.

ⁿ The old *Rhine*, entering the sea near *Leyden*.—*Utrecht* stands at the point of union of four navigable waters, viz. the *Holland Veicht* (*Hollandsche Veicht*), the *Crooked* and *Old Rhine* (*Kromme and Oude Rhyn*), and the *Rhine Canal* (*Vuartsche Rhyn* or *Rhynsche Vaart*.) The *Crooked Rhine* is that part of the old arm of the *Rhine*, extending from the origin of the *Leck* to *Utrecht*, whence it is continued towards *Leyden* in the *Old Rhine* (*Oude Rhyn*.) The *Veicht* separates from it near *Utrecht*, and flows N. W. into the *Zuyderzee*, and the *Rhine Canal* extends from the *Leck* opposite *Vyanen* to the *Old Rhine* at *Utrecht*. (*Busching*).—P.

^o *Utrecht* (*Hubner*).—*Utrecht*, *Utricht* (*Kilian*).—Pronounced by the *Hollanders*, *Uitert*; by the inhabitants, *Oitert*. (*Busching*).—P.

^p The original name of *Utrecht* is said to have been *Antonia*, which some have supposed was one of the fifty fortresses erected by *Drusus* along the left bank of the *Rhine*. (See note ^c p. 1093.) It is called *Trajectum* (ferry) in the *Itinerary of Antonine*. It was also called *Trajectum ad Rhenum* (ferry over the *Rhine*) to distinguish it from *Trajectum ad Mosam* (ferry over the *Meuse*), now *Maestricht*; *Trajectum Inferius* (lower ferry); and in the middle ages, *Trajectum Vetus* (old ferry.) It is called *Utricesium* and *Utricesima*, in *Ammianus Marcellinus*, which has been supposed by *Hadrian Junius*, to signify the station of the 35th legion (*V. TRIC. LEG. STAT.*) The modern Latin name, *Ultrajectum*, has been derived, by contraction, from *Ulpium Trajectum*, or *Ultrajectum*, a name supposed to have been given it from *Ulpianus Trajanus* (the emperor *Trajan*), who commanded the legions in *Lower Germany* during the reign of *Domitian*. Others derive it, by translation, from *Trajectum Vetus*, which in the *Frisian* language is rendered *Old-Trecht*, softened into *Outrecht*, from the first of which the Latin *Ultrajectum*, and from the second the modern name, *Utrecht*, is derived. Others derive it from the *Wiltes* or *Vultes* (*Du. Wilten* or *Vulten*, whence *Vultrajectum*), a *Slavonian* people, who destroyed the fortress of *Antonia*, and erected another called *Wiltenurg*, in 186. But *Altling* denies the existence of such a people. (*Busching*).—There is apparently an error in the text, in stating that the ancient city was destroyed by the *Barbarians* in the reign of *Valentinian*, and rebuilt by *Ulpus Trajan*. The *Almanni*, a nation of ancient *Germany*, thrice invaded *Gaul* (365, 366, and 368,) during the reign of *Valentinian I.* *Ulpus Trajan* was undoubtedly the emperor *Trajan*, who commanded the legions in *Lower Germany*, A. D. 91, consequently, nearly 300 years before the reign of *Valentinian*.—P.

like a garden, the situation is pleasing, and the appearance of the city agreeable. As usual, a number of canals run through it, and the public mall or promenade^a through numerous avenues of fine trees is highly ornamental. Its cathedral was destroyed by a violent storm in the latter part of the seventeenth century, and is now in ruins.^b The tower of the cathedral is very lofty,^c and from the top, it is said that fifty or sixty walled cities and towns may be seen.^d There repose in this cathedral the ashes of several emperors.^e The edifices in Utrecht possess a character of antiquity, which inspires respect: in examining them, the remembrance of the act of union of 1579,^f which proclaimed the independence of the republic of the Seven United Provinces,^g and that of the peace which was signed here in 1713,^h present themselves to the mind. We are reminded that in this city, the cradle of pope Adrian VI., the preceptor of Charles V., was formed that mighty maritime power, which long struggled against England, which was humbled by Louis XIV., but which made that great king to tremble. Its university, its scientific collections, and its societies of arts, of sciences, and for benevolent and useful purposes,ⁱ are worthy of the rank which Utrecht occupies in the annals of Holland. Burman,^k the editor of the classics, was a native of Utrecht. The learned Grævius,^l who resided and died here, was a native of Saxony. It has given name to a kind of velvet which is still manufactured here. [The road from Utrecht to Amsterdam is considered as passing through the most beautiful and picturesque part of Holland. The whole line is over a flat but fertile country, along the banks of the great canal,^m which is ornamented on both sides with nearly one continued range of country seats, belonging to the wealthy merchants. The extremely rich appearance of this part of the country,

^f Called by the Dutch, the treaty of union (*Vereenigings Verbond*), or the Union of Utrecht (*Unie van Utrecht*).—P.

^g See note ^c p. 1092.

^h The peace of Utrecht was concluded, by separate treaties, on the evening of April 11, 1713, in the council chamber (*Raadkamer*) of the town-house (*Stadhuys*) of that city, between France on the one side, and England, Holland, Savoy, Portugal, and Prussia, on the other, thus including all the belligerents, except the Emperor, with whom a separate treaty was concluded at Rastadt, March 6, 1714, and ratified by the treaty of Baden, Sept. 7, of the same year. By these treaties, the war of the Spanish succession was concluded, and the crown of Spain confirmed to Philip V., he renouncing, for himself and his successors, all claims to the throne of France, and on the contrary, all others who had then claims to that throne, renouncing all pretensions to that of Spain. (Leonard, *Recueil*. t. viii. Rousset, *Recueil*. t. i.)—P.

^{aa} The sentences enclosed in brackets are added by the translator.—P.

The island of Texel produces a considerable quantity of tobacco; its meadows are covered with cattle and sheep, principally the latter, whose milk is employed in making excellent cheese of a greenish colour,^a for which it is indebted, it is said, to the dung of the animals. The population amounts to 4,400: on its southern coast it has a commodious roadstead, where ships assemble to wait for a north-east wind, which is necessary to take them through the dangerous current of *Mars-Diep*, and carry them to Amsterdam.^b

The northern extremity of North Holland, which stretches to a point opposite the island of Texel, is a dry and sandy country, which bears the marks of a recent recovery from the sea, and which the Hollanders call their Siberia. The waves, at the entrance into the Zuyderzee, wash the neat town of Helder, where the British forces under the late Duke of York disembarked in 1799, and where, after a fruitless attempt to raise the Dutch, they were compelled to re-embark, after a campaign of a few weeks duration;^c near to it is *Williams Ord*,^d a maritime establishment, founded by Napoleon, and now under the protection of the reigning sovereign, whose name it bears. He even possesses there a small palace, whose park, planted with stunted trees, resembles an oasis in the midst of an arid steppe. On the coast of the Zuyderzee, *Medenblik*,^e a small city^f of 2000 souls, with a harbour, is during severe tempests threatened with complete submersion; it is looked upon as the oldest city in North Holland, and as having been the residence of the ancient kings of Friesland.^g *Horn*,^h at the bottom of a bay, was the birth-place of William Schouten,ⁱ who discovered, in 1616, the American cape, to which he gave the name of his native city. It is a well built town, and possesses a good harbour; its environs are embellished with gar-

^a Called Texel cheese (*Texelsche Kaas*).—P.

^b This roadstead (called the Merchantmen's Road (Du. *Koopvaarders-Reede*), and in the south part of it, the Muscovy Road) lies on the eastern or south-eastern side of the island, near the village of Schil, and is protected by a fort (*schanz*), south of the village. It is frequented by outward bound vessels from the Zuyderzee, who there wait for an east or north-east wind, necessary to take them out to sea through the channel of *Marsdiep*, between the south point of Texel, and the Helder or north point of North Holland. The main channel from this road towards Amsterdam, called the *Texel-Stroom*, runs first north-east and then south-east and south, between the great sand banks at the entrance of the Zuyderzee; consequently a north-east wind would prevent the approach of vessels to Amsterdam. The original has here confounded the inward with the outward passage.—P.

^c "The waves wash the neat town of the Helder."—It is properly called the Helder (Du. *De Helder*.) It is situated on the south side of Marsdiep, and has strong fortifications which protect the road off the mouth of this channel called the *Landsdiep*. (Tuckey. Busching.)—The first column of the Anglo-Russian expedition, as it is called, landed under Sir Ralph Abercrombie to the south-west of the Helder point, Aug. 27. Oct. 17, an armistice was concluded, by which it was stipulated that the Anglo-Russian army should evacuate the territories of the Batavian Republic, Nov. 30.—P.

^d "*Willems-Ord*."—Du. *Willems-oord* (William's Place).—P.

^e Du. *Medenblik*.—Fr. *Medemblik*, *Medemblick*.—Called by seamen, *Memelik* (Busching.)—The name is said to be derived from the Frisic *medem*, meadows, and *leck*, lake. (Enc. Meth.)—P.

^f It was formerly one of the towns or cities, of which there were seven in North Holland, that had a voice in the Provincial States. These towns were called by the Dutch, *Stemmende* or *Stem hebbende Steden* (voting or voice having towns or cities).—P.

^g That part of North Holland, in which Medenblik is situated, including all its northern extremity, is still called West Friesland. The old Frisian kings are said to have held their residence in the castle (*slot*) of Medenblik, situated at the east end of the town. (Busching.)—P.

ⁿ Du. *Alkmaar*—*Alcmaer*, *Alekmaer* (Kilian).—Alkmaer (Pinker-ton).—Alcmar (Morse).—*Aa* and *ae* express the same sound, that of long *a*; the former is now chiefly used; the latter is the old orthography.—The town is said to have been originally called *Almeer* (Lat. *Almeria*), from *al*, all, and *meer*, lake, because it was surrounded with lakes and marshes. (Busching.)—P.

^o It is situated nearly in the centre of North Holland, rather nearer, however, to the western coast, behind the downs of Egmont.—P.

^p The Anglo-Russian army after repeated actions drove the enemy to their position between Beverwyk and Wyk-op-Zee, at the southern extremity of N. Holland, Oct. 6; but on the night of the 7th, it retreated to Alkmaar. (Miller's Geo. III.)—P.

^q This account of Enckhuysen and Alkmaar [] is added by the translator.—P.

^r "Gulf of the Y." (See note ⁱ p. 1093.)—It stands on the north shore of the Y, nearly opposite Amsterdam, and is a considerable town with extensive ship-building establishments belonging to Amsterdam. (Tuckey.)—P.

^s Du. *Zaandam*, properly *Zaanredam* or *Zaannerdam* (so named from the *dam* or sluice by which the *Zaan* communicates with the Y;) commonly called *Saardam*. (Busching.)—*Sardam* (Vosgien).—P.

^t Called East and West *Zaandam*, from their position on the opposite banks of the *Zaan*. The name of *Saardam* or *Sardam* was particularly applied to the former. These two parts were considered as two separate villages (*dorpen*), *Zaandam* not ranking among the cities represented in the States.—P.

^u "The hut which he inhabited is the only curiosity in the place; all travellers inscribe their names in it. *Zaandam* has extensive ship yards (*chantiers*) and carries on a great trade in timber and paper."

^x The village of Broek in Waterland, the capital (*hoofdorp*) of the bailiwick of Waterland—situated about 20 miles N. of Amsterdam.—P.

with the above exception, are clean beyond all comparison; not a dog or cat is to be seen in them at liberty; and there is a regulation by which no person is allowed to smoke within doors or without, without a guard over the ball of the pipe to prevent the ashes from falling out! Notice to this effect is posted up at the entrances into the village. The pavement of the street is inlay or mosaic work, formed of pebbles of every shape and colour, shells, pieces of glazed brick, &c. &c. The houses are painted, every part of them, within and without, with the most costly colours, and their whole appearance bespeaks the most minute attention to neatness; the windows are without a speck, every thing has an air of freshness, and a stranger looks in vain for a grain of dirt, or even a particle of dust. The houses are roofed with tiles so glossy, that in the sunshine they glitter like spar. Small gardens extend from one end of a street to the other, all ornamented in the way most suitable to the owner's taste, and not a blade of grass or withered leaf is allowed to rest on the ground. The town is built partly round the banks of a small circular lake,^a and from this lake are carried through most of the streets small streams in a channel lined with brick on both sides. The numerous bridges required over these small canals afford opportunity for exhibiting the taste of the inhabitants in fanciful devices, and in the intermixture of bright colours. The houses have each two entrances, the one of which, generally painted black, is never opened but in the case of death occurring in the family. The internal cleanliness of the houses corresponds in every part with the external, and the people are equally cleanly in their persons, dress, and habits. Let not strangers laugh at all this particularity. It may be in this instance carried to a fanciful excess, but how conducive would an assimilation to the spirit of the people of Broek be to the health and comfort of mankind?^b

From the northern bank of the gulf Y,^c the passage is only half a league to the entrance of the port of *Amsterdam*.^d A vast extent of meadow-ground, strewed with villages and scattered houses, surrounds the capital of

^a Near the village, on the south-west, lies the *Broeker Meer* (Broek Lake,) which was diked and drained in 1628. It contains 304 *morgen* [640 acres nearly.] (Busching.)—P.

(Busching.)—P.

^e Tour in the Netherlands, &c. by C. Tennant, Esq. [Trans.]

^f "Converted into *boulevards*" (public walks or promenades).—*Boulevard* is a French corruption of bulwark [Germ. *bollwerk*, Du. *bolwerk*, a bastion,] and originally signified a fortification or rampart (see Boyer, *et id genus*), but its meaning is now entirely changed. It at present signifies [in the plural] a line of streets, or a single circular street, surrounding a city, and occupying the site of the demolished walls, such as the Boulevards at Paris and Nismes, or a public walk or promenade, generally planted with trees, along the top of the walls, as is the case in most of the old walled, but now unfortified towns in France. The meaning of the original is therefore the reverse of that given in the translation; the ramparts which were originally meant for defence, being now converted into pleasure walks for the inhabitants.—In earlier times, Amsterdam was a strong fortress; but in consequence of the changes which have taken place in the mode of conducting sieges, it can now be defended only by inundating the surrounding country. It is said, however, that in the last years of the reign of the ex-king Louis, a plan was formed for the regular fortification of Amsterdam. (Enc. Amer. 1830.)—Amsterdam is of a semicircular form, about 9½ miles in compass, surrounded with a ditch 80 feet wide, full of running water, and with a rampart faced with brick [stone, Busching] having 26 bastions, on each of which there has been placed a

Holland, and when we add to this the tranquil course of the Amstel, a little river which passes through the city, and whose banks are bordered, during the fine season, with flowery meadows and trees covered with a beautiful foliage, the whole presents a rich and brilliant picture to the eye of the delighted spectator. "I know no city," says a recent tourist, "the distant view of which is so striking as that of Amsterdam. The eye travels over one vast flat meadow of the richest herbage, and, at the extremity of this, the view is bounded by a thick crowd of towers, cupolas, and spires. On a nearer approach, so level is the wide expanse around, that the eye seems to embrace at once the whole of this magnificent city, and crowds of masts are seen mingling with the houses. It is a sight truly imposing, and worthy of a great commercial nation."^e The city, surrounded by ditches and ramparts converted into fortifications (*boulevards*),^f has no occasion to dread the approach of an enemy, as by means of sluices the whole surrounding country can be inundated. A multitude of canals, the greater part of them bordered by rows of trees, traverse the city, forming ninety islands, which communicate with each other by means of 280 bridges, of which that over the Amstel^g is the finest; it is 660 feet in length, 70 in breadth, and is composed of 35 arches.^h The brackish and muddy water of these canals, although frequently put in motion by the opening and shutting of the sluices, yet spreads through this vast city dangerous miasmata, which, joined to the humidity of the atmosphere and ground, render it an unhealthy place of abode. One great inconvenience is the want of good water; that of the Amstel is bad; they make use of the water of the small river Vecht,ⁱ several leagues from the city, but the best is that which is brought from Utrecht at a great expense. The streets, almost all of them in straight lines on the banks of the canals, are well paved, furnished with foot-paths,^k and carefully lighted during the night; the two finest called the *Heeren-Gragt* and the *Keizers-Gragt*, are magnificent, and are more than half a league in length.^l Nothing can equal their splendour; but it is not, as in

wind-mill. On the side towards the harbour, which is 1½ miles in length, and of a semicircular form, giving to the city the shape of a crescent, there is no line of walls and bastions, the only defences being a double row of piles, connected by large horizontal beams, on the north side of the harbour, separating it from the road in which the larger ships anchor. (Ed. Enc. Busching.)—P.

^g "Bridge of the Amstel (*Pont de l'Amstel*)"—Amstel Bridge (Enc. Amer.)—P.

^h This bridge, called the Pont Neuf [Du. *Nieuwe Brugge*, New Bridge,] is 600 feet long, and 70 broad, and consists of 30 arches. (Ed. Enc.)—There is another bridge over that part of the Amstel called the *Damrak*, adjoining the Corn Market (*Koorn-beurs*), called the Old Bridge (*Oude Brugge*). (Busching.)—P.

ⁱ An arm of the Old Rhine, parting from it at Utrecht, and running N. W. to the Zuyderzee at Muiden.—P.

^k "Trottoirs"—side-walks.—All the streets are paved with brick, and have no raised side-paths for foot passengers; but as wheel carriages are neither numerous in this city, nor allowed to be driven with speed, a person may walk here with as much security as on the flag-stone pavements of London. (Ed. Enc.)—P.

^l Kiezer's [properly, *Keizers*] *gragt*, or emperor's street, Heeren *gragt*, or lords' street, and Prissen's [properly, *Prinsens*; *Princes* (Busching)] *gragt*, or princes' street, are upwards of 140 feet wide, and are lined with houses, whose princely splendour would do honour to any town in Europe. (Ed. Enc.)—*Gragt* [*Gracht*, Busching] properly signifies a ditch or canal, and as applied to a street, it indicates that it has a canal in the centre, or is built along the sides of a canal. The three spacious canals called *Keizers-gragt*, *Heeren-gragt*, and *Prinsens-gragt*, run parallel to each other and to the city walls, in a semicircular form, thus constituting three concentric curves within the fourth formed by the line of fortification, and extend through the whole

Italy, palaces that are the ornament of these streets; the houses, all built of brick and painted with different colours, are tastefully fitted up with the most splendid furniture,^a and the profusion of warehouses and shops, stored with all the productions of the two worlds, announce the wealth of a city which long possessed the commerce of the universe. The *Kalver-Straat*^b and the *Nievedek*^c especially resemble exhibition galleries in the open air, in which are displayed all the treasures of industry.

Fine public edifices still farther display the commercial riches of Amsterdam; in the square of Dam,^d the most magnificent building is the royal palace, formerly the Stadthouse.^e The only fault found with this building is in its proportions, which are not in harmony with each other; thus, its height, which is 116 feet, not comprehending a tower of 41 feet, is too much for its length which is 282, and for its depth which is 222 feet.^f It is built upon 13,659 piles. The interior attests the splendour of the capital, at the time when a building so sumptuous was erected for its magistrates: no decorations have been spared; marbles, statues and pictures abound even to profusion. The royal hall^g is one of the largest in Europe: it is 120 feet in length, 56 in breadth, and 98 in height;^h it is crossed by a meridian line traced by the celebrated Huygens;ⁱ the marbles with which the floor, the walls, and the ceiling, are covered, the pillars which support the latter,^k and the standards taken from the Spaniards, decorate it with a magnificence which nothing could replace. The royal apartments are still in the state in which Louis Bonaparte ornamented and furnished them. The Exchange,^l built

length of the city, bordered on each side by lines of houses, forming the streets above mentioned.—P.

^a “—tastefully garnished with the most brilliant stuffs”—i. e. as we should say in America, with the goods displayed at the doors and windows of dry-goods stores; in other words, these are the Broadways and Bond Streets of Amsterdam.—P.

ⁿ Viz. 11 for the Reformed religion,* 2 French, 1 English, 1 Scotch, 2 for the Confession of Augsburg,† 1 Armenian, 3 Anabaptist, 24 Roman Catholic, 1 Quaker, and 3 Jewish Synagogues. [The churches are numerous; among them, the Dutch Reformed have 10, the French 1, the English 1, the Roman Catholics 18, and even the Greeks and Armenians have a church. (Enc. Amer.)—In 1773, the Dutch Reformed (*Herrormde Gemeente*) had 11 churches (*kerken*) and 30 ministers; the Walloons (*Waalische Gemeente*)—formed by the protestant refugees from the Walloon districts in the Spanish Netherlands, and the

upon a large bridge which conceals the course of the Amstel,^m is an edifice in the Gothic style, 250 feet in length by 140 in breadth; its principal front is ornamented with a Mercury of a colossal size. The churches and other religious edifices in Amsterdam are forty-nine in number.ⁿ That of St. Nicholas, called also *Ouder-Kerk*^o or the Old Church, is a fine building; the roof is supported by forty-two stone pillars, and above it rises a tower 240 feet in height, in which there is a chime composed of thirty-six bells. That of St. Catharine,^p or the New Church, *Nieuwe-Kerk*, is one of the finest in the kingdom, and also contains the tomb of the celebrated admiral, De Ruyter. In the fine street called *Heeren-Gragt*, meets the society *Felix Meritis*, which, from its embracing the sciences, literature, and commerce, is one of the most important and most popular in this capital.^q [It was established within the last fifty years, and is divided into five classes. The first is directed to agriculture, commerce, and manufactures; the second to mathematics and natural philosophy; the third to painting, sculpture, and architecture; the fourth to music; and the fifth to general literature. Each class has its separate museum, library, and hall of assembly, and the rules of each department are as liberal as the objects are enlarged. The building where this society holds its sittings is neat and commodious, and may be regarded an ornament to the city.^r The finest gate of the city is that of Haarlem. There are in Amsterdam three theatres, and a considerable number of hospitals and almshouses, six of which are for orphans alone, and an equal number are houses of correction and hard labour.^s These establishments, much better at-

French refugees after the revocation of the Edict of Nantes,) 2 churches and 6 ministers; the English Episcopalians and Presbyterians, each one church, and the latter two ministers;‡ the Lutherans, 2 churches and 6 ministers; the Roman Catholics (*Roomsgesinden*.) ten places of worship (*kerkhuizen*) within, and 2 without the city;‡ and the Jews, two synagogues (the Portuguese and the German.) Besides these, there was a church for the Armenians, and places of worship for the Remonstrants [Arminians], Mennonites, Quakers, &c. (Busching).—P.]

* Calvinists—the established sect in Holland.—P.

† Lutherans.

‡ Before the French invasion, the English had three places of worship; one for the Presbyterians, whose clergymen were paid by the magistracy; another for the Church of England, the expense of which was defrayed by his Britannic majesty; and a third for the Brownists, whose ministers were maintained by their congregations. The Roman Catholics had 27 places of worship, and were supposed to amount to a third of the population. The Dutch Reformed (established church,) and the three English churches comprehended another third. (Ed. Enc.).—P.

^o This should read *Oude-Kerk* (old church)—dedicated to St. John the Baptist (*S. Johannes de Doper*) and St. Nicholas (*Sant-Niklaas*).—P.

^p This church, like the former (see note ^o.) had two patrons, viz. the Holy Virgin Mary (*Heilige Maagd Maria*) and St. Catharine (*Sante Katharina*).—P.

^q “—which, from its courses of instruction (*cours*) in the sciences, literature and commerce, is one of the most important and most frequented in this capital.”—The beautiful Trippen-house, where the Academy of arts and sciences assembles, is now a temple of the arts and sciences. The society *felix meritis* (established by the merchants;) the society *doctrina et amicitia* [of learning and friendship;] that *tot nut van ’t algemeen* [for promoting the public good,] devoted to the liberal arts and sciences; the excellent reading room; several musical societies, the *hortus medicus* [botanical garden,] belonging to the *Athenaeum Illustre*, and the famous Latin schools,* prove the taste of the citizens of Amsterdam for science and learning. (Enc. Amer.).—P.

* In 1773, there was in Amsterdam, a Latin School (*Latynsche School*.) and another School, called the *Gymnasium Illustre*, with seven professors, viz. 1 of theology, 1 of law, 3 of medicine, 1 of Oriental languages and antiquities, and 1 of Greek, history, &c. (Busching).—P.

^r “The building in which the society holds its sittings, may be considered one of the finest in Amsterdam.”—This is all in the original corresponding to the sentences enclosed in brackets.—P.

^s “—a considerable number of hospitals and almshouses (*hospices*;) six of these are for orphans alone, and there is an equal number of

tended to than in most countries of Europe, are an inevitable scourge in a city, the rendezvous of a crowd of strangers, who spend their gold there, and corrupt the lower classes. We must see the vast East India House, the buildings of the Admiralty,^a which, of themselves, resemble a city, the docks for ship-building, and the majestic extent of the harbour, in order to judge of what was formerly the activity of Amsterdam, by the stir which still prevails. There annually enter the harbour 3000 vessels, but its trade with the two worlds is not the only support of its population. It manufactures a great variety of stuffs, besides chemical products, tobacco, hard-ware and jewelry; from the juniper a great quantity of Geneva is distilled,^b and the art of the lapidary is carried to the highest degree of perfection. This great capital was founded in the twelfth century at the foot of a castle on the banks of the Amstel, from whence it derived its name.^c About the middle of the fourteenth century it received the title of a city; in 1482, it was surrounded with walls,^d but it was not till 1578, when it declared its adherence to the pacification of Ghent,^e that it acquired importance; a century later it had drawn within its walls the whole trade of which Antwerp had been so long in possession.^f At the commencement of the sixteenth century it contained only 2500 houses; at present the number exceeds 27,000. If we are to believe a well informed geographer,^g the expense of maintaining the bridges, the canals, and the dikes of this city, and those which are within its bills of mortality,^h amounts to thirty million francs per day. What treasures must not Holland be possessed of to retain the billows of the ocean within the artificial barriers opposed to them! We conclude our account of this great city, by noticing the canal formed some years

ago to the Texel,ⁱ by which the dangerous navigation of the Zuyderzee is avoided, and not only merchant ships, but ships of war, sail direct from the Texel to the port of Amsterdam.^k

A canal, four leagues in length, conducts from Amsterdam to *Haarlem*,^l an important city, surrounded by ditches and by ramparts flanked with towers, which recall to remembrance the horrors of the too famous siege which this city sustained in 1573^m against the Spaniards, commanded by the Duke of Alva.ⁿ After a series of bloody conflicts, in which the besiegers and besieged suffered almost equal loss, and a resistance of six months,^o the duke forced the place to capitulate, on the promise of an amnesty, but perjured himself, by putting to death, within three days from the surrender, in cold blood, and accompanied by the most frightful punishments, the magistrates of the city, the reformed ministers, 2000 citizens, and the remains of the garrison.^p The buildings of this city are handsome; the streets are not broad,^q but they are furnished with foot paths,^r bordered with balustrades, and are traversed by canals planted with trees; taken as a whole, they present an aspect so much the more agreeable, as the greater part of the houses are decorated with marble, with dazzling sheets of brass, and with paintings. The finest of its buildings is the town-house.^s The church of St. Bavo is celebrated for its magnificent organ, composed of 8000 pipes, the harmony of which surpasses the highest melody we can conceive. In the market-place^t a statue, erected to Laurence Koster,^u announces that the city boasts of having given birth to this man, who passes, especially at Haarlem, for the true inventor of printing, and from whom Faust and Guttenberg stole his types, his secret, and his title to the gratitude of posterity.^v

penitentiaries and work houses (*maisons de correction et de travail*.)—The most remarkable of the latter are the Rasphouse (*Rasphuis*.) the Spinhouse or workhouse (*Spinhuis*.) and the house of correction (Betwering house—*Verbeterhuis*.)—P.

^a Admiralty House (*Admiraliteits Huis*.)—P.

^b "It distils a great quantity of brandy and gin (*caw-de-vie*—*genièvre*.)"

^c At the beginning of the 14th century it was a fishing village, in the possession of the lords of Amstel. (Enc. Amer.)—It was originally a fishing village, built around the dam at the mouth of the Amstel, and at the place of a ferry over the Y to North Holland. It was under the jurisdiction of the lords (*heeren*) of Amstel, who built a castle near the village, and made it their place of residence. It afterwards came under the rule of the counts (*graven*) of Holland, who granted it extensive commercial privileges. (Busching.)—P.

^d It was surrounded with a wall and ditch before the year 1400. In consequence of the great increase of commerce under the rule of the Counts of Holland, extensive suburbs were erected without the old walls, which were inclosed by a new wall in 1482, since which the city has received four enlargements (*vergrootingen*.) also surrounded by walls, viz. in 1585 and 1593, in consequence of the decline of Antwerp,^{*} in 1612, and lastly, in 1658. (Busching.)—P.

^e Following its second capture by the Spaniards in 1585, when its commerce was in a great measure transferred to Amsterdam. Antwerp was first taken in 1576, when it was plundered and burnt.—P.

^f The Pacification of Ghent was a convention or treaty (formed 1576, after the first capture of Antwerp) between the Catholics and Protestants throughout the Low Countries, in which all the provinces united themselves in the same confederacy with Holland and Zealand, and agreed in the expulsion of foreign troops, and in their demands for recovering the privileges they held under the house of Burgundy. Amsterdam was one of the last cities in the Low Countries that embraced the reformed religion, and it was only when it capitulated, after a siege of 10 months by the Hollanders, that it acceded to the Pacification. One of the terms of its capitulation was that the Roman Catholics should be allowed the free exercise of their religion.—P.

^g See note ^d.*

^v The types are said to have been stolen by one of the servants of

This city was also the birth-place of the learned hellenist Cornelius Schrevelius, and of Wouvermans, Van der Helst, and several other celebrated painters. Its society of sciences,^a which ranks several distinguished men amongst its members, and that called the *Teylerian*,^b which every year proposes prizes for the solution of different scientific questions, place Haarlem in the rank of the learned cities in Holland. It is also famed for its bleacheries,^c its manufactures of silk and woollen stuffs, and of carpeting and velvets, its soap-works and type-founderies, and above all for its gardens, in which the culture of tulips has almost degenerated into a mania. All the surrounding grounds^d are consecrated to this species of industry, thus adding to the beauty of its environs, in which we may distinguish a magnificent promenade called *the Wood*,^e pleasure-houses^f in the finest style, and the ruins of the old fortress of Brederode, whose red towers rise majestically in the air.

The road from Haarlem to *Leyden*,^g traced between a canal and the calm sea of Haarlem, is as beautiful, and as well kept, as the walks of an English garden; it is not annoyed by carts, every thing in Holland being transported by canals. During the whole distance to that city, an extent of six leagues, it is one continued agreeable promenade in the midst of meadows, country houses, and elegant villages. Leyden, the birth-place of Rembrandt,^h of Gerard Dow,ⁱ of Muschenbroeck,^k of Isaac Vossius, and of John of Leyden,^l the leader of the German fanatical and misled anabaptists of the sixteenth century,^m was formerly celebrated for its industry, and for its trade in books, which the printing-presses of the Elzevirs rendered so active; it still contains a population of more than 28,000 souls.ⁿ Its university, founded in 1575, possessing fine collections, a library of 60,000 volumes and 14,000 manuscripts, and enjoying a high

reputation in the learned world, is at all times much resorted to. Of great extent, encompassed with ditches and with walls, and communicating with the surrounding country by eight gates, Leyden is composed of numerous islands, intersected by canals bordered with trees, and covered with wide and straight streets, which communicate with each other by a vast number of bridges, principally of stone. The principal street, called the *Rupenburg*,^o is a very fine one, and considered by the people of Leyden as unrivalled in Europe: whatever may be in this, the whole appearance of the town is pleasing; and the number of handsome houses and venerable-looking buildings give it an air of importance.^p In its town-house may be seen one of the finest pictures of Lucas, one of its painters, representing the last judgment.^q The Gothic church of St. Peter^r contains the tomb of the celebrated and excellent Boerhaave.^s The old castle,^t a witness of the famous siege which this city sustained in 1574 against the Spaniards,^u during which more than 6000 persons perished by famine, presents a labyrinth visited by strangers. Several parts of this fortress appear to be of Roman construction, which would seem to confirm the opinion, hitherto uncertain, that Leyden occupies the site of *Lugdunum Batavorum*, mentioned in the Theodosian Table,^x in the Itinerary of Antonine, and by Ptolemy, as the most important city of the *Batavi*. This city, and the Hague, which is but three leagues from it, are in South Holland.^y [It is deserving notice in a geographical work, that it is at Leyden where the Rhine, till very lately, in the words of an old traveller, "faintly finished its course, by losing the small remainder of its waters in two or three canals, without having the honour to enter into the sea." The fate of this mighty river is singular and hard. After rolling its majestic stream from the Lake of Con-

Koster, while the family were at mass. It is generally agreed that his name was John; Busching says John Faust, but this must be a mistake; Meerman seems to have ascertained that it was John Geinsfleisch, who became eminent as a printer at Mentz, whither he absconded. In 1443, three years after he left Haarlem, he associated himself with John Faust, a wealthy citizen of Mentz, and in 1444, with Guttemberg of Strasburg, in connection with whom he first devised the use of cut metal types, cut wooden types having previously been employed. In 1445, the partnership was dissolved, and Faust associated himself with Peter Schæffer, who completed the invention by first casting types in matrices. (Ed. Enc. art. Printing. Thomas' Hist. of Printing.)—P.

^u Leyden was first besieged, or rather blockaded, by the Spanish general Valdez, Oct. 1573, three months after the surrender of Haarlem; but this siege was raised March 21, 1574. The siege was renewed, May 26, 1574, and so closely pressed for five months, that the city was reduced to the last extremities by famine and pestilence. It was however relieved by cutting the dikes on the Meuse, and overflowing the country between it and Delft, by means of which a supply of provisions and ammunition was introduced, and the Spaniards compelled to retire in October. (Busching.)—P.

^x The table of Peutinger (*Tubula Peutingeriana*), so called from its having been found in the library of Conrad Peutinger (died 1547,) and published 1598. It was discovered in a monastic library at Spire by Conrad Celtes, towards the close of the 15th century, and presented to Peutinger. It is a rude chart of the military roads in the greater part of the western Roman empire, drawn in the time of Theodosius the Great. (Rees' Cyc. Beauvais.)—P.

^y South Holland included, under the old government, all that part of the province of Holland, situated south of the Y. It contained at that time, 11 cities having a voice in the Provincial States (*Stemmende Steden*), viz. Dordrecht, Haarlem, Delft, Leyden, Amsterdam, Gouda, Rotterdam, Gorcum (Gorinchem), Schiedam, Schoonhoven and Briel. The Hague, although the seat of government of the whole confederacy, had not the rank of a city, nor any representation in the States of the province.—For the present division of the old province of Holland, into the two provinces of North and South Holland, see Stat. Tab. p. 1109.—P.

stance to the frontiers of Holland, it is there robbed of its name by the Waal, which carries off the largest half of its waters. Before its arrival at Arnheim, the canal of the Yssel, running to the eastward, deprives it of another part of them; and again, below Arnheim, the Leck has usurped the name of the principal branch of the stream, leaving the smaller and now much-diminished branch, under the splendid name of the Rhine, to pass on to Utrecht, where the Vecht carries off another part of its waters. What remains of this mighty river was formerly lost in a marsh,^a without reaching the sea, but is by a canal, cut between the years 1804 and 1810, carried to the sea, which it joins at the village of *Katwyk*.^b^c

The number of considerable cities which cover the territory of the small province of South Holland^d is extraordinary; we can only notice the most interesting. The *Hague* (Dutch, *Haag*, or *S' Groenhegaa*;^e Fr. *La Haye*), as the residence of the court, and the place where the States-General assemble, merits the first notice. Before the revolution of Brussels in 1830, the Hague divided this honour with that city. It is not of very great importance from its size and population, but it must, notwithstanding, be reckoned among the finest cities in Europe. It is one of the small number of those in the Low Countries, the soil of which is dry, and the air pure and healthy. Two thirds of its streets are intersected by canals bordered with trees; fine plantations cover also its squares, and render the regularity of its buildings more agreeable to the eye. An air of ease is observable in every part of the Hague, which may be considered a parliamentary rather than a commercial city. The mercantile quarter^f is composed of streets, narrow indeed, but yet of great neatness; in the quarter where the burgesses reside,^g the houses have a fine appearance, and the streets are broad, straight, and paved with bricks; the finest is the *Prinzen-Gracht*.^h The old Palace-Royal,^h an immense building, but an ungraceful combination of different orders of architecture, contains a fine library, a collection of medals, valuable pictures, and the archives of the kingdom. The new palace, built

by William III., and those of the Count of Bentheim and Prince Maurice of Nassau, are each of them splendid of their kind. The palace last mentioned contains the Museum, which is visited by all the curious: more than 400 pictures recall the ancient splendour of the Flemish and Dutch schools. A museum, filling several apartments, contains a magnificent collection of Chinese and Japanese curiosities, besides objects of great value in the eyes of such Hollanders, as are acquainted with the history of their country. There are here preserved the clothes worn by William of Nassau, the founder of the Dutch republic, when struck by a ball from the fanatic Balthazar Gerard;ⁱ the dress of the stadtholder William III.; the hair of William IV.; the hat of De Ruyter; the silver goblets of the Marquis Spinola; and also the silver trowel employed by Alexander of Russia in laying a stone in the hut of his great progenitor at Saardam. The Stadthouse,^k the corn-market, and the new church,^l are likewise fine edifices; the last is especially remarkable for its frame work. We should enter upon by far too extensive a field, were we to enumerate or describe the hospitals, the almshouses, the schools, the collections, and the scientific societies, of the Hague. All the cities of the Low Countries possess similar establishments. Let us only notice, before proceeding, that this royal city was the birth-place of the astronomer Huygens, and of the poet Johannes Secundus, who imitated with so much grace and ease the language of Ovid. The environs of the Hague, so agreeable and verdant, are besides adorned with charming houses and magnificent promenades. The beauty of the promenade called *the Wood*,^m surpasses every thing imaginable; majestic trees intertwine their thick foliage in the air, and at the extremities of the walks, pavilions, concealing, under elegant fronts, garden or coffee-houses, serve as places of entertainment for visitors, for the Dutch prefer shutting themselves up in these pavilions, to which they are attracted on Sundays by excellent bands of music, to enjoying the pure and open air under the silent arches of this magnificent wood. Near this promenade is situated the beautiful royal mansion of *Oranzenaal*.ⁿ A fine avenue con-

^a The Old Rhine sends off a branch near Leyden, which conveys the greater part of its waters to the lake of Haarlem. The remainder is lost in the sands or downs near Katwyk. (Busching.)—The old mouth of the Rhine, at Katwyk, was obstructed by an incursion of the Ocean, A. D. 860 (Enc. Meth.)—P.

^b Du. *Katwyk*—*Catwijk*, *Catwijck* (Kilian.)—Catwick (Tuckey.)—So called from the ancient *Catti*, who settled there, according to Tacitus. (Busching.)—P.

^c The sentences enclosed in brackets are added by the translator.—P.

^d See note ^γ p. 1103, and Stat. Tab. p. 1109.

^e This is doubtless an error of the press, in the original, from which it is copied strictly by the translator; at least the French writer must have intended it for *S' Graevenhaag*. But even that must be an error, or at least not the usual Dutch orthography.—Du. *'s Graeven Hage*, *den Haag* or *Hage* (Busching)—*'s Graevenhage*, or *den Haag* (Hubner)—*'s Graevenhaage*, or *den Haag* (Wilcocke)—*Graven-Haghe*, or *Haghe* (Kilian.)—Germ. *Haag*.—Lat. *Haga Comitum*.—The orthography of Wilcocke is the most recent.—*'s Graevenhaage* signifies the Count's wood (*des Graeven haag*.) from *Graaf*, count, and *haag*, wood or thicket; *den Haag*, the Wood—so called from a wood or forest there, frequented by the Counts of Holland for hunting.—P.

^f "Quartiers marchands (business or trading quarters)—ceux de bourgeoisie (those occupied by men of fortune, wealthy citizens)."—P.

^g *Prijsen-Gracht*, or *Prinsensgracht* (Prince Street).—*Gracht* properly signifies a street with a canal in the middle; or originally a canal simply. (See note ¹ p. 1100.)—The *Voorhout*, which is accounted the principal street, is about half a mile in length, with a mall in the middle, and contains a number of buildings, in the purest style of ar-

chitecture. (Ed. Enc.)—The *Voorhout* is the most elegant street at the Hague. (Busching.)—P.

^h The Palace of the Stadtholder (consisting chiefly of old buildings, erected at different periods, without any regularity of design.) (Ed. Enc.)—The court or palace (containing several chambers allotted to the different branches of government, besides the apartments of the Stadtholder.) (Pinkerton.)—Du. *Hof* (the Court;) divided into the Outer and Inner Court (*Buiten- and Binnen- Hof*), which communicate with each other by means of the Stadtholder's gate (*Stadhouderlyke poort*.) (Busching.)—The Stadtholder's gate had by long custom been opened only to the Stadtholder's family; but in 1784, the States of Holland decided that it should be opened every day, during their sittings, to the members. A conspiracy was formed by the Orange party to prevent the execution of this act; only two of the members, Messrs. Gyselaer and Gevaerts of Dort, ventured through the gate, and although arrested in their progress, safely cleared the passage, and triumphantly vindicated the majesty of the people. (Mirabeau, aux Bataaves sur le Stathouderat, p. 190—5.)—P.

ⁱ Balthazar Gerard assassinated William of Nassau, the first stadtholder, by shooting him with a pistol as he was going out of his palace at Delft, A. D. 1584.—P.

^k Du. *Raadhuis*, or *Stadhuis* (Council House, or Town House.)—P.

^l Du. *Nieuwe Kerk*—built in 1649; it is of an oval figure, and covered with a cupola. (Busching.)—P.

^m Du. *Haagsche Bosch* (Hague Wood).—On the north side, about a mile from the town, is a noble wood, about two English miles in length, and nearly one in breadth, and full of the finest walks and most pleasing views. (Ed. Enc.)—P.

ⁿ Du. *Oranjezaal* (Orange Hall)—also called, the House in the wood (*het Huis in het Bosch*—Fr. *Maison du Bois*.)—The palace called *Maison*

ducts to the village of *Scheveling* or *Scheveningen*,^a where are to be found different places of amusement. [Its length is said to be nearly two miles in a straight line, having a spacious path in the centre for carriages, with a separate path for equestrians and pedestrians on each side of the centre path. The spire of Scheveling church is seen at the extremity of the avenue, and the effect of the whole is very striking.]^b To the south-east of the Hague^c lies the castle of *Ryswick*,^d where was signed in 1697 the treaty of peace between the Germanic Empire, Spain, England, Holland, and France. An obelisk has been erected to record the memory of this event.

The country between the Hague and the Delft is "a piece of animated tranquillity. All that art has done is to give appropriate decoration to rural objects, and every cottage bears the marks of comfort and prosperity. Canals, raised above the level of the sea, and of the neighbouring plains; windmills, curiously and beautifully thatched; large farms, overspread with flourishing cattle; level and excellent roads;"^e villas, walks, and gardens, are some of the features of the agreeable landscape spread before the traveller.^f *Delft*,^g two leagues from the Hague, occupies a fine position on the banks of the *Schie*. It is a place of defence^h of the third class, a city without stir, and almost without trade, although possessing manufactories of cloth, carpeting and soap, besides breweries of reputation.ⁱ Formerly it was celebrated for its potteries, and hence the name of *Delft-ware*.^k It is 800 years old, but the houses are well built, and the public buildings are even magnificent. "The deserted streets declare that the best days of Delft are passed away. Every thing about the streets and houses shows remarkable attention to neatness; and Delft, although without

the interest attending the bustle of trade, remains a true specimen of an old Dutch town."^l We see in the old church the tombs of Admiral Heyn and the celebrated Tromp;^m the new church contains those of Grotiusⁿ and the physician^o Leuwenhoeck,^p both natives of Delft, which they have thus rendered illustrious; but the most remarkable monument in this church, is the mausoleum of William I.;^q at the *Prinsen-Hof*,^r a few steps from it, this prince was assassinated by Balthasar Gerard.^s From Delft, in less than two hours, we arrive at *Rotterdam*,^t the most commercial and the most populous city in Holland next to the capital. [Rotterdam, besides being one of the most beautiful cities in Holland, is most advantageously situated for trade, both foreign and internal. It stands on one of the branches of the Meuse,^u about twenty miles from the German Ocean, and by this river vessels of a large size come up to it, and, by means of canals, are carried to different parts of the city, and to the very doors of the houses. "Nothing," says an old traveller quaintly, "can be compared with the pleasant mixture of chimneys, tops of trees, and streamers of vessels; one is astonished to behold so beautiful a confusion, and can hardly tell whether it be a fleet, a city, or a forest." The city is well paved and clean, the houses well built, and every thing appears to indicate an active and prosperous commerce. There are no remarkable public buildings; but the quay, called the *Boompjes*,^x presents a long line of handsome houses, the mansions of wealthy merchants.]^y It possesses schools and learned societies; it was the native place of Erasmus, whose house may still be seen, and to whom they have erected a statue in bronze;^z and yet it is perhaps the only large city in the Netherlands which does not possess a public library.^z With this fact before us, shall

de Bois, a house of retirement for the Stadtholder, has nothing remarkable in its appearance or situation, but resembles the residence of a plain country gentleman. (Ed. Enc.)—The epithet in the original, (*jolie*), signifies rather, neat, pretty, than beautiful.—P.

^a "The village of Schweningen."—Du. *Scheveningen*, or *Schevelingen* (Busching.)—Scheveling (Ed. Enc.)—Schevening (Rees' Cyc.)—Situating among the downs on the coast, about two miles N. W. of the Hague.—P.

^g Du. *Delft* or *Delf*—so called, it is said, from a canal, called the *Oude-Delft* (old digging,) which runs through the city. (Busching.)—P.

^h "Place de guerre"—fortress or fortified town.—P.
ⁱ Delft has been long celebrated for its breweries, formerly more considerable than at present. It was noted for a kind of strong beer, sent in great quantities to the Cape of Good Hope and the East Indies. (Busching, 1773.)—P.

^k This sentence is added by the translator.—Delft has been long celebrated for its earthen ware [called Delft ware, Fr. *fatence*,] manufactured in imitation of the porcelain of China and Japan. It is made of baked earth covered with an enamel. (Ed. Enc.)—The only manufacture at present flourishing, is that of pottery, which far surpasses all others in strength and beauty of ornament. (Busching, 1773.)—P.

^l The above quotation is inserted by the translator.—P.
^m Peter Peterson [*Pieterze*] Hein, and Martin Herbertson Tromp. (Busching.) See note ^p p. 1098.—P.

ⁿ Du. *Hugo de Groot*.—His tomb is in the choir of the New Church. (Busching.)—P.

^o "Physicien"—natural philosopher. Leuwenhoek, a Dutch philosopher celebrated for his microscopical observations and discoveries. He

does not appear to have had a learned education, but was first distinguished for his skill in grinding optical glasses, and afterwards for his microscopical observations with instruments of his own contrivance and manufacture. (Ed. Enc. Beauvais.)—P.

^p Du. *Anton. van Leeuwenhoek*.—His monument is at the entrance of the Old Church, not in the New. (Busching.)—P.

^q The tomb of William I. was erected in 1609, at the expense of the general government, in the choir of the New Church, above the vault of that prince, since the burial place of the Orange family (Busching.)—P.

^r *Prince Hof* (Busching.)—The old palace of the stadtholder—originally, the nunnery of St. Agatha. Delft having become the seat of government of Holland, after the revolt against Spain, William I. converted the building into his place of residence, whence the name signifying Prince's Court. It stands on the *Oude-Delft*, directly opposite the Old Church.—The New Church stands in the great market-place (*Groote Markt*), opposite the Stadthouse. (Busching.)—P.

^s See note ⁱ p. 1104.
^t Du. *Rotterdam*—*Roterdam* (Kilian, Vosgien).—The name signifies the dam or sluice of the *Rotte*, a small river that rises in the marshes to the north of the town, and flowing through it, enters the Meuse. (Busching.)—P.

^u On the north side of the Meuse (proper).—The Meuse divides into two arms at Dort, of which the one on the north, passing by Rotterdam, is called the Meuse (*Maas*) simply; that on the south, the Old Meuse (*Oude Maas*). (Busching.)—P.

^x This quay or promenade (Du. *veeg*) extends along the Meuse between the mouths of the two havens or inlets from the river, by which ships pass into the heart of the city, called the *Oude* (Old) and *Leuve Haven*. It is very broad, and closely planted with trees, and is called from the latter circumstance, the *Boomtjes* (*de Boomtjens*) or Under the *Boomtjes* (*Onder de Boomtjens*).—Du. *boom*, a tree—dimin. *boomtje* (*boomtje*). Wilcocke.)—P.

^y In the great square or market place (*Groote Markt*).—P.

^z Among the literary collections and institutions of Rotterdam, are a cabinet of natural history and antiquities, a public library, and an academy of sciences, instituted in 1771. (Ed. Enc.)—P.

* This society, called the Batavian Society (*Bataafsche Genootschap*), was established in 1769. It is principally devoted to experimental philosophy Rotterdam has also a *Gymnasium Illustre* (high school) with six professors (Busching, 1773.)—P.

we be guilty of injustice towards the inhabitants of Rotterdam, in pronouncing them the Bœotians of the Low Countries.^a Absorbed by their commercial occupations, the moments must be very few which they can devote to the study of letters and the sciences!^b The name of this city signifies the *dike of Rotter*,^c because it is situated at the place where the small river of that name throws itself into the Lower Meuse.^d Between an arm of this river and the lake of Biesbosch,^e stands *Dordrecht* or *Dort*,^f a city which disputes the palm of antiquity with Delft. It is distant from Rotterdam about four leagues, and is fortified; but its situation in the midst of an island would prove a much better defence than the old ramparts that surround it. [The trade of Dort was once very considerable, and its situation is said to be more favourable for foreign trade than Rotterdam, the harbour admitting vessels of greater burden; but, whatever be the cause, the trade now is very limited, and confined very much to timber, which is floated down the Rhine in immense rafts.^g The buildings of Dort are chiefly old-fashioned.]^h Within the bounds of this city was held, in 1618 and 1619, the famous synod which condemned the doctrines of Arminius; and at the same time the States-General, influenced by Prince Maurice, sentenced and put to death the grand pension-

^a "We shall not, however, draw from this circumstance, as some have done, the too rigorous conclusion, that the inhabitants of Rotterdam are the Bœotians of the Low Countries."

^b "We speak advisedly," say the Foreign Quarterly Reviewers, "in saying that Rotterdam has among its inhabitants writers of a high order, and that a literary spirit is widely diffused among them."—*Foreign Quarterly Review*, No. IX. Vol. v. p. 227. *Trans.*

^c *Digue de Rotter*.—Properly, the dam of the Rotte. See note ^u p. 1105.—P.

^d "—into the channel (*cours d'eau*) called the Lower Meuse."—See note ^u p. 1105.—P.

^e Dort stands on an island, on the south side of the Meuse, which is there called the *Merwe* (Du. *Merwê*, or *Merwede*), a name which it takes after its junction with the Waal near Gorcum, and which it continues to bear till it divides into two branches, just below Dort, called the Meuse and the Old Meuse. (See note ^u p. 1105.) Previous to 1421, Dort was bounded on the south by a large district between the Merwe and the Meuse, the last of which then flowed in a straight line to the sea by Heusden and Gertruydenberg; which district was called the *Dortsche Waard* (Dort island.) In that year, however, a dreadful inundation broke through the Merwe dike, and overflowed 72 parishes, forming in place of them the lake called the Biesbosch (or *Bergseeld*.) The channel of the Meuse was also altered, its old one by Heusden being obstructed. The only remains of the *Dortsche Waard* was the small island on which Dort stands, called the Island (*ciland*) of Dort. (Busching.)—P.

^f Du. *Dordrecht*, or *Dort* (*Dordt*. Kilian.)—*Dortrecht*; by contraction, *Dort*. (Busching.)—*Durdrecht*, from the river *Durd* (Dort,) and *drecht*, *trecht*, or *tricht* (Lat. *trajectum*), a ferry. (Had. Junius.)—The river *Durd* has, however, disappeared, unless it be the same with the *Merwe*. (Busching.)—Lat. *Dordracum*.—P.

^g These floats [rafts] are sometimes so enormous, that 500 men are necessary to conduct them. The timber is cut in the saw-mills, which are numerous in the vicinity of Dort, or exported unwrought to Britain, Spain and Portugal. Dort is also the magazine for the Rhenish wines, and the coal, lime and iron of Liege and Namur. (Ed. Enc.)—P.

^h The sentences enclosed in brackets are added by the translator.—P.

ⁱ "Within this city was held, in 1618 and 1619, the synod which condemned the doctrines of Arminius, and which, devoted to Prince Maurice, sentenced to death the grand pensionary Barneveldt."¹—The synod was held in a large hall in the building called the *Kloveniers Doele*. (Busching.)—It commenced its sittings in November, 1618. The Arminians refused to appear in the synod; and as the popular feeling was strong against them, Maurice ventured to imprison Barneveldt, Grotius, and others of their leaders, in the castle of Louvestein (*Locesteen*). The States-General were also compelled by him to appoint a commission, all the members of which belonged to the Orange party, to try Barneveldt, by whose sentence he was beheaded at the Hague, May 13, 1618. (Guthrie and Gray. ix. p. 352.)—Grotius was imprisoned in May 1619, and escaped in a large chest in which clothes and books had been transmitted to him, prepared for that purpose by

ary Barneveldt at the advanced age of 72, 50 of which he had spent with integrity and ability in the service of his country. The learned Grotius was imprisoned along with Barneveldt, and after a detention of several years, escaped through a stratagem of his wife. The two brothers, John and Cornelius De Witt, who were torn to pieces by an insurrection of the populace in 1672, were natives of Dort.¹

The province of Zealand,^k formed by the islands which lie at the mouth of the Scheld, has for its capital *Middleburg*,¹ in the island of Walcheren. This is an industrious commercial city, wealthy, and even attached to learning, or at least possessing an academy of sciences,^m besides being the birth-place of Leydeker,ⁿ author of a work on the Hebrew republic. A large canal, constructed in 1817, supplies the place of its former harbour.^o *Flushing*, or *Vlissingen*,^p in the same island, is defended by important fortifications, and possesses a large and secure harbour, docks^q which can contain 80 sail of the line,^r ship-yards and immense store-houses, erections for which it is indebted in a great measure to the French, who, after having expelled the English in 1809,^s kept possession of this place till 1814. It was the first city which, in 1572,^t erected the standard of liberty, and had also the glory of giving birth to the

his wife, in March 1621; consequently he was imprisoned less than two years. (Dumourier, *Mémoires de Hollande*, in Ed. Enc.)—P.

^k Du. *Zeeiland*—*Zoelandt*, *See-land* (Kilian.)—Lat. *Selandia*.—Eng. *Zealand*.—Fr. *Zélande* (M. B.) *Zélande* (Vosgien.)—Germ. *See-land*.—It literally signifies, Sea-land.—P.

¹ Du. *Middelburg*.—Fr. *Middelbourg*.—P.

^m In 1773, Middleburg possessed a *Gymnasium Illustre*, with professors in theology, law, medicine, literature and the sciences. (Busching.)—P.

ⁿ Melchior Leydecker [*Leydekker* (Busching),] author of many voluminous works; among others, of a curious work: "On the Republic of the Hebrews (*De Republicâ Hebræorum*)," in 2 vols. fol.—Middleburg is better entitled to notice as the birth-place of Cornelius Van Bynkershoek, a celebrated writer on international law.—P.

^o Middleburg communicates with Flushing by a canal fit for large vessels. (Tuckey, 1815.)—Middleburg has two harbours or basins, called the Outer and Inner Harbours (*Buiten- and Binnen-Haven*.) (Busching, 1773.)—P.

^p Du. *Vlissingen*—*Vlissinge* (Kilian)—*Vlissinghen* (Enc. Meth.)—Originally, *Vlissingen*, from a flask or cruise (Du. *vles*), said to have been bequeathed to the city by St. Willibrord. The arms of the city are a silver flask (*vles*) in a red field (gules, a flask argent.) (Busching.)—Fr. *Flessingue*.—Eng. *Flushing*.—P. ^q "Basins."

^r Flushing has a beautiful port within two moles, capable of holding 80 sail of the line, besides extensive docks and basins. (Tuckey.)—The port lies between two moles, that break the waves of the sea, which enters the town by means of two canals, forming two basins. (Ed. Enc.)—Inside of the town are two basins, one of such size and depth as to contain a fleet of men of war. (Morsc.)—Previous to the French revolution, Flushing was one of the principal naval stations of the Dutch republic. It contained two ports or harbours, viz. the Old Harbour (*Oude Haven*) on the west, constructed in 1315, and the New Harbour (*Nieuwe Haven*) on the east, constructed in 1614, at the common expense of the republic. The latter communicated by three sluices or locks (*schutsluizen*) with a dock or basin, farther within the city, called the Government Dock (*'s Lands Dok*), constructed for ships of war, and capable of holding 80 of the largest vessels. At the end of this dock was a fine promenade, called the *Boschaadje* (grove.) On the south side of the Government Dock, was the Dry Dock (*Drooge Dok*.) The entrance to this latter dock was by gates opening on the south side from a basin called the Broadwater (*Breedewater*.) (Busching.)—P.

^s The French had taken possession of Flushing with the rest of the United Provinces in 1794—5. During the Walcheren expedition, as it is called, Flushing was taken by the English, after a bombardment of two days, Aug. 15, 1809, but evacuated, with the whole island, Nov. 23, of the same year.—P.

^t It was the first city in the Netherlands, which voluntarily (*zynicillig*) declared against the Spaniards, and in favour of William I. of Orange, April 6, 1572. The centennial anniversary of that day is celebrated as a festival^u in Flushing. (Busching.)—P.

^u Called the Centennial Festival (*Hondertjaarig Eeue-Fest*)

renowned De Ruyter.^a The house where he was born is still shown to strangers.

In North Brabant, the farthest south of the Dutch provinces, and the most important from the rank which it occupies in the States-General, ten cities would merit being mentioned, if we did not wish to avoid the monotonous repetitions which would follow the description of a great number of places presenting the same appearance. The three principal places are fortified towns. On the right bank of the eastern Scheldt,^b and in the midst of swamps,^c stands *Bergen-op-zoom*,^d celebrated as a fortress, and regarded as a chef-d'œuvre of the celebrated Coehorn.^e It is famed for the anchovies which are caught in its neighbourhood, and for its earthen ware.^f The tower of its castle widens as it rises, seems ready to fall, and shakes with the least wind. *Bois-le-Duc*, in Dutch *Hertogenbosch*,^g is the capital of the province. Watered by the Dommel and the Aa, which unite lower down, and fall into the Meuse,^h it can, by inundating the environs,ⁱ augment the means of defence which its citadel and two forts^k already afford. Its streets are straight and well built; its canals branch into nine divisions;^l the town-house and cathedral^m are its finest edifices, and its trade is considerable. Among its celebrated men, are reckoned the painter Jerome Bos,ⁿ and the mathematician S'Gravesande.^o Between these two cities, and eight leagues from both of them,^p stands *Breda*,^q defended by fortifications which are nearly a league in circumference, and by vast marshes.^r It is celebrated in the annals of war: in 1590, Maurice of Nassau made himself master of it by concealing in a boat loaded with turf,^s which he caused to enter the place by night, eighty soldiers,^t who secured

^a "Admiral Ruyter."—Michael Ruyter (Gorton.)—Du. *Michiel de Ruiter* (Busching.)—P.

^b The Scheldt divides into two branches, near Zandvliet below Antwerp, fronting the S. E. point of the island of South Beveland, of which the one on the east, called the East Scheldt (*Ooster-Schelde*), flows north between that island and North Brabant to Bergen op Zoom, where it receives the Zoom from the east, and then west between the islands of Zeeland, to the North Sea, between those of Schouwen and Walcheren, while that on the west, called the West Scheldt (*Wester-Schelde*), and also the *Hondt*, *Hond*, or *Honte*, flows in a westerly direction, between Zeeland and Dutch Flanders, and enters the North Sea near Flushing. (Busching.)—P.

^c Bergen op Zoom stands on a rising ground [Du. *berg*] in the middle of a morass, on the river Zoom, where it joins the Scheldt. (Ed. Enc.)—P.

^d Du. *Bergen op Zoom*—*Bergen op den Zoom* (Busching)—*Bergen op Soom*, or *Berghen op de Zoom* (Kilian.)—*Berg-op-Zoom* (Enc. Meth. Vosgien.)—The name in Dutch, signifies the Hill or Hills on Zoom, or on the Zoom.—P.

^e It was regarded as his master-piece by Coehorn. (Gorton.)—P.

^f "*Berg-op-Zoom* or *Bergen-op-Zoom*, celebrated as a fortress, and noted for the anchovies caught in its neighbourhood, and for its manufacture of pottery."—P.

^g Du. *'s Hertogenbosch*—*Hertoghen-bosch* (Kilian.)—Germ. *Herzogebusch*.—Fr. *Bois-le-Duc*—*Bos-le-Duc* (Vosgien.)—Lat. *Sylva Ducis*.—*Bois-le-Duc*, or *Bosch* (Morse.)—The Dutch name, *'s Hertogenbosch* (*des Hertogen Bosch*), of which the French and Latin names are translations, signifies the Duke's Wood.—P.

^h "—which there unite, and a league lower down fall into the Meuse."—It is situated at the confluence of the Dommel and the Aa, in a low, sandy, but cultivated tract, almost surrounded by a morass. (Ed. Enc.)—Situating at the confluence of the Dommel and the Aa, whose united waters form the Dies [*Diese*], and enter the Meuse at the fort of Crevecoeur [a league and a half from Bois-le Duc. Vosgien.] (Enc. Meth.)—P.

ⁱ The adjacent country can be easily laid under water, and sometimes in winter the town can be approached only by boats. The approaches to it by land are on causeways. (Ed. Enc.)—P.

^k It is defended by a castle [citadel] called Papen Briel; by the fort of Crevecoeur, near the Meuse; the large fort of Isabella; and a small fort towards Brabant, called St. Antoine. (Ed. Enc.)—Under the military governor of Bois-le-Duc (1773,) were the city (Du. *Stad*

the governor and opened the gates. Spinola, the Spanish general, thirty-five years later,^u forced it to surrender, and burned the famous boat. The French seized it in 1794;^v but in 1813, during a sortie which they made to attack the besieging Russian army, the inhabitants rose up, closed the gates and prevented the garrison from re-entering. One of its finest buildings is the great church, the spire of which is 360 feet^w high.

There are few countries where the physical constitution of the soil appears to have more influence upon the character and manners of the inhabitants than the Dutch provinces. The humidity of the climate renders them dull, phlegmatic, and slow; they are rarely affected by violent passions, but their apathy ceases whenever their interest is affected. Selfishness is said to be the basis of their actions, love of gain their chief stimulant. Let us acknowledge, however, that these two failings have been the causes of their past greatness, their riches, and their patriotism, and even of the wisdom of their institutions, and that economy has become one of their political virtues. If their parsimony led them to throw off the yoke of Spain which loaded them with taxes, and to refuse to pay tithes to the clergy, and indulgences to the Roman pontiff, in the great struggle which they sustained in the sixteenth century, their calculating spirit and their perseverance triumphed over every obstacle. They felt that religious liberty was the basis of civil liberty, and that this last secured freedom of trade and industry; and, in the knowledge of this, they preserved as long as they could, the advantages of a representative government. On this account, whatever may have been the moving spring of their great actions, they have at least the merit of having directed their interested

's Hertogenbosch), and the two dependent forts, viz. Fort Isabella (*'t Fort Isabelle*), and Crevecoeur. (Busching.)—P.

^l "Its canals divide it into nine quarters."—P.

^m The cathedral, built in 1366, is one of the finest edifices in the Low Countries. Its wooden tower, which was so lofty as to be seen all the way from Antwerp, was supported by four stone pillars, but was destroyed by lightning in 1584. (Ed. Enc.)—P.

ⁿ One of the first who painted in oil, in which he excelled—born 1450.—P.

^o W. J. S'Gravesande (Gorton. Beauvais.)—Du. *Willem Jacob. 's Graaezande*.—Chiefly known by his Elements of Natural Philosophy, according to the Newtonian System (Physices Elementa Mathematica, experimentis confirmata, sive Introductio ad Philosophiam Newtonianam,) translated into English by Desaguliers.—Du. *'s Graaezande* (*'s Gravesande*, or *'s Graavesande*.—Eng. *Gravesand*) is the name of a town or village, situated among the downs on the coast, south-west of the Hague, signifying the Count's Sands, from its having been a residence of the old Counts of Holland.—P.

^p Nine leagues W. of Bois-le-Duc; 8 leagues N. E. of Berg-op-Zoom. (Vosgien.)—P.

^q The name of this city is the same in the Dutch, English, French and Latin languages.—P.

^r Breda is situated at the confluence of the rivers Aa and Merck, in a fertile but marshy country, and capable of being surrounded with water, so as to be altogether inaccessible to an army. It is regularly fortified, surrounded with a wall three miles in circumference, protected by bastions and a strong citadel. The city is of a triangular form, with a gate at each angle, and the ramparts are adorned with rows of elms. (Ed. Enc.)—P.

^s "Tourbe"—peat.

^t Sixty soldiers. (Ed. Enc.)—Charles de Héraugieres, captain of infantry, with seventy chosen men. (Dél. des Pays-Bas.)—P.

^u A. D. 1625. (Ed. Enc.)—P.

^v In 1793, though the fortifications had been greatly augmented by the Dutch, this important place was surrendered to the French after a siege of ten days; but, in the same year, it was again delivered up by capitulation to the States. (Ed. Enc.)—Breda was taken by the French, Feb. 24, 1793, and again in 1794, and 1795. It was taken possession of by the Russian general Benkendorf, Dec. 1813. (Tegg's Chronology.)—P.

^w 362 feet. (Ed. Enc. Dél. des Pays-Bas.)—P.

views towards what might contribute to promote the prosperity of their country. Their traducers have thought it sufficient to bring forward their faults, to diminish the favourable impression made upon the mind by that crowd of useful works and establishments, maintained at so great an expense, which give to Holland so peculiar an aspect. Those dikes, say these detractors, raised to arrest the encroachments of the ocean, are only owing to their care for their own preservation; those canals which intersect the country in every direction, have been cut with no other view than to favour their commercial relations; those hospitals, and those charitable establishments, so excellent and so numerous, have only been founded to shelter a rich aristocracy from the attacks of the indigent; and even their good faith in matters of business has no other foundation but the necessity of securing confidence.* Man is a being compounded of virtues and vices, and we ought not to expect from a people more disinterestedness than from an individual. Who does not see that in attributing to their interest alone, the institutions and spirit of order which do honour to the Dutch, we render homage to their judgment? They are reproached with their national pride. Where is then the nation which does not love to look back upon its past splendour? The French themselves, the most lively people in the world, do they not rather prefer to think upon their military glory, than upon that which they have acquired in the arts, in literature, and in the sciences?

The manners of the Dutch are not dissolute: this has

* See the work entitled: *Quatre mois dans les Pays-Bas*, tom. ii.

^b "The only assemblies much frequented, are those of men, and even those are regulated by the different classes and employments into which society is distributed. Such are those of ship-owners

been attributed with some reason, to the coldness of their character, and to their parsimonious disposition. Not very delicate in their affections, those who have mistresses choose them from the class of servants, and sometimes the women show themselves not more difficult to please in the choice of the objects of their fondness. There is much less depravity found among the lower classes in Holland than in any other part of Europe. It is very seldom that we hear thefts spoken of, and still more rare to hear of crimes committed. To go little abroad, to smoke much, and to eat and drink often, almost constitute the principal amusements of the rich Hollanders. They do not appreciate the pleasures of society, but they can taste the quiet enjoyment of domestic life. The only intercourse in society that does take place, is regulated by business or profession. Thus, there are captains of vessels, rich merchants and bankers, persons in public office, traders, courtiers, shopkeepers, burgesses;^b but these classes never mix, and even live in a sort of jealousy of each other. Artists and men of letters are little thought of, and though there is no country in which there are found more museums, scientific collections, and literary and learned societies, the brilliant days when so many literary characters, savans, and celebrated painters, were seen to shine in Holland, are for ever past; the sciences and the arts are now only the relaxations of the industrious rich, who, appreciating properly the noble efforts of the human mind, spare no expense to give to their children an education which will dispose them to give themselves up to similar enjoyments.

(*armateurs*,) wealthy merchants and bankers (*riches negocians*,) magistrates, traders (*commerçans*,) brokers (*courtiers*,) shopkeepers (*merchants*,) and burgesses (*bourgeois*.)"

* Capitalists, wealthy citizens not in trade.—P.

^c Delfziel (Hübner.)—Delfsil (Kilian.)—Delfzil (Vosgien.)—Delfzyl is situated at the mouth of the Fivel or Damster Diep [Damster river* (Malham's Naval Gazetteer)], which joins the Dollart [rather the strait that opens into the Dollart]; it is a strong fortress.† (Tuckey.)—Situatd 6 leagues N. E. of Groningen. (Vosgien.)—P.
^e So called from the small town of Dam, situated on it, one league from Delfzyl.—P.

† The key to the provinces of Friesland and Groningen. (Vosgien.)—P.
^d See note ^e p. 1096. ^e "Berg-op-Zoom."—See note ^b p. 1107.
^f "Saint-George de la Mine," Fr. (so called, says Vosgien, from the gold mines in its neighbourhood.)—St. George de la Mine (sometimes called Delmina, and Elmina) is the principal establishment of the Dutch on the coast of Africa. It is a square castle, mounting 100 pieces of cannon, situated on a rocky coast, near the river Benja, and at the foot of it is the large Negro town of Oddenna. (Tuckey.)—St. George's Castle, or Del Minas. (Malham.)—Elmina, or St. George del Mina. (Morse.)—The forts and factories belonging to the Dutch West India Company (1773,) on the coasts of Guinea, Benin and Angola, were under the superintendence of the head-factory (Hoofd-kantoor) at Elmina, or the Castle of St. George del Mina (built on a rock, and near it, a small town called Mina) (Busching.)—P.
^g The Dutch colonies in Africa, are thirteen small forts on the coast of Guinea. (Ed. Enc. art. Netherlands, 1822.)—The Dutch have factories and settlements on the Slave Coast, as well as on the Gold Coast.

DUTCH COLONIES.

Africa.	Elmina, or St. George of the Mine. ^f
	Various small forts on the Gold Coast in Guinea. ^g
	Sumatra (the greatest part of this island with Bencoolen. ^h)
Oceanica. ¹	Java, whose capital, Batavia, is also that of all Dutch Oceania.
	Madura, the whole.
	Celebes, in part.
	Borneo, do.
	Archipelago of Sumbava and Timor, almost entirely.
	Archipelago of the Moluccas, almost entirely.
	Land of Papua ⁱ in New Guinea..
	Islands of Papua. ⁱ
	Riou, a small island, now become of little commercial importance. ^k
	Islands of Bonair, ^m Curaçao, ⁿ St. Eustatius, ^o part of the island of St. Martin, Saba, and some smaller islands of little importance.
America.	Colony of Surinam in Guiana.

(Ed. Enc. art. Guinea, 1817.)—In 1773, the Dutch West India Company possessed on the coasts of Guinea, Benin and Angola, fifteen forts and factories, of which Elmina was the capital. (Busching.)—P.

^h Bencoolen is the principal establishment of the British East India Company in Sumatra, and is incorporated with the presidency of Bengal. (Enc. Amer. Morse.)—P.

ⁱ "—of the Papous" (Papuan.)
^k "Riou, a small island, become recently (*depuis peu*) important from its commerce."

¹ The Dutch colonies in Asia, are Java, with the lesser governments of Amboyna, Banda, Ternate, Malacca and Macassar, and also some factories on the coasts of Coromandel and Persia. (Ed. Enc.)—P.

^m Bonaire, or Buenaire.—P.
ⁿ Curaçao (Tuckey.)—Curaçao (Vosgien.)—Curazao (Pinkerton.)—P.

^a There are some slight differences in the quantities of land as exhibited in this table, and the tables on pages 1109 and 1110. The present table is taken from the *Foreign Quarterly Review*, No. X. art. *Netherlands*.

^b A hectare of land is equal to 2½ English acres. [The hectare is equal to 2 acres, 1 rood, 35.4 rods.—P.]

^c Expenses of dikes, canals, and navigation in general. [*Waterstaat* signifies literally, water administration.—P.]

^d The charges for education are now included under the head of Interior.

^e The preceding part of this table is taken from the original.—P.

EUROPE.

Europe Continued.—Great Britain.—England.—First Section.—Civil Geography.—Early Inhabitants.—Roman Conquests.—Saxon Invasion.—Normans.—History, progress and settlement of the Constitution.

THE island of Great Britain was originally called the country of *Green Hills*, afterwards the island of *Honey*, and at a still later period *Bryt* or *Prydain*, from which the name of Britain appears to have been derived. The rivers Forth and Clyde are the natural limits of two large but unequal portions of the same country. The northern portion was called *Alben*, or the region of mountains; the name of *Kymru* was applied to the western part of the other, and that of *Lægr* to the southern and eastern. The two latter names, unlike the former, were not derived from the nature of the soil or the character of the country, but from two distinct races, the Cambrians and the Lægrians, the early inhabitants of Southern Britain.

Of these two nations, the Cambrians claim the higher antiquity; according to imperfect traditions, they came from the eastern extremities of Europe, and having crossed the German Ocean, many of them settled in Gaul, while others landed on the opposite shores of Britain. Before this period, if credence can be given to the same traditions, Britain was destitute of inhabitants, bears found shelter in the forests, and wild cattle roamed in the plains. The names of many places, not derived from the Cambrian language, and the monuments of an unknown age, attributed by vulgar superstition, to a race of hunters, who, instead of dogs, trained foxes and wild cats for the chase, render it probable that before the arrival of the Cambrians, Britain was inhabited by men of a different origin and a different language. The early inhabitants were gradually forced into the west and north by the successive influx of strangers from the east. Some passed the sea, and reached the large island of Erin, or settled in the western isles, which were peopled by men of the same race as the aboriginal Britons. The high mountains, which stretch from the banks of the Clyde to the extremities of the island, proved an impregnable barrier against new aggressions to as many as retreated into the north, where they assumed and have still preserved the name of Gaels. Increased at different times by their brethren from Ireland, they formed the population of Albania, or the *Highlands*; different from the inhabitants of the plains in the south, and mindful of former injuries, they handed down to their descendants the memory of their conquest and their flight. It is

impossible to determine the time in which these migrations took place, but according to traditional and other evidence, they were anterior to the landing of the Lægrians on the southern shores of Britain. The Lægrians inhabited the south-western parts of Gaul; they were of the same origin, and spoke the same language as the Cambrians, who, compelled to give way to these new settlers, retired to the shores of the western sea, and scattered themselves over a country, which, from that period, has retained the name of Cambria. The Lægrians took possession of the southern and eastern coasts; a third horde of the same race migrated from the country between the Seine and the Loire, and obtained a settlement, it is said, without war and without contest. The name of Britons is exclusively applied to these last settlers in the national poems and ancient annals. Their territory was probably situated on the north of Cambria and Lægria, near the frontier of the Gaelic population, between the firths of Forth and Solway. These barbarians, sprung from a common origin, were sometimes exposed to the invasions of foreign tribes. One of these hordes inhabited that part of Gaul which has since been denominated Flanders; many persons amongst them were destroyed by an inundation, and as many as escaped were compelled to leave for ever their native land; they made themselves masters of the Isle of Wight, and the southern coast of England. The territory of the Lægrians was afterwards divided into two portions by the Caritanians,^b a Teutonic tribe that entered by the mouth of the Humber, and settled on its banks and on the neighbouring shores.^c

The memory of these remote events is partly preserved in obscure traditions, and in the less erring indications, which ancient languages afford. Little, however, was known of Britain before the arrival of the Romans.^d The Phœnicians, Carthaginians and other nations may have repaired to the island, and carried on a trade with the inhabitants, but it was not their policy to make known their route, lest others might participate in the profits of their traffic, much less to explore the country. The pretext which Cæsar uses to justify his expedition, was to make the Romans familiar with the coasts, harbours and landing places, to which the Gauls were strangers. None but merchants resorted to the island, and if the land opposite Gaul be excepted, foreigners were ignorant of the country.^e But Cæsar, it is well known, did not penetrate beyond the banks of the

Thames; more important projects recalled him to Rome, and according to the observation of Lucan, he may be said to have fled from the enemy he sought.—*Territa quasitis ostendit terga Britannis*. During the reign of Augustus, Britain continued a *terra incognita* to the Romans; it was first subdued in the time of Domitian by Agricola, who ascertained it to be an island.^a

A difference of complexion observed among the inhabitants, was supposed to indicate a different origin. The red hair and tall stature of the northern tribes, convinced Tacitus that they had migrated from Germany; while the swarthy complexion and curled locks of the Silures,^b caused them to be considered of Iberian descent.

If, in the time of Cæsar, the natives of the south-eastern part of the island were more refined or less barbarous than the other inhabitants, it was owing to a more frequent intercourse with their Gallic neighbours. Their districts were better peopled; agriculture was not unknown to them; they used marle as a manure, and raised more corn than was necessary for their consumption. The people may be said to have been husbandmen, at a time when the rest of their countrymen were shepherds; consequently to have made the first step towards civilization.

But at the early period of which we speak, all the Britons were little removed from the savage state. Their towns were built in thick woods, fortified with a ditch or rampart to serve as a place of retreat against their enemies, and well adapted, from their situation, to favour their escape on any emergence. Their houses were very rude; a stone foundation supported walls made of timber or reeds, while the interior consisted of a small chamber with a fire in the middle; the floor was strewn with straw or rushes, on which the inmates and visitors slept. Ten or twelve persons resided in a single house; they had their wives in common, but the offspring was always attributed to him who married the mother.^c The zeal of some historians in defending the morals of their ancestors may be commendable, but it cannot by any means invalidate the statement of Cæsar, which is confirmed by Dion and other ancient writers. "It is very likely," says Dr. Henry, "that the Roman general was deceived by appearances, and led to entertain this opinion of the promiscuous intercourse of the sexes by observing the promiscuous manner in which they lived, particularly in which they slept."^d It is doubtful that Cæsar ever observed the manner in which the Britons slept; his information was derived from the natives themselves, who would not have avowed the practice, had it not been general, or if it had been considered disgraceful. The well known story of Cartimandua, the queen of the Brigantes, does not prove that she lost her dominions for the reason that is commonly alleged, but because she raised her standard-bearer to the throne.^e

^a Tacitus, Life of Agricola.

^b South Welsh.

^c Cæsar's Commentaries, Book v. Chap. 10.

^d Henry's History of Britain, Book i. Chap. 7.

^e The story is thus related by Tacitus. "In the reign of Claudius, Cartimandua had treacherously delivered up Caractacus to swell the pomp of that emperor's triumph. From that time riches flowed on her, but riches drew after them their usual appendages, luxury and dissipation. She banished from her presence Venusius her husband, and raised Velleatus her armour-bearer to her throne and bed. By that criminal act she lost all her authority. Convulsions shook her kingdom. The discarded husband had the people on his side, while the adulterer had nothing to protect him but the libidinous passions of the queen and the cruelty of her reign. Venusius was in a short time at the head of a powerful army. The subjects of the queen flocked to his standard, and a body of auxiliaries joined him. Cartimandua

The southern Britons stained their bodies with an infusion of woad, which gave their skins a blue colour, and made them appear terrible in battle; they wore long hair, and shaved all the rest of the body except the head and upper lip.^f The custom of tattooing themselves was confined to the northern tribes; the outlines of animals were punctured in the skin during infancy, and a strong dye was rubbed on the punctures; the figures expanding with the growth of the body, retained their appearance through life.^g Strabo judged from the few he saw at Rome, who were of lofty stature, but ill made and inactive. Want of activity was no characteristic of these tribes. They delighted in war and martial occupations; nay, their chieftains thought the time lost which was spent in peace. The first food given to a male child was put into his mouth on the point of his father's sword, who prayed that he might prove a brave warrior and die in battle; such they deemed the most honourable death.^h The children contended with each other in wrestling, in swimming, and in the race; to the want of restraint, almost constant exercise and simple diet, their bodily strength and daring spirit have with some justice been attributed. Arrived at manhood, the vicissitudes and toils of war were familiar to them; in bearing fatigue, hunger, thirst and cold, they surpassed their conquerors.

"They use chariots in war, they scour the field on every side, throw their darts, and create disorder among the ranks by the terror of their horses, and the noise of their chariot wheels. When they mingle with the cavalry, they leap out and fight on foot; meanwhile the charioteers retire to a short distance, and place themselves in such a manner that if the others are overpowered, they may be secure of their retreat. Thus they act with the agility of cavalry and the steadiness of infantry; expert from constant practice, they can stop their horses at full speed, check and turn them, run along the pole, stand on the harness, and dart into their chariots."ⁱ The different tribes never formed a lasting union with each other, they fought separately against the common enemy, and they were therefore subdued.

Their money consisted of brass or iron rings of a certain weight; they practised hospitality, but it was not considered a crime to plunder the territory, or rob the inhabitants of a different tribe. Their virtues were those of barbarians; frank, generous, and free from deceit, "they are absolute strangers to the pernicious cunning and dissimulation of the men of our times."^k

The numerous clans were under the government of chieftains, but the latter seldom possessed unlimited power. Much exactness was not observed in the order of succession, and, what is a singular custom among a barbarous nation, females were not excluded from the highest dignities; Cartimandua was queen of the Brigantes,

was reduced to the last extremity. She implored the protection of the Romans, who sent some cohorts and squadrons of horse to her relief. Several battles ensued with various success. The queen, however, was rescued from impending danger, though she lost her kingdom. Venusius wrested the sceptre from her hands, and the Romans were involved in a war." Tacitus' History, Book III. chap. 45. The empress Julia alluded to the prevalence of this vice in Britain before a British princess, the wife of Argetocoxus; the latter did not deny the charge, but retorted it against the Romans.

while the famous Boadicea reigned over the Iceni. "There is no rule of distinction to exclude the female line from the throne, or the command of armies."^a It was the right of the monarch to command the army, but he could not depend on the obedience of his troops; they compelled him to make war or peace against his inclination. It appeared a sufficient apology for the imprisonment of Comius, a deputy sent by Cæsar, that it was the act of the multitude, not of the chiefs, who remonstrated in vain. In a barbarous state, men cannot estimate the benefits of government; they are unwilling to surrender any portion of their liberty, that they may enjoy what remains in greater security; it is by acting on the imagination, and by taking advantage of the passions and fears, that barbarians are effectually enslaved.

Accordingly, the authority of the priests was much greater than that of the kings. The druids arrogated the right of making laws, and the power of enforcing them. They declared their decisions the decrees of God, and themselves the only persons who could make them known to the people; so gross an artifice was believed in so rude an age. Their excommunications were as terrible as any that ever emanated from Rome; their doctrines were concealed from the people; sometimes several persons lived together in the same house, that they might perform together their services in the sanctuary; at other times, they retired to caves and desert places, that they might obtain a greater reputation for piety. They abstained from certain meats; "it is unlawful to eat hares, pullets or geese, but many individuals breed them for their diversion or pleasure."^b To enable these men to pass their time in the contemplation of divine truths, undisturbed by worldly cares, they were exempt from every contribution. No sacred rite was performed without them; the prayers, thanksgivings and sacrifices of the people could only be offered by the druids. In times of peace, when the royal authority was much abridged, the whole frame of civil society, loose and imperfect as it must have been, was held together by the same class.

It is natural to suppose that the Roman conquest had the effect of improving the inhabitants, of creating commerce, and of diffusing the comforts which accompany it. Before the invasion of Cæsar, tin was the only article of trade; and it is unnecessary to add that the advantage derived from it was confined to a very small number. In the list of British exports in the time of Agricola, Tacitus specifies corn, cattle, hides, gold and silver, tin, lead and iron. The British *sagum* or plaid was substituted for the undressed skins with which the natives covered themselves, and the *sagum* was afterwards superseded by the Roman *toga*. The Romans styled

Agricola the conqueror of the Britons, but he secured for himself a more imperishable fame; he was their benefactor. Promotion became the consequence of merit, and the affections of the people were conciliated by an impartial administration of justice. It was by no means an easy task to obtain corn and other provisions for the army, but the burden was lightened by equal contributions. In former times, the extortions of the tax-gatherer were more oppressive than the tax itself, and if the Romans were long in making themselves masters of the island, it may be imputed to the injustice and rapacity of their governors. The natives were often defeated in battle, but they were not subdued. It was the object of Agricola to reclaim them from a savage life. "He encouraged by public assistance and by his individual efforts, those who built temples, courts of justice, and commodious dwelling houses. Praises were lavished on as many as cheerfully obeyed; the slow and uncomplying were branded with reproach, and emulation was found to be a more powerful motive for exertion than a sense of duty. To establish a plan of education, and give the sons of the leading chiefs a taste for letters, was part of his policy. By way of encouragement he praised their talents, and already saw them, by the force of their natural genius, rising superior in attainments to the Gauls."^c Monkish historians affirm that the martial spirit of the inhabitants was destroyed by a taste for the refinements and arts of Rome, as if the undisciplined courage of barbarians were a virtue, or in any way worthy of admiration.

The Romans had an imperfect knowledge of the northern tribes in Scotland. Marshes and fens, ravines and mountains, vying with each other in sterility, were the only obstacles to the arms of Agricola after the battle at Mons Grampius; but it was not the policy of that celebrated general, or of the people whom he commanded, to expose themselves needlessly to danger.

It may be observed that the name of Caledonians was extended by the Greek and Roman writers of the three first centuries, to all the independent clans or tribes between the frontier wall and the northern extremity of the island. The Caledonii, however, were confined to the long and narrow belt, that stretches from the Firth of Tay on the eastern, to Loch Fine on the western coast.

There is reason to believe that forty-five distinct tribes or clans inhabited Britain during the Roman period.^d

Conquered Britain was divided by the Romans into six provinces of irregular boundaries. The country that extends from the western extremity of Cornwall to the south foreland of Kent, partly insulated by the Bristol Channel on the west, and the course of the Thames on

^a Tacitus, *Life of Agricola*, chap. 16.

^b Cæsar's *Commentaries*. Book v.

^c Tacitus, *Life of Agricola*, chap. 21.

^d The Cantii, Regni, Bibroces, Atrebatæ, Segontiaci, Belgæ, Durobriges, Hoedui, Carnabii and Damnonii possessed the country from the shores of Kent to those of Cornwall. The Silures, Ordovices and Dimetæ inhabited Wales. The country between the Thames, the Severn, the Mersey, the Humber and the Ocean, was peopled by the Trinabantes, Iceni, Coritani, Cassii, Dobuni, Huicci, Ancalites and Cornabii. The Setantii, Volantii and Brigantes inhabited Lancashire, Westmoreland, Cumberland, Yorkshire, Durham and part of Northumberland. Valentia was peopled by the Ottadini, Gadeni, Selgovæ, Novantes and Damni. Vespasiana by the Harestii, Vecturones, Taixali, Vacomagii, Albani and Attacotti. The tribes in independent Scotland were the Caledonii, Cautæ, Logi, Carnabii, Calini, Mertæ, Carnonacæ, Cerones, Creones and Epidii.—[The tribes in Britain, mentioned by Ptolemy, were the following, viz. Novantæ, Selgovæ,

Damni (Dumnii,) Gadeni, Otadeni (Otodini,) Epidii, Cerones, Creones, Carnonacæ, Carini (Carini,) Cornabii (Cornavii,) Caledonii, Cantæ, Logi, Mertæ, Vacomagii, Venicantes (Vennicones,) Texali (Taixali,) Brigantes, Parisi, Ordovices, Cornavii, Coritani, Catyuchlani (Cassii,) Simeni (Iceni,) Trinoantes (Trinobantes,) Demetæ, Silures, Dobuni (Boduni,) Atrebatii, Cantii, Regni, Belgæ, Durotriges, and Dumnonii (Dannonii, Danmonii.) Besides these, the following are mentioned by Cæsar, viz. the Bibroci (supposed to have inhabited Berks,) the Segontiaci (in Hants,) the Ancalites (in Oxfordshire and Bucks,) and the Cenimagni (considered by Camden, the same as the Iceni.) The Huicci (Jugantes of Tacitus) were included in the Cornavii. The Horesti of Tacitus occupied Angus, under the Vacomagii. The Attacotti are supposed to have occupied some part of the north of Scotland. The Vecturones included all the tribes north of the Forth, not included in the Dicaledones; the latter occupied Argyle, Perth, and the Highlands adjoining those two counties.—P.]

the east, made up *Britannia Prima*, then the most wealthy region in Britain. Wales and the tract that is bounded by the circuitous course of the Severn obtained the name of *Britannia Secunda*. *Flavia Cesariensis* was bounded by the two last provinces, and also by the Humber, the Don and the German Ocean. *Maxima Cesariensis* comprehended all the country between the two seas, from the Humber to the Eden and the Tyne. *Valentia* extended from the northern limits of the last province to the Firths of Forth and Clyde.^a *Vespasiana* was separated from independent Caledonia by the mountainous chain that stretches from Dumbarton to the Firth of Murray. But the Romans exercised a doubtful authority in the last province, and it may perhaps be more correct to consider the *prætentura* of Agricola, as the northern boundary of Roman Britain.

To complete this part of the subject, it is necessary to take some notice of the Roman monuments of the period. Of these none were more important than their military works, their chains of forts, their ramparts and their walls. The troops under the command of Agricola were employed during part of the third, and the whole of the fourth summer, in building forts between the Firths of Forth and Clyde;^b in his opinion, the most advantageous frontier of the Roman territory in Britain. Such a choice was not unworthy so great a general. "Men of skill and military science thought no officer more able than Agricola in choosing the most advantageous situation, and accordingly not one of the stations fortified by his direction was taken by storm. At every post to enable the garrison to stand a siege, a year's provision was laid up; although frequent sallies were made, the besiegers were always repulsed, and the Romans passed the winter without danger."^c It was shown, however, that the possession of the province depended more on the character of the general than on the works which he had erected. The forts were no defence against the weakness of his successors; and during the period that elapsed from the departure of Agricola to the arrival of Hadrian, the tribes in the Lowlands of Scotland, and in the north of England, had thrown off the yoke.

Hadrian, like Augustus, was more desirous of securing his dominions, than enlarging their limits; for this purpose he contracted the boundaries of Roman Britain, and raised a new barrier against the incursions of the northern tribes. The vallum of Hadrian reached from the Solway Firth on the west to the north of the Tyne on the east, or more definitely, from the neighbourhood of Burgh on the Sands to the present town of Newcastle. It was not carried across the heights, but in an oblique direction along the vallies. The works were a rampart, a ditch, and two *aggeres* or mounds. The earthen rampart or vallum was probably twelve feet in height; some parts of it rise, even in the present day, six feet above the surface. The dimensions of the ditch may be more correctly ascertained; it passes through a limestone quarry near Harlow-Hill, where it is eleven feet deep, and nine in width.

^a *Flavia Cesariensis* included all that part of the island south of the Bristol Channel and the Thames; *Britannia Prima*, that part between the Thames, the Severn, the Humber and the German Sea; *Britannia Secunda*, all west of the Severn, or rather more than Wales; *Maxima Cesariensis*, between the Humber and the wall of Severus, from sea to sea; and *Valentia*, all between the walls of Severus and Antoninus. (Henry's Hist. Great Britain, vol. I. p. 347-9.)—P.

^b The *Prætentura* of Agricola.

The two mounds were parallel to the ditch, the one on the north, the other on the south. The southern was a military road, and the original work of Hadrian; the other, it has been conjectured, was added as a military way for the wall of Severus, when the vallum was no longer a work of defence. The fortifications were more than sixty miles in length; forts and stations at short distances from each other served as quarters for the troops.

But the peace which had been restored by Hadrian, was repeatedly broken by the different tribes of the *Mæatæ*^d on the north of the vallum, and on the south by the incursions of the Brigantes into the territory of the Ordovices. Lollius Urbicus was appointed *proprætor* of Britain by Antoninus, the adopted son and immediate successor of Trajan. The different tribes were not only reduced to obedience during his government, but a new vallum^e was erected near the site of the *prætentura*, probably from *Caer Ridden* on the Forth to *Alchuid* on the Clyde.^f According to an inscription that is still preserved, the whole was finished in the third consulship of Antoninus, the year 140 of the vulgar era; not more than twenty years after the vallum of Hadrian had been completed. It appears from several measurements, that the length of this new fortification was not less than thirty-seven miles. The principal parts were a broad ditch, the rampart, of which the foundation was twelve feet wide, a well paved military way on the south side of the vallum, and eighteen forts or stations at convenient distances from each other. Although almost seventeen hundred years have elapsed since this work was finished, and although it is at present in a very imperfect state, yet the troops by whom it was raised, and the portions allotted to the different divisions, may be determined by inscriptions that are still extant. This monument of the Roman power was achieved by the soldiers of the second legion, together with the vexillations of the sixth, the twentieth legions, and one cohort of auxiliaries. If the respective divisions were complete, which was not always the case, the total number could not have been greater than seven thousand eight hundred men.

A battle fought on the plain of Trevoux in the year 197, made Severus master of the empire, and his reign forms an era in the history of Roman Britain. To diminish the too great power of the prefect, the island was divided into two governments; by this means, it was supposed, acts of flagrant injustice were likely in future to be less frequent, and the knowledge of them more readily communicated to the emperor. The northern government was conferred on Varius Lupus, but he found himself unable to repel the *Mæatæ* and Caledonians. The same person was the first Roman governor in Britain, who had recourse to the dangerous expedient of purchasing with money a temporary peace; the conditions, it may be readily supposed, were broken by the fierce and independent Britons, and the measure led to new and repeated aggressions. It was then that Lupus made known the disturbed state of Britain to the emperor, and counsel-

^c Tacitus, Life of Agricola.—Chapter 22.

^d The *Mæatæ* included all the tribes between the walls of Severus and Antoninus, viz. the *Novantæ*, *Selgovæ*, *Damnii*, *Gadeni*, and *Otadeni*. (Henry's Hist. G. Britain. Book I. Append.)—P.

^e Vallum of Antoninus—Graham's Dike.—P.

^f According to Bede, it terminated at *Alcluyd*. (Camden's *Britannia*, p. 1222.)—It extended from *Waltown*, in the parish of *Carriden*, on the Forth, to *Dunglass*, in the parish of *West Kilpatrick*, on the Clyde. (Sinclair's Stat. Account.)—P.

led him to appear in the province, and to bring along with him a more effective army; the advice was followed; the emperor arrived, punished the insurgents, and restored peace to the island. Having advanced to the Firth of Cromarty, he became acquainted with the habits of the northern tribes, and no earthen rampart was thought sufficient to protect the southern provinces against their incursions. A new sort of defence was chosen, and a wall of stone^a was erected near the vallum of Hadrian. It was not parallel to it in its whole length, as it was determined not to follow the winding course of the vallies, but to carry it across the loftiest heights, and the most abrupt precipices. The work was built of polished stone; the height was twelve feet, exclusively of the parapet, and the breadth, eight; such at least are the dimensions according to the venerable Bede, who lived at the east end of the wall, and in whose time it was in many places entire. The length of the fortifications from *Segedunum*, Cousins-House, on the east, to *Tunnocelum*, Boulness, on the west, is more than sixty-eight English, and less than seventy-four Roman miles. The wall was defended by stations, castles, and turrets; the first amounted in number to eighteen; they were fortified with strong walls and deep ditches; the smallest station could contain a cohort or six hundred men. A town, possessed by Roman and British artisans, was built in the neighbourhood of each station, and the inhabitants were protected by the garrison. The castles, situated in the intervals between the stations, were neither so large nor so strongly fortified, but they were not fewer than eighty-one. The turrets served the purposes of watch-towers, and places for sentinels, who being within hearing of each other, could convey any intelligence along the line in a short time.^b

Such was the wall of Severus, which Spartian, the historian of the emperor, calls the greatest glory of his reign; for nearly two hundred years, it proved an impassable barrier to the incursions of the fiercest tribes; during the greater part of a thousand years, it served as a quarry for all the towns and villages that were built near it; its ruins, imperfect as they are, cannot at present be viewed without admiration.

This stupendous work was raised by the second and sixth legions. The Roman soldiers, not less skilled in the useful arts than in the arts of war, were never degraded, in time of peace, by indolence and its consequent vices. The military ways of the Romans were afterwards the principal roads of the Anglo-Saxons, and Roman stations became the most important of the Anglo-Saxon towns.

It has been conjectured that the population of the island at the time of the first invasion of the Romans, was not greater than three hundred thousand individuals. The conquest may have been favourable to the progress of civilization, but the sway of the Romans was cruel, and their government unjust. The Britons could not rise to

^a The Wall of Severus—called also the Picts' Wall.—P.
^b According to the *Notitia Imperii*, the wall was guarded by the following troops.
 Twelve cohorts of infantry, consisting of six hundred men each, 7200
 One cohort of mariners in the station at Boulness, 600
 One detachment of Moors, equal probably to 600
 Four wings of horse, at the lowest computation, four hundred each, 1600
 10,000

^c *Pandects*, xxiii. tit. ii. N. 38, 57, 33.

the dignity of *consulares* or *præsides*; they were thus excluded from the highest offices, and it was unlawful for the strangers, by whom these offices were held, to marry natives, or to purchase land in the island.^c

But the British soldiers in the Roman armies were distinguished for their bravery. It might be shown that there were at least fifteen thousand six hundred men, or twenty-six cohorts of British infantry, under the emperors. The number was, in all probability, much greater; and some of the cohorts, it is certain, received as the reward of their courage, the title of invincible;^d it was not, however, the policy of Rome to suffer them to serve in their native land.

Corn was not the least important of the British products, and merely on account of that article, the island was of value to the Romans. It is now impossible to determine the quantity it afforded, but it was perhaps more considerable than is commonly imagined. While Julian commanded in Gaul, the Franks, Saxons and Alemanni passed the Rhine, devastated the country, laid forty towns in ashes, and carried the inhabitants into captivity. Julian compelled them to restore the prisoners, but they might have perished from hunger, had not the granaries of Britain furnished a plentiful supply. Their wants were thus relieved, and corn was afterwards imported from England to sow their lands.^e

The towns are enumerated, but not described, in the different itineraries. They were of different denominations, viz. the colonial, the municipal, the Latian, the stipendiary, and others to which less important privileges were attached. The number of the first sort was nine; there were only two of the second, and no additions were made to them, because the inhabitants were not subject to the imperial statutes, because they had the power of appointing their own magistrates, and because they possessed the rights of Roman citizens. Ten cities claimed the Latian right; they might be governed by native magistrates, who claimed the freedom of Rome at the expiration of their office. The number of stipendiary towns was equal to twelve.

The conquered countries were divided by the Romans into districts or *civitates*, each of which had its chief town, the seat of a senate, whose jurisdiction extended over all the inhabitants of the *civitas*. Gaul was divided into a hundred and seventeen districts; Britain probably into thirty-three. Honorius, when he gave up the island, addressed his letters to the *civitates* or states of Britain, and warned them to provide for their own safety.

However barbarous Britain may have been when it was visited by Julius Cæsar, it could not have continued a Roman province during four hundred years without participating in Roman civilization. The beneficent influence of Christianity succeeded the debasing superstition of the Druids; the injustice of barbarians was exchanged for the laws and civil institutions of the Romans. The legisla-

tive triumphs of that celebrated people were not less wonderful than their warlike achievements; by the latter, distant provinces were conquered; by the former, discordant tribes were blended into one nation. The laws imposed on conquered states, and the rights and privileges conferred on the inhabitants, produced an union which could not be effected by military occupation. The towns of the Britons were no longer begirt with forests; their houses consisted no longer of wood. The conquered strove to imitate the conquerors; cities were built after the model of those in Italy, and were adorned with market-places, temples, mosaic pavements, porticos, and baths. The emulation of the inhabitants was not confined to the useful, it extended to the liberal arts. Juvenal alludes to the skill of the Britons in one department of letters, certainly not of the highest order—"Gallia caudicosa docuit facunda Britannos." Martial bears witness that the Roman poets were read in the island—"Dicitur et nostros cantare Britannia versus." The more respectable authority of an historian indicates the similarity of institutions, customs, and manners in the two countries—"Ita ut non Britannica sed Romana insula censeretur."^a

The names of two people^b appear for the first time in history during the fourth century; it ought not, however, to be inferred that the older writers were ignorant of their existence. The Scots inhabited Ireland, which, in the Roman language, is indifferently called *Hibernia* and *Scotia*. The frequent intercourse between the British mountaineers and the Irish, and the numerous emigrations from the one country to the other, led in time to a community of names. The Scots possessed the north-western coasts and archipelago, while the Picts dwelt in the east on the confines of the German Ocean; their respective territories were divided by the chain of the Grampian hills. The Scots, living in the mountains, became hunters or wandering shepherds; the Picts, having a more fruitful soil, and a more level country, cultivated the ground, and built solid habitations, of which the ruins still remain. When united together for an irruption into the south, they lived on friendly terms, and their two chiefs, one of whom resided at the mouth of the Tay, and the other between the lakes of Argyll, joined their standards; on other occasions, their friendship was interrupted by mutual depredations.

A small territory in the Cimbric Chersonesus was peopled in ancient times by the ancestors of the English.^c More important tribes have been exterminated or subdued, but a different fate was reserved for a horde of freebooters, too insignificant to be mentioned by Tacitus with the other inhabitants of Germany. The descendants of the same tribe are now the people of England, the citizens of the great republic in the new world, and the settlers in the vast colonial possessions of Great Britain.^d

Ptolemy of Alexandria is the first writer who mentions the Saxons; they inhabited, before the middle of the second century, the western side of the Cimbric Chersonesus, between the Elbe and the Eyder, and three small islands at the mouth of the Elbe. The same people formed at a later period the great Saxon confederation which extended from the Elbe to the Rhine. The Angles, supposed to have been originally a tribe of the

Suevi, the bravest of the German nations, settled in the Cimbric Chersonesus, and inhabited the present duchy of Sleswick. Their name is still preserved in the district of Anglen, between Flensburg and Sleswick. The Jutes, a tribe of the Getæ, inhabited the extremity of the Cimbric Chersonesus, which from them is still called Jutland. Of these, the Saxons were the dominant tribe; the two others were in a state of subjection.

No conquest was more complete, and none more durable in its effects, than that of England by the Saxons. Disastrous at first, as the inroads of savages must ever be, destructive of Roman civilization, and bringing back the country into the barbarism from which it had been saved, the advantages that followed seemed uncertain and remote.

The chiefs or powerful men among the Saxons erected separate sovereignties in the island; new divisions were thus formed, and the old abolished. This period of English history is generally styled the time of the heptarchy; the name, although incorrect, is sanctioned by usage. It is necessary, however, to allude to the error, otherwise the limits of the petty kingdoms might not be readily understood. It may perhaps be better to describe these states according to the dates of their foundation, than their vicinity to each other.

Kent, the first Saxon kingdom in Britain, was not more extensive than the county of the same name. It was founded about the year 455, and the new settlers embraced Christianity, while the rest of their countrymen in England adhered to their pagan superstitions.

The second state, or the kingdom of the South Saxons,^e comprehended the two counties of Sussex and Surrey. Ella and his three sons, accompanied with a band of adventurers, landed in the year 477, but he did not make himself master of his small sovereignty until the year 490, when he took the town of Anderid, in the midst of the forest of Anderida. Chichester, the *Regnum* of the Romans, and the *Caer Cei* of the Britons, appears to have been the capital of his kingdom. It was converted to Christianity in the year 678, and contained at that time about seven thousand families.^f

Cerdic arrived in England five years after the taking of Anderid, but several years elapsed before Wessex or the kingdom of the West Saxons was founded. It consisted of the counties of Hants, Berks, Wilts, Somerset, Dorset, Devon and part of Cornwall. It was not until the year 519, after a destructive battle had been fought at Charford on the Avon, that the Saxons, under Cerdic, established themselves in the country. The Isle of Wight, one of the earliest conquests of the West Saxons, was made over to the nephews of the conqueror.

Erkenwin assumed the sovereignty of Essex or the East Saxons in the year 530; he ruled over Essex, Middlesex and part of Hertfordshire. The princes of Essex acted no distinguished part during the heptarchy; they appear to have been dependent on the kings of Kent.

The Angles, allured by the success of the Saxons, left their native land. They settled in the country on the north-east of the Saxons; Uffa was chosen their leader, and from him, his successors were styled *Uffingas*. Cambridge, Suffolk, and the Isle of Ely, made up the

kingdom of the East Angles;^a St. Edmund's Ditch separated it from Mercia. Dunwich, the capital, is the *Domnoc* of the venerable Bede; although now covered by the sea, it was a place of considerable importance during the Roman and Saxon periods.^b

But the Angles were not confined to East Anglia; the greater number of them invaded the north of England, and founded the kingdom of Bernicia, which extended from the Tyne to the Forth. Ida, their leader, built a castle on a lofty promontory, and called it Bebbanburgh in honour of his wife Bebba; and the same place is now better known by the name of Bamburgh.^c

Deira, the third Anglian kingdom, was bounded on the south by the Humber, and on the north by the Tyne. The Britons in that part of England were subdued in the year 560 by Sella, an Anglian chief, but the country retained the name of its early inhabitants. Thus the kingdoms of Bernicia and Deira stretched from the Humber to the Forth, and from the eastern to the western sea.

Crida passed the Humber in the year 586, defeated the Britons on the coast, and extended his conquests to the heart of England. The powerful kingdom of Mercia comprehended the counties of Huntingdon, Rutland, Lincoln, Northampton, Leicester, Derby, Nottingham, Oxford, Cheshire, Salop, Gloucester, Worcester, Stafford, Warwick, Buckingham, Bedford, and part of Hertford. Sometimes called the kingdom of the Central Angles, it derived the more common name of Mercia from being contiguous to Wales and all the other Saxon kingdoms.

Thus it has been shown that eight separate states were founded in Britain by the Saxons. Bernicia and Deira were often under the same sceptre, and it has been supposed that they formed one kingdom, but some of the others were at different times united under the same monarch. An octarchy denotes the total number of Anglo-Saxon states in Britain; a triarchy the different tribes that subdued the country.^d

The present chorography of England derives its origin from the Saxon period, or to speak more precisely, from the time of Alfred the Great. Certain districts were governed by ealdormen or aldermen, a dignity, which indicated the age of the individuals on whom it was conferred; but when England was afterwards invaded by the Northmen, these persons were styled *jarls*, and the title of earl has been substituted for that of ealdorman. The districts which were thus governed, corresponded in some degree with the present counties, but their limits were not the same. England in the time of Alfred contained only thirty-two counties; Durham and Lancashire formed part of Yorkshire, while Cornwall was united to Devonshire, and Rutland to Northamptonshire; Northumberland, Westmoreland and Cumberland were subject to Scotland. The districts were entrusted by the ealdormen to the care of deputies, who were called shire-reeves, shrieves or sheriffs, the Anglo-Saxon word *shire* being synonymous with the English word *share*, and *reeve* signifying to manage or govern.

In the Norman period, England was enlarged by the accession of Cumberland and Westmoreland; Northum-

berland, exposed to the incursions of the Scots, was little more than a nominal part of the kingdom. Wales was then independent, and it continued so until the time of Edward the First, who defeated the Welsh, abolished the line of their kings, and annexed the principality to the English throne. It was, however, at a much more recent period that the counties in England and Wales were divided according to their present limits. The improvement, if on the whole it can be called one, was not effected before the thirty-fourth year of Henry the Eighth. An act was passed in that year, by which the marches or intermediate lands between England and Wales, were divided anew, or annexed to old counties. The new counties are Monmouthshire, then declared an English county, and Brecknockshire, Denbighshire, Montgomeryshire and Radnorshire in Wales. Additional land was annexed to Gloucestershire, Herefordshire and Shropshire, and also to Cardiganshire, Caermarthenshire, Glamorganshire, Merionethshire and Pembrokeshire.

The districts^e were divided into trethings, trithings or tridings, a division which is still preserved in the ridings of Yorkshire. They were governed by a trithing-reeve, an officer subordinate to the sheriff. Lathes and rapes cannot be correctly defined; they were probably less than trithings; it is certain they were larger than hundreds. Kent is still divided into lathes, and Sussex into rapes.

The divisions into hundreds and tithings have been attributed to Alfred; it is more probable they were established by the Saxons at an earlier period, at least they corresponded with the *pagi* and *vici* into which the country of the ancient Germans was divided. The hundreds were so called because they contained a hundred free families. It has been maintained that they depended not on the population, but on the size of the district; it is difficult, however, to reconcile this opinion with the fact that the most populous districts in the Saxon times were divided into a greater number of hundreds than more extensive but less fruitful tracts. The tithings, as their name imports, were the tenth part of a hundred.

The northern counties were not made up of hundreds, but of wards and wapentakes. They were called wards because the inhabitants, in ancient times, were obliged to watch and ward against the incursions of their enemies. Wapentake and weapon-take are evidently synonymous. Cumberland, Westmoreland, Northumberland, Durham and Lanarkshire are divided into wards; Yorkshire into wapentakes.

It has been seen that the present divisions of England may be traced to Saxon times; the names of ancient offices and titles of honour are referrible to the same period; the greater number of towns, burghs and villages retain, with little variation, the names which were given them by the Saxons. The Anglo-Saxon language resembles the English in its structure, grammar, and idiomatic expressions; the genius of the two languages is the same, and the one may be considered the daughter of the other. A knowledge of the Anglo-Saxon enabled an English philologist^f to analyze all the indeclinable parts

mined by the sea, almost the whole of the town has been washed away. In 1801, it contained only forty-two houses, and 184 inhabitants (Shoberl's Suffolk.)—P.

^e Counties.

^f Horne Tooke.

^a East Anglia.

^b Dunwich was formerly one of the most flourishing maritime towns in England. It had attained its highest prosperity in the reign of Henry II. In the reign of Edward III. after it had considerably declined, it had eleven ships of war, thirty-six merchant ships, and twenty-four fishing vessels. It had eight parish churches, of which only one remains. As it is situated on a high loamy bank, continually under-

of speech in his own language, and to trace them to their source. The studies of Johnson rendered him ill fitted for his laborious task; of the only language that could guide him in his researches, the author of the dictionary was ignorant; his etymologies are generally erroneous; his ingenuity is exhausted in fanciful and unmeaning analogies. Few men could have raised such a monument from so imperfect materials; but it may be doubted if the dictionary has tended to render Englishmen more familiar with the power and copiousness of their vernacular tongue.^a

A Saxon king, it might seem, had enough to do to conquer his enemies, to give laws to his subjects, and to administer justice among them in person; but Alfred found time to cultivate letters, and some of his writings are still extant. "In three pages of Alfred's Orosius," says Sharon Turner, "I found seventy-eight words which had become obsolete in English out of five hundred and forty-eight, or about one-seventh. In three pages of his Boethius, I found a hundred and forty-three obsolete out of six hundred and sixty-six, or about one-fifth. In three pages of his Bede, I found two hundred and thirty obsolete, out of nine hundred and sixty-nine, or about one-fifth. The difference in the proportion between these and the Orosius proceeds from the latter containing many historical names."^b Not more than one-fifth part of the words in the Saxon are now wholly obsolete in English; this must not be considered a mere assertion; the truth of it has been proved, in some degree at least, by Mr. Turner. The English language is principally derived from the Saxon, and it has been remarked that the idiomatic phrases, those on which the characteristic differences of languages depend, are the same in the one and in the other. It need not, therefore, excite surprise, that the English writers, who are the most remarkable for the purity of their style, abound most in Saxon expressions.

It could not have been foreseen, at the time Britain was inhabited by the civilized Romans, that the island was to be conquered by an obscure, nay, almost an unknown tribe, much less that works comparable to those of the best periods of Greece and Rome, were to be written by Englishmen in a language handed down to them by northern barbarians.^c

It is of importance, in examining the historical geography of a country, to ascertain its population at any remarkable epoch, such as that of the Saxons in England; but, unfortunately, this can seldom be done with any thing like precision. It is not easy to find the truth in the conflicting statements of different writers. The low state of the arts, the wretched condition of the ancient Britons, the destructive wars with the Danes, and above all, the division of the people into two classes, the servile and the free, must have had a tendency to perpet-

^a Want of candour was no part of Johnson's character; he acknowledged his errors, and declared that, if he lived to give another edition of his dictionary, he would adopt Mr. Horne's derivations. *Diversions of Purley*, edited by Taylor, vol. i. page 154.

^b *History of the Anglo-Saxons*, Appendix, chap. iii.

^c "Of sixty-nine words which make up the Lord's prayer, there are only five not Saxon, the best example of the natural bent of our language, and of the words apt to be chosen by those who speak and write it without design. Of eighty-one words in the soliloquy of Hamlet, thirteen only are of Latin origin. Even in a passage of ninety words in Milton, whose diction is more learned than that of any other poet, there are only sixteen Latin words. In four verses of the authorized version of Genesis, which contain about a hundred and thirty words, there are no more than five Latin. In seventy-nine words of Addison, whose perfect taste preserved him from a pedantic or con-

uate barbarism, and to check the progress of population; but the total number of inhabitants is supposed to have been less than, in all probability, it really was. It has been affirmed that the population was not much greater in the time of the heptarchy than before the Roman invasion, and much less than in the flourishing times of the Roman government.^d This opinion rests chiefly on the evidence afforded by Domesday-book, but according to that register, there is reason to believe that the population of the Anglo-Saxon counties amounted to a million and a half.^e Those, however, who have examined the work most minutely, do not think it contains the data on which such a calculation can be made. Some of the northern counties are omitted, and many of the burgesses are not mentioned. Thus, there were not more than seventy in Yarmouth, fifty-two in Buckingham, ten in Bristol, then an important town, nine in Bedford and five in Sudbury. No notice is taken of Winchester; the monks and almost all the secular clergy are not enumerated. If allowances are made for these defects, the result can only be considered an approximation. There is besides another source of error, and one which is not always taken into account; in other words, it may easily be shown that the population was greater in the time of the Saxons than at the time the register of Domesday was taken. It is necessary to calculate the effects of the exterminating wars waged by the conqueror, of whole districts withdrawn from cultivation, of the signal punishments inflicted on the northern rebels, and of the almost total depopulation of their country.

The Saxons were a barbarous people; the superior genius of a few was obscured in the general darkness. The example of the venerable Bede was not imitated; his moral worth and intellectual attainments formed a bright contrast to the greater number of the clergy, and to the greater number of his countrymen. The thanes or powerful men were more ignorant than the peasantry of the present day; none of them could read or write, and when something like a better change was effected by the authority, encouragement and remonstrances of Alfred, many regretted that they had neglected letters in their youth, believing it impossible for a man of mature age to learn to read or write. Kings put a cross to charters as a substitute for their signature, and Alfred's brothers were as ignorant as the rest of their countrymen.^f "It is known," says Alfred, "how few of the clergy can read; still they are the only instructors of the people."

The arts during the same period indicate a rude state of society; the home trade was almost confined to the necessaries of life, while foreign commerce was very insignificant; some encouragement, however, must have been given to it, for a merchant who went three times over sea in his own craft, might become a thane.^g It

strained preference for any portion of the language, we find only fifteen Latin. In later times the language has rebelled against the bad taste of those otherwise vigorous minds, who, instead of ennobling their style like Milton, by the position and combination of words, have tried to raise it by unusual and far-fetched expressions. Dr. Johnson himself, from whose corruptions English style is only recovering, in eighty-seven words of his fine parallel between Dryden and Pope, has found means to introduce no more than twenty-one of Latin derivation." *History of England*, by Sir James Mackintosh, page 82.

Robertson and Hume have been submitted to a similar analysis, and the result is equally satisfactory.

sometimes happened that abbots and influential persons requested their friends on the Continent to send artificers in different articles, that could not be made in England. Goat-skin coverlets and pillows stuffed with straw were the luxuries of the rich, and ladies of rank bequeathed their bed-linen to their daughters. The dialogues of Elfric throw some light on the occupations and trades of the Saxons.

It is incorrect to judge of their private houses from the comparative magnificence of their churches. The former were small, ill built, and not comparable, in point of cleanliness at least, to those that are now inhabited by the lower orders in England. Alcuin, an Anglo-Saxon abbot of immense wealth, but more remarkable as being one of the few great men of his day, lived in a mean and dirty house. Some costly articles, such as gold cups and silver goblets, adorned the rude halls in which the feasts of the nobles were held; but the wealthiest amongst them never enjoyed the luxuries which are now common to every peasant. The collective happiness or misery of a people is proportionate to their knowledge or ignorance; the diffusion of wealth or luxury, if a term can be used, the meaning of which varies in different states of society, is one effect of the progress of knowledge, and not the least beneficial, as it extends to all orders and ranks of men.

The nobles passed their time on their estates; the tedium of indolence, and the absence of social or intellectual enjoyment, was relieved by manly exercises. They shared with their sovereign in the pleasures of the chase; to excel in this amusement was the boast of princes. The imperfect state of cultivation, the great extent of waste lands, and the number of wild animals, some of which are now extinct in England, were favorable to an occupation which accorded well with the manners and habits of the Saxons.

The people, it has been already observed, consisted of two classes, the free and the servile; among the former, there were distinctions of rank; among the latter, different degrees of slavery; the cottars, bordars, and villeins were subject to a bondage more or less oppressive. Some were liberated by the benevolence or generosity of their masters; others might amass property, and purchase their freedom; still, it is certain, the servile population was much more numerous than the free. The influence of the church and the new religion might have tended to soften the rigours of slavery; in latter times, it was unlawful to alienate a christian from the land.^a Extraordinary changes take place in the affairs of nations; if a slave now lands on the English shores, at that moment he obtains his freedom, but formerly the English themselves were sold as slaves in a barbarous and revolting manner.^b

The authority of the Anglo-Saxon princes was limited by the nobles, and in some measure dependent on the national councils. Not arbitrary, but more of a mixed

character, their government resembled that of the ancient German kings, as it is described by Tacitus. Their monarchies were elective rather than hereditary, at least the person in the regular order of succession was often omitted, and another appointed by the wittenagemot. If the power of the kings was afterwards increased, and if the government tended towards a despotism, it may be attributed to the force of circumstances, and to the genius of the individuals who reigned, not to any change in the character of the people.

Antiquarians have traced the commencement of parliaments to the time of the wittenagemot. Although the members of the latter may have been the most influential persons in the country, it was widely different from either house of parliament; it resembled more the assemblies of the ancient Germans. The institution of juries is commonly believed to be of Saxon origin, and it is not unlikely that the germs of them existed in the time of Alfred. He is said to have put a judge to death for condemning a criminal, when the jury were in doubt about their verdict, "for when in doubt, they ought rather to save than condemn."^c

The virtue of chastity was common to the Anglo-Saxon women with those of ancient Germany. Bede bears his testimony to the virtue of his countrywomen, and Tacitus deploras that what could not be effected by the refinement of Greece and Rome, was accomplished almost by the natural instinct of barbarians.

The subjugation of England by William the Bastard, Duke of Normandy, is the last territorial conquest that has taken place in the west of Europe, but it was by no means the most complete of its kind; it was insufficient, it has been already seen, to destroy the language, much less the memory of the Saxons. The destinies of the vanquished were changed; reduced to slavery, they could not engage in the military profession, or exercise command. Soldiers left their castles or forts, and repaired to towns, where they subsisted, not by arms, but by toil and servile employments. In these towns, it has been shown,^d the embers of Roman civilization were preserved, and it is certain the rise of the conquered class corresponded with the decline of the feudal nobility, the descendants of the conquerors. Historians narrate the victories of the Normans, and affirm that the destruction of the Saxons was the inevitable consequence of the battle of Hastings. A people are not so easily destroyed; their inveterate hatred against their oppressors is cherished by the memory of past independence; the state of England under the Normans has with more truth been compared to that of the Greeks under the Turks. In both countries many lost their lives in the vain attempt to regain their freedom.

The history of England from the year 1066, the epoch

^a An Anglo-Saxon noble gave his lands to the church, and the teams of men are enumerated with the teams of oxen. Turner, vol. iii. appendix.

^b The custom of selling their nearest relations for their own advantage, is said to be natural to the people of Northumberland. Malm. lib. i. chap. 3d. "There is a seaport town called Bristol, opposite to Ireland, into which its inhabitants make frequent voyages on account of trade. Wolfstan cured the people of this town of a most odious and inveterate custom which they derived from their ancestors, of buying men and women in all parts of England, and exporting them to Ireland for the sake of gain. The young women they commonly got with child, and carried them to market in their pregnancy, that they might bring a better price. You might have seen with sorrow, long ranks of young persons of both sexes and of the greatest beauty, tied together with ropes,

and daily exposed to sale: nor were these men ashamed. O horrid wickedness! to give up their nearest relations, nay their own children to slavery. Wolfstan knowing the obstinacy of these people, sometimes stayed two months amongst them preaching; by which in process of time, he had made so great an impression on their minds, that they abandoned their wicked trade, and set an example to all the rest in England to do the same." Henry's History of Great Britain. Gregory the Great pitied the fate of the English (Angles), who were often sold as slaves at Rome, and was thus led to think of converting the islanders.

^c *Miroir des Justices*, p. 297. See also Turner's History, Book v chap. 6.

^d Savigny's History of the Roman Law, translated by E. Cathcart Esq. See Mr. Cathcart's valuable notes at the end of the volume.

of the conquest, to 1215, the date of the great charter, appears to confirm these remarks. It consists of changes in the government, insurrections among the people, domestic spoliation and foreign warfare; many, who escaped these calamities, were cut off by famine or pestilence.^a William made over the land to seven hundred of his officers, who divided it among their followers; from this period, the vanquished classes are placed too much out of view; it has been ascertained, however, that superstition was not the sole cause of the long and violent quarrel between Henry the Second and Archbishop Becket, and that Englishmen are indebted to others besides the barons for the charter of their liberties.^b

The seeds of freedom began to spring during the long reign of Henry the Third; but, marked as it was with faction, the consequence of weakness, and with civil war, the result of turbulence, the advantages were of short duration. The following reigns of the Edwards have been considered "the most glorious in the English annals." It is almost unnecessary to remark that one of these kings was inhumanly murdered by his own subjects, and that during a period of not less than a century, the nation enjoyed scarcely ten years of peace. The reigns of the Edwards may be admitted to have been remarkable for the splendour of victories, the pomp of triumphs, and the acquisition of distant territories, not so on account of the happiness of the people. Military renown was a poor recompense for the waste of war, a decreasing population, and a neglected husbandry. The laws indicate the wretched condition of the inhabitants. "Every able-bodied man under sixty years of age, not having sufficient to live on, being required, shall be bound to serve him that doth require him, or else shall be committed to gaol, till he finds security to serve. If a servant or workman depart from service before the time agreed on, he shall be imprisoned. If any artificer take more wages than were wont to be paid, he shall be committed to gaol."^c

Thus superior and inferior skill were equally rewarded, but the severity of these statutes was increased by the 34th Edward the Third. According to that act, if a labourer or servant flee to a town, the chief officer shall deliver him up, and if he depart to another county, the letter F shall be burnt on his forehead. Those who affect to admire the past, might do well to examine it more minutely, to convince themselves of the poverty and ignorance of the people, and the unjust oppression to which they were subject, to estimate correctly the barbarism of such enactments as have been mentioned, and the collective misery co-existent with them. The tendency of industry and civilization is to diffuse happiness among every order of the community, to increase the enjoyments which wealth commands, and to diminish the evils to which poverty is exposed. The mental and moral education of the lower orders, which has lately been put into practice, is conducive to the same end; it tends, besides, to strengthen government. Knowledge does not breed discontent; ignorance, on the contrary, seems the parent of anarchy: the whispers of faction have overthrown despotisms; the loudest clamours of sedition are sounded in vain in a free country. If the perfec-

tion of government consists in giving the governed, with the least possible inconvenience, all the advantages of which it is susceptible, it is difficult to conceive how this can be effected in any other way than by successive meliorations. It is thus that something like a self-correcting principle has been introduced into the English constitution, preventing the permanence of abuses without endangering the government, and leading to improvement without the bad effects of innovation, and to the redress of wrongs without the calamities of revolution. These reflections arise naturally from considering what England was in the fourteenth century, and what it is at present.

The subject may be more minutely examined. It is impossible to read the history of the middle ages without being convinced that famines, of which happily but an imperfect idea can be formed in modern times, were among the greatest evils to which nations were liable. The progress of commerce, of agriculture, and, above all, of knowledge, have enabled men to elude these wrathful dispensations. Land is much more productive than formerly, and the excess of one country is transported with ease to supply the deficiencies of another. The famines, so common in past times, are now unknown; but the extent of country over which they once raged, their duration, and the misery occasioned by them, are historical facts that cannot be disputed. No man recollects any calamity so great as that which befel England in the reign of Edward the Second; for three years the people groaned under the double scourge of pestilence and famine. Parliament fixed in vain the maximum price of provisions in 1315; the measure was of no avail, every article of consumption sold at a much higher rate, and it was found very difficult on some occasions to obtain bread for the king's table, a circumstance from which some notion of the scarcity may be inferred.^d The misery, however great during 1315, was more than doubled in the following year; the early crops were spoiled by incessant rains, and the late never arrived at maturity; the want of nourishment, and unwholesome food, produced dysenteries and epidemic disorders among the people. The maximum prices were repealed, and wheat rose until the quarter was sold for ten times its usual value. The cravings of hunger constrained the poor to feed on roots, horses, dogs and the most loathsome animals; instances more revolting to humanity are mentioned by cotemporary writers; many expelled from their castles the crowds of domestics, with which they usually swarmed, and these unfortunate men, without the lawful means of support, were necessitated to live by the plunder of their former patrons or their inoffensive neighbours. Every county was infested with bands of robbers, whose desperate rapacity was not to be checked by the terrors or punishments of the law. The inhabitants were forced to combine for their own protection, association was opposed to association; summary vengeance was inflicted by each party, and the whole country presented one great theatre of rapine, anarchy and bloodshed.^e

Little more than thirty years after these distressing events, the inhabitants were exposed to other evils more destructive in their effects. The great pestilence which

^a Not fewer than twenty-one dearths and famines are enumerated by Howe between the years 1069 and 1325.

^e Lingard's History of England, volume iii.

passed from Asia to the banks and Delta of the Nile, and onwards to the Greek Islands, Italy, and other countries in Europe, was as general and fatal as any recorded in history. Mr. Hume supposes it to have cut off about a third part of the people in England; Dr. Mead makes the number amount to more than a half, and adds, correctly, that the time of the pestilence was the period of the greatest mortality which has been recorded in English history. According to Stowe, those who died in the metropolis were not fewer than fifty thousand. No calamity of a similar nature has taken place in England since the year 1665; how remote then are the chances of them in modern times! The intercourse with the east, nay, with every region of the globe, has decupled, and the seeds of disease, it might be reasonably inferred, are now more easily transported. The contrary, however, is the fact, and it is mainly owing to the precautions taken by European governments, and to the diffused comforts which the people enjoy.

The proportion between the population and the surface of the country indicates, with some exactness, the intellectual advancement of the inhabitants. The population and the extent of England are now known; it is interesting to determine what the former was in past times. According to the fifty-first of Edward the Third, a poll-tax of four-pence was imposed in the year 1377, on lay persons, male and female, of fourteen years of age and upwards; mendicants only were excepted. An official return of those who paid the tax in each county, city and town, is fortunately preserved.^a The persons who paid it appear from the subsidy roll to have been equal to 1,367,239. If the number of mendicants and those who eluded payment could be discovered, the total population might at once be known; for it may be assumed, with sufficient accuracy, that all the individuals under fourteen years of age are less numerous than a third part of the inhabitants. If the poor, the young under fourteen years of age, and the omissions in collecting the tax, be supposed equal to one half of the original number, the lay population amounted to 2,050,858. But the beneficed clergy, who contributed, were equal to 15,229, and the non-beneficed clergy to 13,932. Wales is not included in the roll, but it is supposed to have contained as many inhabitants as Yorkshire, or 196,560. Cheshire and Durham had their separate receivers; the first is ranked with Cornwall, 51,411, and the second with Northumberland, 25,213. All the inhabitants of England and Wales were thus equal to 2,353,293.^b This approximation is more probably above than below the truth, for there is reason to believe that Wales was less populous than Yorkshire, Cheshire than Cornwall, and Durham than Northumberland. Although the data may be defective, they indicate, with sufficient accuracy, a very scanty population, the result of an imperfect state of society, foreign wars, domestic dissensions and pestilential diseases.

A great council appears to have shared the legislative authority with their sovereign, after the Norman conquest. These councils were founded on feudal principles, and the royal revenue was derived from the royal demesnes, and by dues from military tenants. The king might receive extraordinary contributions from the great-

er vassals, but the consent of the latter was implied, and it was their duty to consult with the inferior vassals, of whose rights and interests, as their lords, they were the natural protectors. The changes by which these great councils merged into parliaments have been obscurely handed down to posterity.

The earliest records from which the existence of the house of commons can be regularly traced, date from the twenty-third year of Edward the First. It then consisted of seventy-four knights from all the counties in England, except Chester, Durham and Monmouth, and of a varying number of members from cities, towns and burghs, amounting sometimes to two hundred and sixty, and at other times to not more than a hundred and seventy-four.^c The variation may be attributed to the negligence, remissness or partiality of the sheriffs, to whom the returns were committed, and also, but in a less degree, to the little value attached to a seat in parliament in early times, for the inhabitants of different places were allowed, at their own request, to discontinue the exercise of the elective franchise. Not long afterwards, other places, either because they had risen into importance, or, in some instances, for other reasons, obtained the right of sending members to parliament. It is proved by constitutional writers, that all who possessed landed or moveable property, ought to be bound by no laws, more particularly, ought to be liable to no taxes, to which their consent had not been obtained by means of their representatives. "This is so much the case," says Mr. Hallam, "that if, in examining the map, we find any sea-port, as Sunderland or Falmouth, or any inland town, as Leeds or Birmingham, which has never enjoyed the elective franchise, it may at once be concluded that it has emerged from obscurity since the reign of Henry the Eighth."^d

If it were necessary to trace the parliamentary history to an earlier period, it might be shewn from the innovations attributed to Simon de Montfort, Earl of Leicester, that the towns had risen before the year 1264, from the degradation in which they were placed after the conquest. So great a change was accomplished in two centuries; during that interval, the citizens and burgesses availed themselves of the poverty of their lords to purchase important privileges. The latter received a common rent, and they exacted no longer individual services; the guilds were incorporated by charters, and the towns were entitled to levy tolls, hold fairs, enact laws, and elect their own magistrates. Much about the same time, gifts were substituted for tollages, or in other words, the towns obtained the right of taxing themselves.^e It is of little consequence if, in some corporate burghs, the elective right was vested in freemen, for all those who were assessed for their landed or moveable property, were included in that class; the great distinctions between freemen and the other inhabitants of towns, are of later origin.

Although the government of Henry the Eighth was practically despotic, he is entitled to the merit of having extended the elective franchise. The whole of Wales, the counties of Chester and Monmouth, and even the towns of Berwick and Calais, were for the first time represented; thirty-three new members were thus added to the commons. Edward the Sixth erected fourteen

^a This record was laid before the Antiquary Society in 1784, by the late Mr. Totham of the Paper Office.

^e Lingard's History, chap. v.

burghs, and restored ten that had discontinued their privileges. Mary added twenty-one, Elizabeth sixty, and James twenty-seven members. Five Cornish towns were represented at the accession of Edward the Sixth, and twenty-one at the death of Elizabeth. The oppressive jurisdiction of the stannary courts, and the burdens to which some of the inhabitants in Cornwall were subject, were not the real causes of such innovations. The practice of conferring the elective right on insignificant places and small burghs, commenced in the reign of Edward the Sixth, a practice occasioned by the importance of the popular part of the government, and adopted by the crown to increase its influence. It is remarkable that the inhabitants of the town and county of Durham were overlooked during this long period; the right was first conferred on them in 1673; the cause of their exclusion cannot be easily explained; it has been attributed to the prevalence of popery.^a Liability to local and perhaps general taxes, was without doubt the principle on account of which the elective franchise was first conferred, but it has been confined in later times to particular classes, such as burgage tenants, the freemen of corporations, or the magistrates of towns.

The aristocratical branch of the government^b may be traced to the Norman conquest. This assembly was composed of the barons and prelates, who were afterwards styled the greater barons in the great charter. Baronies by tenure or in fee are of a later date, but at a still later period, the introduction of barons by writ, produced an important change in the character of the assembly. Notable persons, not possessing any previous title, were summoned by John to attend his first parliament. Similar writs of summons became more frequent in the succeeding reign, for the same policy was adopted by Henry the Third to strengthen himself against the more powerful lords. The crown might withdraw the writs of summons, so that the privileges of the titular barons depended on their subserviency to the court. If a person be now summoned to parliament, he and his heirs are ennobled, but this improvement was first introduced in the sixteenth century.^c

The period, from the accession of Edward the First to the death of Edward the Third, cannot be considered unfavourable to the development of constitutional principles. To carry on the expensive wars in which the last of these monarchs was engaged, heavy taxes were necessary; these were borne by the people, but they do not appear to have been backward in asserting their rights—their money was not spent in vain. The utility of frequent parliaments was acknowledged as the only means of amending errors, redressing grievances, and abolishing abuses. It was ordained in the preceding reign that a parliament should be held at least once a year, but as the power of those who made the law might be called in question, the same statute was again solemnly passed and faithfully observed. Although Edward the Third may

have wished, he had not the power to break it; his wants rendered him dependent on the aids of his people, and more than seventy writs were issued for assembling parliament in his fifty years' reign.

Purveyance had become an intolerable hardship; the right of exacting it extended to the royal suite, which amounted often to more than a thousand persons; it was much curtailed by parliament. The sources of justice were corrupt, and judges were accessible to bribery; to lessen the temptation, the salaries were increased, but their integrity continued doubtful. The French language was the language of the tribunals, but as it was unknown to the greater number of Englishmen, the proceedings of the different courts may be said to have been secret. It was enacted that all informations should be laid, and all pleadings delivered in English; a great improvement was thus accomplished.

The celebrated statute of treasons was the greatest benefit that was conferred on Englishmen in this reign. An able writer has shewn that the effect of this law was to weaken the power of oppression in England more than in other countries.^d The light of knowledge began to dawn in the same period. Wycliffe has been styled the "Morning Star of the reformation;" but he lived in too early an age; the spirit of his innovations was not communicated to the people; still the zeal of his followers, and the boldness of the lower orders, broke out in rebellions during the succeeding reign.

Religious edifices are the noblest monuments of the architecture of the period. If it be denied that this art was then carried to a degree of perfection in England, which it has not since attained, it may be admitted that some of the finest structures in the same country were raised in the thirteenth and fourteenth centuries. As a proof of this remark, it is only necessary to mention the cathedrals of York, Winchester, Salisbury, Lichfield, and many others. It is said that not fewer than a hundred and fifty-seven abbeys and other religious houses were founded in the reign of Henry the Third.^e Rome encouraged those who engaged in such works, and for its vain promises, men consented to spend their time, their labor and their wealth. The associations which the sanctuary recalled, accorded with the feelings of the age, and these it was the policy of Rome to cherish—the hopes giving rise to enthusiasm, and the fears terminating in superstition, both alike fatal to truth, but well adapted to strengthen the power of the church.^f

These buildings indicate the progress of an important art, and improvement cannot be made in any art or science without communicating something of it to others. Thus, to have clocks for the cathedrals, Edward the Third invited John Uniman, William Uniman and John Lutuyt of Delft to come into England, and granted them the royal protection to exercise their trade in any part of the kingdom.^g Englishmen learnt the art from these foreigners, and a clock made by Richard de Wallingford, abbot

^f "Italians, some Greek refugees, Frenchmen, Germans and Flemings formed a fraternity of architects, possessing particular privileges, and obtaining papal bulls for their protection. They styled themselves freemasons, and went from one nation to another, as they found churches to be built (for very many in those ages were everywhere

building through piety or emulation :) their government was regular; and where they fixed near a building, they made a camp of huts. A surveyor governed in chief; every tenth man was called a warden, and overlooked each nine. The gentlemen in the neighborhood, either out of charity or commutation of penance, gave the materials and carriages. Those who have seen the accounts or records of the charge of the fabrics of some of our cathedrals, cannot but have a great esteem for their economy, and admire how soon they erected such lofty structures." ^g Henry, book iv. chap. 5.

of St. Albans in the succeeding reign, is described by a writer who appears to have examined it.^a

The inhabitants of Flanders and the Netherlands had acquired wealth from the sale of their woollen stuffs. The importance of English wool was well known even at this time, and it was the object of government to encourage its manufacture. John Kempe, a celebrated woollen manufacturer of Flanders, accepted the invitation of Edward the Third, and arrived in England in 1331, with his apprentices and workmen; the royal protection was promised at the same time to all weavers and fullers who settled in the island; in consequence, seventy Walloon families came in the same year, and their example was followed by greater numbers in the succeeding years of the reign.

The most remarkable trading companies or rather corporations were the brotherhood of St. Thomas à Becket, afterwards the merchant adventurers, the German merchants of the Steel Yard, and the merchants of the Staple. It was the object of the last to purchase the staple commodities of the kingdom, viz. wool, wool-fells, leather, lead and tin, and to convey them to certain towns, called *staple towns*, that the king's customs might be collected with ease, and that foreign merchants might know where to find the commodities. One of the regulations was very impolitic; natives might be employed in collecting and conveying the different articles, but no Englishman was allowed to export them. The people complained that the trade was in the hands of foreigners, and it is certain the greatest merchants then in England were merchant strangers. Those of Lombardy were perhaps more opulent than the rest, but their usurious practices brought popular vengeance more than once upon them. The Caurisimi of Rome, according to Matthew Paris, charged sometimes sixty per cent. interest. Edward the Third acknowledged a debt of 12,000 marks to the Bardi of Florence, and granted them a present of two thousand pounds for their good services.^b However imperfect or unjust the traffic of these foreigners may have been, the country was really improved by them; they shewed others the road to wealth, and they made Englishmen acquainted in some degree with the civilization of Italy.

The tumults in the next reign^c indicate the rising importance of the people, and the decline of servitude, if not of vassalage. To enforce the arbitrary laws which had been enacted, required all the energy of Edward; the task was too great for his feeble successor. The excesses of the people are sometimes the consequences of oppression and injustice on the part of their rulers; in the reign of Richard, the brutality of a tax-gatherer was the signal of a revolt, which endangered the throne, and levelled with the ground the finest buildings in London. The doctrines of Wycliffe were perhaps the remote causes of the same event; it was difficult to restore Christianity to any thing like its original

^a "Being now an abbot, and possessed of wealth and leisure, he resolved to leave a lasting monument of his ingenuity, art and learning. With this view he fabricated, at a great expense of money, thought and labour, a most wonderful clock, which represents the revolutions of the sun and moon, the fixed stars, the ebbing and flowing of the tides, and an almost infinite number of other lines and figures. When he had finished this wonderful piece of mechanism, to which, in my opinion, there is nothing in Europe comparable, he composed a book of directions for managing and keeping it in order, that it might not be ruined by the ignorance of the monks." *Leland de Scriptoribus Britannicis.*

purity, without exposing the corruptions that prevailed. Preachers embraced the new opinions, and although they could not correct the abuses of the church, they roused the people to an insurrection pernicious in its immediate consequences, but productive afterwards of great good.^d

An evil resulting from the feudal system called forth the interference of the legislature; although it was not abolished until a later period, it may be mentioned as descriptive of the state of society. Numerous dependents wore the badges or livery of their respective chiefs, engaged in their quarrels, and participated in their crimes. The chieftains were often at enmity with each other, and the people obtained protection not from the government, but from the lord whose cause they espoused; improvement was thus retarded, the useful arts were neglected, and the indolence and predatory habits of the nobility were imitated by their followers. It might be urged that the first peer, whose title depended on letters patent, was created by Richard the Second, but it was merely by the remote consequences of the innovation that the feudal system was weakened.

The solemn deposition of Richard the Second by the parliament, may indicate the dependence of kings on their subjects; but this violent proceeding has been quoted to extenuate other measures of the same kind; it is to pervert history to suppose it was in any way brought about by the people. In feudal times and in so rude an age, their influence is very insignificant, and it might with equal truth be imagined that the Russian people and not the Russian nobles had the guilt or merit of putting the emperor Paul to death.

The period from the year 1399 to 1455,^e is eventful in foreign wars, brilliant victories, civil discord and national calamities. The doubtful title of Henry the Fourth gave rise to a civil war that was not terminated before the battle of Bosworth. In these contests, the wealth of England was wasted, and her nobles slain. It is uncertain whether the conquests by which Henry the Fifth extended his dominions, or the defeats by which they were lost, were more fatal to the prosperity of the country. Men's minds were averted from the arts of peace by wars abroad; civil dissensions, religious persecution and the rancour of faction at home produced the same effect.

The church had reached the acme of its power in the same reign;^f persecution then began, and William Sautre was the first Englishman whose life was sacrificed on account of his religious belief; not long afterwards, many others obtained the honour of martyrdom. Henry, when Duke of Lancaster, was suspected of favouring the Lollards, but no sooner had he ascended the throne, than he became their persecutor; as a subject, he embraced the popular opinion; as a king, he thought differently; the church might strengthen his authority, or sanction his usurpation.

On one occasion, the commons instead of granting supplies, advised the king to seize the temporalities of the

^f That of Henry IV.—P.

church; the lands of the clergy, they insisted, amounted to a third part of the kingdom; they contributed nothing to the exigencies of the state; their great wealth made them neglectful of their duties. The advice was followed in a later reign.

The exigencies of the sovereign were at least attended with one advantage; they made him more dependent on the commons. It is impossible to read the history of the period, without being convinced of the increasing importance of the lower house, perhaps the only real advantage that was obtained in these troublous times. Acts of misgovernment, unjust exactions on the part of the prince, or prodigality of the public money, seldom escaped the vigilance of the commons, and they were not slow in remonstrating against them. Sir John Tiptot, speaker of the lower house, in a speech addressed to the throne, told Henry the Fourth, that the country was impoverished by excessive impositions, while nothing was done for its benefit. Ninety-six towns and castles, he added, were taken in Guienne; Ireland was almost lost, although much money had been expended in its defence; the Scottish marches were in a bad condition, the rebellion still continued in Wales, the sea was ill guarded, and the merchants ruined; the expenses of the household were excessive, and the court was filled with worthless men.^a

Such remonstrances were sometimes of little use; in the present case, Henry had the address to obtain from the same parliament a considerable sum; although many other instances might be mentioned, in which the same means were unavailing, still the effect of remonstrances continually urged, and of grievances always exposed, was to obtain concessions from the sovereign, and supplies from the people, to raise and strengthen the fabric of English liberty.

It is of consequence to mark the changes that have taken place in the representative system. Before the year 1429, every man, who possessed a freehold, however small, had a vote in electing a knight of the shire; but in the same year, the law was changed, and the small freeholders were deprived of their rights. It is declared in the 8th Henry VI., "that the knights of the shire shall be chosen in every county, by people dwelling and resident in the same counties, whereof every one of them shall have free land or tenement to the value of forty shillings the year, at least, above all deductions." He who possessed a freehold estate of forty pounds a year, was qualified to become a knight of the shire, or the member of parliament for a county. As to the towns and burghs, the electors were directed by the writs to choose the most fit and discreet freemen, resident amongst them, and none others upon any pretext.

The business of parliament was not so well understood in those times as at present, elections were not conducted with the same regularity, and the powers of sheriffs

were less accurately defined. Thus, it is certain, the number of members in the lower house was indeterminate, while the sheriffs appear to have exercised a discretionary power; they sent precepts sometimes to more, sometimes to fewer towns and burghs in the different counties. It happened also that precepts were sent to some places, from which no returns were made, and that others excused themselves on the plea of poverty.

To regulate the proceedings at elections many laws were made, but these were not always effectual. From the year 1411 to 1447, the knights for the large and populous county of York were not returned by the freeholders, but by the attorneys of a few nobles.^b

The corruption of sheriffs was one of the most common abuses that prevailed in those times. By different statutes it was enacted, that if a sheriff made a false return, he was liable to a fine of £100 to the king, and of a like sum to the injured party, and to a twelvemonth's imprisonment.^c It has been well observed that this severity was necessary, for if a member was deprived of his seat by a false return, the sessions of parliament were so short, that he had little chance of recovering it.

It was not imagined, in this period, that members for parliamentary influence, or for the distinctions and emoluments to which parliament leads, should devote their time and attention to the public service, and, in particular, to the interests of the counties and towns, of which they were the representatives. Coeval with the origin of the lower house, was the practice of remunerating its members, a practice not sanctioned by any enactment, but founded rather on a principle of justice. These wages, if they may be so called, varied at different times; they were fixed, in the reign of Edward the Third, besides travelling expenses, at four shillings a day for a knight of the shire, and at two shillings for a citizen or burgess. It is almost unnecessary to add that no member disdained to receive his hire. This custom enables us to explain why the inhabitants of so many places considered the elective privilege a burden, and prayed to be excused from exercising it.^d

It would have been of little avail to pay members for their services, if they were prevented from performing them. It was therefore declared unlawful to arrest them for debt, or any civil obligation, during the sitting of parliament; but the same rule was not then applicable to the intervals between the sessions; the extension of the privilege was of more recent origin.

The greatest improvement in the parliamentary history of the period related to the manner in which laws were framed. In early times the commons presented petitions at the end of every session; of these, some were either granted or refused by the king, while the consideration of others was deferred to a future period. In the reign of Henry the Fifth, in place of petitions, acts were drawn up by the judges before the close of the session. Such

^a Parliamentary History, A. D. 1406.

^b Henry's History of Great Britain. Book v. chap. 3.

^c "Diverse sheriffs of the counties of the realm of England, for their singular avail and lucre, have not made due elections of the knights, nor in convenient time, nor good men and true, returned, and sometimes no returns of the knights, citizens, and burgesses, lawfully chosen to come to the parliament; but such knights, citizens, and burgesses, have been returned, which were never duly chosen, and other citizens and burgesses than those which, by the mayors and bailiffs, were, to the said sheriffs, returned. And sometimes the sheriffs have not returned the writs which they had to make of elections of knights

to come to the parliaments; but the said writs have imbisied, and moreover, made no precept to the mayor and bailiff, or to the bailiff or bailiffs, where no mayor is, of cities or boroughs for the election of citizens, or burgesses to come to the parliament." 23d Henry VI. chap. 14.

^d In the longest parliament of Henry IV. the members sat one hundred and fifty-nine days. "The two knights of the shire for Cumberland received £80, 8s.; because, besides the one hundred and fifty-nine days that the three sessions lasted, they were allowed wages for forty-two days for their three journies." Henry, book v. chap. 3. It is needless to make any comment on the rate of travelling; the three journies may now be performed in less than ten days.

a power, it was evident, could not long continue in such hands; accordingly, in the succeeding reign, bills and acts were framed by the commons, and one enacting clause sufficed for as many as were passed in a session, or in other words, for all those to which the lords agreed, and the king gave his royal assent.

The rights of the subject were held by a very precarious tenure, the people had often no control over their king, and so long as he was independent of them, the latter were exposed to all the evils of a despotic government. There were so many illegal methods of obtaining money, and these were so frequently resorted to, as to preclude the necessity of having recourse to the commons. Thus, Edward the Fourth having expended all the supplies that were granted by parliament, obtained a benevolence or free gift from his subjects, by which the wealthiest amongst them were impoverished.

The dispensing power of the king was incompatible with the existence of a free community; it enabled a monarch to dispense with the most solemn laws, and to extend a like indulgence to individuals and whole classes of men. Wilkins mentions an extraordinary instance of the exercise of this power; to gain the support of the clergy, Edward the Fourth, in the second year of his reign, allowed them to violate every law, and the judges were prohibited to try or punish an archbishop, bishop or clergyman for treason, ravishing women, or any other crime.^a The same power, it may be added, was exercised in many other instances, although perhaps never in so iniquitous and absurd a manner.

The English government resembled a military despotism during the worst period of the civil wars. The high constable was vested with a commission, by which he might put any subject to death secretly, and without the salutary constraint of legal forms. If he wished to discover the guilt or innocence of those whom he condemned, (an act of humanity by no means necessary), recourse was had to the torture. A monument of these times is still preserved in the tower of London; the rack, called the Duke of Exeter's daughter, was invented by that nobleman when he filled the office of high constable.

The arts of peace, and the varied resources of commerce and industry, were almost destroyed in the confusion of wars and civil discord. The population, there is reason to believe, was much reduced; many towns were changed into villages, and others were levelled with the ground. A great part of the country was laid waste, agriculture was neglected, and arable lands were converted into pasturage. It would be incorrect, however, to imagine that nothing was gained from these contentions; they were the precursors, perhaps the causes of the rapid improvements, that may be dated from the accession of Henry the Seventh. An important change took place in the condition of the great body of the people; if the decline of slavery commenced before the reign of Henry the Third, the period of the civil wars determines the decline of villeinage.

The country having been desolated with numerous armies during the greater part of a century, these armies, and the others that engaged in the expeditions against France, consisted of the lower orders; but, according to the genius of feudalism, the villein, who was released

from the soil, and who fought in the cause of nobles and kings, could not afterwards be degraded by servitude. The church was unfavourable to bondage even in the darkest times; in England the laws and the nature of the government were equally against it; but the principal cause of the change must be attributed to the progress of knowledge. While the spirit of commerce created a greater demand for labour, which could be only supplied by a scanty population, it was discovered that the hired labour of freemen was far more productive than the forced toil and the habitual indifference of slaves.

The changes that had been made from time to time in the currency, tended to create embarrassment and confusion; the higher orders suffered most from the evils springing from such causes; the revenue of the king, and the incomes of the nobles, remaining nominally the same, were necessarily diminished. Commerce had to contend not merely against impolitic decrees and unwise regulations, the arbitrary power of princes was destructive of its true interests; in those days the king could not only press mariners and soldiers, but artificers of every kind, and all the merchant vessels of his subjects. Thus, Henry the Fifth, preparatory to his first expedition against France, pressed all the ships of twenty tons and upwards, in all the English ports. Letters of marque, so common in that period, and frequently obtained on false pretences, by making it unsafe even in time of peace, to transport commodities, increased the risks to which trade was unnecessarily exposed. But in spite of every disadvantage, the most absurd regulations, an arbitrary government, and the unjust system of reprisals, commerce must have been even then a road to wealth. Norburg and Hende lent large sums of money to their sovereign, and adorned the capital with public buildings. Sir Richard Whittington rebuilt Newgate, the library of the Grey-Friars, and part of St. Bartholomew's hospital, and also founded a college of priests in the street that is still called College Hill. William Canning was five times mayor of the trading city of Bristol; some notion of his wealth may be formed from the fact that he paid Edward the Fourth a fine of 2470 tons of shipping.

The population of England in 1485 may be vaguely estimated by comparing the imperfect census in 1378, with one equally loose in 1588; and although nothing more than a rude approximation can be obtained, it is certain the total number of inhabitants was not more than three millions; it was distributed in a very different way from what it is at present; Lancashire and Cumberland were ill peopled, while London and Westminster did not contain more than sixty or seventy thousand persons.

The germs of liberty are sometimes the consequences of civil wars and revolutions, but they did not spring after the contests between the roses. Freedom was repressed, if not crushed, by the Tudors; the moral degradation of the people, the result of political servitude, was completed by Henry the Eighth, and faint indications of a better spirit are all that can be discovered in the long and glorious reign of Elizabeth. The ancestors of the English had left them a noble example; on some occasions they had maintained their rights by constitutional means; at other times by resisting despotic acts. Their children submitted to a new line of kings, and instead of extending the privileges which their fathers had won,

^a Wilkins, Concil. tom. iii. p. 583.

they relinquished them without a struggle. English historians have endeavoured to account for this change in the character of their countrymen. "It is now the generally received opinion, that to the provisions of that reign (viz. of Henry the Seventh) we are to refer the origin, both of the unlimited power of the Tudors, and of the liberties wrested by our ancestors from the Stuarts: that tyranny was their immediate, and resistance their remote consequence; but he must have great confidence in his own sagacity, that unaided by subsequent events could, from a consideration of the causes, have foreseen the succession of events so different."^a It is not perhaps inaccurate to attribute immediate submission to some of the measures in that reign, and remote resistance to others of a very different character. To account for the former, much must be ascribed to the state of England at the time; a reaction must have certainly been produced by the civil wars; the memory of the contest was fresh in the minds of many; the evils attending it were perhaps exaggerated by their interests or their fears; at all events, repose seemed an invaluable blessing.

The aristocracy had always resisted the power of the crown, but their order had been much reduced in the wars between the rival houses of York and Lancaster. So many peers had been attainted, so many had fallen in battle or perished on the scaffold, that thirty only could be summoned to the first parliament of Henry the Seventh; it was not his policy to increase them; accordingly, not more than thirty-eight temporal peers attended the first parliament in the succeeding reign. It must also be allowed that the contests tended to weaken liberty, and to strengthen faction. The blood of the nation had been shed, not for their rights, but for the claims and pretensions of their rulers. Henry the Seventh ascended the throne, and although his real title was that of conquest, no attempt was made on the part of the people to secure their rights, none to redress grievances, or abolish abuses. It is well remarked by Lord Bolingbroke, that all the power with which the victory of Bosworth had invested the earl of Richmond, was employed in having the act of settlement so framed that his right to the crown might appear inherent in himself and independent of parliament. The wisdom of his policy in other respects may be doubted; he ruled more like the leader of a faction than the king of a great nation; every opportunity was taken to elevate the Lancastrians, and to humble the Yorkists. The reign was by no means a quiet one, but the people took no part in the disturbances; the opposition sprang from factions, of which the puppets were a Simnel and a Warbeck. An insurrection was no sooner repressed, a rebellion no sooner subdued, than the king strengthened his authority, and arbitrary power was gradually established; the danger to which the kingdom had been exposed, seemed to justify every new encroachment, until the first of the Tudors ruled by force, and the nation, too desirous of tranquillity, suffered its rights to be taken away one after another.

The measures, of which the remote result was favourable to freedom, were of a very different nature; some of

them related to the internal government of the country; commerce was increased, agriculture was improved, and the useful arts were encouraged and promoted. The taxes imposed in this reign, however oppressive, were borne by the people; the treasures amassed by the king, however unjustly acquired, were much greater than any of which mention is made in a former age. Wise laws were enacted, and it is comparatively of little consequence to whom the merit of them may be due. All the effects of the king's policy were probably unknown at the time; while he humbled the peerage, the condition of the middling and the lower orders was improved; but it was not thought that they could become at a future period a more formidable enemy than the aristocracy to arbitrary power. The personal services of the tenants were now commuted into rents, and much about the same time the nobles were allowed to alienate their lands; the means were thus acquired by the commons of increasing their property and influence in the state.^b

It is impossible, in a work of this nature, to enter into details on any part of English history; still it might be considered an omission to take no notice of the Court of Star Chamber, which is commonly supposed to have had its origin in this reign. It is not indeed imagined that it then existed in all its iniquity; the jurisdiction of the tribunal was gradually extended. Had the purposes, for which it was first instituted, been always adhered to, it might have been more deserving the praise which has been bestowed on it by Bacon; many deviations had been made in his time, and if there were no reasons to suspect his commendation, it was necessary at least to place its proceedings wholly out of view, to consider what it might have been, or even what it was in the reign of Henry the Seventh. The inherent vice of the court, if it may be so termed, was manifest in its construction. The judges were the chancellor, the treasurer, and the lord privy seal; they might claim the assistance of a bishop, a temporal lord of the king's council, and the two chief justices. The judges, it might be urged, were afterwards altered, still they were always confined to the members of the council; they became more numerous, but not more independent. It may be right to observe that the encroachments of the Star Chamber were for a time restrained by the bishops; they appear to have possessed considerable influence, and they exerted it in mitigating severe penalties.^c The power of the court, it is equally true, was greatly increased by Cardinal Wolsey, then chancellor of England, and archbishop of York. It assumed an almost indefinite jurisdiction in cases of offences, and it could inflict any punishment short of death; fine and imprisonment were the earliest, perhaps the most frequent; the pillory, whipping, branding and cutting off ears became common in later times; hands and noses were cut off in the reign of Elizabeth.^d If subject to salutary and wise regulations, the method of punishing by fines, may not be liable to serious objections; but it never has been maintained that the fines imposed by the Star Chamber were either proportionate to the offences, or inflicted for the purpose of preventing them. It became customary to impose fines that were wholly ruinous to individuals, and the judges partici-

^d Idem, chap. 8.

pated in the ill-gotten wealth, a temptation too great perhaps for ordinary virtue to resist in any age, particularly under the dynasty of the Tudors.

The influence of the Star Chamber may be traced in some parts of the English law; the court did not exist in all its rigour before the time of the Stuarts; to enumerate all its proceedings in the reign of Charles the First, all the unjust decisions that were pronounced, and all the cruel punishments that were inflicted, might fill a volume. Thus a tribunal, which had been originally instituted to restrain the lawless power of the nobles, and to prevent the recurrence of crimes that had been too often committed with impunity, became gradually subversive of freedom, and extended its oppressive jurisdiction over every class of the community.

The reign of Henry the Eighth, inasmuch as it is connected with the reformation, forms an era in English history; it may therefore be necessary to state succinctly his religious creed and that of his subjects; in reality, it differed less from Catholicism, than is commonly imagined. The creed that was finally imposed on Englishmen by the monarch, is contained in the law of the six articles, which are confirmatory of the Catholic faith. It was the boast of Henry, that he retained the religion of Rome, after having shaken off the supremacy of the Pope. According to the first article, there remains no substance of bread and wine in the sacrament of the altar after the consecration, but under the forms of bread and wine, the natural body and blood of Christ. According to the second, the communion in both kinds is not necessary to the salvation of all persons by the law of God. Thirdly, priests may not marry by the law of God. Fourthly, vows of chastity ought to be observed by the law of God. Fifthly, the use of private masses ought to be continued, since they are agreeable to God's law, and men derive great benefit from them. Lastly, auricular confession is expedient and necessary, and ought to be retained by the church.

It was not until the reign of Edward the Sixth, while the Duke of Somerset was protector, that the actual reformation took place in England. It was then that prayers to saints were declared superstitious, and that masses, dirges and prayers in a foreign tongue, were prohibited. To write or speak against the dispensation of the sacrament in both kinds was made unlawful by act of parliament, the liturgy of the church of England was introduced, and the statute of the six articles was repealed. In this drama, the king and the nobles were the principal actors; it may be inferred that the people were not ripe for the change, because insurrections broke out in many parts of the country, and because it was easy in the next reign, to bring back the nation to its ancient faith.^a The Pope, it is natural to suppose, might have been more compliant; his refusal was certainly a deviation from the usual policy of Rome, but one for which the state of Europe sufficiently accounts.^b The power of Charles the Fifth continuing on the ascendant in Italy, Clement the Seventh concluded a treaty with him on the most advantageous terms; the latter obtained the great object of his desire; the Medici were restored, and Tuscan liberty was lost. The taking of Genoa, and the

destruction of the French army in Naples, compelled Francis to submit to the league of Cambray; Henry was deserted by his allies, and the Pope sacrificed the interests of the church to those of his family. If a different policy had been pursued, the separation from the catholic church might have been retarded; to prevent it from ever taking place, was beyond the power of any English monarch or any Roman pontiff.

Vanity and presumption were as conspicuous in the character of Henry, as cruelty and ungodly passion; these may have been the immediate causes of the rupture, but the wealth of the church increased the resources of the king, and rendered him independent of his people. Never had so much been gained by the crown from the confiscations that followed subdued rebellions, as from the suppression of monasteries. The clear yearly revenue was rated at £131,607, but, according to Bishop Burnet, it amounted to ten times the sum; although the last sum may have been overrated, the other, it is certain, was much too low; besides, it is well known to have been the practice of the courtiers to undervalue the estates, that they might purchase them on easy terms. The king, it is said, was advised to divide the abbey lands, and to make them over *on easy terms* to the nobles and gentry; if they were bound, it was argued, by the ties of private interest, there could never be a lasting reconciliation with the court of Rome. The soundness of the argument was made evident in Mary's reign, for although her parliaments exhibited the most perfect obsequiousness in all matters relative to religion, they could never be made to consent to the alienation of the church lands. The justice or injustice of Henry the Eighth's conduct has been maintained by different writers according to their protestant or catholic views. These lands escheated not necessarily to the crown because the authority of the pope was denied; but the seizure of them, it is asserted, was a violation of private property; there is some difference, however, between the property of individuals and of corporations; the one is considered more sacred than the other.^c The justice of the measure may be called in question, but the advantages of it cannot be reasonably doubted. The weakness and almost total extinction of the nobility accounts for the despotic sway of the Tudors; to strengthen the aristocracy, therefore, was to raise a barrier against farther encroachments; now, with a few exceptions, all the great English families rose first into notice in the time of Henry the Eighth; the weight of their influence was thrown into the opposite scale; it became adverse to tyranny. Independently of this high consideration, much benefit resulted from the diffusion of property; in those days the English nobles were given to profuse hospitality, they now encourage the liberal and the useful arts. Many of the church lands had been left by pious persons on condition of performing masses for their souls, or other ceremonies, which, although sanctioned by the church, are deemed superstitious. The necessary consequence of such property remaining in such hands, was to promote idleness and mendicity, to encourage ignorance, and to check improvement by an obstinate adherence to antiquated customs and erroneous opinions.

^a Essay on the English Constitution, by Lord John Russell.

preceding, as it now stands, to the reign of Edward VI.; but it might equally apply to the suppression of the monasteries by Henry VIII.—P.

^c The question has been ably treated by the learned Mr. Hallam.

If Henry the Eighth was tyrannical, parliament put the seal of its authority to the laws which confirmed arbitrary power. The first part of the reign is distinguished by the persecution of heretics, the last by the murder of catholics; in short, no man's life was safe, who believed more or less in matters of religion than the monarch prescribed. If the king wished to repudiate his queen, parliament condemned her on the most unjust and frivolous pretexts. If any man eminent for learning or virtue incurred the royal displeasure, he was put to death, but without any violation of the forms and ceremony of law. The people could not contend against the impetuosity of the prince, and the abject complacency of parliament. The king threatened to cut off the heads of refractory commons, and the threat silenced the loudest murmurers. To levy an oppressive tax, archbishop Morton used an unanswerable argument; the merchants who lived sumptuously were informed that their wealth was evident from their expenditure; those who lived frugally, it was urged by the same person, must have amassed great sums by economy; both were forced to contribute. On one occasion, an attempt to raise a sixth on the goods of the laity, and a fourth on those of the clergy, was resisted; the commissioners were recalled, and the project was abandoned.

Queen Elizabeth had the merit of having first firmly established the protestant religion; in the reign of the same princess, England rose to a state of greatness, of which there had been no parallel in past times. It is doubtful if there ever was a greater queen in any other country; it is certain she was superior to English sovereigns in the art of ruling. In her reign, England became the guardian of the protestant faith, the mistress of the sea, the scourge of Spain, and the mediatrix of the factions in France. The nature of the government, however, was very different from the present. The vague jurisdiction of the Star Chamber extended to whatever was not cognizable at common law. The established church was guarded by the high court of commission for ecclesiastical affairs; it punished with equal severity the catholics on the one side, and the puritans on the other; boundaries were assigned to faith, and men were commanded to believe particular tenets and speculative doctrines. The right of printing was not only a monopoly, but the favored few who enjoyed it, were restrained by a most vigilant censorship. The importation of foreign books was prohibited, and some individuals were punished for having the works of catholics in their possession. Judges allowed themselves an extraordinary latitude, and they could do so with impunity, while the semblance of juries was all that had been preserved, and while fines and imprisonment awaited every juryman who gave a verdict according to his conscience. The royal proclamations had the force of statutes, and such a power seems incompatible with the existence of a mixed monarchy. While these acts of injustice were committed, many persons, it is undeniable, were not forgetful of ancient rights, and if they were unsuccessful in maintaining them, it must be attributed to the profound dissimulation, the consummate wisdom, and the extreme popularity of the queen. It required all the address of Elizabeth to maintain the prerogatives of which she was so jealous; had a less able hand guided the government, the people might have vindicated their rights. Knowing the danger of having recourse to parliaments, the queen practised the utmost economy; in truth, the new institutions were subversive of

the old, both could never be amalgamated, and the surest method of establishing the former, was to destroy the latter; this, however, no English sovereign was able to accomplish. To grant subsidies, which could not be raised by any other method, to propose statutes, which were not binding without their consent, to examine grievances, and to obtain their redress either by law or by petition to the crown, were the acknowledged privileges of the commons. The speaker claimed the freedom of debate and free access to the royal person at the commencement of every session. The history of the house of commons brightens the darkest pages in the reign of Elizabeth. The queen, some commons insisted, was amenable to the laws; others connected the cause of the puritans with that of freedom. Morice wrote a letter from his prison to Lord Burleigh, expressing his sorrow for having offended the sovereign, but avowing his resolution to strive, while life should last, for freedom of conscience, public justice, and the liberties of his country.^a Every member in the house of commons, it was admitted, is deputed to serve not only his constituents, but the whole kingdom, a power never possessed by the parliaments of Paris, or by the deputations of the estates of other countries; it resulted in England from the election of non-resident burgesses. The commons wrested the right of monopolies, which the queen termed "the brightest gem in her crown, the fairest flower in her garden."

On the whole, if the people submitted to encroachments on their rights, it may be attributed to the illustrious qualities of the princess, to the wisdom and talents of her advisers, to such men as Cecil and Bacon; but in the latter years of her reign, the nation became weary of her sway, and the spirit of freedom revived in England.

If the affection of a people for their rulers depends in any degree on the prosperity of their country, the nation had good reason to be satisfied with their queen; never before was the commerce of England so important, its shipping more numerous, or industry more flourishing. The trade to Russia and Persia was, perhaps, the first indication in England of that commercial enterprise, which forms so striking a feature in the history of the sixteenth century. The earliest commercial treaty between the English and the Ottomans was concluded in 1575, and the former derived many advantages in consequence of their direct communication with Turkey. Thus, the Venetians and Genoese, who had enjoyed almost exclusively the carrying trade of the Levant, were gradually supplanted by the English.

The establishment of an East India company was the last, and in its results, the most important event during the reign. The original stock of a company destined to govern territory, more extensive and more populous than the Roman Empire, amounted only to £72,000; their first fleet consisted of four ships under the conduct of Captain Lancaster.

The bigoted Philip and his sanguinary general contributed most to increase the internal resources of England. The Flemish manufacturers who fled before the Duke of Alva, were received by Elizabeth with kindness; they peopled the deserted streets of Canterbury, Maidstone, Norwich, Southampton and other towns, and they taught the inhabitants to manufacture important articles. It

^a Lodge's Illustrations.

was in the same reign that the ingenious Mr. Lee erected a loom of his own invention for weaving silk stockings. Knives were first made in London about the year 1563; it is almost needless to add that English cutlery is now superior to any other. The first pin manufactory was established in the reign of Henry the Eighth, but it was not until the year 1566 that Elias Grouse, a German, taught the English the art of making needles.

The activity which pervaded every branch of the government under Elizabeth, was communicated to individuals; navigators sailed round the globe, and voyages of discovery were made with success. But it cannot be disputed that commerce might have been extended, and the wealth of the country increased, had the queen followed a different policy; her avarice and importunate favorites prompted her to grant monopolies and exclusive privileges, injurious to an industrious community.

It would be incorrect to follow the example of different writers, and to attribute the origin of the poor laws to a statute passed in this reign. It is declared in the forty-third of Elizabeth that the aged and infirm should be maintained, but that the strong and healthy should be made to work. To provide for all the old and infirm poor, although practicable, may not be expedient; it tends to weaken individual exertion, and to render men indifferent about providing for the wants of old age. It is needless to add that to furnish employment to all the healthy and robust is in ordinary cases beyond the power of government. The English system of poor laws, so different from that of most countries, may be attributed to two causes, the necessity of providing for the poor at the Reformation, then deprived of the charitable aid and the means of subsistence, which they received from the monasteries, and the rapid and great increase in the price of provisions, which took place in the sixteenth century. The act of 1601 is framed with all the deliberation and wisdom for which the ministers of Elizabeth were so remarkable, and if it had been strictly enforced, the condition of the poor in England might have been little different from that of those in Scotland. It was thought afterwards obligatory on the government to find work for all the unemployed, and in dear seasons to make up to those who had families, the difference between the price of bread and the rate of wages. The meaning of the act was thus perverted by the ignorance or unfitness of overseers, and by the method in which relief was afforded.

It might be important to determine the gradual extension of the poor laws, but unfortunately little information can be obtained from the imperfect state of the earlier records. The number of persons receiving parochial aid is said to have amounted about the close of the seventeenth century to as large a portion as at present, or to one-tenth of the population of England and Wales.^a The money collected for the purpose cannot be ascertained; it is not supposed, however, to have been much less than £1,000,000. The long peace and the reduced rate in the price of provisions which followed the treaty of Utrecht, were favourable to the diminution of poor rates. The average amount of them during the three years ending with 1750, did not exceed £700,000. Considerable additions were afterwards made; in 1760 they amounted to £985,000, and in 1770 to £1,306,000. The contest with the North American colonies, the decline of

trade, and the suspension of undertakings, in consequence of the want of capital, or the higher rates of interest, which capital commanded, raised them in 1780 to £1,774,000. The increase in the population, and the war that followed the French revolution, rendered the price of bread so disproportionate to that of labour that the poor rates rose in 1800 to £3,861,000, in 1810 to £5,407,000, and in 1812, to £6,680,000. The average amount of them since the year 1812 has been equal to more than £6,000,000.

Workhouses are in some degree peculiar to England, for they are not, as in other countries, hospitals or houses of correction. The plan of them was established about a century ago, but it was greatly extended by an act, which is commonly called Gilbert's act, from the name of the member by whom it was proposed. The object of the act was to obtain from a number assembled in the same place, all the advantages resulting from a minute division of labour, and a joint disbursement; magistrates were authorized to consider any large workhouse as a common receptacle for the poor throughout an area of twenty miles. However just the theoretical principles on which these institutions were founded may appear, much practical advantage has not been derived from them: the inmates are not separated according to their ages, their habits, or their pursuits, and the division of labour has not been carried to any degree of minuteness.

It is the effect of the poor laws to lower the rate of wages, and although they were productive of no other evil, that alone renders them hurtful to the labouring classes. It appears from the following table that the wages of the country labourers, estimated according to the quantity of provisions they may command, have continually decreased from the year 1742 to 1808.

Periods.	Weekly Pay.		Wheat per quarter.		Wages in Pints of Wheat.
	s.	d.	s.	d.	
1742 to 1752	6	0	30	0	102
1761 to 1770	7	6	42	6	90
1780 to 1790	8	0	51	2	80
1795 to 1799	9	0	70	8	65
1800 to 1808	11	0	86	8	60

Although other articles, particularly clothing, have fallen in price since the middle of the last century, the condition of the lower orders, it is certain, has not been improved. The fluctuations in the price of grain, so common in England, are more severely felt by the same class than by any other of the community. In dear seasons, the mortality among those whose means of subsistence are partly derived from poor rates, is generally greatest.

Years.	Average price of Wheat per quarter.		Deaths.
	s.	d.	
1801	118	3	55,965
1804	60	1	44,794
1807	73	3	48,118
1810	106	2	54,864

The great objection against the poor laws, consists in the inducement which they offer to the lower orders to contract early marriages, and to depress their circumstances

^a Clarkson on Pauperism.

by an undue increase of their numbers: in other respects, their effect is very pernicious; the poor are exposed to the petty tyranny and oppression of parish officers, and gradually habituated to all the vices that spring from humiliating dependence. It may be urged that whatever tends to make them less dependent on parochial relief, tends also to improve their condition. This is best done by removing the taxes, which are imposed on the necessities of life, and which, from that very circumstance, press most heavily on the poor. Such taxes may be compared in their effects to dear corn; in other words, the increased rate of wages by no means corresponds with them. Much good has already been accomplished by taking away the taxes on different articles; those on beer and sea-borne coal, which have been lately repealed, are likely to be followed with similar results. The increasing resources of the country, and a judicious plan of taxation, may lead in time to many improvements, if not to a total change, of the present system.

Adhering to the order of time, it may be necessary to remark that the law by which every parish was obliged to repair its own roads by four days' labour of its inhabitants passed in the reign of Philip and Mary. The first act on a subject so much connected with the prosperity of a country, dates from the reign of Edward the First, but it was intended to prevent robbery rather than to improve the means of communication from one place to another. The roads in several districts were amended, in conformity to different laws of Henry the Eighth. It was not, however, before the reign of Charles the Second, that turnpikes were established, and that those who reap the advantages of easy conveyance, were made to contribute the necessary expense. The rate of travelling in those days was very slow; Cowley having retired from the *hum* of men, invited his friend Sprat to enjoy the pleasures of St. Ann's Hill, and informed him that he might sleep the first night at Hampton Town; the same journey may now be performed before breakfast. When at a later period, Sir Francis Wronghead was chosen member of Parliament, great preparations were made for his journey to town, and many accidents happened by the way, all of which were owing to the badness of the roads. A member at present, when there is a call of the house, orders post horses from the next stage, and calculates the hour of his arrival at Westminster.^a

The defeat and dispersion of the armada, was one of the most remarkable events in the reign of Elizabeth. The subsequent war with Spain, and the romantic attempt of twenty thousand volunteers under the command of Norris and Drake, to place Don Antonio on the throne of Portugal, shewed the enthusiasm with which the people were animated. An alarm having been given of a second Spanish invasion in the year 1599, the queen equipped a fleet, and levied an army in a fortnight to oppose it; from this promptness, foreigners formed a very high notion of the resources of England. But if it were necessary to enter into statistical details, it might be shewn that the single county of Lancashire, from the resources of its manufactures and extensive commerce, can now offer a more effectual resistance to an enemy,

^a Chalmers on the Domestic Economy of Britain.

^b Many instances in which old laws were repealed in vain, are to be found in the works of Lingard, Hallam, and other writers.

than the whole kingdom could have done in the reign of Elizabeth.

The Tudor line having presided over the destinies of England, during a period of nearly a hundred and twenty years, ended at the death of Elizabeth. It was succeeded by the Stuarts, a family less skilled in the art of ruling than their predecessors, less conspicuous for their great qualities, and better adapted to adorn a private station, than to govern a kingdom in troublous times. Every one acquainted with English history, must be convinced that very valuable rights were obtained at an early period from different sovereigns; ever since the barons wrested from John the great charter of their liberties, the government, unless that charter had been violated, could never have been a pure monarchy. But in a rude age, government depended more on the character of princes, than on the force of laws; concessions reluctantly made by one king, were little regarded by his more able or more fortunate successor, and the sway of the Plantagenets was milder than that of the Tudors. Institutions subversive of freedom were first introduced and gradually sanctioned, if they were not accompanied with the most pernicious consequences; the ancient laws, it may be recollected, were never repealed; on the contrary, their authority was often asserted in parliament, at a time when their power was of no effect.^b It was evident, however, that the people must either vindicate their rights, which could only be done by preventing regal encroachment, and by making kings subject not superior to the laws, or give up for ever the great work which their ancestors had begun. A family unable to maintain, and unwilling to give up what they considered their prerogative, ascended the throne, when the people were more powerful than at a former period, and when their additional power was not so much the consequence of greater wealth as of greater knowledge. The study of the Greek and Roman authors, which may be dated in England from the reign of Elizabeth, had enabled the higher orders to form better and juster notions on the subject of government. The stern puritans, now acquainted with the abuses of the Romish church, were naturally enlisted in the cause of freedom; their inflexible spirit might have been prognosticated from the first petition that was presented to James on his road to London, and fortunate had it been for his family and the happiness of the kingdom, had he acceded to its terms. But such lessons left little impression on the mind of the king; his learning betrayed his incapacity to govern; his notions of kingly power accorded ill both with public opinion and English institutions. The puritans could by no means admit of a comparison between the regal and the divine government, but according to the sovereign, the one was emblematic of the other, and resistance to either was impious. Such doctrines were avowed by a prince, who had no legitimate right to the throne of England, and although there is reason to believe that he may have possessed a more sacred title, founded on the people's choice, still it is certain he must have despised it for other reasons than that it was contrary to a positive enactment.^c The acknowledgment, more than the exercise of absolute power, gratified the weakness of the

^c "The declaration, which Mr. Hume asserts Elizabeth to have made on her death-bed, intimating her wish that her kinsman, the king of the Scots, should succeed her, is not confirmed by cotem-

prince, but his doctrines cannot be reconciled with the existence of a limited monarchy. They were put in practice by venal judges and an ambitious priesthood. By a sort of sophistry, difficult to understand, it was declared in England, for the first time, that the king's power is of two kinds, a power ordinary, and a power absolute. "He is above the law by his absolute power, and though for the better and equal course of making laws, he do admit the three estates into council, yet this in divers learned men's opinion is not of constraint, but of his own benignity, or by reason of the promise made upon oath at the time of his coronation. Of these two one must be true, either that the king must be above the parliament, that is the positive laws of the kingdom, or else not an absolute king, and I hold it incontrovertible that the king of England is an absolute king."^a The decisions of judges were influenced by this strange doctrine.

The clergy were well aware that their authority was derived from the king, and if they were the most strenuous assertors of his power absolute, it was from motives connected with their own aggrandizement. The convocation held in 1606, drew up a set of canons, and it may be sufficient to mention, that the tenets to which the bishops gave the sanction of their name, might have alarmed the most indifferent. The origin of government is not traced to popular election, but to the authority that a father has over his family; the power of kings is of God; that of the parliament, only of man; passive obedience in every case is inculcated. The character of the king was ill adapted to sustain his lofty pretensions; although a stranger, his conduct was generally at variance with the opinions or prejudices of his people; indeed, one effect of his learning was to heighten his contempt of public opinion. The English have been considered a loyal people, but few amongst them either loved or feared James, and his government exhibited a strange contrast with that of Elizabeth. Dignity was incompatible with his easy but passionate temper, with a character in which pusillanimity was the most conspicuous feature; accordingly, his parliaments became indifferent to his noisy threats, and it is not too much to assert that he compromised national honour, and disgusted his subjects, by his peaceful policy towards Spain.

The commons, during the whole of this reign, never lost sight of one great object—their country's freedom. The right of impeachment, which had fallen into disuse, was restored by their efforts; they asserted their privilege to debate on all matters of public concern, and resisted the authority of proclamations. The king had issued a proclamation, according to which certain buildings should be pulled down, but this was declared unlawful; in other words, a sovereign cannot, by a proclamation, create an offence where none had before existed.

The exclusive privilege of the commons to determine contested elections was put in this reign beyond the reach of controversy. Much, however, was still imperfect; others had to finish what was now commenced.

porary authority. The determination of the queen's council to proclaim his accession could give him no right to the throne. It might be shown that the choice of the nation was in his favour, although their choice was not expressed by suffrages, or any formal deed. It may be doubted, however, in a legal point of view, if the nation could exercise such a power in the present instance, because it was contrary to a provision in the will of Henry the Eighth, which had been ratified by a solemn act of the legislature. A king of England, with the consent of parliament, can make such statutes to limit the succession as

The nation were animated with the hope of freedom, this sentiment pervaded, with one exception, every order of the community, but the excepted order was the priesthood. The clergy, in their vain attempt to realize the dreams of their monarch, brought against them the hatred of the people; popish ceremonies were still retained, these were offensive to the greater number, and the law of uniformity, establishing one rule of faith throughout the kingdom, connected religious with civil liberty.

No concessions on the part of the prince to the great change in public opinion, the disputes between the crown and the commons, and the imprisonment of Coke, Selden, Pym, Mallory and Phillips, prepared the way for "the fatal contests, which marked with a line of blood the dynasty of the Stuarts."

Elizabeth is justly hated on account of her conduct to the unfortunate Mary, but James was guilty of the blood of another victim, the no less unfortunate although less celebrated Arabella Stuart; the state policy that influenced the two sovereigns was in both cases the same. A magnanimous prince would never have condemned the great Sir Walter Raleigh; his execution, and the proceedings during his long imprisonment, prove the timidity and injustice of the king. The best feelings of the nation were outraged at the murder of Sir Thomas Overbury; the weakness of the king was made manifest by the influence of his favourite, and to pardon Somerset was to participate in his crimes. These and other transactions shewed the necessity of limiting the power of the crown, and of hindering princes from perverting just laws. The subserviency and venality of judges may be ranked among the indirect sources of corruption. It would be incorrect to infer, from the penalty imposed on the great Bacon, that bribery was of rare occurrence; the sentence passed against him has been considered a harsh one, and it is certain that other judges, guilty of like offences, were more fortunate in their obscurity.

No period of English history has been more diligently examined than the reign of the first Charles, both on account of the great lessons it affords, and because it is intimately connected with the rise of freedom. But the events of this memorable reign are foreign to the nature of the present work; even to mention such only as are connected with the progress of the constitution, is incompatible with its limits. If liberty was the end in view, it may be regretted that other means were not employed to obtain it. If the royal prerogative was stretched beyond its just boundaries, little advantage could be gained by transferring arbitrary power from the king to the commons. Charles had recourse to the last argument of kings, but it was not until the commons had left him only the trappings of royalty, nor before the due influence of the upper-house was destroyed. It may then be doubted if any concessions, even a presbyterian establishment, or the abolition of episcopacy, could have effected a lasting reconciliation between the king and his people, such were the fatal effects of his insincerity and too great facility

may seem fit. An act, passed in the 35th year of Henry the Eighth, confirmed his last will, signed with his own hand. The succession was thus limited to the issue of his own children, and in default of them, to the descendants of his younger sister Mary, duchess of Suffolk, before those of Margaret, queen of the Scots. The descendants of Mary were alive at the death of Elizabeth." Hallam's Constitutional History of England, chapter vi.

^a Cowell's Law Interpreter, 1607.

But the triumph of the commons was of short duration ; independents succeeded presbyterians, and republicans yielded to a military tyranny, that was established in the government of Cromwell. Many causes contributed to these calamities, but the consideration of them belongs not to the present subject. While it is admitted that the people abused their victory, it cannot be denied that the declamations of churchmen, and the intrigues of courtiers, were attended with the worst effects. The king was thus persuaded of his right to absolute dominion, and to an uncontrolled power, not only over the temporal, but spiritual concerns of his people. To obtain what he believed his right, a policy, which has been often imitated in later times, was adopted. The offices, honours and emoluments of the crown were employed to turn aside the parliamentary leaders from the cause of the people, and men not actuated by more elevated views, whose chief motive was selfishness or worldly aggrandizement, were easily made to support an authority in which they participated. An unjust sentence and an ignominious death have been urged to extenuate the infamy of Strafford. The excesses of the commons may be regretted ; their services need not be forgotten. Ship-money was declared illegal and arbitrary, the sentence against Hampden was cancelled, the exclusion of the forest laws was condemned, and patents for monopolies were annulled. Later proceedings are worthy of admiration ; a bill was unanimously passed by both houses for the suppression of the Star Chamber and High Commission Courts, and by the same bill the jurisdiction of the Privy Council was regulated, and its authority abridged. Other arbitrary courts were abolished, and the king, at the request of his parliament, instead of patents during pleasure, gave all the judges patents during their good behaviour ; an improvement of the greatest importance towards the impartial administration of justice, and the exclusion of the influence of the crown from the ordinary courts of law. It would have been fortunate had the commons been satisfied with these and other triumphs of a like nature ; but moderation was not the virtue of a period in which religious zeal was associated with extravagant notions of liberty. It was evidently the design of the ruling party to subvert the constitution, not to reform or improve it by enforcing ancient and wise laws, and by cancelling others of a different description and a more recent origin ; not to limit, but to abolish monarchy.

The offers made by the commons were such as no English king could receive with honour. They are contained in nineteen propositions of which the following are the most remarkable. The privy council and officers of state, it was proposed, should be approved by parliament, and take such an oath as the two houses might prescribe. No vacancy in the council could be supplied during the intervals of parliament without the assent of the majority, and an election thus made, required for its ratification the subsequent assent of both houses. The education and marriage of the king's children were to be under parliamentary control. Popish peers should not be permitted to vote. The church government and liturgy should be reformed according to the wisdom of both houses. The regulation of the militia should be committed to parliament ; the command of all fortified places should be intrusted to such persons as parliament

appointed. All peers made in future were not to sit in parliament unless with the consent of both houses.

To these propositions it was not doubtful that another would be added ; according to the right meaning of the old coronation oath, the king, it was maintained, must give his consent to all the bills which were passed by the two houses. It is not wonderful that Charles refused to divest himself of his crown, for he must have done so had he accepted such conditions ; no prince of any spirit could, in his situation, have acceded to such terms, but the commons thought what they had already obtained, insecure without farther concessions. The high notions Charles entertained of his prerogative, notions inherited from his father, prevented him from giving due weight to public opinion ; he encroached continually on his subjects' rights, while he may have thought perhaps that he was defending his own ; hence the belief in the necessity of a republic or nominal monarchy. But while it was determined to have recourse to arms, royalists and republicans were little aware of the calamities of a civil war. The probable consequences of the contest, however dangerous to liberty, were not regarded ; chimerical notions of freedom are akin to fanaticism, and the blood of the nation was spilt to elevate a soldier of fortune, and to establish a military power, to which unhappily the king fell a victim, and which, in this as in every other instance, proved incompatible with freedom. The long struggle between the king and his people was not marked by the same cruelty or the same treachery, that disgraced the annals of France during the wars of the League. As to the general calamities of the contest, it may be sufficient to remark that from the year 1642 to 1649, commerce was obstructed, while property and life were endangered by constant skirmishes and frequent sieges. Agriculture was interrupted, for there was hardly a county in England that was not at one time or other the scene of devastations, and to add to the misery, capitulations were violated, and mutual faith was disregarded by both parties.^a

It would be incorrect to suppose the nation guilty of the crimes that followed the civil war ; there was no longer any freedom in England, when the king went through the mockery of a trial, and perished on the scaffold. Occasion has been taken, in a former part of this work, to mention the causes that led to the death of Louis the Sixteenth. Anarchy and misrule in France were accompanied with the abolition of Christianity, and, according to some writers, the prevalence of infidelity accounts for the worst crimes that were committed during the French Revolution. Very different notions prevailed in England ; very different were the motives that induced the regicides to condemn Charles. It was imagined that the sovereign ought to die to expiate the sins of the war, that the sins of the people should be borne by him and not by them. Ludlow quotes the following passage from the book of Numbers ; " Blood defileth the land, and the land cannot be cleansed of the blood shed thereon, but by the blood of him that shed it. And, therefore, I could not consent to the counsels of those who were contented to leave the guilt of so much blood on the nation, when it was most evident that the war had been occasioned by the invasion of our rights, and the open breach of our laws and constitution on the king's part.^b " As

^a Hallam, volume 2d.

^b Ludlow's Memoirs, vol. 1st, 267.

for Mr. Hutchinson," says one of the best writers of the period, "although he was very much confirmed in his judgment concerning the cause, yet being here called to an extraordinary action, whereof many were of several minds, he addressed himself to God by prayer, desiring the Lord, that if through any human frailty, he were led into any error or false opinion in those great transactions, he would open his eyes, and not suffer him to proceed, but that he would confirm his spirit in the truth, and lead him by a right enlightened conscience; and finding no check but a confirmation in his conscience that it was his duty to act as he did, he, upon serious debate, both privately and in his address to God, and in conferences with conscientious, upright, unbiassed persons, proceeded to sign the sentence against the king."^a Such, in all probability, were the real sentiments of Ludlow and Hutchinson, the most virtuous among those who decided the fate of Charles. It was necessary for Cromwell to act in the same manner that he might regain his influence over the army, and that he might render it subservient to his ambition; skilled in concealing his real motives, those which he alleges, indicate the infatuation, and the strange fanaticism, that prevailed. "Should any one have voluntarily proposed to bring the king to punishment, I should have regarded him as the greatest traitor; but since *providence* and *necessity* have cast us upon it, I will pray to God for a blessing on your counsels, though I am not prepared to give you any advice on this important occasion. Even I myself, when I was lately offering up petitions for his majesty's restoration, felt my tongue cleave to the roof of my mouth, and considered this supernatural movement as the answer which heaven, having rejected the king, had sent to my prayers."^b The judges of Louis were nowise actuated by religious scruples; so far their opinion was participated by the people, who embraced a system of which the ceremonies were borrowed from the Greek mythology. A debasing superstition, and a perverted religion, inconsistent with moral rectitude or common justice, influenced the judges of Charles; their notions were those of the ruling party; those who adopted better sentiments or a milder creed, were ranked among the vanquished royalists. The dissolution of the monarchy and the English constitution succeeded the death of the king. The commons voted that kingly power should be annulled, because it was "unnecessary, burthensome, and dangerous;" the house of peers was considered "useless and dangerous," and on that account it was abolished. A new great seal was made with the date on one side, while on the other the assembled commons were represented, and the following inscription was engraved: IN THE FIRST YEAR OF FREEDOM BY GOD'S GRACE RESTORED. The care of the great seal was committed to certain persons, who were denominated the conservators of the liberties of England. The king's statue in the exchange was pulled down, and the following words were inscribed on the pedestal: *Exit Tyrannus Regum ultimus.*

If to gain freedom were the cause of the civil wars, the end was not attained after their termination. The English government, from the death of the king to the year 1658, was first changed into a military oligarchy, and afterwards into a despotism. Although disturbed by seditions and intrigues of which the object was to rid the

nation of a tyrant, and at other times to restore the house of Stuart, it has held together after the battle of Worcester by an army of forty-five thousand men, and many were compelled to swear fidelity to the commonwealth. The government of Cromwell, it is undeniable, could not have been secure a single day without so great a military force; but even the army was not the sole instrument by which his power was wielded. It enabled him in 1656 to exclude many members from the house of commons, and to mould it to his will. A military guard demanded a certificate from the council before any member could obtain admission. So novel a proceeding excited unusual disapprobation, but to the remonstrances of the excluded members, it was answered that the qualifications of members were vested in the lords of the council, who had exercised their right according to the best of their judgment. The most revered institutions were abolished, and to condemn men, who would not have been condemned by jurymen, the use of juries was dispensed with in the new high court of justice. It is needless to add that such a tribunal was contrary to law, and to the very oath that Cromwell had taken; prisoners protested against the legality of the court, ancient statutes were quoted, and the words *Magna Charta* were pronounced in vain. One individual, believing that to defend himself was to betray the liberties of his country, remained silent, but his silence hastened his fate, it was considered a confession of guilt. Not only were juries abolished, but the accused were not allowed the benefit of counsel. The court was "of sufficient counsel to the prisoner and the commonwealth," but men declared it was of counsel for the commonwealth and against the prisoner. In some instances, however, this was not the case; more than one judge had the boldness to decide justly, while others chose rather to resign their office than to pervert the laws. Although it was declared high treason by a new act to assert that the government was tyrannical, unlawful or unjust, many were not deterred from expressing their real sentiments; Cromwell was generally called an artful hypocrite, and a dissembling villain, while the republicans deplored that they had fought for a worse tyrant than Charles Stuart.

The decimation of the property of the royalists was an act of tyranny without a parallel in the history of the Tudors. England was divided into eleven military governments under as many major-generals. These persons were authorized to raise forces within their jurisdictions, to exact the decimation and different taxes, to suppress tumults and insurrections, to disarm catholics and cavaliers, to inquire into the conduct of ministers and schoolmasters, and to imprison all dangerous and suspect persons. The powers, such a commission conferred, great as they were, appeared too limited to these military prefects; their rapacity more than their hatred against the royalists excited them to acts of injustice; they took care to make it less, and as many as had remained neutral were ranked with the proscribed. The fruits of the civil wars were now apparent, and bitter disappointment succeeded the hopes of the republicans; if the Star Chamber had been abolished, a more iniquitous tribunal was established in its place; if illegal taxes had

^a Hutchinson, page 303.

^b Parliamentary History, vol. xviii.

been resisted, others infinitely more onerous were imposed. It required but little reflection to conclude that the property and the lives of men were insecure, while the Protector could erect a high court of justice, and divide the country into prefectures. The "good old cause" was thus connected with dismal associations, and the friends of royalty were increased; many remembered ancient and better institutions, and forgot, under the actual despotism, the abuses which had led to their subversion. If the sense of the nation could have been taken, it might have been shown that not an individual out of a thousand was friendly to the new government. Had the moral qualities of Cromwell at all corresponded with his intellectual faculties, he might have been as much loved as he was hated by his countrymen. Extraordinary precautions, movements concealed from the nearest attendants, fears of assassination, and sleepless nights, proved him not ignorant of the execration in which he was held. The history of the commonwealth and the protectorate may be distinguished by national greatness, and by the increased importance of England among European powers, but it forms a dark era in the history of the constitution.

It was not before the restoration that any advantages were gained from the civil wars; many, who had exposed themselves to the dangers, lived not to enjoy the fruits of the contest. If the individual who placed Charles the Second on the throne, had entered into conditions to abridge the royal authority, and to extend the rights and privileges of the people, he might have added immeasurably to his own fame, rendered the government more secure, and prevented perhaps the subsequent exile and misfortunes of the Stuarts. The monarchy, it is admitted, was milder during the reign of the second Charles than in the time of preceding kings, but it was owing to the efforts of upright men and resolute patriots, not certainly of General Monk, who had it in his power to confer the greatest benefits on his country. The anomalies introduced after the civil wars survived not the usurper, the concessions made by Charles the First were not rendered nugatory by alarming innovations, and government began to assume the character which it now bears. Royal proclamations were seldom issued, the Star Chamber was anew abolished, and the right of Habeas Corpus was enforced. It must be confessed, on the other hand, that many acts of injustice were perpetrated; the condemnation of Sir Henry Vane was a violation of a solemn promise; the sentences passed against Sidney, Russel and others, marked the latter part of the reign with a character of despotism; the deaths more than the lives of these patriots strengthened the cause they maintained. It is incorrect, therefore, to conclude with some writers that "the constitution had arrived at its full vigour, that the balance between prerogative and liberty was happily established." The next reign^a affords the best refutation to such a remark; it may be sufficient to observe that attempts to exercise the dispensing power, to repeal the test laws, and to establish catholicism, ended in the final expulsion of the Stuarts. William of Orange, the son-in-law of James, and one of the greatest princes that appears in modern history, continued a watchful observer of these violent measures. To preserve the rights

and privileges, which it was the open design of the king to destroy, seven persons, eminent from their rank and influence, invited William to land in England.^b The invitation was accepted, and the revolution of 1688 was achieved. No event of a like nature has been attended with fewer calamities, or followed with greater advantages; it rendered the different kinds of government, which are blended in that of England, more secure, and at the same time, independent of each other; the constitution acquired a degree of stability which it had not obtained since the Norman conquest; it took away every pretext for the destructive contests between kings and their subjects, contests equally fatal to civil liberty, whether they terminated in the death of the monarch, or in the oppression of the people; since the same period the chances of faction have been diminished, it is no longer apt to be confounded with party. The English monarchy can hardly be said to have been united with free institutions before the revolution, otherwise the indefeasible right of kings, and their absolute prerogative, could never have been so boldly maintained; parliament, it was insisted, owed its existence to the sovereign; it might be destroyed by the same power that called it into being. The great practical difficulty in the science of government was now overcome, and Parliament became an inseparable part of the government; whatever may have been the right of other kings to the throne, whatever sophistry may have alleged, William the Third and his successors could claim only a parliamentary title. The influence of public opinion on government is often as beneficial as positive enactments; it is now very powerful in England, but it was not so before the same period.

The conditions by which the throne is held, are partly enumerated in the declaration of rights, which was presented to William before both houses of parliament by the Marquis of Halifax, the speaker of the lords. To suspend laws or the execution of laws by regal authority, without consent of parliament, is declared to be illegal. The pretended power of dispensing with laws, as it hath been exercised, is contrary to law. The commission for erecting the court of commissioners for ecclesiastical causes, and all other commissions and courts of the like nature, are illegal and pernicious. To levy money for the use of the crown by pretence of prerogative without consent of parliament, is illegal. The right of the subject to petition the king is confirmed; all commitments for, and abstractions against the exercise of this right, are illegal. The raising or keeping a standing army within the kingdom in time of peace, unless it be with consent of parliament, is illegal. The elections of members of parliament ought to be free; the freedom of speech or debates or proceedings in parliament ought not to be impeached or questioned in any court or in any place out of parliament. Excessive bail ought not to be imposed, nor cruel and unusual punishments inflicted. Juries ought to be duly impannelled and returned, and jurors that pass on men in trials of high treason ought to be freeholders. All grants and promises of fines and forfeitures of particular persons before conviction, are illegal. Lastly, parliaments ought to be frequently held, in order that all grievances may be redressed, and that the laws may be amended, strengthened and preserved. Such

^a James II.

^b These persons were the Earls of Danby, Shrewsbury and Devon-

shire, Lords Delamere and Lumley, the Bishop of London, and Admiral Russel

are some of the conditions which were afterwards more solemnly confirmed in the bill of rights, and which have served as the basis of the later improvements in the English constitution.

That the money voted by parliament should be appropriated to specified purposes had been considered the practice of government in the reign of Charles the Second; it was not, however, strictly followed; the house of commons that sat in 1685, betrayed their trust to gratify the king, and boasted of not having appropriated their supplies. The same practice has been invariably adhered to since the revolution; it has given the commons such a control over the executive power that no administration can subsist without their concurrence; the naval and military forces are placed at their disposal, for by refusing the supplies, neither the one nor the other can be maintained. It is obvious too, from what has been remarked, that no longer period than a twelvemonth can intervene between the sessions of parliament. In war or during any emergence, considerable sums may be raised by a vote of credit, and the crown may have perhaps applied them during the intervals of parliament to different purposes than those for which they were granted. It has sometimes happened that the annual sums appropriated for the public service are inadequate to the charge of it. The means thus obtained of corrupting the commons, and increasing the influence of the crown, have in some periods given rise to abuses against which no provision has been devised; they are not, however, of a permanent character, for if sanctioned by one parliament, it does not follow that they must be so in another, and they are not likely to excite reasonable apprehensions so long as there is an urgent necessity for public economy in every department of the state.

The long duration of the second house of commons in the reign of Charles the Second, was not forgotten after the revolution; if the king were enabled to lengthen the existence of a parliament to an almost indefinite period, the connexion between the people and their representatives, it was feared, might be destroyed. It was not likely that an evil from which so much inconvenience had been felt, could be tolerated in the changed state of public opinion, when liberal notions prevailed, and when the people recollected that they had changed the line of succession on account of the misgovernment of their rulers. The bill for triennial parliaments received the royal assent in 1694, six years after the landing of William. It declares that parliament shall cease and determine three years from its meeting, and provides against the intermission of parliament for a longer period. The last clause is also mentioned in an act of Charles the Second; in practice it was unnecessary, since the appropriation of the revenue, and the mutiny bill, which is always passed for a limited time, and without which a standing army is illegal, render the intermission of parliament for a much shorter period than three years, incompatible with the government of the state.

The law was changed in 1717, and the duration of parliament was extended to seven years. The new bill was introduced for temporary purposes by the ministry of the day; it has continued in force for more than a hundred years, and has been attended with important advantages. Great corruption still prevails during elections; but in consequence of this change the people are less habit-

uated to them, and their demoralizing influence is necessarily diminished. It is the chief duty of a member of parliament to watch over the liberties of his countrymen; but if he were not independent of the people, the democratic part of the constitution might be liable to such defects as those, which were so conspicuous in the most celebrated republics of antiquity.

It was attempted in the same reign to restore the early laws relative to treason; their spirit, although obvious, and their meaning, although definite, had not defended them against the interpretations of corrupt judges. The statute is remarkable in some respects, since different offences which have no connexion with treason, are included in it, and no mention is made of an intention, or even actual preparations to make war against the king. If the law of treason had always remained so defective, it might have been as dangerous to the safety of the government as if it had depended on the will of the prince, or the subserviency of the judge. The omissions, however, were supplied, and the limits of the monarchy, in as much as they relate to this subject, were determined at a comparatively recent period. The 57th of George the Third, now the law of the land, supersedes the famous statute of Edward the Third.

The liberty of the press, in as much as it consists in the exemption from a censorship or a licenser, was confirmed in the reign of William the Third. The licensing act, it is true, expired in 1679, but it was renewed for seven years in 1685, and, at the end of that period, it continued in force during the greater part of 1693, when it was finally abolished. It must not, however, be inferred, that the press was as free as it has since become; some time elapsed before men were allowed to express their opinions fully on public affairs; to write against a ministry of the day was included in the number of libels, for any attempt, by means of the press, to bring the servants of the king into discredit, was thought, in some degree at least, to extend to the sovereign. Ministers thought it better to answer than to prosecute their adversaries, the greatest men of the time defended or opposed by their writings the measures of government, and the public character of statesmen became gradually a fair subject of discussion.

Another important advantage connected with a free press was acquired at a later period. It is still supposed that the deliberations of the two houses are secret, and it is competent for any member to insist on the exclusion of strangers, not for any particular reason, but that a standing order for the purpose may be enforced. It has more than once been considered a high breach of privilege to publish the speeches or proceedings in the lower house of parliament; for such offences different persons have been committed, and it is still deemed irregular in any member of the commons to allude to the reports in newspapers, unless it be on account of a breach of privilege. While the people were ignorant of what passed in parliament, it sometimes happened that abridgments of the debates were published, and on some occasions, for the sake of popularity, entire speeches were printed, and circulated by the members who delivered them. It is undeniable, however, that after the accession of George the First, a register of the debates was annually published, until the year 1737; after that period, they appeared monthly, in a less abridged form, in the London and Gentleman's Magazines. It is almost

superfluous to remark that the presence of strangers must have been tacitly sanctioned before such works were published. It was not then customary to prefix the names of members to their speeches, but merely the initial letters, and in this way it was imagined the breach of privilege might be evaded. The practice, however ridiculous, was not wholly abolished during the American war. From that time until the present, successive improvements have been made in the method of reporting debates; the art of short-hand writing has probably attained the utmost degree of perfection of which it is susceptible, and the speeches of the different members are now regularly printed a few hours after they are delivered.

It is impossible to estimate too highly this great advantage resulting from a free press; it forms a new and powerful connexion between the people and their representatives; to the former the conduct of public men is thus made known, and it is thus that they judge if those entrusted with their rights, are worthy of their confidence. The same custom accounts in some degree at least for the great influence of public opinion in England, an influence which it would be vain to attribute wholly to the diffusion of wealth and knowledge among the middling ranks. This important privilege has only been established by usage, and that too from no remote period, but it could not be destroyed without the worst consequences; indeed if it were possible to shut the doors of parliament against strangers, no more effectual means could be devised by a tyrant or an usurper to subvert the British constitution.

Such were some of the later benefits that sprung from the revolution; the more immediate consequences, it has been shewn, were equally salutary; the notions concerning the absolute right of kings had led to acts of tyranny on the part of the prince, and to resistance on the part of the people; such notions it was impossible longer to entertain; the crown had been given by the people to William of Nassau, and to the gift conditions were annexed. The theory of an original contract had been adopted by parliament; it was decided that it had been violated by James, and that in consequence the throne had been abdicated. An approximation was thus made to the truth, that the power of kings is committed to them for the happiness and welfare of their people. Although this principle was not expressed by parliament, it appears to have been afterwards sanctioned by their proceedings, and in particular by the act of settlement. It was considered unnecessary at the revolution to extend the line of succession beyond the descendants of Anne and William; the former became a few months afterwards the mother of a son, so that the provisions, which had been already made, were not thought in any way too limited. It was manifest, however, in the year 1700, that the first act of settlement could not extend beyond the life of the king and the princess of Denmark; under such circumstances the necessity of a new one became imperative. The people had to exercise a second time a most important right, that of choosing their monarch; in the first instance it had been preceded with revolution and the deposition of a king; in the second, the government was established, and the chances of civil war were remote. It was solemnly determined by parliament that the princess Sophia, the wife of the elector of Hanover, and her descendants, should succeed to the throne of England. The

connexion between that princess and the house of Stuart was certainly the cause of this resolution, but neither herself nor her descendants could claim their new dignity from any hereditary title. Had the nearest relatives of the Stuarts succeeded to the crown of England, it must have first devolved on the duchess of Savoy, the daughter of Henrietta of Orleans, and on several members of the Palatine family; but these had abjured the reformed faith. The genius and the research of Gibbon have been employed in illustrating the house of Brunswick, a house which yields to none in antiquity or in renown; although connected with Cerdic, the Conqueror, the Edwards and the Henries, its right to the throne rests on the act of settlement, a parliamentary title, which necessarily presupposes the supremacy of the legislature.^a

It is superfluous to enumerate the conditions, which were annexed to the Hanoverian succession; all of them are of a liberal tendency; some made for temporary purposes, have been since abolished; it may be regretted, however, that another was not added, by which the king of England must have renounced the electorate of Hanover.

The benefits which were derived from the revolution, were confirmed by the act of settlement, and the constitution was established. An end was put to the long contest that, with some intervals, lasted for ages between the sovereign and the people. Although the government, since the admission of the commons into the legislature, may have been nominally divided into three kinds, its real character was that of a monarchy, and the power of the crown was above the power of the nobility and the people. The conqueror and his successors, to the end of the sixteenth century, may bear a comparison in many respects with the princes of the Capetian race. The Stuarts aimed at arbitrary power, and sought by illegal means to rule without parliament, to elude the restraints on their authority, and to govern "after the French method." It would be incorrect to suppose that all the great advantages obtained at the revolution were felt immediately after it; the divisions in England, and the state of Europe at the time, seemed to justify decisive, and to palliate arbitrary measures.

The personal qualities of William, and his consummate skill in the details of government, rendered many of the conditions irksome; he is said to have been his own minister, and it must be admitted that he was better fitted to be so than most men in his dominions. A great prince is dangerous to a limited monarchy; but that the constitution was not shaken, while so many circumstances concurred to subvert it, may be considered a proof of the spirit by which the people were actuated.

It is undeniable that important changes have taken place, some of them greatly increasing the power of the executive government, and others of so opposite a tendency as to render it difficult to estimate their counter-acting effects. It has been urged, not without reason, that an excess of power, similar in some respects to that wrested from the crown at the expulsion of the Stuarts, has been gradually transferred to the aristocracy, and that it is not sufficiently restrained by the king or the people.

The great territorial proprietors may be classed with the aristocracy, and their united influence has too often

^a Hallam, *Idem*,—ibid.

prevailed in the lower house of parliament; but it is more reasonable to believe that the evil may be remedied, than that it is of such a nature as to endanger permanently the rights and liberties of the people.

Although the origin of parties may be referred to an earlier period, their increased importance forms a remarkable feature in the history of England since the revolution. The government of the country has been committed nearly two centuries to whigs or tories; under one or other of these denominations, the members of parliament, and almost all those who set any value on their political privileges, may be classed. It is of consequence, therefore, to ascertain their distinctive principles; this, however, is not easily done, both on account of the latitude with which the meaning of the terms is received, the variations they undergo, and the factions that have used them for unworthy purposes. While the number on either side is so great, there must be many whose principles sit loosely on them, and it requires but a superficial acquaintance with history to be convinced that the attainment of power has too often been the leading motive of political conduct.

It would be unfair to derive the distinctions between the parties from such examples. The tory and the whig are equally attached to the constitution; the one is not a friend to unlimited monarchy, the other is not a republican. The one believes the constitution perfect, and wishes to preserve it unchanged; the other considers the welfare of the community, and the public good, of paramount importance. The tory has been naturally averse to innovation; the whig, for such purposes, not unfriendly to it. The one opposes whatever may tend to endanger the prerogative; the other resists every encroachment on the liberties of the people. The tory is distinguished by his zeal for the established church; for its sake in past times catholics were persecuted, and unjust restraints were imposed on dissenters; the cause of the church has been sometimes confounded with the cause of loyalty, a fact which accounts in a great degree for the slow progress of religious liberty in England.

It is natural to infer that tory principles are likely to prevail among the hereditary aristocracy, an order which derives its brightest lustre from the crown. It is equally certain that whig principles are more comprehensive, more philosophical, and more consonant with the purposes of civil society, the progress of improvement, and the temporary nature of human institutions. It is fortunate that they have been counteracted by each other: from the excess of the one, too rapid innovations might ensue, while the tendency of the other is to retard improvement.

If civil liberty was established at the revolution, the commencement of religious liberty may be dated from the same epoch. By the toleration act, the first act of William and Mary, all their majesties' protestant subjects, dissenting from the church of England, were exempted from penalties, and permitted the free exercise of their religious duties, provided they took the oath of allegiance. The same indulgence was not conferred on the catholics; the memory of their past conduct was fresh in the minds of men, and the guilt of it was exaggerated by their fears or hatred. It must be confessed that from the reign of Elizabeth to the time of William, the government had been endangered by their conspiracies or plots; in some of them the end was to assassi-

nate the monarch, in others to bring in a foreign army, in all to subvert the liberties of Englishmen. New restraints were imposed on the catholics; it was the object of the legislature to exclude them from every dignity, to destroy their political existence, to keep them poor and ignorant, in a word, to make them helots in a free community. The consequence of such policy, it is unnecessary to add, increased the chances of conspiracies and revolts. The effects of it are still apparent in the present state of Ireland, and in the degraded condition of its inhabitants. Some of the restrictions thus imposed, were taken away at different times, but it is not more than a year or two since they were all removed, and the person who has so much extended the military glory of England, may claim the merit of having brought about an act of justice, from which it is not unreasonable to look forward to the most beneficial results.

Thus, it appears, that the revolution is the era of many improvements in the English constitution; from it the doctrine of the responsibility of ministers may be derived, a doctrine which is now fully established, and which, so long as it continues in force, may be the best guarantee of the dignity of the crown, and the liberties of the people.

But increased resources, extended commerce and great diffusion of wealth form perhaps the most remarkable features in the later period of English history. The long and expensive wars of William and Anne must have contributed to diminish the resources of the nation, but it recovered in the prosperous and peaceful reign of George the Second; during the repose which was then enjoyed, the country increased in strength, and was enabled to undertake the gigantic efforts, which have been accomplished in our own times. If this be the fact, and it is not doubted, it follows as a necessary consequence, that additional influence must have been acquired by the middling ranks. Other effects may be attributed to the same cause, and a very remarkable one has been mentioned by the ingenious Mr. Hallam. "The smaller boroughs, which had been from the earliest time under the command of neighboring peers and gentlemen, or sometimes of the crown, were attempted by rich capitalists with no other connexion or recommendation than one, which is generally sufficient. This appears to have been first observed in the general elections of 1747 and 1754; and although the prevalence of bribery is attested in the statute-book since the revolution, it seems not to have broken down all flood-gates till near the end of the reign of George the Second. The sale of seats in parliament, like other transferable property, is never mentioned in any book that I remember to have seen of an earlier date than 1760."^a

The widely scattered provinces and colonies under the British government have been described in a different part of this work. The dominion of England, it has been shown, is acknowledged in every quarter of the globe, while every nation that has made any advances in civilization participates in its commerce. Every coast is visited by English mariners, in every land the influence of England may be traced, and the products of its industry are seen in the most barbarous countries. It might be readily supposed that colonies so remote from each other, and above all from the mother country, might

^a Hallam, Chap. xiv

hasten its decline. These circumstances, on the contrary, prove additional elements of strength, and the distance between the different stations renders any union among them impracticable. Many ships are at all times necessary to keep up the intercourse with the seat of government, or rather to supply the wants of trade, and to carry the products of British industry to the points from which they are diffused over so vast a surface; the same ships serve on any emergence to repel aggression, and to secure the means of defence. The naval resources of England are proportionate to her commercial greatness; no nation can oppose the one; it has no rivals in the other. Secure from danger, and fearing no competition, the restrictions in the navigation acts, originally introduced to protect the trade of the country, have been repealed; England claims only from others the same liberty that they enjoy. But this commercial greatness, without example in the history of any other country, may give rise to higher considerations. The elements of civilization, if they may be so termed, are thus transported from England to the remotest limits; from the same centre, knowledge is diffused, and free institutions are gradually established. Already has one colony assumed a high rank among nations; whatever may be the future greatness of the American republic, it is reasonable to infer from its present state, that it must exert a beneficent influence over the destinies of the new world. The mother country too has gained by the independence of the settlers; the sphere of her activity has been enlarged, and additional outlets have been opened for her products. England pursues the same career, and is still founding free states for future generations. No other nation has given the same encouragement to industry, and the same extension to commerce; none has so much contributed to promote freedom, and to enlighten mankind in every quarter of the globe. It belongs more particularly to the present subject, to describe the country of which the influence is so widely diffused, and to examine the physical and moral causes that have contributed to its greatness.

However numerous the natural advantages of England for commerce may be, it is certain little was added to them by art until a recent period. No canal was formed, no artificial channels were cut, before the year 1756, and this fact appears the more remarkable, if the increased wealth of the country be taken into account, and if it be considered that the rivers, although in general ill fitted for the means of communication, are admirably adapted to facilitate such works.

It was known that goods might be conveyed by means of canals for a fourth part of the sum expended on them by the ordinary method, and consequently that many natural products as well as other articles, which, from their remote situation, or different causes, were comparatively of little value, might be brought within the sphere of commerce. The length of Great Britain from north to south, being much greater than its mean breadth from east to west, the best way of avoiding the long and, in some places, dangerous circuit of the coasts, was to connect, by means of canals at the most convenient positions, the eastern with the western shores. The dilatoriness of the English seemed the less excusable, because the French preceded them in this branch of industry, which had proved a source of wealth to the inhabitants of Lombardy, Belgium and Holland.

Although the English were so long in beginning such undertakings, Great Britain is now better provided with canals than any other country, and in none are they so extensive in proportion to the surface. It is unnecessary at present to enumerate them, or to enter into any details concerning their history.

The most important run from east to west; they are grouped round Manchester, Liverpool, London, Birmingham, Hull and Bristol, so that these wealthy and industrious towns are thus connected with each other, and with the fruitful country that separates them. By means of these works, the manufactures and the various products, which emanate from the same towns, are quickly and cheaply conveyed to the numerous places for which they are destined. It might be shown that within a period not much longer than half a century, canals have been made by which opposite seas are united, by which basins, separated by lofty heights, are joined together, and by which ports communicate with fruitful plains and rich mines.^a The length of these navigable ways is more than 2500 miles, while the territory they traverse is less than a sixth part of France.

The same remarks that have been made on the canals, are applicable to the roads; the greater number and the improved method of making them date from the middle of the last century. It results from the ingenuity and practical skill of English engineers that travelling is easy and rapid, that animal force is employed to much advantage, and that heavy loads are dragged by fewer horses than in other countries, while light carriages are impelled with greater velocity. These advantages, however great, are of secondary importance; the roads in England are not only better, they are more extensive in proportion to the surface than in any part of Europe. Those who are aware of all the benefits arising from improved means of communication, can best appreciate how much they contribute to promote commerce and diffuse wealth. England contains 20,000 leagues of roads, 1500 leagues of canals, and 1200 leagues of rail-roads; France, which is so much more extensive, has only 3500 leagues of roads, 500 leagues of canals, and 40 leagues of rail-roads.

Numerous works have been raised within the same recent period along the coasts; piers, moles, breakwaters and lighthouses have been erected to afford an easy access and a safe shelter to ships, and to facilitate the means of carrying on an immense trade, which consists in the exportation of the various products of English industry, and in the importation of the products of every quarter of the globe. In this trade 168,000 seamen are employed, while the number of merchant vessels amounts to 22,500, and their tonnage exceeds two millions. Some notion of the resources of Britain may be inferred from the fact that, within the last seventy years, more than £30,000,000 have been expended on roads, more than twice that sum on canals and rail-roads, and as much on works along the coasts. The increase in the value of land within the same period is well known; it appears as if the sums expended for the purposes already mentioned, had been laid out in improving the soil, and it is difficult to suppose that agriculture could have otherwise been brought to such perfection, and that land could have been rendered so productive.

^a Baron C. Dupin, Force Commerciale de la Grande Bretagne, Chap. 6.

The inventions of great men, and the application of science to the useful arts, have increased to an almost indefinite extent the productive power of industry, and rendered it proportionably independent of the labor of man. The machinery now used in a single branch of industry, namely, in manufacturing cotton, has enabled one individual to perform the work of a hundred and fifty. It appears from the lowest computation, that 280,000 persons are employed in the cotton manufactories, while according to the highest, the number amounts to 350,000; but by the aid of machinery, they are enabled to accomplish what must have required, less than a century ago, the labor of at least 42,000,000 or at most 52,500,000 persons, or in other words, about three times the present population of Great Britain. The wages of 42,000,000 of men, at the rate of a shilling a day, amount to £756,000,000; but the actual wages of all the individuals engaged in manufacturing cotton, and the expenses attending the various works, including the interest of the capital laid out in erecting them, are much less than £56,000,000; consequently the saving effected by means of machinery in this department of industry alone, is more than £700,000,000. It is hardly necessary to add that the power employed in the cotton manufactories in Britain, is greater than that in all the manufactories of Europe. Occasion shall be taken in the subsequent chapters to examine more fully the great resources of the

island; to enter into all the minute details would greatly exceed the limits of the present article. To increase the productive energy of their country, the English have availed themselves of the ingenuity of every nation. A single instance may be mentioned; the celebrated Mr. Watt happened to be in Paris, when Berthollet discovered the singular property which chlorine possesses, of destroying vegetable colours, and proposed it as a substitute for exposure to the sun in bleaching. This great discovery was applied to the useful arts in Lanarkshire and Lancashire, before it was introduced into many parts of France, and the same individual who invented the steam-engine, had the good fortune to confer a second obligation on his country.

Many other changes have taken place within the same period; the streets in almost all the towns are now illumined with a brilliant light,^a and the inhabitants are no longer dependent on the produce of the Greenland fisheries; an immense improvement has been effected by the use of steam-boats, and another, which may be attended with still greater advantage, is now in progress; rail-roads and steam-carriages are likely ere long to be common, and thus the rapid and cheap conveyance of goods may ensure the success of British industry over all its rivals.

BOOK CLIII.

EUROPE.

Europe continued.—England and Wales.—Second Section.—Physical Geography.—Extent.—Climate.—Coasts.—Rivers.—Mountains.—Productions.

THE southern and larger portion of Great Britain, comprehending England and Wales, is situated between 50° and $55^{\circ} 45'$ north latitude, and $1^{\circ} 50'$ east, and $5^{\circ} 40'$ west longitude. Bounded on three sides by the sea, it is contiguous on the north to Scotland. St. George's Channel washes it on the west, the German Ocean on the east, and the English Channel on the south. The figure of the same country bears some resemblance to a triangle; a line drawn from Berwick to the South Foreland represents the eastern side, the western is formed by another line commencing at Berwick, and terminating at the Land's End in Cornwall, while the base extends from the South Foreland to the Land's End.

Early geographers differ widely concerning the superficial extent of England, some believing it not to be more than twenty-eight millions of acres, and others making it amount to forty-six millions nine hundred and sixteen thousand. According to a traditional opinion, perhaps more ancient than any other, the extent of South Britain was supposed equal to twenty-nine millions of acres. The data from which this opinion was derived, are not known; even the period in which it was formed cannot be ascertained. Because it accords nearly with the extent of the Anglo-Saxon kingdoms, it has been inferred that it dates from so remote an epoch. Although the branch of science on which mensuration depends, was not then known to the rude inhabitants of Britain, other means might have enabled them to arrive at tolerably correct results. The mode in which the revenues of the Anglo-Saxon kings were collected, might afford sufficient materials for the calculation, in as much as it is better adapted for such a purpose than any other method that has been since employed; besides in Domesday-book, remarkable for great minuteness and accuracy, continual reference is made to a more ancient register of the same kind. The correctness of the measurement does not appear to have been doubted before the seventeenth century; since that period the subject has attracted the attention of numerous writers, such as Gerard Malines, Sir William Petty, Gregory King, the celebrated Halley, Grew, Templeman, Mr. Arthur Young and many others. The data necessary for such a task were wanting, and the calculations differing widely from each other, afforded a convincing proof of their inaccuracy.

Other errors of the same sort might be still believed, had not the trigonometrical survey been undertaken by direction of government; in the course of it the maps,

not only of the whole country, but of the different counties, were discovered to be incorrect, and the distance between the South Foreland and the Land's End was found to be less by about half a degree than the distance formerly laid down. The difference between the parallels of latitude of Greenwich and Paris, it was ascertained, is equal to 963,954 feet, or 182.567 miles, which corresponds with $2^{\circ} 38' 26''$. Thus, the length of a degree of the meridian, in latitude $50^{\circ} 10'$, amounts to 69.14 miles. The difference of longitude between Greenwich and Paris is equal to $2^{\circ} 19' 51''$, or, in time, $9^m 19'' 4'''$. It may be mentioned that a line drawn across the English Channel, from the South Foreland to Blancnez,^a is equal to 20.025 miles; such is the breadth of the natural barrier which has secured Britain against foreign aggression. A remarkable example of the accuracy to which practical geometry had attained, was afforded in the course of the survey. In two distances deduced from sets of triangles, measured by General Roy in 1787, and by Colonel Mudge in 1794, the one of 24.133 miles, the other of 38.688, the two agree within a foot as to the first distance, and within sixteen inches as to the second. Formerly, the calculations, or rather the conjectures, concerning the area of England and Wales, were of such a nature that no reasonable confidence could be placed in them; now, the extent of the country may not only be better determined than that of any other, but with a degree of accuracy more than sufficient for the purposes of geography.

It is vain to compare the climate of England with that of other countries in more favorable latitudes. If the genial influence of the sun is never long felt, it may be attributed to a situation in the northern part of the temperate zone, while the chilly and damp weather of so frequent occurrence may be accounted for by an insular position and other causes that may be afterwards mentioned. Stinted as it is of the light of the sun, and exposed to frequent rains or blasting winds, the soil does not yield those vegetable treasures which appear in such luxuriance in tropical climates, and which, almost without any labour, satisfy the wants or luxuries of indolent inhabitants. England, it has often been remarked, is better adapted for the growth than the ripening of the productions of the earth. Extreme cold is not felt in winter, and the summers are seldom oppressive; hence an appearance of verdure that continues in a greater or less degree throughout the year, vegetation not being destroyed by the winter's cold, nor wholly parched and withered by the summer's heat. No charm in the rural

^a Blanc-nez (The White Cape,) a promontory 4 miles west of Calais. The name is corrupted by English sailors into Blackness.—P.

districts is comparable to their perpetual verdure, none is more characteristic of England; the English themselves may be insensible to it from custom, foreigners can appreciate it better. To enjoy such scenery, one must visit the country in summer or in autumn, for even in the fruit season, the freshness of spring is apparent, and the flowers exhale the sweetness of their early perfume.^a

The theoretic arrangement of the seasons, so well adapted for the southern latitudes, is not equally applicable to the climate of Britain; on the continent their commencement and duration may be predicted with sufficient precision, while in England the weather is so variable, and all the seasons are so much intermixed, that it is very difficult to determine the periods of their arrival and departure. According to a common opinion, December, January and February are the winter months; the three following form the spring, while the summer begins in June, and continues to the end of August; September, October and November are the autumnal months. It must not however be imagined that the seasons are confined to their respective months; something like the spring appears occasionally in January or February; the air is mild, buds are seen on the hedges or the trees, and the songs of the birds enliven the woods. But these gleams of a warmer sunshine are soon dissipated, winter resumes its horrors, and the intervals of fine weather are not longer than what the French call *un été de St. Martin*, or Martinmas summer. Those who have paid most attention to such subjects, and who have observed with the greatest attention different indications or probable signs, confess their ignorance of any by which the severity or mildness of an English winter can be foretold. It is known, however, that frost seldom sets in before Christmas; however severe the season may be, it is much milder than in continental countries under the same parallels. The sea-ports of Holland and Germany are every winter blocked with ice, while those in England are always open.

^a Baron C. Dupin, Force Commerciale de la Grande Bretagne.

^b Milton's Ode to May,* although the production of his younger years, is an ode of uncommon beauty, but it is not descriptive of what May is in England.

* Song on May Morning.—P.

^c Pinkerton's Modern Geography, vol. I. p. 70, 3d Edit.

^d Different maladies are produced or aggravated by the variableness of the climate; it is one reason of the frequency of pulmonary consumption, it increases scrofula, and it gives rise to catarrhs, rheumatisms and many other diseases. These remarks are generally applicable to the climate of Great Britain, but what has been called the mild region of England forms an exception; it is divided into four groups, of which the first includes the tract of coast between Hastings and Portland Island, the second extends from the last point to Cornwall, the third forms the district of the Land's End, and the fourth comprehends the country on the borders of the Bristol Channel and the estuary of the Severn.

The climate, with all its defects, has been extolled by many, among others by the celebrated Sir William Temple. Numerous instances of longevity are mentioned in his essay on health.—“I must needs add one thing more in favour of our climate, which I heard the king say, and I thought new and right, and truly like a king of England that loved and esteemed his own country; it was in reply to some of the company that were reviling our climate, and extolling those of Italy and Spain, or at least of France: he said, he thought that was the best climate where he could be abroad in the air with pleasure, or at least without trouble and inconvenience, the most days of the year, and the most hours in the day; and this he thought he could be in England more than any other country in Europe.”

It has been maintained that a considerable change to the worse must have taken place in the climate of Great Britain, because at an early period the vine was cultivated, and not without success. The arguments, or rather the alleged facts, on which this opinion is founded, may be briefly examined. The Isle of Ely was called the *Isle of Vines*

March, April and May, it has been observed, are the nominal spring, but there is certainly no month in which the weather is more unsettled or variable than in March; when it does not assume the character of winter, it is wet and boisterous, or accompanied with frequent storms of hail. The injury thus occasioned to agriculture, has probably given rise to the English proverb, “a peck of March dust is worth a king's ransom.” April, although a wet, is commonly a mild month, but the east winds prevalent in May, seem ordained to destroy the efforts of reviving nature, and to blast the hopes of the husbandman. Warmth, and genial breezes or refreshing showers, are the attendants of May in France, and all nature appears instinct with life. Constant disappointment has not convinced the English that the same month is very different in the two countries.^b It has been often said that there is no spring in England: the saying is true, if by spring is meant a succession of fine weather, constantly improving and terminating in the warmth and luxuriance of summer; but intervals of spring, sometimes a week or two at a time, are not unknown over the whole country.

The cold easterly winds prevalent in May, are often felt in the early part of June; during their continuance, the two months cannot be classed under any of the seasons; they belong as much to winter as to summer. June, however, is much milder in the southern than in the northern counties. July, August and September are summer months throughout the country, but slight frosts have been felt even in August in the north, and during September in the south. October is the precursor of winter in the northern, and November in the southern counties. The weather then becomes disagreeable and unsettled, and it is in November that the dark fogs generally take place in London and the neighbourhood. Such are the seasons in England, and so great is their uncertainty that a writer of some celebrity^c does not hesitate to affirm it might be better to divide them into eight months of winter and four of summer, than according to the ordinary method.^d

by the Normans. It appears from the accounts in Domesday, that there were vineyards in different parts of England; that they existed at so early a period as the commencement of the eighth century is confirmed by the authority of the venerable Bede. The bishop of Ely used to receive three or four tuns of wine annually as tithes from the produce of the vineyards in his diocese. A piece of ground near London was withheld from a religious house by four successive constables of the tower, in the reigns of Rufus, Henry and Stephen, and converted by them into a vineyard “to their great emolument and profit.” The tithe on wine, it is said, was no uncommon article in the old accounts of the rectorial and vicarial revenues in Kent, Surrey, and other counties. The sheriffs of Northamptonshire and Leicestershire were allowed so much for the livery of the king's vinedresser, and other necessaries of the vineyard. The following extracts are taken from the church archives by the dean of Ely:—

Exitus Vineti	£2	15	3
Idem Vineæ	10	12	2½
Ten bushels of grapes from the vineyard	0	7	6
Seven dolia musti from the vineyard, 12 Edward II.	15	10	0
Wine sold for	1	12	0
Verjuice	1	7	0
One dolium and one pipe filled with wine, supposed at Ely			
Wine out of this vineyard	1	2	2
Verjuice from thence	0	16	6
No wine but verjuice made 9th Edward IV.			

According to the above valuable extract, verjuice only was sometimes obtained from the English vineyards; it is reasonable, therefore, to conclude, that they yielded at best but imperfect wines in the most favourable seasons. If sheltered spots were cultivated at present after the same manner, and with as much care, the results, in all probability, would be the same. It is incorrect, therefore, to derive any arguments on the deterioration of the climate from such facts. But there is reason to infer from registers of the weather that some change has

It may be readily supposed, that the climate in so extensive a country as England, is different in different places. In the north the fine season commences later, and is still more uncertain and of shorter duration than in the southern counties. The winters are not only more severe, but they continue a greater length of time; indeed, it is generally admitted that spring or summer begins a fortnight later on the north of the Mersey and the Humber, than in the south and the south-west. It is doubtful, however, that there is so much difference in the coldness or severity of winter in the northern and southern parts of the country. The autumn is shorter in the north, and frosty nights are of more frequent occurrence. The difference of the climate in the eastern and western counties, although not of the same kind, is not less remarkable than that between the north and the south. The weather in the west is much more humid and also milder than in the east; the difference depends on three causes, the vicinity of the western counties to the Atlantic Ocean, the prevalence of the westerly winds, and a ridge of hills that extends along the western side of the island.

The west winds are saturated with the vapours that rise from the Atlantic Ocean; these being intercepted in their passage across the range of hills, the aqueous particles are disengaged, but before the same winds reach the eastern part of the kingdom, their vapours are exhausted in the form of rain. The winds that blow from the continent on the east are much colder, and fewer vapours are collected in their passage to England. The temperature of the ocean, it is well known, is more equable than that of the land, milder during winter, and cooler in the summer. The western part of England being exposed to the winds from the Atlantic, the winters are wet but not severe, and snow seldom lies on the ground any length of time. The same causes account for the genial climate of the south-western counties; the proverbial mildness of Devonshire and Cornwall depends in a great degree on their exposure to the winds from the Bristol and English Channels.

It has been proved by careful observers that the south-western coasts are much more exposed to rain than the south-eastern side of the island. It is now more than a century since the quantity of rain which fell at Townley in Lancashire, was measured and compared with the quantity that fell at Axminster in Essex. It was ascertained that the annual quantity at Townley during a period of six years from 1700 to 1705, inclusive, was equal to forty-two inches and a half, while that at Axminster amounted only to nineteen and a half. It appears from observations made in Rutlandshire that the mean quantity of rain which falls in the county, is twenty inches and a half. It is known that 36.98 inches were the average quantity that fell at Selbourne in Hampshire, between the years 1780 and 1786.

Devonshire, it cannot be doubted, is much moister, and the actual quantity of rain much greater than in the southern and south-eastern counties; still in 1731, the rain measured only 17.266 inches, in 1741, 20.344, and in 1743, 20.998.

It appears from a meteorological journal kept by Major Rooke, that the quantity of rain, which fell in

taken place within the last sixty years, that the winters are in general milder, and the summers colder and more humid than formerly.

^a Less than the mean.

London in 1798, was 26.22, at West Bridgeford in Nottinghamshire, 27.22, at Lancaster, 48.19, and at Kendal, 60.85. The average gauge of rain at Sheffield is 33 inches, nearly the mean between that of Lancashire and the eastern coast.

The annual rains in the midland counties are nearly equal to the mean of those in the east and west, or more correctly, they do not amount to so great a quantity.^a Thus Derbyshire, although a mountainous district, is much less exposed to rain than Lancashire, Staffordshire, or even Shropshire. It appears, indeed, from a register kept during fourteen years at Chatsworth in Derbyshire, that the following was the average quantity of rain, which fell in each season:—in spring, 4.959, in summer, 7.547, in autumn, 8.181, and in winter, 6.686. In that part of Derbyshire, therefore, most rain falls in autumn, and least in spring; the same remark is applicable to Liverpool.

The average quantity of rain increases as we advance northwards on the western coast. In Liverpool it is ascertained to be equal to 34.41 inches, while at Lancaster it amounts to 40.3. In the last place too, the greatest quantity falls in the autumn, or perhaps during the months of July, August and September.

The counties in the neighbourhood of London are not exposed to much rain. The observations in this part of England may not have been made with sufficient accuracy, nor may they have been continued a sufficient length of time; but in one place, at Youngsbury near Ware in Hertfordshire, about twenty miles from London, a register was kept during five years; there the annual fall in 1787, was equal to 23.664 inches, in 1788, to 17.676, in 1789, to 29.493, in 1790, to 22.970, and in 1791, to 24.200.^b A tolerably correct notion of the annual falls in the neighbouring counties, may be inferred from these results; at all events, the difference, if it be great, must be attributed to local causes.

Some conclusions may be deduced from the above details. The greatest quantity of rain falls near Kendal, where the annual average exceeds sixty inches. Although the southern parts of the western coast are less liable to rain than the northern, it is doubtful if the rule be equally applicable to the peninsula of Cornwall, and the west of Devonshire. More rain falls in the north-eastern than in the south-eastern counties; still in both, the climate is much drier than in the western part of the island. Norfolk is probably the county in which the least rain falls during the year. July, August, September and October are the wettest months in the western; November, December and January, in the eastern counties.

It is very difficult to determine with any thing like accuracy, the quantity of rain that falls annually in England and Wales; a sufficient number of experiments have not been made in different places, and the mean of all the observations cannot be considered applicable to the whole surface. Dr. Halley supposed the annual quantity equal to twenty-two inches, but Mr. Dalton fixed it with greater probability at 31.3.^c The same philosopher concluded from a series of experiments, that five inches of water fall annually throughout the country in the form of dew; hence taking thirty-one inches for rain, and five

^b See the article England in the Encyclopedia Edinensis [Edinburgh Encyclopedia.]

^c See Mr. Dalton's paper in the Manchester Transactions for 1798

for dew, and supposing the whole extended over the surface of England and Wales, it is equal to twenty-eight cubic miles, or 11,500,000,000 tons in weight.

In England, the warmest months are July and August, and a greater degree of cold occurs commonly about the end of December, or beginning of January, than at any other period of the year. The thermometer, it has been ascertained, rises higher in the immediate vicinity of the metropolis than in any other part of the island. The north-eastern districts are exposed to the greatest degree of cold, but the difference of temperature in winter is not nearly so great as the difference during summer in the northern and southern counties. The mean range of the thermometer has been determined in different parts of the island. The mean temperature at Liverpool, during a period of twenty-five years, was 53° of Fahrenheit at noon, the greatest degree of heat 86° , and the lowest 22° . The greatest range of the thermometer at the same place is 64° , and the mean annual range, 46° . At Dover the mean heat is 57° ; the highest degree observed between the years 1790 and 1793, was 86° , and the lowest, 16° ; the greatest range, 70° , and the mean annual range, 51° . The mean height of the thermometer at Lancaster during seven years was $51^{\circ}.8$ at two o'clock in the afternoon, and $45^{\circ}.6$ at ten o'clock at night; the mean heat, noon and night, $48^{\circ}.7$, the highest 82° , and the lowest 18° .

It appears from a series of observations, made at the Royal Society from 1772 to 1780, that the mean annual temperature is $51^{\circ}.9$, and the monthly temperature as follows: January $35^{\circ}.9$, February $42^{\circ}.3$, March $46^{\circ}.4$, April $49^{\circ}.9$, May $56^{\circ}.61$, June $63^{\circ}.22$, July $66^{\circ}.3$, August $65^{\circ}.85$, September $59^{\circ}.63$, October $52^{\circ}.81$, November $44^{\circ}.44$, and December $41^{\circ}.04$. The greatest cold is 20° , and the greatest heat 81° ; the former occurs generally in January, and the latter in July.

Dr. Young remarks, that the mean temperature of the six winter months from October to March at London, is $43^{\circ}.5$, while it is $45^{\circ}.3$ at Dawlish on the south coast of Devonshire, and so high as 59° at Ilfracombe on the Bristol Channel. The temperature in the most sheltered parts of Devonshire, during winter, is $1^{\circ}.5$ above that of London; in the coldest months, it is $4^{\circ}.5$ higher at Penzance than in the metropolis.

It would be incorrect to infer from these observations on the climate of England, that extremes of cold or heat are unknown in the country. A degree of cold has been felt in some years, that is of rare occurrence in more northern parallels, in countries more remote from the sea. In the years 1794, 1798, and 1813—14, the thermometer, it is said, fell to five degrees above zero; it is certain that in the last of these years it was within 8° of the same point. The heat, on the other hand, is sometimes excessive; in the summer of 1808, the thermometer rose higher than 89° in many places round London. It happens sometimes in the southern districts, if the sun shines bright, and the weather is serene or unclouded, a few days or even hours in summer, that the temperature becomes suddenly as warm as in the south of France or even Italy; but these moments of a

more genial climate are commonly succeeded by cold weather, storms of hail, or violent showers.

It has already been observed that the west and south-west winds are most prevalent in England; their constancy may be attributed to the situation of the island, and its exposure to the Atlantic Ocean. The same winds are also the most violent, not only in the western, but also in the midland and eastern counties. The trees in every part of the country have an evident bending in the same direction, and no other proof of the violence and constancy of these winds can be more satisfactory. The east and north-east winds are, next to the west and south-west, perhaps the most regular; it seldom happens, however, that they blow violently any length of time. The north-west wind is not of common occurrence, but the most rare of any is that which proceeds from the south. In the summer season, and in calm weather, the wind veers frequently to different quarters in the same day, or even in the course of a few hours. Near the sea-coast, during the same season, and in this sort of weather, the wind at break of day blows from the land; at noon, or a little before it, it changes to the direction of the sea, and becomes again a land wind in the course of the evening. A wind not unlike the Italian sirocco is sometimes felt in England, but the change of temperature is comparatively inconsiderable. Occurring commonly in April or May, the medium height of the thermometer being about 45° , the barometer falls, the winds, before variable, continue stationary at south-west or south, and the thermometer rises suddenly to 65° ; no sooner, however, has the wind ceased, than it descends again to the usual level.

The following facts are deducible from the observations which were made by order of the Royal Society. In the vicinity of London, the south-west wind blows more frequently every month in the year than any other, particularly in July and August: the north-east wind prevails during the months of January, March, April, May and June; it occurs most rarely in February, July, September and December: the north-west wind is most frequent from November to March; it is less so in September and October than in any other months.

It follows from the careful observations made by Mr. Hutchinson at Liverpool, that the south-east wind is most common in that place, a fact at variance with the general remark that has been made on the prevalent winds in England.^a Dr. Darwin attributes this remarkable deviation to an atmospheric eddy, produced by the situation of the town; there can be no doubt that it is occasioned by local causes. As to the connexion between the height of the barometer and the different winds, it is well known that in England, nay, in every part of the island, the mercury rises higher when the wind proceeds from the north or east, or from any point between these quarters, than when it blows from the south or west, or from any point between them. Thus it often rains during a north or east wind, when the barometer remains at a height, which would be considered an indication of fair weather with a west or south-west wind.^b

^a In the course of the year, and on an average in the same part of the country, the south-west winds blow 112 days, the south-east 32, the north-east 58, the east 26, the north-west 50, the south 18 days, the west 53, and the north 16 days.

^b The author of the article England in the Encyclopedia Edinensis [Edinburgh Encyclopedia] has collected the results of most of the observations concerning the climate; to mention them might lead to too long details

The coasts, an important feature in the geography of a maritime country, may be briefly described. The western coast is formed on the north, by Cumberland, Lancashire and Cheshire, by Flintshire, Denbighshire, Caernarvonshire, Anglesea and Merionethshire in North Wales, and by Cardiganshire and part of Pembrokeshire in South Wales. The remaining portion of the Pembrokeshire coast, and those of Caermarthenshire and Glamorganshire, bound the Bristol Channel on the north, while Somersetshire and the northern coast of Devonshire confine it on the south; lastly, the northern coast of Cornwall forms the extremity of the western side of the island.

The Esk separates Scotland from England at the extremity of the Solway Firth,^a which is bounded in many places by a marshy shore. The coasts of Cumberland and part of Lancashire form a sort of semicircle from the mouth of the Eden to the Isle of Walney. Between the two last places, and on the south of the Derwent, the small bay of Whitehaven is sheltered by naked hills and by the white rocks from which its name has been derived. Not more than six miles from Whitehaven, the promontory of St. Bees Head, the resort of numerous sea-fowl, protrudes into the sea.

The rugged and indented coast of Lancashire may be divided into three parts; the first comprehends the space between the Dudden and the Ken, which separate it from Cumberland and Westmoreland; the second extends from the Ken to the Ribble; and the third from the Ribble to the Mersey, which separates the county from Cheshire. The coast of Furness, the first of these divisions, is nearly equal to thirty miles in length; the long and narrow isle of Walney, which appears to have formed at one period part of the Lancashire coast, now serves to protect it against the impetuous waves of the Irish Sea. The broad estuary, which separates Furness from the rest of the county, is sometimes forded at low water, but not without danger. The Dudden, the Ken, the Lune and other streams discharge themselves into the deep bay of Morecambe, opposite the town of Lancaster. The second part is flatter than the first; a marshy tract almost encloses Poulton, and the coast beyond it, is indented by the estuary of the Ribble.

The Romans gave the name of the *Port of Lancashire* to this part of the coast, which appears to be much changed since their time. "Tradition," says Mr. Whitaker, "the faithful recorder of many a fact, that history has forgotten, speaks confidently of the cause, ascribing the final ruin of Ribchester to the overwhelming violence of an earthquake. And nothing but such an accident could have originally changed the nature of the estuary, once the most remarkable in the county, or have thrown out that large and broad barrier of sand, which crosses the entrance, almost chokes the inlet into the tide, and contracts the original breadth of the navigable channel from the majestic extent of eight or nine miles, to the narrow span of a hundred yards." The last part of the Lancashire coast between the Ribble and

^a This is not correct. The boundary from the head of Solway Firth, is first formed by the Sark, a small river entering the Firth to the west of the Esk; then by a line drawn eastward from the Sark to the Esk; then by the Liddel, an eastern branch of the Esk; and lastly, by Kershope Water, a southern branch of the Liddel.—P.

^b Penmaenmawr^r is a promontory, 1550 feet high, projecting into

^c Welsh, *pen*, head; *maen*, stone or rock; and *mawr*, great.

the Mersey is nowhere bold or lofty, and it becomes gradually flatter towards the southern extremity.

The short line of coast in the county of Chester, may be compared to a headland stretching a considerable way into the Irish Channel; the Mersey and the Dee form the northern and southern boundaries. The coast of Flintshire extends between the last river and the Clwyd; it is in general low and marshy, but in some places, particularly in the neighbourhood of Holywell, the hills rise a considerable height above the sea. The county of Denbigh begins beyond the Clwyd; although rich in lead mines, and famed for its manufactures, it has no convenient port; it terminates in the peninsula and cape of Great Ormes Head at the mouth of the Conway, the boundary between Denbighshire and Caernarvonshire. The long line of coast in the last county is bold and lofty, broken by precipices, and indented by bays. An excellent road has been cut across the once inaccessible height of Penmaenmawr, which rises near the middle of an extensive inlet between Aberconway and Bangor.^b At the last place commence the Menai Straits, a narrow channel, which changes the character of the coast by separating Wales from the Isle of Anglesea, sometimes appearing as motionless as a lake, and at other times, flowing majestically from north to south.^c

The small island of Holyhead, on the west of Anglesea, at the entrance of St. George's Channel, is well known on account of its port, admirably adapted to afford shelter to ships on their way from the north or south. Hundreds of vessels unable to run out to sea from contrary winds, are sometimes detained in the harbour; they have been seen setting sail at the same time, as soon as the wind has changed in their favour. Returning to the Welsh coast, we observe no harbour of any consequence in the bay of Caernarvon, or the sweep from the southern extremity of the Menai Straits to the promontory of Bronhy-Swil, on the east of which are the roadstead of Aberdaron, and the gulf of Hell's Mouth. Beyond these places, the Caernarvonshire coast turns to the north-east, and reaches the limits of Merionethshire, a county in which the population, relatively to the surface, is less than in any other in Wales.

Cardigan Bay, the largest of any on the western side of the island, extending from the abrupt angle at Aberdaron Point to the north of St. Davids, washes North and South Wales. The coast of Merionethshire, part of the same bay, is wild and rugged: Harlech Fort defends a good anchorage, and Barmouth, the only port in the county, is situated at the mouth of the Avon, on an arm of the sea, into which other rivers and streams are discharged. The coast of Cardiganshire fronts the west, a considerable way below Aberystwith, and afterwards diverges gradually so as to front the north. The line of coast in this county is nearly equal to forty miles; it has been much exposed to the encroachments of the sea; once covered with numerous towns, a few wretched villages are all that can now be seen.

The bold coast of Pembrokeshire is bounded by nu-

the eastern entrance of the Menai Straits, about half way between Aberconway and Bangor. A road winds round it, on a ledge of rock.—P.

^c The Menai Straits—sometimes appear land-locked, like a lake, and at other times assume the form of a large navigable river, flowing with several curves, nearly in a direction from north to south. (Ed. Enc. art. England.)—P.

merous hills, or by steep and precipitous cliffs, and is cut in many places by different bays. The first of any consequence is that of Aberkikar, formed by Kenmaes-Head on the north, and Pendroy on the south. The last promontory is the northern boundary of Newport Haven, which stretches towards the south-west to Dinas-Head. A larger bay, that of F'isguard, cuts deeper into the land, and is limited on one side by Dinas-Head, and on the other by Pen Anglas. The coast beyond it, bending towards the south-west, winds round Strumble Head, and continues in a south-south-west direction to Cape St. David. Having doubled the last cape, we enter St. Bride's Bay, of a semicircular form, open on the west, and prolonged on the south by several small islands.

On the south-east of these islands, and at no great distance from them is situated Milford Haven, enclosed by lofty mountains, sinuous, penetrating far into the land, and of a sufficient depth to receive the largest ships. In time of war, Milford Haven is of importance as a naval station; in time of peace, it is equally so for the purposes of commerce, as a place of shelter from storms or contrary winds, to the merchant vessels that depart from or return to the Bristol Channel. The Dugledy and the Cleddy, which are navigable to Haverford and Narbeth, fall into the same bay; it thus affords an outlet to the produce of the coal mines and chalk pits in the vallies watered by these rivers.

Leaving Milford Haven, and pursuing an easterly course into the Bristol Channel, the coast of South Wales continues rocky and broken by natural cavities to the entrance of Caermarthen Bay, bounded on one side by the rock on which the small port of Tenby is built, and on the other by Penryhn Gwye point, the extremity of Gower, a remarkable headland of Glamorganshire; its limestone cliffs tower above the sea, and a great quantity of lime is obtained and exported from it to the English counties on the other side of the channel.

The bay, the peninsula and town of Swansea are situated on the east of Gower, nearly midway between Tenby and Bristol. The town, a convenient port, is built near the mouth of the Towy, and in the neighbourhood of its banks, coal, iron-ore and limestone are obtained. The Bristol Channel is so much contracted beyond the peninsula of Swansea, that all the heights on the opposite coasts of Devonshire and Somersetshire may be distinctly seen from the bay of Glamorgan.

The province of Wales abounds in coal, iron-ore and other valuable minerals; their conveyance to the coasts is facilitated by artificial communications, by rail-roads, canals and other works, in the construction of which much ingenuity has been exerted, and many natural obstacles have been surmounted. It is by the same means that the copper and tin ore dug in Cornwall are conveyed to the extensive founderies near the rich coal mines in Wales.

Of the Monmouthshire coast, it may be remarked that one part is low and marshy, while the other in the neighbourhood of the Wye is rocky and precipitous.

The Bristol Channel enters an extensive bay on the coast of Somersetshire, of which the curved and indented outline is nearly equal in length to sixty miles. The Axe and the Yeo convey their streams to the same coast; the former ascends to Glastonbury; the latter passes by Bridge-

water and Langport. Beyond the Yeo, the coast turns to the west, and in this part of it is situated the small port of Watchet, formerly famous for its herring fisheries, now better known for a species of alabaster, which is converted into hydraulic lime. Continuing our journey westwards, we pass along a rocky and rugged shore, to the safe and commodious port of Minehead, of which the trade has ceased, since the herring has disappeared from the neighbouring sea. Beyond the last place, the northern coast of Devonshire joins that of Somersetshire; the port of Ilfracombe is defended by a semicircular range of hills, which add greatly to the beauty and salubrity of its situation: it is visited by strangers in the bathing season, and it carries on a regular intercourse with Bristol, Swansea and Milford. The coast turns to the south from Ilfracombe to the mouth of the Taw in the bay of Barnstaple, in which the small town of Bideford may be remarked for the industry of its inhabitants; they carry on a great coasting trade with Ireland and Scotland, convey to Wales the produce of the mines in Devonshire and Cornwall, and send a considerable number of vessels to the fisheries on the banks of Newfoundland. The promontory of Hartland Point forms the southern extremity of Barnstaple Bay; at no great distance from it, the northern part of the Cornish coast, the last on the western side of England, commences. A long and broken shore extends from Beedshaven to St. Ives, between which and the Land's End, the most westerly point in the island, no harbour of any consequence can be mentioned. Some statistical results, relative to the population of the western coast, may be subjoined.

	Population.	Square miles.	Inhabitants per square mile.
Cumberland and Westmoreland . . .	211,700	2241	94
Lancashire and Cheshire . . .	1,349,500	2382	468
Wales—western part of . . .	369,850	3331	111
Counties on the Bristol Channel . . .	2,392,400	4146	160
Total	4,323,450	12,600	189

The southern side of England is bounded by the southern coasts of Cornwall and Devonshire, by the coasts of Dorsetshire, Hampshire and Sussex, and by part of Kent.

Doubling the Land's End, and passing between the main-land and the Scilly Isles, we enter the bay of St. Michael, on which are situated the three ports of Penzance, Marazion and Helston. The same bay affords, in the event of storms or contrary winds, a safe retreat to the ships that return to or depart from England. It terminates on the east near the promontory of the Lizard,* which may be mentioned as the southernmost point in Great Britain, being somewhat below the fiftieth degree of latitude. The shore is irregularly indented from the same point to the southern extremity of the Ram Head, that fronts the coast of Devonshire. Several bays and havens lie on this part of the coast of Cornwall, among others, Falmouth Haven, the estuaries of the Fowey and the Looe, and lastly, that of the Tamar, where the harbour and sound of Plymouth, one of the first military ports in England, pass between the counties of Cornwall and Devon. The harbour is formed by the junction of the Plym and the Tamar at their confluence with the

* Lizard Point.

sea. The Eddystone rocks are irregularly scattered about the distance of twelve miles from the middle of Plymouth Sound. Exposed to the tremendous swells from the Bay of Biscay and the Atlantic Ocean, the waves break over them with great violence, and the number of shipwrecks might be still as great as formerly, were not vessels warned of their danger by a light-house, which attests the skill and ingenuity of the late Mr. Smeaton.

Start Point and Forward Point are the boundaries of the spacious and safe bay of Dartmouth. The harbour of the same name is defended by a fort and two batteries; it may contain five hundred ships. Torbay, about five miles to the north-east of Dartmouth, is not less than twelve miles in circumference; as it affords a secure retreat against westerly winds, it has become a *rendezvous* to the royal navy. The coast is protected by a natural rampart of rocks, crowned by thick woods and lofty trees. The clefts in the rocks are very large; Kent's hold,^a one of the most remarkable, is a wide cave about six hundred feet in length. The small river Teign and the Exe enter the English Channel on the north-east of Torbay; from the mouth of the last river, the shore turns gradually towards the south,^b and unites at Lyme-Regis with that of Dorsetshire. The shore fronts the south-west at the last place,^c and stretches as far south as Portland-Bill.^d Thus Start Point and Portland-Bill may be considered the western and eastern extremities of a large gulf, in which are included the numerous small bays between them, and the greater part of the Devon and Dorset coasts. A safe road for ships is situated on the north of Portland, but the southern point or Portland-Race, so called from the rapid currents produced by the tides, is perhaps more dangerous than any other part of the Channel. Having passed Portland-Race, we enter the bay of Weymouth on which the town of the same name is built, and only separated from Melcombe-Regis by a bridge over the Wye.^e The harbour is completely sheltered by the surrounding hills, which by opposing a barrier to the north winds, add considerably to the mildness and salubrity of the climate. The bays of Swanwich^f and Studland are situated on the same coast, on the north-east of Cape St. Albans;^g the spacious haven of Poole communicates with the latter; as its entrance is very narrow in proportion to the width, that circumstance accounts sufficiently for the stillness of its waters. Peverel-Point forms the eastern limit of the county,^h and at no great distance from it, is seen the Isle of Wight, which from the mildness of its climate, and the richness and variety of its vegetation, may be considered one of the finest situations in Great Britain. It is twenty-two miles in length and more than twelve in breadth; bounded by four sides that are almost rectilinear, the two northern front England, and the two others, the open sea. It thus affords shelter to the flourishing ports and the excellent anchorages on the opposite shore.

To judge from the appearance of the rocks on the island, and from the projecting point of Hurst Castle on the opposite shore of Hampshire, it is by no means improbable that the Isle of Wight and the mainland were

once united. The natural causeway on which Hurst Castle stands, runs two miles into the sea, and approaches within a mile of the island. The tide rushes with great violence through the strait thus formed, and the depth of the water is not less than twenty-eight fathoms. The bold ledges on the side of the island may be attributed to the impetuosity of the waves, but the opposite coast is in many places undermined by the water which the tide collects into a smooth and sequestered bay.

The Avon descends by Christchurch to the Hampshire coast. The bay of Christchurch is formed by the streams of the Avon and the Stour, which join each other a short way below the town. As the promontory of Hengistbury Head, its western limit, appears when seen from the sea to be connected with the town, it is generally known by the name of Christchurch Head.

Southampton Water or Trissanton Bay, a remarkable inlet on the same coast, extends in a north-westerly direction from Calshot Castle to the distance of ten miles; large vessels can sail to its head. The shores of the inlet are varied by picturesque scenery and romantic sites; on one side they terminate in the New Forest, on the other are the majestic ruins of Netley abbey.

Further east, the coast of Hampshire fronts the south-west, and that part of the Isle of Wight, where the river Medina throws itself into the channel. The well known road of Spithead, the common rendezvous of ships of war and merchant vessels on their departure for long voyages or distant expeditions, lies between the Isle of Wight and the entrance to Portsmouth harbour.

The coast of Sussex begins on the east of Portsmouth harbour, and is indented by a large basin or inlet, in which several small islands are situated. The port of Chichester is formed by a branch of the inlet, and a flat shore extends beyond it to the headland of Selsea Bill. Although some rocks are scattered in different directions near Bognor, the coast continues low and apparently almost level with the sea, to the neighbourhood of Little Hampton. The South Downs form a better defined barrier; approaching gradually to the shore, they are broken by the lofty cliffs, which terminate in the bold promontory of Beachy Head, the highest of any on the southern coast of England, dreaded by mariners on account of numerous shipwrecks, and pierced by several caves to which the sea finds a passage. A sandy shore stretches from Beachy Head to Hastings Rock, but the port of Hastings lies between two cliffs. On a capacious bay near the eastern extremity of the county, are the once frequented ports of Winchelsea and Rye; the sea has now receded from the one, and the other is so much encumbered with sand as to admit only very small vessels. The long coast of Sussex, upwards of seventy miles in length, is bounded on the east by Dungeness, the extremity of Romney Marsh.

The part of the Kentish coast next to Sussex, is low, flat and sandy; a hilly district extends beyond Sandgate, passes from the interior of the county to the shore, and ends in the chalky cliffs that are familiar to the readers of Shakspeare. Part of the same range forms a sort of curve, and recedes a short way from the shore; the town

of Dover is situated below it, and occupies almost all the space between the cliffs and the sea. The same chalky range, broken in different places by intervening hollows, stretches to the South Foreland, which may be considered the eastern extremity of the southern coast, for beyond it the shore recedes and fronts the east, leaving a large space that appears to have been abandoned by the sea.^a To complete the survey of the same part of England, it may be necessary to subjoin a table of its superficies and population.

Counties.	Population.	Square miles.	Inhabitants per square mile
Cornwall (a half) . . .	131,300	663	198
Devon (a half) . . .	223,950	1,289	173

Kent (two fifths) . . .	134,600	615	248
Total	1,164,250	6,663	Mean 172½

The eastern side of England is formed by part of Kent, and by the coasts of Essex, Suffolk, Norfolk, Lincoln, Yorkshire, Durham and Northumberland.

The Downs, a much frequented road for ships, particularly in time of war, front the port of Deal, and are not less than six miles in length from the South to the North Foreland.^b The dangerous Goodwin Sands lie off the port of Deal, and extend to the neighbourhood of the North Foreland; a vessel is always moored on them, and lights are constantly burning to warn mariners of their danger.

The Isle of Thanet, part of Kent, separated from the rest of the county by the narrow channel of the Stour, is about ten miles in length from the North Foreland to Sarr Bridge, and eight miles from Westgate to Sandwich Ferry. It has undergone great changes; now hardly a peninsula, it was an island in the time of the Romans, and at the same period, the sea between it and Kent,^c was four miles in breadth. Such was the greatest distance between the island and the mainland; on the southern side it was not more than two, and at Sarr or the port, it did not exceed a mile and a half. The South met the North Sea at the same place, which was called *Northmutha*, the mouth or entrance of the latter.^d An accustomed passage to London by sea, at so late a period as the middle of the fourth century, lay between the Isle of Thanet and the mainland of Kent. The breadth of the passage was considerably diminished in the time of the venerable Bede, who says it was then only three furlongs wide, and so shallow as to be fordable at two places. It afforded, however, a passage for small vessels about the period of the Norman conquest; at last the inhabitants observing that the tide flowed no longer with any rapidity, began to erect dikes, and brought about the present change. Formerly separated from the mainland by the channel of the *Portus Ritupensis*, it is now at most a river isle, having the Stour-Wantsome on the

south, the Mill-stream on the south-west, and the Nethergong-Wantsome on the west; the rest of Thanet fronts the sea as before. The junction was thus effected, and the sea, impeded in its course, threw up immense quantities of sand; in this way, *Estanore* on the eastern shore was formed, being originally an island, which the monks united to Thanet by means of a causeway.

The Kentish coast becomes marshy as it descends the Swale, a narrow arm of the sea, which bathes the Isle of Sheppey.

It turns eastwards^e to the entrance of the Medway into the Swale, and on the north of the last place are the projecting fort of Sheerness, and the mouth of the Thames. The last river discharges itself into the sea between the North Foreland in Kent, and the Naze, a hooked promontory in Essex, or more definitely, between Sheerness in Kent, and Leigh in Essex.

The coast of Essex, the most southern of the three maritime counties, that form the peninsula between the Thames and the Wash, is bounded on the south by the Thames, and on the north by the Stour. Essex, Suffolk and Norfolk form a continuous tract of great extent, undistinguished by any considerable eminence or ridge, but sufficiently elevated in most places to be dry, arable and productive. The Crouch, the first river north of the Thames, on the Essex coast, enters the sea at Foulness; it may be mentioned on account of the oysters, which are taken at its mouth, and which are considered superior to any others in England. The coast runs northwards from the mouth of the Crouch to the distance of about ten miles, where the fine bay formed by the Blackwater, is enlarged by a great number of small streams, and by the Chelmer, which has been rendered navigable to Chelmsford.

The Colne, which communicates with the northern shores of the same bay, is now navigable for ships to Wivenhoe, and for smaller vessels to Colchester. A more important bay, on the northern confines of the Essex coast, receives the waters of the Stour and Orwell, the former of which is navigable to the distance of twenty-eight miles. Harwich is built on a peninsula at the mouth of the Stour, and the packet boats to Holland and Belgium set sail from its harbour. More than once during the great struggle between the English and the Dutch, a hundred men of war, and three hundred merchant vessels, have been moored at the same time in the spacious haven of Harwich. The greater part of the Essex coast is low, marshy and exposed to the encroachments of the sea. According to tradition the outlets of the Stour and Orwell were formerly situated on the north of Landguard Fort, and the Fleets, as they are now called, formed part of the channel.

The waving shore of Suffolk is chiefly composed of loamy cliffs, continually falling down, and occasioning great changes on the coast, so that whole towns and villages have been destroyed by the sea. The small town

^a Between the North and South Forelands, the shore fronts the east. Off the coast lie the Downs, and beyond them the Goodwin Sands, supposed to have been originally a part of Kent, and submerged about the end of the reign of William II. Near the South Foreland, the chalk cliffs recede from the coast in a direction west by north, and leave a low tertiary tract between them and the chalk of Thanet.—P.

^b Between the North and South Forelands are the Downs. They extend about six miles. The Goodwin Sands extend N. N. E. and

S. S. W. about 12 miles. (Ed. Enc.) The South Foreland is in lat. 51° 12' N., long. 1° 25' E. The North Foreland, in lat. 51° 25' N., long. 1° 29' E. The Downs begin near the S. Foreland, and lie off the port of Deal.—P.

^c On the south-west side.—P.

^d The North Sea entered at what was, from this circumstance, called *Northmutha*, or North-Mouth. (Ed. Enc.)—P.

^e So as to front the east.—P.

of Felix Stow^a is situated to the north of Harwich Bay at the mouth of the Deben, which is navigable to Woodbridge, a distance of ten miles. The Alde and the Blyth are only navigable a few miles: Orford, near the mouth of the former, was once a flourishing port; it is now wholly blocked up by sand and alluvial deposits. Aldborough, situated, as its name imports, on the same river, has on the contrary been almost washed away by the sea. The Suffolk coast stretches due north from Orfordness to Southwold; the last place is built at the mouth of the Blyth, on Solebay, which was formerly bounded by Eastonness, and another cape to the south-east of Dunwich, but these limits have been removed by the waves. The picturesque town of Lowestoff, near the northern extremity of the coast, may be remarked on account of its position on the most eastern promontory in Great Britain. The sea coast of Norfolk is formed either by clayey cliffs, continually a prey to the ocean, or by low sandy shores, overspread with loose pebbles, and rising in many places into a kind of natural bank, covered with sand that is held together by the roots of the sea reed grass. Behind these sand-hills are salt marshes of considerable extent, occasionally inundated by the tides, which find an entrance through gaps between the hillocks. Hunstanton Cliff, at the mouth of the Wash, is the only rocky eminence on the coast. Various ports are formed on the northern side by creeks and bays, but they can only admit small vessels. Sandbanks, the dread of the coasting mariners, and the occasion of numerous shipwrecks, lie off the coast; of these the most remarkable run parallel to the coast of Yarmouth, and form the celebrated Yarmouth Roads, a place of great resort for ships; they may ride there in security, although the entrance is difficult and dangerous.

A great part of the Norfolk coast fronts the north, and bounds on the south the gulf of the Wash, which receives the waters of many streams and rivers. The same gulf serves as a limit between Norfolk and Lincolnshire. The coast of Lincolnshire, like that of Holland, is protected by dikes against the waves. It is distinguishable by churches, not by hills, being so low as to be seen only a short way from the land. The sea has made encroachments in some places, and the remains of forests have been discovered under the water; in others, fruitful tracts have been gained by its recession. Former ports are now either obstructed with sand, or wholly deserted by the ocean, a circumstance which has been adduced by some writers to account for the decay of trade in this part of England. The Lincolnshire coast is upwards of a hundred miles in extent; it stretches first to the north-east, and then inclines westwards to the mouth of the Humber, which separates it from Yorkshire.

The river Humber, as it is commonly called, is a large gulf or arm of the sea, at the mouth of the Ouse, enlarged by the Trent and its numerous feeders, and by all the streams from Yorkshire.^b The extremity of Holderness or Spurn-Head, a long and curved promontory,^c on which a light-house has been erected for the direction of ships, protects the mouth of the estuary. Sunk Island

consists of the sand, which has been deposited on the Yorkshire side. The sea has occasioned great changes in this part of the country. Headdon, a free port in the time of King John, and so populous as to contain three parishes, is now little better than a village with scarcely any harbour. The shore continues low and flat from the Humber to the neighbourhood of Bridlington Bay, which is sheltered by Flamborough-Head from the north-east and north-west winds. The character of the coast changes at the same promontory; snow-white rocks and lofty cliffs stretching far out at sea, serve as beacons to mariners. They are composed of mouldering limestone, and their base is pierced by numerous caverns, and broken by the violence of the waves. In the breeding season, their summits are tenanted by countless multitudes of sea fowl, that animate the air and ocean all around. A remarkable ledge called Filey-Bridge, connecting a kind of natural mole, runs nearly half a mile into the sea from the other extremity of the bay;^d the rocks are left dry at low water, and serve to protect the coast against the high waves, which break upon them in stormy weather. Further north are situated the town and port of Scarborough in the recess of a bay, forming a sort of amphitheatre crowned by a cliff or *scar*, from which the name of the place has been derived. The port is the only one between the Humber and the Tyne, that affords a secure refuge for large ships in violent gales from the east. Lofty hills of alum rock bound the coast beyond Scarborough; on the north of them is Robinhood's Bay, in which the small but populous village of the same name is inhabited by fishermen, who supply Whitby with the produce of their industry. The prosperity of the last place depends chiefly on its extensive alum works, and the aluminous schistus which abounds in the neighbourhood. A rude and precipitous coast extends from Whitby to the mouth of the Tees; many fishing villages, singularly placed like nests on the ledges of the rocks, are situated in different places, and no part of the English coast abounds more with various kinds of fish.

The river Tees, although not even navigable as far as Darlington, forms at its mouth a considerable estuary, which separates the coasts of Yorkshire and Durham. The town of Hartlepool, built on a small promontory, surrounded on all sides except the west by the sea, is the first place on the north of the Tees. Sunderland stands on the right bank of the mouth of the Wear, and Wearmouth on the left. The two towns are united by a bridge of a single arch, of which the span is 236 feet, and the height from the keystone to the level of the highest tide, not less than ninety-eight. The view of the two towns, and of the bridge that unites them, is remarkable; the arch appears suspended in the air, ships of considerable burden with topsails set, pass beneath it, while heavy waggons are drawn by many horses along its aerial causeway: vessels are constantly loading and unloading on both banks of the Wear; they sail down the river when the tide is ebbing, while others arrive from the sea when it is flowing. Coal and limestone are transported

^c The extremity of Holderness [the low country S. E. of the Yorkshire Wolds] contracts into a neck of land, forming a curve towards

the south-west. The extremity of this neck of land is the Spurn Head, a sickle-shaped promontory. (Ed. Enc.)—P.

^d Filey Bay, between Flamborough Head on the south, and Filey Point on the north.—P.

in numerous waggons along iron rail-ways to the place of embarkation ; lastly, two fine towns crown this magnificent amphitheatre, in which the varied resources of art and industry form a singular contrast with many natural and picturesque beauties. The Tyne falls into the sea at no great distance from the Wear, and serves equally for the exportation of coal, lime and many other articles. These two rivers, watering an extent of coast, which a foot-passenger may walk over in three or four hours, receive annually 16,000 vessels, and send them away laden with the produce of their banks. It need not therefore excite surprise, if six flourishing towns, containing in all a population of 86,000 inhabitants, are situated on this narrow tract, of which the length is little more than the breadth.^a

North Shields is the first port on the coast of Northumberland ; beyond it, at the distance of about a mile and a half, rise the majestic ruins of Tynemouth Castle. Small vessels sail on the Wansbeck to Morpeth, a distance of five or six miles ; but the Coquet is not even navigable to Rothbury, the only town that has been built on its banks. Holy Island is situated on the north of the Farn Isles, which lie nearly opposite to Bamborough Castle, once a strong hold of great importance. A sandy shore extends from Bamborough to the mouth of the Tweed.

Eastern Coast.	Population, census 1821.	Extent, square miles.	Inhabitants per square mile.
Kent (a part) . . .	300,000	921	326

Northumberland . .	203,000	1871	108
Total	3,123,430	17,696	Mean 185

It may be remarked, that no islands of any consequence are situated near the eastern shores ; the Isle of Wight, and a few others of a much smaller size, lie on the south ; the Scilly Islands, Anglesea and Man front the western coast. The estuary of the Exe is the principal inlet on the south ; the most important on the east are that of the Thames, the Wash, and the indentation by which the Humber communicates with the German Ocean ; lastly, Cardigan Bay and the Bristol Channel, the largest inlet on the English coast, are situated on the west.

The remarkable resemblance between the British coasts and the opposite shores of the continent, has not failed to attract the attention of geologists. "In the neighbourhood of Aberdeen," says M. Coquebert, "one might imagine himself transported to the precipitous granite shores of Norway, and below Aberdeen the coasts are very similar to those of Denmark." There is a great resemblance between the Low Countries on the continent and the marshy districts in the south-east of England. Thus, the elevation of the land, and the nature and stratification of the soil, are the same in maritime Flanders, and in the low shores on the

opposite side. The superficial strata on both sides, consist of clay silt and sand, which are mixed in many places with vegetable remains. They cover on both sides, a deep stratum of dark coloured clay, unmixed with extraneous matter ; lastly, they are bounded on both sides by lines of hills. Tropical plants have been discovered in the British and the Belgic ridge. Cocoa nuts and the fruits of the areca have been collected on the Belgic side ; many petrified fruits of the same sort, and many impressions of tropical plants, have been found in the Isle of Sheppey. The coasts of Devonshire and Cornwall may be compared to those in the departments of Finisterre and the North Coast. The same remark is also applicable to the marshes in Sussex, and to others in the Pays de Caux. Appearances render it highly probable that France and England were once united ; the deposits on the coast of Kent, extending to a great distance on the other side of the Channel, the narrow strait separating the two countries, and the nature of the rocks, as easily undermined as clay, sand or chalk, may be considered the proofs of a disruption.^b

Four rivulets, which rise from different parts of the Coteswold Hills in Gloucestershire, form the sources of the Thames, the most important of the British rivers ; these streams are the Lech, the Colne, the Churne and the Isis. The last is navigable to a considerable distance, but the course is sinuous, and the river abounds in shallows. It waters Oxford, and receives, below the same town, the streams of the Cherwell. It is joined by the Thame in the neighbourhood of Dorchester in Oxfordshire. The last river is formed by different streams, some of which have their sources in the central districts of Buckinghamshire, others on the confines of Hertfordshire, and several in the lower part of Oxfordshire. The one and the other, after their junction, form the Thames or the Thame-isis, as it was originally called. The general direction of its course is towards the south-east, but from Wallingford to Pangbourn it is almost due south, and from the latter place to Henley it bends to the north-east. In the vicinity of the metropolis, it turns with a bold swell to the east, and pursues the same direction, which is only varied by broad reaches, until it falls into the sea.

The Thames receives not fewer than eleven navigable rivers, and six of a comparatively large size, although not navigable. The length of its course is equal to a hundred and sixty miles, and the length of the navigation to a hundred and thirty from its mouth. It is navigable for vessels of almost any burden to Deptford, for vessels of four hundred tons to the Pool, and of more than two hundred to London Bridge. The effect of the tide is perceptible at the distance of eighty miles from its mouth. It waters a hilly country and the most fruitful districts in England, but in no part of its course does it assume the character of a rapid river. It is distinguished by clear and limpid waters, which are only discoloured after great floods ; when these happen, the banks are in some places submerged ; still, the injury which the husbandman sustains, is not so great as that occasioned by smaller but more impetuous streams.

^a C. Dupin, Force Commerciale de la Grande Bretagne.

^b "These deposits [viz. green sand (*glauconie*), chalk, plastic clay, and other formations analogous to those in the environs of Paris (i. e. the tertiary formations of the Paris basin,) just mentioned as skirting the English coast of the Channel,] which are continued beyond the

Straits of Calais, and even to a great distance in the interior of France, are irrefutable proofs that Great Britain was originally united with the continent. Does not the little width of the Straits of Calais also prove that the ocean may have gradually undermined strata as easily broken as sand, clay and chalk?" M. B. t. viii. p. 571.—P.

The principal source of the Severn, the second river in Great Britain, is a small lake on the eastern side of Plinlimmon, at no great distance from the head of the Wye, and on the borders of two shires, those of Cardigan and Montgomery. Watering the last county, and also Shropshire, Worcestershire and Gloucestershire, it discharges itself into the Bristol Channel. It flows through a hilly but well wooded country, in the upper part of its course, and bears the name of the Hafren until it arrives at Llanidloes; but, in ancient times, it was known to the Britons by the same name through the whole of its course.^a Passing through the romantic vale of Montgomeryshire, it enters the great plain of Shropshire, and, after a considerable circuit, turns abruptly beyond Welshpool, to the south-east. Continuing in the same direction, it almost encircles the town of Shrewsbury; it then traverses the famous Coalbrook-dale, passes Bridgenorth, bends to the south, leaves the county of Salop, and enters Worcestershire at Bewdley. As it proceeds, it is joined by the numerous canals that bear the treasures of Birmingham, Kidderminster, and the trading towns in Warwickshire, Staffordshire and Worcestershire. It crosses part of the vale of Evesham, between the Malvern Hills and the heights of Bredon. It divides itself into two branches about a mile above Gloucester; these unite below the same town, and enclose the tract, which is called Alney Island. It is enlarged in this part of its course by several streams, and communicates with the canals that convey the products of the woollen manufactories in the county. Lastly, it receives the Wye near Chepstow, and the Avon from Somersetshire.

One might be apt to form an incorrect notion of the Severn from the nature of the country in which it has its source. Thus, it would be inaccurate to consider it an impetuous river; in some places, it is broad and shallow, and the fields on both sides are liable to inundations; in others, the waters are almost concealed by deep and overhanging banks. Not broken by torrents below Llanidloes, it resembles more the slow rivers in the extensive plains of England than the rapid streams that flow through the narrow vallies and ravines in Wales. It is connected by numerous canals with the principal trading districts in the kingdom, being united with the Thames on the east, and the Trent, the Mersey and the Humber on the north.^b

The Washes serve as an outlet to many rivers, which intersect a low and marshy country; if it is not so populous as other districts in England, it may be attributed to the stagnant and unwholesome waters that cover the greater part of it. Natural obstacles retarded the cultiva-

tion and improvement of the soil, and it was found necessary at so early a period as the middle ages to obtain the resources of Dutch industry, to secure the land against inundations, and to recover plains which had been submerged by the sea and by rivers. The superfluous water has been partly directed of late years into different canals, which, by facilitating inland navigation, have diffused wealth among the inhabitants. The Great Ouse rises on the confines of two counties, those of Northampton and Oxford; it first proceeds eastwards, and waters Buckinghamshire; it then pursues a very sinuous course, until it reaches Bedford, where it becomes navigable; flowing through Huntingdonshire, Cambridgeshire, and the Isle of Ely, it passes into Norfolk, and falls into the Wash at Lynn-Regis. The principal feeders are the Nen from Northamptonshire, the Cam from Cambridgeshire, the Little Ouse from Norfolk, and the Mildenhall^c from Suffolk, all of them navigable rivers. The course of the Great Ouse is not less than a hundred miles in length. In the latter part of its course, it communicates with the extensive marshes which abound on this part of the eastern coast. The Welland and the Glen flow into the bay of Foss-Dike Wash, so called from the ancient *Fossa* of the Romans, which was repaired by Henry the First, and extended from Lincoln to the Trent; at the former place, the Witham becomes navigable, and afterwards falls into the same bay. Such are the principal rivers that communicate with the Washes, the natural drains of the extensive marshes on the low shores of England.

The Trent, one of the finest rivers in Great Britain, and the chief link in that vast chain of inland navigation, which unites all the central parts of England, may be more fully described.^d It rises from the hills beyond Newcastle under Lyne, in that part of Staffordshire near the confines of Cheshire. Following first a south-easterly course, it turns abruptly by the east to the north near Barton, and serves a short way as a boundary between Leicestershire and Derbyshire;^e it crosses the southern part of the latter, skirts the north-western portion of the former county,^f and enters Nottinghamshire a little below Thrumpton. It then waters Nottingham, Newark and Gainsborough, enters Lincolnshire at East Stockworth,^g and falls into the Humber about five miles below Burton upon Stratler.^h Vessels sail on the Trent to the distance of more than a hundred miles from its mouth.

The same river waters verdant meadows, and flows through populous districts. It meets with numerous canals beyond Newcastle under Lyne, some of which extend in a direction parallel to its course. Enlarged by

^a Or Severn swift, guilty of Maiden's death.—Milton.

"Lochrine, king of the Britons, married Guendolen, the daughter of Corineus, duke of Cornwall; but he loved Estrildis, a fair captive, whom he had taken in battle with Humber king of the Huns; and had by her a daughter, equally fair, whose name was Sabra. The secret of the king's love was confined to a very few, lest it should be revealed to Corineus. But when his fear was removed by the death of the duke, not content with secret enjoyment, he divorces Guendolen, and makes Estrildis his queen. Guendolen, tormented with jealousy and rage, departs into Cornwall, gives battle to her husband, who is shot with an arrow near the river Stour, and ends his life. But not so ends the fury of Guendolen, who throws Estrildis and her daughter Sabra into a river; and to leave a monument of revenge, proclaims that the stream be thenceforth called after the damsel's name, which, by length of time, has been changed into *Sabrina* or *Severn*, the ancient name of Hafren falling gradually into disuse." Such is the account, given by Milton, in the first book of his history of England.

^b The barges on the Severn are 120 feet long, 20 broad, and 5 deep; they carry more than 100 tons.

^h Stather. (Luckombe).—P.

several streams, it enters the fruitful meadows that are bounded on the left by the hills in Sherwood Forest. It divides itself into two branches in the neighbourhood of Newark, one of which flows beneath the walls of that town, while the other waters Kelham. The two branches unite in an extensive plain below the last place. It passes through a number of fens in a very uninteresting country beyond Gainsborough; joined at last by the Yorkshire Ouse, it forms the great estuary of the Humber.

The Blyth, a river of some importance, joins the Trent in the neighbourhood of King's Bromley. The Tame, which rises near Coleshill in Warwickshire, falls into it a few miles above Burton. It receives the Dove below the same place, a feeder which rises near the Peak in Derbyshire, and passes through the dell of Dovedale. The Derwent, like the Dove, has its source near the Peak, and flows parallel to it until it reaches Derby; but as it proceeds, it bends eastwards, and unites with the Trent at Sawley near the confines of Leicestershire and Nottinghamshire. The Soar issues from the neighbourhood of Hinckley, passes through a rich grazing country, and almost encompasses the town of Leicester. Continuing its course along a very fruitful tract, it receives the Wreke from the north-east, and falls into the Trent at no great distance from Cavendish Bridge.

The tributary streams from the north^a are not less important. The Don falls into the Northern Ouse near Thorne. The Calder rises in Yorkshire, not far from the borders of Lancashire, joins the Aire near Ferrybridge, and falls into the Ouse. It is remarkable on account of the numerous canals by which it is intersected, and which form a communication between the eastern and western seas. The Ure issues from Wensleydale in Yorkshire, rushes into a deep cascade at Aysgarth,^b joins the Swale at Aldborough, and their united streams form the Ouse. The latter waters York, Cawood, where it receives the Wharfe, Selby, and other towns; it takes the name of the Humber at its confluence with the Trent, below which it forms the great estuary that divides Yorkshire and Lincolnshire.

If the basins of the rivers, which have been now mentioned, be determined, if their extent and relative populousness be ascertained, it may be easy to compare them with each other, or to estimate their relative importance. The basin of the Thames is included in the following counties.

Counties.	Population, census of 1821.	Square miles.	Inhabitants to each square mile.
Kent	300,000	921	326
Surrey	406,700	757	537
Berks	134,700	756	178
Oxford	139,800	751	186
Buckingham	136,800	740	185
Hertford	132,400	528	251
Middlesex	1,167,500	281	4,154
Essex	295,300	1,532	192
Suffolk	276,000	1,512	182
Total	2,989,200	7,778	Mean 384

^a As there is some confusion in the language here used, respecting the connexion of the different streams forming the Humber, I will just state, that the Humber is an arm of the sea or estuary, formed by the union of the Ouse, from the north, and the Trent, from the south, and that the Trent receives most of the streams from the Midland counties, viz. the Blyth, Tame, Dove, Derwent, Soar, &c. and the Ouse, those from Yorkshire, viz. the Ure and Swale, which form it by their union,

It appears from the above table that the basin of the Thames is the most populous part of Great Britain. In extent it is equal to more than an eleventh part of England and Scotland, while a fifth part of the British population are collected on its surface. It has been remarked in the account of France that the population of the basin of the Seine, is to the whole population of the kingdom as one to five; that of the basin of the Thames is to the whole population of Great Britain in the same proportion. The superficial extent of the former is to that of France as one to nine, while that of the latter is to the whole of England and Scotland as one to eleven and a half. It has been seen that the average number of inhabitants on each square mile of the basin of the Thames is equal to three hundred and eighty-four persons, but the mean number on each square mile of the basin of the Seine does not exceed a hundred and eighty-four. Thus on an equal superficies, the population of the one is more than double that of the other. The country watered by the Thames is naturally less productive than the banks of the Seine; the difference then in the number of inhabitants must be attributed to the more advanced state of commerce and industry. It is a remarkable fact that the population of the basin of the Thames has more than doubled since a comparatively recent period; in other words, since the canals were commenced, and the numerous public works, which have been undertaken and completed in England.^c

The counties bordering on the Bristol Channel, or the country from the most western promontory in Wales to the Land's End in Cornwall—the south-western extremity of England, may be included in the basin of the Severn. This large tract is contained in the following counties.

Counties.	Inhabitants.	Square miles.	Inhabitants to each square mile
Pembroke	37,750	305	123
Caermarthen	92,000	974	97
Brecon	44,500	754	59
Glamorgan	103,800	792	131
Monmouth	72,300	459	158
Hereford	105,300	860	128
Radnor	23,500	426	55
Shropshire	210,300	1341	157
Montgomery	61,100	1070	57
Worcester	188,200	729	244
Warwick	280,000	902	310
Gloucester	342,600	1251	273
Wilts (½)	113,300	688	164
Somerset	362,500	1642	221
Devon (½)	223,950	1289	173
Cornwall (½)	131,300	663	198
Total	2,392,400	14,145	Mean 169

Thus the basin of the Severn is almost twice as extensive as that of the Thames, but the population, relatively to the surface, is not nearly so great. The country near the Bristol Channel furnishes numerous resources to commerce, and various employments to industry. In this part of England, the three natural kingdoms are rendered subservient to the wants of the inhabitants.

the Nidd, the Wharfe, the Derwent, and the Aire, the last of which receives, in its course, the Calder and the Don.—P.

^b "The Ure rises in the vale of Wensley, and passes by Aysgarth, where it forms a superb cascade." M. B. t. viii. p. 569.—Aysgarth Force is a cascade on the Tees, a few miles W. of Barnard Castle in Durham, 23 yards in height. (Luckombe.)—P.

^c C. Dupin, Force Commerciale de la Grande Bretagne. Book ii. Chap 1.

Gloucestershire and Somersetshire are fruitful in grain, and abound in oxen and sheep; Monmouthshire, Devonshire, Cornwall, and the opposite coast of Wales, are not less distinguished for their mineral wealth. Additional facilities are afforded to an immense inland trade by the Severn, from the extent of its course, from the great difference in the soil and the natural productions of the country which it waters, and also from the no less striking difference in the products of industry to which it furnishes the means of exportation.

The following counties make up the basin of the Wash.

Counties.	Population.	Square miles.	Inhabitants to each square mile.
Norfolk . . .	351,300	2092	167
Cambridge . . .	124,400	858	145
Bedford . . .	85,400	463	184
Huntingdon . . .	49,800	370	124
Northampton . . .	165,800	1018	163
Rutland . . .	18,900	148	127
Lincoln (§) . . .	192,533	4831	105
Total	988,133	9780	Mean 145

If the population of the basin of the Wash is less considerable than that of the Severn, it may be attributed to the nature of the country. It is well known that great difficulties had to be surmounted, before it could be rendered habitable or fit for cultivation; even at present, many parts of it are covered with stagnant waters and unwholesome marshes.

Six counties form the basin of the Humber.

Counties.	Population.	Square miles.	Inhabitants to each square mile.
Lincoln (§) . . .	96,267	915	105
Leicester . . .	178,100	803	222
Nottingham . . .	190,700	837	228
Derby . . .	217,600	1033	210
Stafford . . .	347,900	1148	303
York . . .	1,197,130	5961	200
Total	2,227,697	10,697	Mean 208½

Thus, although the basin of the Humber is not much larger than that of the Wash, it surpasses it greatly in the number of inhabitants.

The Mersey is, without doubt, one of the secondary English rivers, but it waters a country, of which the inhabitants are distinguished by their industry and their wealth. It is formed by several streams in Cheshire; it passes Stockport, and receives below it the waters of the Irwell. Following a serpentine course westwards, it enters the arm of the sea, on which the commercial port of Liverpool is built. It is navigable for vessels of considerable burden from Liverpool to the confluence of the Irwell, a distance of thirty-five miles; the latter river has been made navigable for boats and barges to Manchester. The Mersey communicates by means of canals with the Dee, the Ribble, the Ouse, the Trent, the Derwent, the Severn, the Humber, the Thames and the Avon.

The basin of the river is contained in two counties.

Counties.	Inhabitants.	Square miles.	Inhabitants to each square mile.
Lancashire . . .	1,074,000	1830	587
Cheshire . . .	275,500	1052	262
Total	1,349,500	2882	Mean 468

^a Qu. Is it not the reverse—do not the canals join the rivers, not the rivers the canals?—P.

Thus, with the exception of the country in the neighbourhood of the metropolis, and one or two other districts, no part of England is more populous than the basin of the Mersey.

Such are some of the principal rivers in England; the others of less importance are very numerous. According to Camden, there are not fewer than five hundred and fifty rivers and streams in England and Wales, that are distinguished by particular names. The bounty of nature in this respect has not been without advantage to the inhabitants. The rivers supply the numerous canals, and by means of the former, the latter are joined to each other;^a in the same way, it has been seen, the eastern and western seas are united, and outlets for the natural productions of the country, and the various products of industry, are facilitated and increased. These indeed may be considered the greatest advantages which the English have derived from their rivers, but before they were obtained, it was necessary to overcome many difficulties, and to obviate many prejudices. It is related that the celebrated Brindley, when examined before a committee of the House of Commons on the subject of a projected canal, maintained the utility of the scheme, although the proximity of a river appeared to render it superfluous. "For what purpose," asked a member, "do you suppose providence created so many fine rivers in England?" "To feed canals," replied the engineer. A long time elapsed before the bold but most correct opinion of Mr. Brindley was generally believed; as if in a country where commerce and the useful arts flourish, rapid and impetuous streams could be employed to a more useful purpose.

The lakes in England, like the rivers, are numerous, but none of them are large. Some are famed for their romantic beauties; others render the country in the neighbourhood unwholesome, on account of the miasms that rise from them. Of the latter sort are those in Huntingdonshire, formerly more extensive than at present; their banks have been contracted since the inhabitants betook themselves to drain their lands. Whittlesea-meer, the largest lake in that county, is about six miles in length, and three in breadth. It is mentioned that there was a water communication in former times from Peterborough to this lake, and from it to Ramsey. It is long since the series of meers or marshes,^b which formed the communication, has been broken. The lakes in Cheshire are not remarkable for their size, but almost all of them are the sources of rivulets, if not of rivers; the largest are Bog-meer, Comber-meer, Oakhanger-meer, and Pick-meer.

It might be difficult to mention a county in Wales without a lake, but more perhaps are situated in Cardiganshire and Caernarvonshire, than in any other part of the country. The Tivy, the principal river in Cardiganshire, issues from one of these lakes. Lyn-Savadhan, in Brecknockshire, at no great distance from the town of Brecon, is about two miles long and as many broad. When the ice dissolves, it emits loud sounds, which have been compared to long and repeated peals of thunder. Bosherton-meer, near Stackpole in Pembrokehire, is also well known on account of the sounds which are heard from it,

^b Meer is a local term for lake or pond.—P.

and by which the country people in the neighbourhood can prognosticate the state of the weather.

But the largest lakes, and the most celebrated on account of their scenery, are situated in the counties of Cumberland, Westmoreland and Lancashire. Ulleswater, partly in Cumberland and partly in Westmoreland, is supposed to be equal to nine miles in length, but it is of an irregular form, and of inconsiderable breadth. Many of the views it presents are very striking; they contrast well with the crags and mountains that surround it, and give great variety to the scene. Thirlmere or Leatheswater, in the vicinity, is comparatively narrow, but about three miles in length. It lies sequestered at the base of the huge Helvellyn, and the banks, covered with stones or masses of naked rock, which appear to have fallen from the mountain, add to the picture of desolation. The impression thus produced is heightened by the noise of cataracts, which fall on every side from lofty rocks.

Derwent-Water, called also Keswick lake, from its vicinity to the town of the same name, is of an elliptical form; the length is not less than three miles, while the breadth may be equal to one and a half. It is of a different character from those which have been mentioned; the scenery and the beauties are of the milder kind; less grand perhaps, but more pleasing than the others. The prospect on the north terminates in the high mountain of Skiddaw, while the southern extremity is lost among the wild rocks of Borrowdale. "The soft undulation of its shores, the mingled wood and pasture that front them, the brilliant purity of the water, that gives back every landscape on its bank, and frequently with heightened colouring; the fantastic wildness of the rocks and the magnificence of the amphitheatre they form, are circumstances, the view of which excites emotions of sweet and tranquil pleasure. When visited by moon-light, the deep shades of the frowning mountain, the reflected light of the moon on the unrippled surface, and the silence of the night, broken only by the murmurs of cascades, excite emotions, which cannot be easily described."^a

Bassenthwaite-Water is situated on the north-west of Keswick lake, with which it is connected by the Derwent. The lofty Skiddaw, which soars above the adjacent valley,^b adds greatly to the grandeur of the scenery. The opposite banks are bounded by a range of heights, and their declivities, covered in many places with thick woods, descend almost to the water's edge. Barren hills and cultivated plains extend from the northern part of the lake.

"None of the lakes in this part of England," says the author last quoted, "have juster claims to the character of picturesque than Crummock-Water; the barren Mollbreak, and other high mountains, confine the western banks of this lake, while the eastern are much indented and varied with low bays, curious promontories and little coppices, the whole terminating in a rich scene of woodland that covers the higher grounds. On each side there is a chain of mountains, some naked, others wooded to their bases; some verdant, some rocky and

heathy, and some covered with shiver, which streams down their furrowed sides." The length of the lake exceeds four miles, while the average breadth is little more than half a mile.

Buttermere is only separated from the last lake by a narrow but fruitful valley; the distance between them is less than a mile. It is chiefly celebrated on account of its waterfalls, but none of them are so high as the one called Scale-Force,^c about a mile and a half to the west of it. Ennerdale-Water is surrounded on three sides by wild and rugged heights; the scenery, it may be easily believed, is of a sombre cast, but the gloom is in some measure relieved by the farms and country houses on the eastern banks.

Wastwater lies in the middle of Wastdale, which is enclosed by mountains that rise to a great height, and almost meet at their bases.

It has been remarked that these, as well as other lakes in Cumberland, have each of them a distinct character; some are distinguished by the contrast of pleasing scenery and savage wildness on their opposite banks, but several are so difficult of access that they are only visited by pedestrians.

Winandermere serves as a boundary between Westmoreland and Lancashire. It is about fourteen miles long, but the breadth is very disproportionate, varying only from one to two miles. The greatest depth near Eccles-crig-crag^d has been ascertained to be equal to 200 feet. The Brathay, the Rothay and the Troutbeck are the principal feeders of the lake. The surface is spotted by a number of islands, and on some of them buildings have been erected, which cannot be considered any ornament to the scenery. The banks are not bold; they rise gently on the Westmoreland side, while those on the Lancashire side are more precipitous and better wooded. The effect is that of a rich landscape, in which the distance is bounded by lofty hills. The char is common to almost all the lakes, but trouts, pikes, perch and eels are taken in the waters of Winandermere, and in the winter season numerous water-fowl of different species resort to it.

The loftiest heights in England and Wales form part of the groups which extend along the western side of the kingdom. Two lower ranges traverse the country in different directions; one extending from Dorsetshire into Kent, the other from the Isle of Portland to the Yorkshire Wolds. The groups on the western side are broken by the low grounds in Lancashire and Cheshire, and also by the indentation into which the Bristol Channel finds a passage. They may thus be divided into the Northern, the Cambrian or Welsh and the Devonian ranges. They serve to determine the length of the country; the lower chains indicate the breadth, but less accurately, on account of the irregular lines which they describe.

The Northern range passes from Scotland into England, and covers part of Cumberland, Westmoreland, Northumberland and Durham. The Cheviot, the highest of the Northumbrian branch, and the one from which

^a Gilpin on Picturesque Scenery.

^b On the east of Bassenthwaite-Water is spread the beautiful and extensive vale of Bassenthwaite, beyond which Skiddaw rears its lofty head. (Ed. Enc. art. England.)—P.

^c Force, in the North of England dialects, signifies a waterfall. This is a word of Scandinavian origin (Swed. *fors*, a waterfall,) like many other words in those and the Lowland Scottish dialects; all of them

indicating the Scandinavian origin of at least a portion of the population in that part of the island. Such words are, *fell*, a mountain, (Swed. *fall*, Dan. *field*;) *by*, a termination of the names of towns, as in Whitby Appleby, Canobie (Scott.) (Dan. Swed. *by*, a town;) *toom* (Scott.) empty, (Dan. *tom*;) *gar* (Scott.) to make, (Dan. *giare*.)—P

^d Ecclesrig-Crag. (Luckombe.)—P.

the other hills in the northern part of the same county take their name, is not more than eighteen miles from the coast. The top of the Cheviot is covered with heath; in this respect it forms an exception to the others, for in most of them the green sward rises to a great height, and gives place only to the naked rocks or loose stones at their very summits. Thus, the soil, if the elevation be taken into account, must be considered very fruitful, being almost everywhere covered with rich pastures on which numerous herds and flocks are reared. Neither are the Cheviots destitute of romantic beauty; in some places their sides terminate in precipices, or form narrow and deep glens; in others they are furrowed by mountain streams, and many of them enclose peaceful and sequestered vallies. As to their form, some of them rise like so many cones, but in general their shape is very irregular. They communicate on the west with other green hills of the same character in Scotland, and pass southwards to the moorland districts in Northumberland. It is not easy to calculate their superficies, but it is probably greater than a hundred and fifty, and less than two hundred square miles.

The Cumberland branch of the Northern range commences at Geltsdale forest, about fourteen miles to the south-east of Carlisle, and passes to the west of Durham and Yorkshire. The surface of these mountains is very rugged, exhibiting no regularity of arrangement, and no lengthened ridge or continuous chain. In appearance, they may be compared to a number of broken and pointed masses, of which the bases are united, or only separated by the lakes that lie between them. In their verdure they resemble the mountains of Northumberland, but Skiddaw, like the Cheviot, is covered with heath.

The superficial extent of the mountains in Cumberland, Westmoreland and Durham, is supposed to be equal to six hundred square miles; their height varies from 3000 to 3400 feet, and within the area which they occupy, are situated the romantic lakes that have been already mentioned.

The vallies of the Ribble, Craven and Aire separate these hills from another range,^a of which the length may be about sixty miles; their breadth, however, is very irregular, being in some places upwards of twenty, and in others less than four or five. Kinderscout near Hayfield, Axe-Edge near Buxton, and Whinhill and Mam-Tor near Castleton, are the loftiest heights in Derbyshire. But the highest part of Derbyshire is not more than 2100 feet above the level of the sea; the hills, therefore, cannot be compared with those in the northern counties.

Other hills, still lower than the former, are situated on the east of Wales. The Malvern Hills in Herefordshire and Worcestershire extend to part of Gloucestershire. The Herefordshire and Worcester beacons, as they are called, form the highest of the Malvern Hills; the one rises to 1260, and the other to 1500 feet above the plain. They terminate on the eastern side in the flat country, which forms the vale of the Severn, but they are connected on the west with a range of hills that passes into Herefordshire.

It has been maintained that the Coteswold and Stroudwater Hills in Gloucestershire ought to be considered a

^a The southern division of the northern range is divided from the northern division, by the valley of the Ribble, Craven, and the valley

continuation of the central chain, extending from Derbyshire into Wiltshire, there forming the Salisbury Downs, and afterwards stretching in a western direction towards the Land's End in Cornwall. If this opinion be admitted, and it does not appear to be incorrect, it follows that these hills unite the Northern chain with the one in Devonshire.

But the highest mountains in the kingdom form part of the Cambrian range; no others are so lofty as the heights in North Wales. They extend through Caernarvonshire, Merionethshire and Cardiganshire; in the last county their altitude is perceptibly diminished. The range increases gradually in height from the extremities to the centre, which is occupied by the famed Snowdon, a mountain not less than 3600 feet above the high water mark on Caernarvon quay. It consists of numerous cliffs towering above each other, and the one that bears the name of Snowdon is little higher than the others which surround it.

The summit of Cader Idris is the highest part of a mountainous line which passes from Snowdon to Plinlimmon, a boundary of North Wales. In point of height, it is the second in the country, being only inferior to Snowdon. Rising above the small town of Dolgelly, it is steep and craggy on every side, particularly on the south near Tallylin lake. According to different calculations, it is 3540 feet above the level of the sea, so that it is considerably higher than any mountain in the north of England. The hills in the eastern part of North Wales are not nearly so lofty as those which have been mentioned. A comparatively low chain in South Wales extends from the north to the neighbourhood of Cardiff, but a small branch diverges from it in a westerly direction.

The Devonian range covers part of Somersetshire, passes through Devonshire and Cornwall, and terminates at the Land's End. The hills in Dartmoor are the loftiest eminences in this range; their height varies from fifteen to eighteen hundred feet. They are situated in the tract which extends from the vale of Exeter to the borders of Cornwall, a tract containing between two and three hundred thousand acres of open and uncultivated land, in which Dartmoor occupies more than eighty thousand. The large waste of Dartmoor exhibits gigantic tors, and surfaces covered with scattered masses of granite that appear to have fallen from the declivities into the vallies. The higher parts are covered with marshes or wet and swampy ground, dangerous to cattle, but valuable on account of the fuel which they furnish to the inhabitants. These morasses are generally very deep; in dry summers, they afford a strong succulent grass. The Mendip Hills in Somersetshire, the only other portion of the same range, extend southwards from Bedminster to Glastonbury.

The two lines of hills which extend in a different direction, the one from Dorsetshire to Kent, and the other from Portland Isle to the Wolds, are much lower than those that may be supposed to determine the length of England. It is not improbable that the three highest ridges in the south-eastern districts commence on Salisbury plain, an immense tract of high and chalky land, fifty-three miles in length from east to west, and thirty-five or

of the Aire. (Ed. Enc.)—Craven is a moorland district in Yorkshire between the sources of the Ribble and the Aire.—P.

forty in breadth. Hampshire and Sussex are intersected by the first ridge, which terminates at Beachy Head; the second extends to the eastern shore of Kent; the third crosses Oxfordshire, passes to Norfolk, and forms the Gogmagog Hills in Cambridgeshire.

It appears then that England is by no means a mountainous country; the loftiest heights are lower than those in Scotland, neither are they accompanied, like many in the sister kingdom, with all the features of sterility. In the one country, the nature of the ground has retarded the progress of civilization; the same obstacles were not found in the other.

England, however, is sufficiently varied with hill and dale, while the plains are extensive, and some of them very fruitful. The largest stretches from the banks of the Thames through Essex, Suffolk, Norfolk and the adjacent counties on the west. The road from London to Norwich by Newmarket, along the western sides of Essex and Suffolk, is equal to a hundred and eight miles in length, and the country is more even and unvaried in its surface than any other tract of the same extent in England. Lincolnshire may be said to form a part of the same plain, which terminates beyond the Humber in the low grounds of Holderness in Yorkshire.

The Wealds of Kent, Surrey and Sussex form a large plain, broken in some places by gentle heights or declivities; they are covered with a pale clayey soil, and many parts of them yield rich harvests. The length of the plain, or the distance from Ashworth^a in Kent to Petworth in Sussex, is about sixty or seventy miles, the breadth varies from ten to fifteen, and the surface is nearly equal to a thousand square miles. The area of the vale of York is still greater; it extends from the small lakes between the Tees, the Swale and the Wiske to the marshes of Lincolnshire on the south, and from the Wolds in the East Riding to the limestone districts of West Yorkshire, a length of more than sixty miles, and an average breadth exceeding sixteen. None of the other plains or vales in England, although numerous, are so extensive.

Many places, now almost destitute of trees, still retain the name of forests; such are Dartmoor Forest in Devonshire, Enfield Chase in Middlesex, Witham and Epping Forests in Essex, Peak Forest in Derbyshire, Malvern Chase, Wyre Forest, and several others. The most important of those that still exist, are Dean Forest in Gloucestershire, Sherwood Forest in Nottinghamshire, Windsor Forest in Berkshire, and the New Forest in Hampshire. Some formed part of the royal demesnes during the early period of the Anglo-Saxon princes, but the passion for the chase was carried to its height by the kings of the Norman race, and at one time nearly a hundred extensive forests belonged to the crown. Contemporary writers describe the evils which were thus occasioned. "He also," William the Conqueror, "set many deer friths, and he made laws therewith, that whoever should slay hart or hind, him man should blind. As he forbade the slaying of harts, so also did he of boars. So much he loved the high deer as if he had been their father. He also decreed about hares that they should go free. His rich men moaned and his poor men murmured, but he was so hard that he wrecked not the hatred of them all. For it was meet they should follow the

king's will withal, if they wished to live or to have lands or goods or his favour. Alas that any man should be so moody, and should so puff up himself, and think himself above all other men! May Almighty God," adds the pious chronicler, "have mercy on his soul, and grant him forgiveness of his sins." The same monarch was lord of sixty-eight forests, besides parks and chases in different parts of England; these, however, were not considered sufficient, and it was deemed right to afforest a fruitful and cultivated district between the city of Winchester and the sea coast. The inhabitants were expelled; houses, cottages and even churehes were destroyed; and a fertile country, more than thirty square miles in extent, was converted into a desert. The name of the New Forest serves still to record this act of despotism. The royal forests, then so large a portion of the kingdom, distinct in their nature, and subject to different regulations from the rest of the country, were the source of much grievance to the neighbouring proprietors, nor was redress obtained until the barons forced Henry the Third to grant the forest charter, by which greater equity was extended, and the more oppressive enactments abolished.

From the details into which we have entered concerning the climate of England, some notion may be formed of its vegetable productions. It may be inferred that the plants indigenous to the country are wholly inadequate to the sustenance of man. In more favoured regions nature pours out her treasures, and affords more than a supply to the wants of indolent inhabitants. The ever verdant hills and plains in Britain show how well they are adapted for the support of granivorous animals, and this circumstance may have had some influence on the character of the early Britons. While different fruits, many of exquisite flavour, afforded food to the natives of warmer climates, without any exertion on their part, the rude Britons depended on the produce of the chase for a scanty subsistence, sought the deer in the recesses of their forests, and disputed their prey with the wolf and other carnivorous animals.^b Although the vegetable riches of every climate have been long at the disposal of the English, it is not improbable that the first germs of their activity and exertion were called forth by a scanty supply of animal food, not to be obtained without labour, the necessity of relieving their most urgent wants stimulating them to exertion. In later times, the benefits arising from commerce and industry have rendered the advantages of climate of comparatively little consequence. It is now ascertained that the British Flora, although it cannot boast of any very valuable or useful plants, contains as many as are generally found in other countries, similar to Great Britain in climate and extent. To enumerate, therefore, the different plants, might be to repeat such as have been already mentioned in different parts of this work. It may be remarked that some very ordinary and useful potherbs were first transported to England from Holland, in the time of Henry the Seventh. The deciduous trees are the oak, the chestnut and the beech, all of which are mast-bearing trees; the birch, the alder, the horn-beam, the abele, the black poplar and the aspen, bearing catkins; the sycamore, the maple and the ash; and lastly, the lime, the elm and the wick-hazle. The

^a Ashford.—P.

^b Pinkerton's Geography, vol. i. chap. 7. [vol. i. p. 78 (England chap. 4).—P.]

numerous species of willows and the hazle may be supposed to occupy a middle station between the trees and shrubs.^a

The oak is the most valuable, although by no means the most common of the British trees. It arrives at great perfection in Kent, Surrey, Sussex, Cheshire and Monmouthshire, but the principal supply is obtained from the royal forests, of which the timber belongs to the crown. It may be shown, however, that the oak is now less common than at a former period. The wood, in a great part, but not in the whole of the crown lands, was surveyed in the year 1608, and it appeared from the survey that there were then not fewer than 649,880 loads of timber fit for the navy, and 1,148,660 of a less perfect sort. A second survey was made in 1783, by order of the house of commons, and it was then ascertained that the New Forest, Alice-Holt and Wolmer, Bere, Whittlewood, Salcey and Sherwood, which might have yielded 234,229 loads of naval timber in 1608, contained only 50,445 in 1783; so that, in the latter period, little more than a fifth part of the trees which existed in 1608, remained. The difference in the quantity of decayed or imperfect timber was not less remarkable; in 1608 it amounted to 265,145 loads, and in 1783 to 35,554. Other facts, which lead to the same conclusion, have been since brought to light; the answers returned to the House of Commons by the principal wood-merchants in England, and by the chairmen of the quarter sessions in the different counties, prove the decrease of oak timber in the country. The deficiency, however, may in time be supplied, as many trees have of late years been planted by the landed proprietors in different parts of England. The comparative scarcity has compelled government to make use of inferior timber for the navy; some of the trees, which have been employed, are considered too young, and others not sufficiently perfect; to this circumstance has been attributed the frequency of the dry rot in ships, a disease which was certainly little known, when old and good oaks were more abundant.

Some observations ought perhaps to be made on the different soils, in which the vegetable productions are found; in England, however, they are so various and numerous that it might be difficult to enumerate them, still more so to mark their position, the transitions being so irregular and abrupt. They may be classed under six general divisions, those of clay, loam, sand, chalk, gravel and peat. These again may be subdivided into many varieties. Of the clay, two sorts are perhaps more common than the rest; the one is rich and of a dark colour; the other is not so tenacious, and of a less fruitful quality; the former descends to a considerable depth; the latter is only found near the surface. The different kinds of loam are equally numerous; what is commonly called strong loam, consists of clay that has been long under a course of tillage, impregnated with manure, and exposed to the action of the atmosphere; it, as well as sandy loam, is an artificial soil. The sandy tracts in France are much more extensive than any in England; indeed, in the latter country, it is impossible to mention any large tract

in which a covering of pure sand renders the soil wholly useless for the purposes of agriculture. The sand is either mixed with vegetable mould, or enriched by manure and the continued action of the sun and air. The same may be said of chalk as a soil, it having, in most parts of the kingdom, received the nature and qualities of calcareous loam by cultivation. Of the gravel soils, one sort of a light colour, and not uncommon in different parts of the country, is unfruitful; other kinds are more or less productive, but their fertility depends on the quantity of earth or alluvial deposits that is mixed with them. The peat soil, as it is called, occurs in many parts of England, but is most common in the north it is observed, but not in so great an extent, in the south and the south-west. It may be remarked that the same sort of soil extends in few places to a great distance without exhibiting different appearances, if not a change of kind. It is well known that the largest tracts of a uniform soil are those in the county of Norfolk and in the Wealds of Kent, Surrey and Sussex. If some varieties be excepted, red loam may be said to form a uniform soil; it gives its name to Rutlandshire, the county in which it is most abundant; in a north-eastern direction it passes to Nottingham, and terminates towards the south-west in Devonshire, but the continuity, it may be easily imagined, is often broken in so vast an extent.

The knowledge of the geological structure of a country has been considered indispensable to that of its physical geography. It is thus that new limits have been assigned to different regions, limits much less subject to variation than those of a political character. Although the limits of such a country as Great Britain may be sufficiently defined without having recourse to the consideration of geology, still the same science serves to unfold the riches of the mineral kingdom, marks their position, and determines such as have contributed to increase the wealth or power of the inhabitants.

If the gravels and alluvia be not taken into account, the sand that covers Bagshot heath, and a great portion of Surrey, as well as several districts in the southern and eastern counties, may be considered the highest stratum in England, the one from beneath which the others rise in succession.^b The same deposit is met with in the Isle of Wight, and the sand at Alum Bay^c is supposed to be better adapted for making flint glass than any other in the kingdom.

Of an earlier origin is an argillaceous formation which may be mentioned on account of its organic remains, and which has been called the London clay, from its occurring in the neighbourhood of the metropolis, immediately beneath the vegetable soil. It occupies a large part of Essex, all Middlesex, and part of Berkshire, Surrey and Kent. It appears in the last county on the northern side of the Medway, and forms the Isle of Sheppey.^d

Some of the organic remains are those of crocodiles and turtles, vertebral fish of different species, and nautilites resembling others that still frequent the Indian Seas. The bones of the elephant, the rhinoceros, the hippopotamus, the tapir and the elk were discovered in the neighbourhood of London, when the excavation was

^a Pinkerton's Geography, vol. i. p. 82.

^b The Upper Freshwater Formation lies above the Upper Marine Formation (the one to which the Bagshot sand belongs) in the Isle of Wight; but in the London Basin, the Upper Marine is the highest formation.—P.

^c The sand at Alum Bay belongs to the sands of the plastic clay formation.—P.

^d Smith's Geological Map of England and Wales.

making for the Highgate archway. The remains of the vegetable kingdom are not less extraordinary, but they are perhaps more abundant in the Isle of Sheppey than in any other part of the stratum. It is there, at least, that the greatest number of fruit or ligneous seed vessels have been observed; one gentleman, Mr. Crowe of Faversham, having carefully examined the external and internal appearance of the plants, selected seven hundred specimens, of which none were duplicates, and of which very few corresponded with any that are now known to exist. The most of them, however, appeared to belong to tropical climates; some differed little from the cocoa-nut; others were probably varieties of spices.

The alluvium covering the surface of the clay is full of water, and a great advantage is thus obtained by the inhabitants of London and the neighbouring country; indeed, the quantity drawn daily in the metropolis alone might almost exceed belief. The wells or the public pumps to which the people have access, afford a plentiful supply of clear but somewhat hard water, which is used in many of the large distilleries, sugar-houses, and also in some of the breweries. Abundance of soft water may be had by increasing the depth of the wells, or by piercing through the London clay to the plastic clay stratum, the next in succession.^a Some of these wells have been dug in London, and very many on the north and north-east of it. The effect has been to supply different places, which were destitute of good water for domestic purposes, until within the last thirty years. If a new well be sunk, the water in the neighbouring wells is for a time depressed; nay more, the sinking of one on the south of the Thames above London Bridge, lowered the water in another on the northern bank, showing evidently that the communication extended below the bed of the river.^b

The chalk deposit is one of the most remarkable in England; stretching with little interruption from Flamborough Head on the coast of Yorkshire to the neighbourhood of Sidmouth on the coast of Devonshire, it is connected with the chalk districts in the south, and forms a range of hills, which are generally most precipitous on the north-west. The Yorkshire Wolds, which are broken by the Humber, are part of these heights; they appear anew on the opposite banks of the same river, and form the Lincolnshire Wolds. The Wash separates the same tract from Norfolk, but in that county, a ridge of chalk extends nearly in a southern direction to the distance of sixteen miles.^c It passes from Cambridge to Goring in Oxfordshire, where it is broken by the valley of the Thames; the distance between the two last places is not less than seventy miles.

It is almost unnecessary to add that the Chiltern Hills in Buckinghamshire and Oxfordshire, and the Royston and Luton Downs in Bedfordshire, are composed of chalk; their average breadth varies from fifteen to twenty miles. The chain is continued on the west of the Thames, where it is known by the names of Ilsey Downs, the Whitehorse Hills and Marlborough Downs; but the last are broken by the valley of the Kennet, which, like

many of the rivers that water this formation, rises in the older and subjacent stratum, and has broken a passage for itself through the chalky downs. The same valley separates the northern Marlborough Downs from the long ridge on the south of Marlborough, which stretches westwards to Bagdon hill in the neighbourhood of Devizes in Wiltshire. This last ridge skirts round the vale of Pewsey, and connects itself with the cretaceous district, which occupies the northern part of Hampshire, and the southern of Wiltshire, a surface about fifty miles in length from east to west, and about twenty from north to south. It is this vast area which Mr. Pennant has designated the central *Patria* of the chalk, of which the different ranges that traverse the island, may be considered so many ramifications. It may be remarked that the loftiest summit in this formation reaches to the height of 1011 feet above the level of the sea. A great part of the central mass is known by the name of Salisbury plain, an elevated platform broken by gentle hills, and covered with scanty herbage. The chalk chain which bounds the London basin on the south, extends from the north-eastern extremity of the same area, forms the North Downs in Surrey and Kent, and terminates at the Straits of Dover.^d

The same chain exhibits one of the characteristic phenomena of the chalk formation; it is broken by all the rivers which run northwards from the Wealds, namely, by the Wey, the Mole, the Darent, the Medway, and the Stowe,^e which have made for themselves so many transverse vallies at right angles to the great valley which passes along the base of the heights.

It may be worth while to mention an error that has been committed by Camden. "The Mole," says that writer, "coming to White-hill,^f hides itself, or is rather swallowed up, at the foot of the hill there; but, about two miles below, it bubbles up and rises again; so that the inhabitants of this tract, no less than the Spaniards, may boast of having a bridge that feeds several flocks of sheep." If it be inferred that the river disappears, forms a channel for itself under ground, and rises again at a certain distance, the account is incorrect. The appearance depends on the cavernous nature of the chalk, and the porous texture of the soil; the water being admitted by passages in the banks and channel of the river. In ordinary seasons, the caverns are full, and their contents are not discharged faster than they are supplied by the river, whence it suffers no diminution; but in dry seasons the water in these reservoirs being gradually absorbed, the streams are diverted from their ordinary course, and the river is diminished. The decrease depends on the state of the weather, and in times of great drought, part of the channel is left dry.^g

Another chain, which branches from the south-east angle of the central mass, forms the South Downs, or southern limit of the Weald district, which is bounded by the North Downs in the opposite direction.

Lastly, a third chain, which extends from the southern extremity of the great chalk formation near Salisbury, passes west-south-west to Shaftesbury and then south to Blandford, where it is broken by the valley of the Stour.

on the north of Thetford, and passing by Newmarket and a little to the east of Cambridge, stretches S. W. to Goring on the Thames.—P.

^b Geology of England and Wales, by Conybeare and Phillips, Part I. p. 35.

^c Commencing in Hunstanton Cliff, and terminating at Castle Acre, where it sinks beneath the diluvial sands of Norfolk. It recommences

It bends towards the west at the last place, and continues in that direction to the distance of twenty miles. But at Horn-hill,^a the westernmost point of the chain,^b it turns abruptly to the east,^c and proceeds through the middle of the isle, or rather peninsula, of Purbeck. The cliffs that rise above the sea, form Handfast-Point on the east, and Whitenose on the west, the eastern and western extremities of Purbeck.^d

The frequent occurrence of chalk in other countries has been indicated in a former part of this work. The belt which sweeps across the eastern and southern counties of England is part of the extensive tract that occupies the great central basin of Europe. The chalk formation stretches from the Thames to the Don; extending on the east to the Ural and its branches, on the north to the primitive districts of Russian Finland, Sweden, Norway and Scotland, on the west to the primitive and transition chains in the north, the west and the south of England,^e and on the south to the ramifications of the Cevennes in the centre of France, the Alps with the ancient groups of Germany,^f and the Bohemian, Silesian and Carpathian mountains.^g

The chalk formation throughout its vast extent affords a striking confirmation of Mr. Smith's method of identifying strata by their organic remains, for more than eight-tenths of the organic remains which are found in chalk are common to all the localities in which it has been observed. It is asserted, indeed, that a fossil has never been dug from a continental chalk pit to which a similar one cannot be produced from the pits in Britain.^h

It may be observed, that the lower strata of chalk increase generally in hardness, and afford sometimes a tolerably compact limestone. The cliff on the east of Dover is blasted, squared and used in repairing the harbour; it was employed in constructing the docks, and it is found to be well adapted for buildings under water.

The different kinds of chalky marles are obtained in many parts of England. Pliny, in his account of the British marles, observes that they last eighty years, there not being an example of the same man being obliged to marle his land twice in the course of his life. An intelligent farmer in Hertfordshire informed Mr. Pennant, that he had used the same marle on a field thirty years before, and if he were to live the time mentioned by Pliny, he need not have any occasion to repeat the operation.ⁱ The method now used to obtain chalk in Hertfordshire and different counties, has been described by Pennant. "The farmer sinks a pit, *drives out on all sides*, leaving a sufficient roof, and draws up the chalk in buckets through a narrow mouth." It is remarkable that the same method was employed in the time of the Roman naturalist. "*Creta argentaria petitur ex alto, in centenos pedes actis plerumque puteis, ore angustatis, intus, ut in metallis, spatiente vena. Hac maxime Britannia utitur.*"

^a To the north of Beaminster.—P.

^b West of Horn-hill, there are several outlying masses of chalk, resting upon and surrounded by the green sand. They proceed in a west-south-west direction, by Crewkerne and Chard, to Sidmouth, east of which there are three large outliers, very near to the coast.—P.

^c From Horn-hill, the escarpment of the chalk runs south to within a mile of the coast near Abbotsbury. It then suddenly turns to the east.—P.

^d Besides these continuous ranges of chalk, and the outlying masses on the west, it forms a range of downs, stretching through the middle of the Isle of Wight from west to east, from the Needles on the west to Culver Cliffs on the east; also, an outlying mass above the southern

The Romans in this instance followed the same practice as the Britons, and it is doubtful that any other of a more ancient origin is still in use in England. Chalk is also employed for another economical purpose; and it may be observed on the authority of Mr. Smeaton, that, if well burnt, it makes as good lime as the hardest marble.

It has been observed in different parts of this work that the presence of chalk is generally accompanied with sterility; it has been seen in the account of Champagne, that some districts are almost uninhabited, and statistical data are not wanting to show that the chalk lands in England are less populous in proportion to their extent, than any other secondary formation. No portion, however, is wholly unproductive; on the contrary, some of the vallies are very fruitful, and hops are cultivated in those of Kent and Surrey. The downs afford excellent pasturage for sheep, and the different sorts of clover and sainfoin thrive on a chalky soil. The same may be said of different trees, particularly the beech. It is well known that the Chiltern Hills in Oxfordshire were formerly covered with woods, which were frequented by robbers and freebooters; hence the office of steward of the Chiltern Hundreds, now become nominal, but which, being held under the crown, enables a member to vacate his seat in parliament.^k

Although oolites occur extensively on the continent, the different members of the series, and their relation to each other, have only been examined and explained in Britain. The oolites occupy a zone nearly thirty miles in average breadth, extending across the island from Yorkshire on the north-east to Dorsetshire on the south-west;^l in other words, within the limits of the zone are contained the best materials for architectural purposes in England. The Purbeck beds, which occupy the highest place in the series, consist of many thin strata of argillaceous limestone. The stone, which is commonly called Purbeck marble, is generally found in the uppermost beds. It was formerly much used in adorning Gothic churches, and the finest specimens of it may still be seen in many of the old columns and monuments. The Purbeck stone is not considered so valuable for architecture as the Portland; but of the one or other most of the edifices in London and in the neighbourhood have been built.

The great oolite, on account of its thickness and utility, is more important than any other. It consists of a stratified calcareous mass, varying in thickness from a hundred and thirty to two hundred feet. The quality of the strata is different even in neighbouring quarries. The softer kinds are not only marked by those distinct oviform concretions, which give their name to the whole series, but they afford the freestone, which renders this rock so valuable. The Kettering freestone of Northamptonshire, says Mr. Smith, is rendered extremely beautiful by the distinctness of its oolitic structure; that of Bath, however, has generally a finer grain. The latter stone was

point of the island. The Isle of Thanet consists too of chalk, separated from the North Downs by a tertiary valley.—P.

used in repairing Henry the Seventh's chapel at Westminster, but it was from the quarries near Burford in Oxfordshire, that the materials were supplied for the erection of St. Paul's, the finest architectural monument in London.

The oolites are remarkable for the number of their organic remains. Different bones, believed by M. Cuvier to belong to a species of *Didelphis*, or opossum, have been discovered near Stonesfield in the calcareous slate, which forms part of the series. They are imbedded in the slate, not intruded into the fissures, exhibiting a singular instance of the occurrence of beings of such an order, in strata older than the lowest members of the tertiary class.^a A well characterized crocodile, but of a species distinct from those that now exist, and from those that have been found in a fossil state in Germany, was dug up at Gibraltar near Oxford,^b and may now be seen in the museum of the university. The *ichthyosaurus* has been observed in the strata both above and below the argillaceous slate;^c in the same slate,^d an immense animal, bearing some resemblance to the *monitor* in its dentition and other external characters, has been discovered, and bones of it are not wanting, which must have belonged to individuals forty feet in length, and at least twelve in height. Lastly, specimens, of which there are two or three different species, and which are believed by naturalists to be the *elytra* of coleopterous insects, occur in the Stonesfield slate.

Aluminous shale is included under this series.^e The earthy part of the shale is found to contain the most alum, and the following process is carried on at the works near Whitby. A layer of brush-wood serves as a base, and shale is thrown over it until a mound is raised. The brush-wood is then kindled, and a slow combustion ensues. The fire is at last communicated to the shale, and it continues to burn without any addition of fuel. The residuum is put into vats with water, and boiled twenty-four hours; it is then thrown into other vats, and by the addition of an alkali, is made to crystallize; lastly, it is again melted and purified by a second crystallization. Thus prepared, it is shipped off to London, and from thence exported to Sweden, Russia and other countries.^f

The most important, and by far the most valuable of the British mineral products, the one on which the wealth and prosperity of the country mainly depend, remains to be examined. The other substances which have been mentioned are comparatively of so little utility, that they can hardly be taken into account. It is to the coal mines that Great Britain is indebted for its manufacturing power, which, although colossal, must otherwise have been insignificant. The labour of man has been superseded by this wonderful agent, the productive power of the country has been increased more than a hundred-fold, and among the monuments of English genius, those are not the least worthy of admiration, by which the same substance has been made conducive to the various purposes of civilization.

It must not be imagined that this source of wealth is

inexhaustible; on the contrary, there is a limit to which it is always approaching. The distribution of this substance, it is well known, is by no means proportionate to its utility; even in Great Britain, one of the countries in which it is most abundant, the superficies of the coal district is very small relatively to the size of the island. The transition, however, from abundance to scarcity, can only be very gradual, and many ages must yet elapse before it can be sensibly felt; when it does begin, the increasing difficulty of working the coal mines must operate by slow and successive checks. If these mines could be suddenly exhausted, the effect might be as destructive of private comfort as of national wealth. Such a calamity could not happen without taking away the means of subsistence from an immense number of productive hands, and without depriving the country of the blessings which they diffuse. As a consequence of such an event, the inferior lands must be withdrawn from cultivation; they were first cultivated to supply the wants of an increasing and a flourishing population, but if the country were exhausted of its coal, they might again, as in ancient times, be covered with forests.

The three principal coal districts in England, and three only are of any importance, are, 1st, the Great Northern district, including all the coal-fields north of the Trent; 2d, the Central district, including Leicestershire, Warwickshire, Staffordshire, and Shropshire; and 3d, the Western district, which may be subdivided into the North-western, including North Wales, and the South-western, including South Wales, Gloucestershire, and Somersetshire. The coal deposits rest on limestone and sandstone, and extensive iron ores are situated near the carboniferous strata. Thus, all the great iron-works in England have been established within the limits of the coal country, because it is only within these limits that the fuel and the flux necessary for smelting the ore are easily obtained. Copper and zinc are found in the transition and primitive series, but it may be remarked that they are of secondary importance.

It may be necessary to describe more minutely the limits which have been mentioned. The first or the Northern district, it has been already stated, includes all the coal-fields on the north of the Trent and Mersey. A central chain traverses the district from north to south. These mountains were known to the Romans by the name of the *Penine Alps*, at least they are thus denominated by a British writer,^g in describing the Roman province of *Maxima Cesariensis*. "Totam in aequalis fere partes provinciam dividunt montes *Alpes Penini* dicti." It is not believed that they were thus called from any fancied resemblance between them and the Alpine crest near St. Bernard; it is more probable that they were so named from the British word *Pen*, which signifies a head or summit. As there is no modern name which comprehends the whole of this range, it is necessary to make use of the one that has been left by the Romans. The Penine chain consists of the rocks which

are associated with the coal formation; it is remarkable in some places for its wild scenery, the extent of its caverns, the depth of its ravines, and the height of its precipices; it is broken by torrents and cataracts. Two facts may throw some light on the nature of the scenery in the Staffordshire part of it. The sun, when nearest the tropic of Capricorn, never rises to the inhabitants of Narrowdale, during a period of nearly three months, and when it is visible, it never rises until one o'clock P. M. Secondly, at Leek, during a certain period of the year, the sun is seen to set twice in the same evening, a phenomenon which must be attributed to a mountain at some distance from the town, for after it sets behind the summit, it breaks out again on the northern or most precipitous side. Thus, in a tract of no great extent, the sun appears to set twice in the same evening, and to rise when it has passed the meridian.^b

This district is more important on account of its mineral products than any other in England. The great coal-field of Northumberland and Durham, several others of a smaller size in the north of Yorkshire, and the great coal-field in South Yorkshire, Nottinghamshire and Derbyshire, are situated on the eastern side of the Penine chain; the principal deposits on the west are those of North Staffordshire, Manchester or South Lancashire, North Lancashire and Whitehaven.

The first of these coal-fields^c is the most remarkable; situated in the north-eastern extremity of England, it occupies the greater part of two counties, Northumberland and Durham. Commencing near the river Coquet on the north, it extends nearly to the Tees on the south, forming an area, of which the greatest breadth is equal to twenty-four miles, and the length to fifty-eight.^d Jarrow on the southern bank of the Tyne, and about five miles from its mouth, is considered the centre of the coal-measures, or in other words, the beds of coal are there found at the greatest depths; the High Main, one of the thickest, is not less than nine hundred and sixty feet below the surface. It is well known, however, that the inclination of the strata is not uniform, so that the depths are not equal at equal distances from Jarrow.

This coal is generally admitted to be superior in quality to any in the other formations of the same kind, and the difference in the quantity is not less remarkable. Forty beds have been already seen, but many of these are of no great thickness; the most important have been distinguished by the names of the High Main and the

Low Main. Shields and Sunderland are the places from which the coal is exported, and the distribution of the trade depends on the size of the two rivers.^e The Tyne vessels being large, are, therefore, chiefly destined for the London market; the Wear vessels, on the other hand, are so small that they can make their way into the small rivers and harbours in most parts of the kingdom. They supply, therefore, the eastern and southern coasts as far west as Plymouth.

It is difficult to estimate the quantity of coal contained in the formation, called the coal-measures. It is not easy to determine accurately their length and average breadth; at all events, a great difference in the necessary data may be found in the different calculations, which have been made on the subject. The quantity exhausted by mining must be very great, as nearly four millions of chaldrons are annually taken from the coal-fields in Northumberland and Durham; but however great, it cannot be ascertained. There is a source of error in supposing the beds equally thick throughout, which is by no means the case; neither are they co-extensive; the upper, it is well known, occupy a less space than the lower. The calculations which have been made of their contents, ought to be regarded merely as approximations; but even in this light, it is not easy to estimate their relative value. One of the most recent was lately presented to the House of Peers; it is partly founded on hypothesis, and also perhaps on inaccurate data; even some of the necessary elements are not taken into account.^f

According to Dr. Thomson, the extent of the coal-measures is only equal to 180 square miles; and even according to this hypothesis, it appears that they may be worked in the same way that they have hitherto been, during a period of fifteen hundred years. It is not, however, improbable that the beds are assumed to be thicker than they really are.

The abundance of coal cannot justify the waste that takes place in Northumberland and Durham. The practice of separating the more fragile from the sounder parts, was adopted about forty years ago by some miners; it has now become general, and immense heaps of coal are piled at the mouths of the pits. The heat evolved by the decomposition of the pyrites sets fire to them, and they continue to burn for years. One of these masses, which is still burning, is said to cover twelve acres. It is certain, however, that this small coal might be used with profit; it might be converted into coke,

^a The whole of the Penine chain is composed of the four series of rocks associated in our coal districts, viz. Coal Measures, Millstone-grit and Shale, Carboniferous Limestone, and Old Red Sandstone. (Conybeare and Phillips, p. 366.)—P.

^c The great coal-field of Northumberland and Durham.

^d Two accounts of this district have been published; the one by N. F. Winch, Esq. in the Transactions of the Geological Society; the other by Dr. Thomson, in the Annals of Philosophy. We shall refer to both of them in the text.

^e Winch, Geological Transactions, volume fourth.

^f An estimate of the extent and produce of the Durham and Northumberland coal-fields, by Mr. Hugh Taylor:

DURHAM.

From South Shields southward to Castle Eden, twenty-one miles; thence westward to West Auckland, thirty-two miles; north-east from West Auckland to Eltringham, thirty-three miles; and thence to Shields, twenty-two miles; being an extent of 594 square miles.

NORTHUMBERLAND.

From Shields northwards twenty-seven miles, by an average breadth of nine miles; 243 square miles. In all, 837 square miles.

Portion Excavated.

	Square miles.
In Durham.	
On Tyne, say	39
On Wear	40
In Northumberland.	
Say thirteen miles by two	26

The surface of the coal-fields is thus equal to . . . 732

Estimating the workable coal strata at an average thickness of twelve feet, the contents of a square mile are nearly 12,300,000 tons, and of 732 square miles 9,069,480,000 tons.

Deduct one-third for loss by small coal, interruptions by dikes, and other interruptions 3,023,160,000
There remains 6,046,320,000 tons.

The coal worked annually in this tract amounts to 3,500,000 tons so that the present sale may continue during 1727 years.

and for the purpose of coal gas, it is not inferior to any other sort. Wallis gives an account in his history of Northumberland of a fire, which happened in the High Main coal about a hundred and forty years ago. It began at Benwell, a quarter of a mile north of the Tyne, and at last extended itself to the estate of Fenham, nearly a mile from the place where it first appeared. Eruptions were observed in many places; sulphur and sal ammoniac were sublimed from the fissures, but no stones of any size were ejected. Red ashes and burnt clay, the relics of this pseudo-volcano, are still seen on the western declivity of Benwell hill; and it is credibly attested that the soil in some parts of Fenham has been rendered unproductive by the action of the fire.

It must not be supposed that the most valuable of the British minerals is obtained without danger; the calamitous accidents, which still take place in the mines, although fortunately their occurrence is now less frequent, prove that the natural obstacles which present themselves, have not been wholly removed by the art of man. It is by no means a matter of surprise that something more remains to be done, but rather that so much has already been accomplished; and it is certain that the accidents, which still happen occasionally, cannot be attributed to negligence or want of skill in those to whom the superintendence of the works is committed. The choak-damp, the fire-damp and the stythe or after-damp are the names that the miners give the gases to which the coal mines are exposed. Their rapid production has been attributed to the following causes: first, the coal parts with a portion of its carburetted hydrogen on exposure to the air; secondly, the pyritous shale which forms the floors of the coal mines, decomposes the water that lodges in them; the latter process is constantly operating in old mines. Other causes are in all probability going on in these natural laboratories; for the gases are generated so rapidly and in such quantities as might appear almost incredible without unquestionable evidence. They often take fire in a shaft, long before the sinkers have reached the coal seam; and the pickmen open crevices occasionally, which emit seven hundred hogs-heads of fire-damp in a minute. These currents continue sometimes for several months, and are of more frequent occurrence in the deep and valuable collieries, where the most tremendous explosions take place. The after-damp or stythe by which these currents are succeeded, is a mixture of the carbonic acid and azotic gases, resulting from the combustion of the carburetted hydrogen in atmospheric air, and more lives have been lost by it than by the fire-damp. If these calamities are now less frequent than formerly, it is because much ingenuity has been exercised in obviating them, and in this point of view the safety-lamp may be considered an invaluable present which the sciences have made to the arts; but it is not the only means by which the chance of danger is averted; large furnaces are kept burning at the upcast shafts; powerful air-pumps, worked by steam-engines, are employed to quicken the draught, and their effect may be ascertained from the fact that a thousand hogs-heads of air are thus drawn out of one mine in a minute. A sort of trap-door, the invention of Mr. Buddle, is now used in the mines; it is suspended wherever a door is found necessary to prevent the escape of air. It is

propped close to the roof in a horizontal position, but in case of an explosion, the blast removes the prop, and the door falls and closes the aperture.^a

The importance of the trade to which these mines have given rise, is so great as to render some remarks on its history not unnecessary. It has been supposed that coal was obtained at a very early period in the vicinity of Newcastle; some writers affirm that a colliery was wrought not far from Benwell, the *Condercum* of the Romans, at the time when they were in possession of Britain. The fact, however, is very problematical, and if it be true, it is certain that the use of the same substance was long afterwards unknown to the inhabitants themselves. In the *Leges Burgorum*, which were enacted in Scotland about the year 1140, particular privileges are conferred on those who bring fuel into burghs; wood, turf and peats are mentioned, but no notice is taken of coal. It does not appear that any advantage was derived from it in England before the year 1234, when Henry the Third granted by a charter the right of digging coal in the neighbourhood to the inhabitants of Newcastle, and not long afterwards it was designated by the name of *sea coal*. The trade made some progress in the reign of King John, but although coal was found to be the best kind of fuel, its use was prohibited in London by a royal proclamation. A license was granted by Edward III. to the burgesses of Newcastle to dig coals and stones in Castle Field without the walls, and the colliery at Elswick was demised at the same time to Adam Colewell for five pounds of yearly rent. In the fifteenth century, the coal trade had risen to such importance, that acts of parliament were framed for its regulation, and it was directed by one that was passed in the year 1421, that all vessels carrying coal, must be measured by commissioners nominated by the king, and must have their burden marked upon them, that his majesty may not be deprived of his duty of twopence per chaldron by false measure. It was in the middle of the same century that Scotland was visited by Pope Pius the Second; he relates that he saw poor people begging in rags at the churches, and receiving, not money nor alms, but pieces of black stone with which they went away satisfied. This species of stone, adds the pope, whether with sulphur or whatever inflammable substance it may be impregnated, they burn instead of wood, of which their country is destitute.^b

It appears that a lease of two coal pits at Elswick was granted in 1538 for the term of eight years by the prior of Tynemouth to Christopher Midford, at the annual rent of £50. The price of coals at that time in Newcastle was 2s. 6d. a chaldron, and about 4s. in London. Queen Elizabeth obtained, in 1582, from the Bishop of Durham, a lease of the manor of Gateshead and Whickham, with the coal mines, common wastes and parks, for ninety-nine years, at the annual rent of £90. This lease, which occasioned an increase of two shillings in the price of coals per chaldron, was first assigned to the Earl of Leicester, the queen's favourite, and afterwards to the celebrated Sutton, the founder of the Charter-house. An assignment of the same lease for the sum of £12,000 was made by Mr. Sutton to Sir William Liddle and others for the use of the mayor and burgesses of Newcastle. Coals then rose to seven, afterwards to eight, and lastly to nine shillings per chaldron. Various regulations and

^a Geological Transactions, vol. iv.

^b *Ænæ Silvii Opera.*

acts relative to the coal trade were made during the same and the four succeeding reigns; it is said indeed that in the year 1648, the price of coal was so high in London that many poor persons perished for want of fuel. In the year 1655, the price of coals in London was upwards of twenty shillings per chaldron, and during the same period three hundred and twenty vessels were employed in the coal trade upon the Tyne, each of them carrying annually eight hundred chaldrons. An act of parliament was passed in 1655,^a by which a duty of one shilling per chaldron was granted to the lord mayor, to enable him to rebuild the churches and other public buildings, which were destroyed by the great fire in the preceding year. The sum, however, was found to be insufficient, and it was raised to three shillings. Charles the Second granted to the Duke of Richmond a duty of one shilling per chaldron, on coal exported by the Tyne, and the right to it continued in the same family until the year 1800, when it was purchased by government.

The state of the coal trade accorded ill with the liberal spirit which pervaded other branches of British commerce, and it called at last for the interference of the legislature. The high price of fuel in the metropolis was attributed to an impost of six shillings a chaldron levied by government on sea-borne coal, and to other local dues equally oppressive. It may be remarked that the same impost was not exacted at the pits or in the counties from which fuel is obtained, and where it is comparatively cheap. Thus a chaldron of coal which costs twelve or thirteen shillings at the coal works, was not sold in London under fifty-five. But the evils of such a system were not confined to the capital, they extended to the country, and it required no great sagacity to discover that this was one and certainly not the least cause of the superior condition of the labouring classes in the north over those in the south.

It may not perhaps be readily believed that the northern coal trade, or extracting coal from the pits, and conveying it to different places, affords the means of subsistence to more than forty-five thousand individuals. Such, however, is certainly the case, and as no other proof illustrates better the importance of this trade, it may be right to subjoin a quotation from the evidence of Mr. Buddle, taken by a committee of the House of Commons. "I hold a paper in my hand stating the number of people employed in the coal trade in each department. I beg to observe the returns from the Tyne are official documents; from the Wear I have no returns, but it is by an approximate calculation.^b The number of persons employed under ground on the Tyne are—men 4937, boys 3554, together 8491; above ground, men 2745, boys 718; making the total employed in the mines above and below ground 11,954, which in round numbers I shall call 12,000, because I am pretty sure there were some omissions in the returns. On the Wear I conceive there are at least 9000 employed, making 21,000 employed in digging the coal, and in delivering it on the two rivers. From the best calculations it would appear that averaging the coasting vessels that carry coal, at the size of 220 London chaldrons each vessel, there would be 1400 vessels employed, which would require 15,000 seamen and boys. I have made a summary;

there are seamen, 15,000; pitmen and above ground people employed at the collieries, 21,000; keelmen, coal boatmen, casters and trimmers, 2000; making the total number employed in what I call the northern coal trade, 38,000; in London, whippers, lightermen and so forth, 5000; factors, agents, &c. on the coal exchange, 2500; 7500 in all in London. Making the grand total in the north country and London departments of the trade, 45,500. This does not of course include the persons employed in the outports in discharging the ships."

The trade, however important in itself, is much more so in its relation to others; on it the others in a great degree depend. It enables us to explain the rapid and extraordinary rise of many populous towns, such as Manchester, Glasgow, Birmingham and Leeds; it accounts for the commercial greatness of Britain, to which nothing analogous can be found in ancient or in modern times. If the immense power which the genius of man has derived from this substance be considered, it need not excite surprise that the products of British industry have been multiplied almost to infinity. What has actually happened, may therefore be easily inferred; the different eras that mark the progress of this trade, indicate also corresponding advances in the arts and civilization.

The other places from which coal is obtained, may now be briefly mentioned. Other coal districts are situated in the Great Northern division, or in the country north of the Trent; of these some are little inferior to the one that has been described. The detached basins or seams in the north of Yorkshire are too insignificant both in extent and thickness to require any particular notice; but it is otherwise with the field in the southern part of the same county. The great Yorkshire and Derbyshire coal-field agrees so closely with that of Northumberland in the direction, inclination and character of its strata, that it has been considered a re-emergence of the same beds from the magnesian limestone, which conceals them through the long intermediate space.^c The area which it occupies may be compared to a triangle with a truncated apex. The northern extremity forms the base or broadest part, while the apex or narrowest is situated in the opposite direction. The greatest length from north to south, between Leeds in Yorkshire and Nottingham, is more than sixty miles; the greatest breadth, which is equal to twenty-two, is situated in Yorkshire. Like the strata of the Northumberland coal-field, they range from north to south, dip to the east, where they sink beneath the magnesian limestone, and rise towards the west and north-west, where the lowest measures at length crop out against the millstone-grit rocks, that form the higher ridges of the Penine chain.

Indications of coal have been discovered on the south of the Penine chain, between Ashborne and Derby, consequently on the north of the Trent. Turning from the southern to the western side of the same chain, two coal-fields may be observed, those of Cheadle and Newcastle under Lyne. The latter, or, as it is generally called, the Pottery coal-field, forms a triangular area, of which the sides are each nearly equal to ten miles, and the base to seven. The number of beds, it has been ascertained, amounts to thirty-two, while their thickness varies from

^a 1667.—The great fire in London happened in Sept. 1666.—P.

^b The approximate calculation has since been ascertained to be under the truth.

^c Geology of England and Wales, Part I. page 378.

three to ten feet. Mole-Copt hill may be considered the vertex of the triangle, the sides of which diverge toward the south-south-east and south-south-west. Much more important than the last is the coal-field of Manchester or South Lancashire, which commences in the north-western part of Derbyshire, and extends to the south-western part of Lancashire, forming a crescent, of which the opposite horns are at least forty miles from each other, and almost at an equal distance between them is situated the town of Manchester. The Derbyshire part of the field has been described by Mr. Farey in his natural history of that county; it may be regretted that his example has not been imitated, or that no accurate account has hitherto been published of the Lancashire portion, a fact not a little surprising, considering the zeal of English geologists. But the same may be said of another and a smaller field, occupying probably a detached basin in the northern extremity of the same county, between Lancaster and Ingleton.

The transition group of the Cumbrian mountains, says Mr. Conybeare, protrudes like an immense excrescence from the side of the Penine chain, and the formations of which it consists are thus forced to make a long detour, as the layers of wood are seen to do in surrounding a knot. The coal measures might be found on the south of this circle, were it not for the indentation formed by Morecambe Bay; they extend, however, on the western coast from Egremont, on the south of Whitehaven, to Hesket, and onwards at irregular distances to the vicinity of Orton; in other words, they may be traced through the northern semi-circle or boundary of the transition group.

The Rev. Mr. Townsend makes the following remarks concerning the coal of Cumberland: "Collieries proceed along the coast by Cocker-mouth to Maryport, forming a district of about one hundred square miles, in which three coal-fields are particularly noticed. First, Howgill, west of Whitehaven, two miles and a half wide from the rivulet called Pow on the eastern side, to more than one thousand yards under the sea. In this field, seven beds have been worked. Second, Whingill, north-east of Whitehaven; it extends 3000 yards in length by 2800 in width. In the depth of 165 fathoms, they work seven large beds, and eighteen thin ones have been observed. Third, Besides these, a more extensive coal-field has been discovered on the south and south-west of Whitehaven, which is yet unexplored."^a

All the coal-fields of any importance in the Great Northern district, have now been enumerated; they may be considered, not only in their relation to the physical geography of the country, but also as having an influence on the destinies of the inhabitants, accounting for the nature of their occupations, the diffusion of wealth, and the greatness of the population in comparison of the surface.

Three coal-fields are situated in the Central district, namely, one on the confines of Leicestershire and Staffordshire, another in Warwickshire, and a third in South Staffordshire. The first of these has obtained its name from the town of Ashby de la Zouch, around which it forms an irregular oval, equal in length to ten miles, and

to nearly eight at its greatest breadth. But the coal formations within this boundary are much broken, and it is uncertain whether they occupy two detached basins, or belong to one common field. The second or the Warwickshire field extends to the distance of sixteen miles from south-east to north-west, from Wicken, about three miles east from Coventry, to Wareston, about five miles to the east of Tamworth. The average breadth of the tract exceeds three miles. The principal works are at Griff and Bedworth, in the southern part of the field. In the former place four beds of coal are worked; the depth of the first is about 117 yards, and the principal seam is three yards in thickness. The Bedworth works are on the same strata, but the first and second run together, and form a seam of five yards.^b

The Dudley or South Staffordshire field is more extensive than either of the former, being about twenty miles in length, and about four at its greatest breadth. The area has been ascertained by measurement to be equal to sixty square miles. It may be divided into two portions, of which the northern stretches from Cannock Chase to Bilston, and the southern from the last place to the neighbourhood of Stourbridge. It may be mentioned that a bed of remarkable thickness, not less than thirty feet, is worked in this field. As this part of the country is inconveniently situated for conveying coals to a great distance, the produce is sold at a cheap rate, and much of it is never carried from the works. It is well known that coals are cheaper in Birmingham than in any other part of England, and that circumstance accounts sufficiently for the rise of the town. There is reason to believe that little more than a third part of the coal obtained from the mines is actually sold, while the rest or the smaller fragments become useless by exposure to the air. All the neighbouring counties are now supplied with coal by means of the canals that communicate with Birmingham, and an immense quantity is necessary for the numerous iron works in the vicinity.

It may be observed that the North Welsh coal-fields^c have been less accurately examined than most others in England. A valley nearly parallel to the Menai Straits, and about six miles distant from it, traverses the Isle of Anglesea. It is bounded on both sides by carboniferous limestone, and coal, which has been found in the depressions, is worked near the Maltraeth estuary, while the same substance extends probably along the whole line. The coal measures in Flintshire are supposed to extend nearly thirty miles from Llanassa,^d near the western cape of the Dee, to the neighbourhood of Oswestry in Shropshire. The plain of Shrewsbury is in most places covered with strata of the newer red sandstone, but several broken patches of coal are scattered over it; they are besides found in the intervals between the transition chains by which the same plain is indented. The Coalbrook-dale field extends from Wombridge to Coal-port on the Severn. The length of the tract is equal to six miles, while the greatest breadth does not exceed two. Some of the beds are very sulphureous, and on account of the fetid odour which they emit, they are only used for burning lime. Brown Clee Hill and Titterstone Clee

^a Vindication of the character of Moses as an historian.

together, and constitute one five-yard seam. Conybeare and Phillips Geology, Part I. p. 407.—P.]

^c North-western district.

^d Llan Asaph (St. Asaph's Church).—P.

Hill, two of the loftiest heights in Shropshire, are situated a few miles to the south of Coalbrook-dale. The summits are covered with overlying masses of basalt, but the coal is worked about midway from the base; in the first, the coal is observed in thin strata, but in the other, the principal stratum is upwards of six feet in thickness. The most valuable field, or that of Cornbrook,^a is about a mile long by a quarter broad. The Billingsley tract on the east of the Clee hills, stretches from Deuse hill on the north, to the borders of Shropshire and Worcestershire on the south, a length of eight miles; but it is doubtful whether it consists of one continuous field or several small ones. Two small fields are situated near the base of the Aberley hills, the one at Pensax, the other at the distance of three miles to the west of it; their geological relations have not been examined.^b

Another coal country may now be mentioned; it has been called the South-western district, and it comprehends the South Welsh basin, that of the Forest of Dean, and that of South Gloucestershire and Somersetshire. These basins are connected with each other by contiguity of position, and geologically by a common base and the general analogies of their structure. The strata near the edges of the basins are often very highly inclined, but nearer the centre a great portion of them is concealed by horizontal deposits of more recent formation, such as calcareo-magnesian conglomerate, new red sandstone, red marle and lias. Thus, in many instances in Somersetshire, the shafts are begun in lias, and sunk completely through the newer sandstone to the coal measures; some of them, indeed, have been sunk to the great depth of two hundred fathoms.^c

The great coal-field of South Wales extends from Pontypool on the east, to St. Bride's Bay on the west. The lowest beds of coal are about seven hundred fathoms beneath the highest elevation in the district, but from this circumstance, the miner is not put to much inconvenience, for the country is intersected by deep vallies, which extend generally from north to south. It appears, from a survey of the district, that there are twelve beds of coal from three to nine feet thick, together seventy feet and a half, and eleven others from eighteen inches to three feet, together twenty-four feet and a quarter; in all nearly ninety-five feet. The extent of surface is not less than one hundred square miles, and according to the common method of working, every square acre may yield 100,000 tons, or every square mile, 64,000,000 tons of coal. Different sorts of coal are obtained in different parts of the district; on the north-east, it resembles coke; what is termed stone coal is more common on the north-west; the larger sort is used for drying malt and hops, and the smaller or culm, as it is termed, for burning limestone; on the south side, it is mostly of a bituminous quality.

The Forest of Dean coal is contained in an elliptical basin, of which the superficial extent is nearly equal to forty square miles. There are not fewer than seventeen strata, but the total thickness of coal does not exceed thirty-seven feet.

The last coal basin that shall be mentioned, is that of South Gloucestershire and Somersetshire; it stretches

^a On the Titterstone Clee Hill there are six different coal-fields, of which the Cornbrook coal-field is the most extensive and valuable. It is about a mile long, and half a mile broad. (Conybeare and Phillips, p. 423.)—P.

from Iron Acton on the north, to the foot of the Mendip Hills on the south, a distance of twenty-five miles; its breadth from the neighbourhood of Bath on the east, to that of Bristol on the west, is about eleven miles, and this last line is marked by the course of the river Avon, which divides the basin into two nearly equal parts. In this tract there are several extensive faults, some of which elevate the strata more than one hundred feet; in the greater portion of it, also, the coal measures are concealed by more recent deposits; the labour of working them is thus greatly increased, but the difficulty has been surmounted by British industry.

All the coal districts of any importance in England, have now been enumerated; it was thought necessary to describe them minutely, not because this substance forms a distinguishing feature in the physical geography of the country, but an important element of its wealth, the ingenuity of man rendering it subservient to his purposes, and thus increasing his power. It places the mariner beyond the control of the winds, while it renders the land traveller no longer dependent on animal force, and enables him to proceed with a velocity which, in the last age, might have been deemed *impossible*, so little are inventions or improvements contemplated by the generation that immediately precedes them.

Iron and lead, the most useful of the metals, are found in the coal districts; we shall afterwards have occasion to allude to them more fully; at present it may be remarked that other metals of great utility, such as copper and tin, are the products of transition or primitive districts. On account of these metals, Cornwall has been long famous; at an early period the Phœnicians repaired to this part of England, and traded with the inhabitants; in a later age the Cornish mines were deemed of so much importance that the *stannary* courts for assaying and stamping the metals, the produce of these mines, were established in different towns. In several parts of Cornwall, alluvial deposits of tin are found in vallies and low grounds; they are worked or separated from the earthly matter by passing a stream of water over them; with this exception, copper and tin are not found in strata or beds in Cornwall. The veins in which they occur, extend generally from east to west; their deviation from that direction, or their inclination to the north or south in some parts of their course, is termed by the miners the *underlie of the load*. What might be naturally expected when two veins underlie each other in opposite directions, and meet under ground, does not often happen, for in many instances they are rich, when separate, and poor, beyond their junction. If, on the other hand, two veins underlie each other in the same or nearly the same direction, and the one overtakes the other, they seem mutually to enrich each other.^d

No precise information has been obtained concerning the length or depth of the veins. The most productive, it is known, extend to a greater distance than three or four miles; it has been supposed indeed that they extend the whole length of the county, but such an opinion is merely conjectural, as there is every reason to believe that no miner ever observed the termination of a vein either on the east or the west. The same may

^b Tracts on Natural History by Dr. Townson.

^c Dr. Townson's Tracts, &c.

^d Transactions of the Geological Society, volume 4th. Mr. Phillips on the veins of Cornwall.

be said of their depth, for no instance has occurred in which the miners have reached the lowest part of the vein; before that happens, the works are abandoned either on account of their poverty, or because the expense of continuing them is not likely to be indemnified by the produce. The mine of Dolcoath is said to be the deepest in Cornwall, and the works are carried on at the depth of 228 fathoms.

As to the breadth of the veins, they vary from one to thirty feet, but the widest are not considered the most productive; on the contrary, one of two or three feet is preferred, as the ore is found to be mixed in less proportion with foreign ingredients. A hundred and twenty mines were worked a few years ago in Cornwall, and the net annual produce of the copper mines alone amounts in value to nearly £400,000.^a A century ago the English imported the same metal from Germany and Sweden; it is now exported from England to every quarter of the globe.

The manner in which the works are managed, and the prospect of gain held out to individuals, are probably the chief causes of so great a change. In other parts of Europe, works of the same sort are under the control of the different governments, and a portion of the public revenue is set apart for such purposes, or grants and immunities are established in their favour; lastly, officers educated to the profession of mining are appointed by the state to superintend the mines. But in England the method is different; all that government does is to respect and secure private property; the rest is left to individual ingenuity and enterprise.

It might be shown, were it at all necessary, that individuals are better qualified than governments to estimate the profits likely to arise from such undertakings. But while it is not doubtful that the English method is the best, the defects that arise from the habits and ignorance of the miners, may be mentioned with regret. No class of men are more expert than the Cornish miners in discovering veins, a branch of their profession, in which skill is the result of long experience and repeated trials. It may not perhaps be readily believed that all of them, even the directors of the works, or the *captains* as they are provincially styled, are ignorant of chemistry and geology, two sciences, of which some knowledge at least is of the highest use in their art. Much loss and waste which might have been otherwise prevented, must be attributed to the above cause. It is not more than a century since the copper ore was discovered beneath the tin, and within that period, whatever was not tin was considered of no value. It is well known that many roads in the county have been mended with copper ore. Cobalt has been thrown away by the miners on the heaps at Dolcoath mine, and bismuth has been mistaken for cobalt in the works at Huel-Sparnon. The native silver in Herland might have remained concealed, had not the vibrations of some filaments attracted the attention of a workman; before that time the ore containing the precious metal was thrown away as useless.^b

^a Taylor on the Economy of the Mines of Cornwall and Devon. Geological Transactions, volume 4th.

^b Phillips on the veins of Cornwall. Geological Transactions, volume 4th.

^c "Whether tin doth grow again, and fill up places which have been formerly wrought away, or whether it only separateth itself from the consumed offal, hath been much controverted, and is not to this day

Some improvement, however, has taken place of late years, and some good has been effected by mechanics' institutions; still it might be of advantage to establish schools in the most convenient places, that the miners may attain a competent knowledge of their art. The laudable desire of diffusing knowledge among the lower orders might thus be gratified, and the mines might be worked with much greater profit. It is certain that the workmen still make use of the divining rod, and still believe in the reproduction of metals.^c But the Cornish miners are patient and laborious; they brave great dangers for a very trifling profit. It is customary for a workman to walk two or three miles in the middle of the night, and in the worst weather; having reached the mine, he throws off his dress, and puts on his underground clothes, slings his tools over his shoulder, and descends by ladders with the light of a small candle, a depth of a thousand or twelve hundred feet. The same person works six or eight hours amidst the noise of pumps and steam-engines, with as much alacrity and as little consciousness of danger, as if he were engaged in his ordinary occupations above ground.^d "The mine of Huel-Cock," says Mr. Pryce, "is wrought eighty fathoms in length under the sea, below low-water mark; and the sea in some places, is only three fathoms over the back of the works, so that the men underneath hear the break, flux, ebb and reflux of the waves, which having had the run of the Atlantic Ocean for many hundred leagues, are consequently impetuous and boisterous. They also hear the rumbling noise of every nodule and fragment of rock, continually rolling on the submarine stratum, and producing a kind of thundering noise, which is not heard without dread by a stranger. Add to this, that several parts of the vein, which are richer than others, have been very indiscreetly hulked and worked within four feet of the sea; whereby in violent stormy weather, the noise has been so tremendous that the workmen have often fled from their labour, fearing that the sea was about to break in on them."^e

Such is their occupation, and although they are not better paid than men engaged in other sorts of labour, attended with less danger and less toil, comparatively few of them change their calling, or seek elsewhere the means of subsistence.

To describe minutely the mineral kingdom in England is not the design of the present work; the most valuable substances have now been mentioned, and in the remarks on the different counties, occasion shall be taken to notice the most remarkable of their mineral products.

If a line be drawn from the coast of Berwickshire to Liverpool, and through Montgomery in North Wales, to Ludlow, then east of Hereford, and onwards to Teignmouth on the coast of Devon, on the west of it are the mountainous tracts of Cornwall and Devonshire, Wales, Cumberland and Westmoreland; it may serve also as a boundary between the primitive and transition rocks that extend towards the west, and the more regularly stratified

decided. And whether dead lodes that have not one grain of tin in them, may not hereafter be impregnated, matured and prove a future supply to the country when the present lodes are exhausted, I think well deserves our highest consideration." Notes to Carew's Survey of Cornwall by Tomkin, edited by Lord de Dunstanville, 1811.

^d Phillips on the veins of Cornwall.

^e Mineralogia Cornubiensis.

and newer deposits on the east. If another line be extended northwards, from Exmouth, through Taunton, to Tewkesbury, and thence with a moderate curvature to the east, through Stratford upon Avon, Leicester, east of Nottingham, Newark, Gainsborough and York, to the mouth of the Tees, it will also divide the island into two portions, of which the western includes, besides the mountainous regions already mentioned, the remaining metaliferous tract, and all the coal districts, that on the east consisting entirely of the more recent stratified rocks; a division which, it has been remarked, is attended with a corresponding difference in the occupations of the inhabitants of the two portions, and forms a sort of natural boundary between the agricultural and manufacturing population.^a

The science of geology has been cultivated with much success in England, and many persons, whose only object is to gratify a desire of knowledge, have bestowed on it their time and their labour. If Mr. Smith had concealed his discoveries, he might have reaped a golden harvest, but he took every opportunity of proclaiming them, thinking it best for the interests of science, and the welfare of his country. The practical advantages resulting from the labours of such men might be appreciated, were it possible to ascertain the sums that have been lost, or may still be lost, in speculations, of which the failure may be predicted with certainty. It is not long since £80,000 were expended in seeking for coal at Bexhill in Sussex, although the sand of that place^b is separated by so great a depth from the coal series, as to render abortive every attempt to pass through the intermediate strata.^c Mr. Townsend informs us, that a pit was sunk for coal to the depth of six hundred fathoms, at Bruham near the chalk hills of Bradley-Nole, and that the miners reached only to the uppermost beds of the great oolite.^d The history of mining operations in England abounds with such examples. It may be mentioned, on the authority of the last writer, that the commissioners of the Bath roads sent ten miles for flints, while their waggons actually passed, without their knowing it, over a bed of flints for the greater part of the way, which was concealed by the sand that covers the surface. The stone of which the Bath cathedral is built, was conveyed from the distance of four miles; it was not then known that the same stone might be obtained in the immediate vicinity; quarries have since been opened. If errors of a like nature are now less frequently committed, if pits are not so often sunk in vain, it is because practical men have availed themselves of the discoveries of geologists, or in other words, have become better acquainted with the geological position of the different strata.

The animal kingdom in England differs little from that of other countries between nearly corresponding parallels; it is unnecessary, therefore, to enumerate the species that compose it. It may be remarked that the wolf and the wild boar, formerly not unknown in England, have long since been extirpated. It is not easy, however, to obtain any accurate information concerning the precise period in which these animals were destroyed.

^a Introduction to the Geology of England and Wales Smith's Geological Map.

^b Iron sand.—This formation often contains, (especially in Bedfordshire, Dorsetshire, and near Hastings,) a considerable quantity of fossil wood, and even regular beds of wood coal. The sands alternating with these beds also much resemble, in some places, those occurring in the great coal formation. These circumstances have led to expen-

It is known that Edgar, who reigned in the early part of the tenth century, employed many persons in hunting wolves, and so great was their diligence, that these ravenous animals were driven or fled for refuge to the mountains and forests of Wales. Athelstan, the predecessor of the same prince, imposed a tribute on the Welsh, from which they were exonerated by Edgar, on condition of rendering him every year three hundred wolves' heads. The latter tax, it is added, was punctually paid. It appears, from the laws of Hoel-Dha,^e the Welsh legislator, that his grand huntsman was permitted to chase the wild boar from the middle of November to the beginning of December. The same animal, it is likely, existed in England after the reign of William the Conqueror; but in his time it was by no means common, and those who killed a wild boar within the royal forests, were punished with the loss of their eyes.

The stag in its natural state is very rare in England, still a few of them are found on the borders of Cornwall. In most countries, the colour of the stag is yellow, but in England, it is of a dusky red. Of the fallow deer that are seen in the parks of the landed proprietors, there are two sorts; the one of a fine dappled colour was originally brought from India; the other of a dark brown was imported from Norway by James the First.

The hills, the woods, and the valleys, abound with different kinds of game, of which the most common perhaps are the hare, the partridge, and the pheasant. The red variety of the partridge is by no means scarce in Suffolk and other counties, but the pheasant can hardly be said to exist in a wild state; some, it is true, are bred in the woods of Norfolk, and in other parts of the country, but the greater number are brought up in confinement; the eggs are hatched under domestic fowls, and the young at a certain age are set at liberty. The red grouse is observed on the hilly and barren tracts in the north of England, but they are not so common as in many parts of Scotland. The black cock is found in Wales, and also in different parts of the New Forest, in Hampshire, where it is preserved as royal game. The ptarmigan has been occasionally seen on the lofty hills of Wales and Cumberland. The bustard, although very scarce, exists still in different parts of England, as in the open country near Dorchester, on Salisbury plain, in the neighbourhood of Newmarket, and in the Wolds of Yorkshire. The wild duck is nowhere more common than in the fens of Lincolnshire.

The turtle dove arrives late in the spring, and departs about the end of August; they appear in greater numbers in Kent than in any other county. The nightingale, the finest of the British songsters, visits England in April, and leaves it in August; it is rare in Yorkshire, and is not heard in the more northern counties. The woodcocks begin to appear in October, but the greater number do not arrive before November or December; they return about the middle of March; coming down to the sea coast when the wind is favourable, they then repair to their breeding places. It has been observed

sive but abortive attempts to procure this combustible from these beds near Bexhill in Sussex. (Conybeare and Phillips' Geol. England and Wales, p. 137.)—Bexhill is near the coast, to the west of Hastings.—P.

^d Townsend's Vindication of Moses, &c. page 125.

^e Hoel Dda (Howel the Good).—P

that the woodcock is gradually becoming rare in England, and the cause is attributed to the progress of cultivation. The starlings appear perhaps in denser flocks than any of the other birds; they actually darken the air in the fens of Lincolnshire, and break down the reeds with their weight.

Of the different kinds of fish that frequent the English rivers, the salmon is the most valuable; although it is found in most of the principal streams, it is more plentiful in the Tweed, the border river, than in any other. Other kinds are obtained in great abundance on the coasts, and the different fisheries to which they have given rise, form an important branch of commerce.

The herring fisheries on the coasts of England, are less valuable and extensive than in Scotland; they are taken, however, on many parts of the eastern coast, and principally in the neighbourhood of Yarmouth; they are also found on the western coast, but not in so great numbers.

Many of the herrings are exported, but the produce of the mackerel fisheries is confined to the supply of the home market; they are taken between the coasts of Norfolk on the east and north, and those of Hampshire on the south and west. Mackerel are not so plentiful to the north of Yarmouth, and they are neglected westward of Hampshire, on account of the greater importance of the pilchard fishery. London is the great market for mackerel, and it is calculated that some millions of them are sold there every year.

It is on the coasts of Dorsetshire, Devonshire and Cornwall, particularly the last, that the greater number of pilchards are taken. These fish were once in so much request in the Italian states, that the orders to Cornwall for tin and copper were frequently conditional, or it was stipulated that if so many pilchards could not be sent, the other articles would not be received.^a Dartmouth and Falmouth are the two ports in which the trade is chiefly carried on, and although it has much declined of late years, there are not fewer than three hundred pilchard vessels of every kind in the former place, and a still greater number in the latter.

Colchester, Wells, Faversham, Milton, the Swales of the Medway, Queenborough, Rochester, Sea Salter, Poole, Tenby and Port Inon are the principal seats of the oyster fisheries. The Colchester oysters are held in the greatest repute, but they are only fattened there; most of them are taken between Chichester and Southampton. Poole employs about forty sloops and boats in fishing oysters, and supplies the London market two months every season, in which time the receipts are supposed to average £8000 or £10,000. Two hundred fishermen and five or six sloops are employed at Port Inon in this trade; it supplies the Bristol, Bath and Gloucester markets. The other fisheries are of less consequence; they consist chiefly of turbot, cod and lobsters: the most important turbot fisheries are situated on the coasts of Norfolk, Suffolk, Essex and different parts of the English Channel; on the other hand, the greatest quantity of cod and lobsters are taken on the north-eastern coasts.

It might be shown that England derives considerable advantage from her fisheries, some affording a cheap

and wholesome article of food to every class of the community, others ministering to the luxuries of the rich, and all of them furnishing a hardy race of men to the navy. Few countries indeed are so favourably situated in this respect, the extent of the coasts being very great in proportion to the extent of surface, and the numerous indentations, creeks and inlets affording shelter from every wind.

In every civilized country, the *fera*^b are of infinitely less value than the domestic animals: the food which the latter afford, depends not on the contingencies of the chase; their strength is employed for the advantage of man; their multiplication is subject to his control, and is regulated by his wants; nay more, the very qualities for which they are most valuable, are improved by his care. It is long since the superiority of the English horse has been admitted; certainly neither the soil nor the climate is favourable to that animal in its wild state, but every obstacle has been overcome by the inhabitants, and their coursers are equal to any for strength and swiftness. The English racer has been improved with the best blood of Arabia; the remarkable resemblance between them was observed by Buffon, who thought the principal difference consisted in the greater size of the English horse. The latter are probably fleetier, but it need not be forgotten, that the best of them were sprung from Arabs. The English themselves believe that the breed of their racers is apt to degenerate, if it be not crossed at certain intervals with the Asiatic. The passion of the English for horse racing has been at least attended with one advantage, that of improving the breed; in the qualities of the racer, the hunter and the carriage-horse participate; the excellence of the one is well known, and the rate of travelling is the best proof that can be adduced of the superiority of the other.

The English draught horses are held in great and merited repute; the three best sorts are the Cleveland bay, the Suffolk punch, and the Old English black or Lincolnshire cart horse. The first are bred in many parts of Northumberland and Durham, and also in Cleveland, a district in Yorkshire, from which, as well as from their ordinary colour, they derive their name. If not urged beyond their ordinary pace, they can bear a long continuance of fatigue; it is said on good authority, that many of them have travelled with heavy loads the extraordinary distance of sixty or seventy miles within twenty-four hours, not once, but three or four times in a week. No animal, it is added, is better adapted for farm labour, and the mares are the best species of stock for the double purpose of work and breeding.^c The second variety is admirably adapted for the light and sandy lands in Norfolk and Suffolk, where they are generally used, and where, it is said, they can plough more in a given time than other horses; this, if correct, is as much owing to the nature of the soil as to any excellence in the breed. The black cart horse is common in Leicestershire, Northamptonshire, Lincolnshire, and some of the neighbouring counties. It is remarkable for its size and strength, but not for its activity; on the contrary, it is supposed to be heavy and sluggish. These horses have been at different times improved, particularly

^a Edinburgh Encyclopedia, art. England—Fisheries.
VOL. III.—NO. 57

^b Wild animals.

^c Agricultural Survey of Durham, p. 257.

by the late Earl of Chesterfield, who sent six Zealand mares to England during his embassy at the Hague, and at a latter period by the celebrated Mr. Bakewell. The properties of this breed are exhibited in the London dray horse, and his extreme docility is not the least valuable of his qualities. The other sorts are inferior to the three that have been now mentioned; they are, however, sufficiently numerous; indeed, it is hardly possible to travel through England without observing a difference in the draught horses of different counties.

The type of the English ox is said to be preserved at Chartley Park in Derbyshire,^a and at Chillingham Castle in Northumberland, the seat of the Earl of Tankerville. These animals exist still in a wild state, and their colour, shape and habits are very different from those of the domestic ox. The following description of them is given by Mr. Bailey. "Their colour is invariably white, muzzle black; the whole of the inside of the ear, and about one-third of the outside from the tip downwards, red; horns white with black tips, very fine, and bent upwards. Some of the bulls have a thin and upright mane about an inch and a half or two inches long. The weight of the oxen is from thirty-five to forty-five stone of fourteen pounds, and that of the cows from twenty-five to thirty-five the four quarters."^b

The county of Devonshire has been long famous for its oxen, and it has been asserted by some writers on agriculture, that they are directly descended from the wild race. It is certain that they are well calculated for draught, and fatten readily, and from them are derived the *old red cattle* of Gloucestershire, and the Herefordshire and Sussex breeds. But the old Gloucester reds are now very scarce; they appear to have been a mixed breed, from the Devonshire and Welsh cattle. The Herefordshire cattle, although larger than the Devonshire, resemble them in other respects. The Sussex cattle are supposed to be the best in the kingdom for draught, and oxen are used more for labour in Sussex than in other parts of England.

The neck of land, containing Cumberland and Lancashire on the western, and Northumberland, Durham and Yorkshire, on the eastern coast, is considered the native country of the long and short horned oxen. It was on the former that Mr. Bakewell made his experiments for the improvement of cattle, from which there resulted the new Leicester variety, believed to be better adapted for the grazier than any other in the kingdom. The short horns, or the Teesdale, Lincoln, Holderness and Tweed-side oxen, are the largest of any in Britain. The data are wanting to form a correct estimate of the number of cattle in England, but from an approximation sufficiently near the truth, it cannot be less than 4,000,000.

The rearing of sheep forms another branch of rural economy, more important than the last in its relation to commerce and manufacturing industry. To enumerate the different varieties of this useful animal might lead us into minute details, which it is necessary to avoid. Sheep are most common on the mountainous districts of England and Wales, on the rich pastures in the midland counties, and on the marshy lands; they are also fattened on many arable farms in different parts of the country.

^a In Staffordshire, 3 miles N. E. of the town of Stafford.—P.

^b Agricultural Survey of Northumberland, p. 141.

All the varieties in the kingdom may be divided into two classes, the long and the short woolled sheep; the difference between them is founded on the nature of their fleece, the wool of the one being better adapted for woollen goods, that of the other for the fabrication of worsted.

The former, although common in many districts, are more numerous on the eastern than the western side of the kingdom; they are found too in greater numbers near the coasts than the middle of the country. The most northern are reared near the mouth of the Tees; others in the tract which comprehends the south-eastern extremity of Yorkshire, the greater part of Lincolnshire, and the fen-lands of Huntingdonshire, Cambridgeshire and Norfolk. They may be seen in the small marshes which surround the inlets of the sea in Essex and Kent, but nowhere in so great numbers as in those of Romney and Guilford in the latter county. They are common throughout Leicestershire, Rutlandshire and Northamptonshire, in most parts of Dorsetshire, Devonshire and Cornwall, on the Coteswold Hills, and along the banks of the principal rivers.

The short woolled sheep are more scattered, and are divided into six different kinds, namely, the Norfolk, South Down, Wiltshire, Herefordshire, the heath sheep, and the Cheviot or mountain breed.

According to an approximation, which is not believed to be very wide of the truth, the long woolled sheep are equal in number to 4,153,308, and the number of acres on which they are maintained, to 3,939,563. The highest stock of long woolled sheep per acre, is twenty-one on four, and the lowest, one on three acres. The weight of the fleece varying from five to nine pounds, may give the average of seven pounds ten ounces. The total quantity of long wool is not less than 137,288 packs. The number of short woolled sheep may be equal to 14,854,299; the highest stock per acre is about four sheep on three acres, and the lowest, one on four. The fleece varies from one pound and a half to five pounds, and the number of packs is calculated to be equal to 255,948. In this estimate the shorn, the carrion, and the wool from slaughtered animals, are included. If to these results the quantity of lamb's wool be added, the total produce may amount to 403,954 packs. It is hardly necessary to add that a considerable portion is not fitted for manufacturing purposes.^c

As the breeding of pigs is an object of some impor-

^c Some notion of the different sorts of sheep may be inferred from the following table.

Different breeds and distinguishing properties.				Weight of fleece.	Weight per quarter.
1 Dishley	no horns	white faces and legs	combing wool	7 lbs.	25 lbs.
2 Lincoln	ditto	ditto	ditto	8	25
3 Teeswater	ditto	ditto	ditto	8	30

tance in England, it may be right to mention the most ordinary sorts or, at all events, the most valuable. The Berkshire is small boned, and disposed to fatten quickly; it has extended from the county, from which it takes its name, to most parts of the island. The Chinese crosses are very common. The Gloucestershire, supposed to have once been the prevailing breed in the island, are of a white colour, large and ill-shaped. The Rudgwick, so called from a town of the same name in Sussex, are the largest sort in England: they feed to an extraordinary size; at two years old, being generally twice as heavy as other kinds of the same age. A new variety, the large spotted Woburn, was introduced by the late Duke of Bedford; they are prolific, hardy and easily fattened. The Dishley breed is distinguished by the common properties of Mr. Bakewell's stock.

BOOK CLIV.

EUROPE.

Europe continued.—England.—Section Third.—Topographical Divisions.—Towns, &c.

HAVING endeavoured in the preceding chapters to give a succinct account of the physical geography of England, and having also entered into some details concerning its early inhabitants, their manners, institutions and government, it is only necessary to examine the country more minutely, to describe the different towns, and to make known the sources of wealth, or the products of industry, for which they are remarkable.

The principal civil divisions are counties or shires; of these there are forty in England and twelve in Wales. It may be as well, however, before attempting to describe them, to take some notice of the Anglo-Norman islands near the coasts of France, all that the English sovereigns now possess of the ancient duchy of Normandy. The inhabitants are governed by their own laws, which are derived for the most part from Norman customs. Although nominally under the government of a higher power, they may be considered free: they are exempt from naval and military service; they are not subject to the English church; and lastly, they enjoy the benefit of a free port, and may carry on a trade with the enemies of England in time of war.

The island of Jersey is situated about eighteen miles west of Normandy, and about eighty-four south of Portland in Dorsetshire. It contains two towns, St. Helier and St. Aubin, and twelve parishes. The number of inhabitants amounts nearly to 30,000; they are scattered over a surface not more than twelve miles in length and six in breadth. The southern side is almost level with the sea; the three others are defended by dangerous quick-sands and rocks, which rise on the north to the height of forty or fifty fathoms. A series of hills extends through the middle of the island; they are so thickly planted with orchards that they resemble a forest; indeed these plantations are too numerous, enough of arable land is not reserved for the growth of corn, and the deficiency is supplied by importations from the Baltic, England and France. The produce of the apple trees yields twenty-five thousand hogsheads of cider in a season. The island abounds also in cattle and sheep; the wool which the latter afford is manufactured by the inhabitants, and sold in the market of St. Helier.

Guernsey, neither so large nor so populous as Jersey, is situated about twenty-one miles to the north of it. St. Pierre or St. Peter,^a the only town in the island,

^a Fr. Port St. Pierre. Eng. St. Peter le Port, St. Peter's Port, or Port St. Peter's.—P.

^b Sea weed. *Vraic* (Ed. Enc.) Fr. *varec*. Eng. *wrack*.—P.

^c Sark (Fr. *Cerq*), a small island, east of Guernsey, with less than 500 inhabitants, should be added to the list of Anglo-Norman isles.—P.

consists of a long narrow street, adorned with several fine buildings. The harbour is safe and commodious, and on each side of it are strong piers. The town and the harbour are defended by the strong fortress of Castle Cornet, built on a steep rock, surrounded by the sea, and only accessible at low water by a very narrow passage. The island is noted for its fruits and for *wrac*,^b a marine plant, which grows in profusion, and is used both for fuel and manure. The inhabitants are distinguished by their loyalty, but they resemble the French more than the English in their manners and customs. A town, which contains only a thousand inhabitants, and which from the appearance of its houses, resembles a village, is situated near the centre of the small island of Alderney. In the year 1119, Henry, Duke of Normandy, son of King Henry the First, and many of the nobility, were shipwrecked and lost in the neighbourhood of the island.^c

Not more than five or six of the Scilly Islands are inhabited,^d and the total number of inhabitants does not amount to three thousand. In St. Mary, the largest of these islands, is situated the small town of Heughton or Newtown, in which the most remarkable buildings are a custom-house, a council-house, and a prison. Dolphin, the only town in Treseo, consists of a church and about forty houses built of stone. The people earn a subsistence by acting as pilots, by fishing, and by burning kelp.

The county of Cornwall, of which these islands form a part, is surrounded by the sea on all sides except the east, where it is bounded by the Tamar, which separates it from Devonshire. It was the ancient country of the *Dumnonii*; it derives its present name from its shape, which bears some resemblance to a horn. It has been found by actual measurement to contain 849,280 acres, but of these more than 200,000 are waste; the rest are divided into pasturage and tillage. The greatest length of the county is upwards of ninety miles, the greatest breadth about forty-two, and the narrowest part towards the Land's-End, or from Mount's Bay to the Bristol Channel, not more than four. Situated at the extremity of the island, and long deprived by their secluded position from the advantages of frequent intercourse with the other inhabitants, the Cornish men were less civilized or more ignorant than the rest of their countrymen; the Armorican, a dialect of the Welsh, was spoken by them at no remote period, but it has since been superseded by the English.^e

It may be inferred from the extent of the waste lands

^d The inhabited islands are six in number, viz. St. Mary's, Treseo, St. Martin's, St. Agnes, Sampson, and Brehar or Breyer. (Ed. Enc.)—P.

^e Till about three centuries ago, a peculiar language was spoken in Cornwall, which was evidently Celtic, and allied to the Welsh and the language of Brittany. (Ed. Enc.)—The Cornish was a dialect of the

that Cornwall cannot be considered an agricultural county. A ridge of bare and rugged hills, intermixed with bleak moors, runs along its whole length, and reaches in the narrowest parts from side to side. The low grounds from the hills to the coasts are rendered fertile by the manure which the sea weeds afford, but a brackish atmosphere and violent winds prevent the growth of trees and hedges near the shore. Barley is the grain that succeeds best, and large crops of it are produced near the banks of the Camel; the potato arrives also at great perfection, and seems to be admirably adapted to the climate. But the wealth of Cornwall consists in its mines and fisheries. Various sorts of fish are taken on the Cornish coast, but none in such abundance as the pilchard; immense shoals of them appear in the summer and autumn; it affords a cheap and wholesome food to the poor, and forms besides an important article of trade; large quantities of them are cured and exported to the Mediterranean. The capital employed in the fisheries exceeds £400,000; they furnish occupation to 12,000 individuals, and the annual revenue derived from them is not less than £50,000.

Cornwall surpasses most other counties in its mineral products; by an accurate survey of the mines, made in the beginning of the present century, and by subsequent observations, it has been ascertained that there are forty-five mines of copper, thirty of tin, eighteen of copper and tin, two of copper and silver, one of silver, and others of cobalt, antimony and manganese. The present stannary towns, viz. Launceston, Lostwithiel, Truro, Helston and Penzance, may indicate the importance which has been attached to the tin mines. The tanners are obliged to convey their blocks to these places that they may be stamped by the proper officers. The ordinary weight of these blocks is about 336 lbs., the value of each is upwards of £10, and the number obtained every year varies from twenty-five to thirty thousand. The annual value of the produce of the copper mines has lately been estimated at £400,000. The other minerals are *lapis calaminaris*, soap rock, and China stone, a decomposed granite, of which the feldspar having lost its fusibility, renders it a valuable substance in the Staffordshire potteries. Steatite^a abounds between Mullien and the Lizard Point, and the quarries are let to the Worcester porcelain company. Granite, not the least valuable of the Cornish minerals, forms the chain that passes from Dartmoor to the Land's End; the rock, when first broken, is so soft as to be easily worked, but it becomes very hard by exposure to the atmosphere. The industry of the inhabitants is not confined to the occupations which the metals and the minerals of the county afford; there are many paper mills on the streams near Hayle, a village remarkable for its extensive smelting works; carpets are manufactured at Truro, and coarse woollen stuffs in Callington, Launceston, St. Austle,^b Bodmin and other towns.

As a port and a place of trade, Falmouth may be considered the most important town in the county. It consisted only of a few fishing huts about two centuries

ago, but its position without the channel, enabling vessels to sail to the south of Europe, and avoid the gulf of Gascony, have rendered it an important town. Packets sail regularly for the Peninsula, the West Indies and other parts of the world. The port is supposed to occupy the site which Ptolemy assigns to the *Cenionis Ostium*, and according to a tradition, the *Black Rock* near the middle of the entrance was once an island in which the Phœnicians carried on a trade in tin with the natives. The bay from its numerous creeks or windings is capable of affording shelter to the whole navy of England. The river *Cenio*, mentioned by Ptolemy, is the modern Fal, which gives its name to the town; the latter is principally composed of a single and well built street nearly a mile in length. The harbour is defended by the two forts of St. Mawe's and Pendennis, on two small capes about a mile and a half distant from each other. They were both built by Henry the Eighth, but Pendennis was considerably enlarged by Elizabeth; during the civil wars it made an obstinate resistance against Cromwell, whose lines of defence may still be traced at a short distance from the town.

The parliamentary representation of Cornwall is too remarkable to be passed over in silence; the county and the boroughs send forty-four members to parliament.^c Elective rights were conferred on different places at different periods, evidently for the purpose of increasing the influence of the crown over the commons. The boroughs from which members are returned, are very insignificant; still all the bribery and corruption that prevail, are insufficient to save the degraded inhabitants from poverty and wretchedness.

Devonshire, or the county of Devon, in size the second in England, lies between two seas, having the Bristol Channel on the north and north-west, and the English Channel on the south and south-east. It extends to the distance of sixty-seven miles from the most northern to the most southern point, while its breadth from east to west is not less than sixty-four. The Tamar and the Exe are the principal rivers; the first forms the western limit of the county; the second takes its rise in the sterile and marshy district of Exmoor, and having been enlarged by several streams, throws itself into the English Channel at Exmouth. The soil and the face of the country are very various; the district from the borders of Dorsetshire to Exeter,^d comprehending the greater part of the southern coast, is pleasant and fruitful. Such is the mildness of the climate that the myrtle grows without shelter on the shore, and the winters are sometimes not less favourable to invalids than those in the South of Europe. The South-Hams, part of the same tract, has been frequently called the garden of Devonshire; it abounds in picturesque scenery, varied by bold swells and rich vallies. Numerous springs, flowing from the sides of the hills, unite into brooks, and spread luxuriance along their banks.

The country extending from the vale of Exeter to the borders of Cornwall, or the greater portion of the western district, consists of about three hundred thousand acres

Kymric, one of the two great divisions of the Celtic family of languages, including also the Welsh and the Armoric or Breton (in France.) The Gaelic, the other division of the Celtic, includes the Irish, the Highland Scotch, and the Manks.—P.

^a Soap stone

^b St. Austell.

^c This, and the following statements on parliamentary representation, apply to the old system, previous to the recent reform.—P.

^d This should doubtless read: from the borders of Cornwall to Exeter. The district of South Hams extends along the southern coast from Plymouth Sound to Torbay.—P.

of uncultivated land, in which the bleak and naked morass of Dartmoor occupies more than eighty thousand. The forest of Dartmoor, as its name implies, was once covered with trees, but a few stunted oaks, together with some mountain ashes and willows, are all that grow on it at present. The marshes in the higher parts of Dartmoor, although dangerous to cattle, are valuable on account of the fuel with which they supply the inhabitants. Sheep and black cattle are the riches of the people; the latter thrive well on the coarse and sour herbage, but the former are of a small size and subject to different diseases.

North Devon extends from Dartmoor to the Bristol Channel; in this district the land yields plenty of corn, and the soil is everywhere productive except on the tops of the highest hills; lofty trees are seen in the vallies, and the heights are in many places covered with coppice woods.

The value of the mineral products of Devonshire may be inferred from its geological position; tin was formerly obtained in great quantities, but the mines are no longer worked; copper, lead, manganese and gypsum are found in the north-eastern part, or in the neighbourhood of Exmoor; in other places are quarries of marble, and of stone well adapted for building. The products of industry are serges, shalloons, broad-cloths and blond lace.

Plymouth in the southern part of the county, was formerly better known by the name of Devonport;^a it is now a very flourishing town, a well frequented port, and an important maritime arsenal. The Sound by means of the break-water, lately erected across its entrance, may afford a safe protection to a large fleet; but a reef of rocks^b about fourteen miles south-west by south from Plymouth, rendered the access dangerous to ships. It was found very difficult to erect a sufficiently strong light-house on these rocks, both because they are exposed to frequent storms, and because at high water they are covered by the sea; besides, as a foundation for such a building, they offered many disadvantages, which it was necessary to surmount. Three Eddystone light-houses were at different times erected, and all of them were overthrown. The present one, it has been already observed, was built in 1774, under the direction and according to the plan of the celebrated Mr. Smeaton.

The principal imports of Plymouth are coal, culm, corn, wine and timber. The various works, that are carried on, and the trade it possesses, render it a place of considerable wealth; but it is not less distinguished by its charitable institutions: there are many schools for the poor, several hospitals and alms-houses, a public dispensary and a large asylum for females.

The ancient inhabitants of Devonshire were the same as those of Cornwall; *Isex*, their principal city, is the *Isca Dumnoniorum* of the Itinerary of Antonine; it afterwards took the name of *Excester*, and at a still later period that of *Exeter*; its different names indicate its position on the Exe. It was erected into the capital of

^a Its ancient name was Sutton (i. e. Southtown;) but as early as 1383, it appears to have been occasionally called Plymouth. (Ed. Enc.)—P.

^b The Eddystone Rocks.

^c There are four principal streets, all centering in the middle of the city, which is therefore called Carfox,* from the old Norman word, Quatre-voix, i. e. the four ways. (Luckombe.)—P.

*"—which meet at a point where a magnificent conduit, called *Carfoix*, formerly stood." (Ed. Enc.)

^d On the north-east.—P

a diocese by Edward the Confessor in the year 1094, but before that time it contained so many convents that it was known by the name of Monkstown. It consists of four principal streets, which terminate in *Carfax* place, so called from two old Norman words, signifying four ways.^c The upper part of the city^d is defended by an ancient castle, which, it is generally supposed, was built by the West Saxons, although it seems more probable from the name of *Rougemont* that it was the work of the Normans. The cathedral, dedicated to St. Peter, is a magnificent building, but the Lady-Chapel is the only part of the original fabric that remains. Although commenced in the year 932, in the reign of Athelstan, and carried on under different bishops during four hundred years, it appears from its uniformity and the proportions between the different parts, as if the whole had been the work of a single architect. The modern bridge over the Exe might be considered a fine structure, if it were not disfigured by houses on both sides, and by a church which covers a great part of it. An arm of the sea flowed formerly near the walls of Exeter, but the navigation was almost destroyed by one of the earls of Devon.^e The present haven was constructed in 1697, and by means of flood gates, which were then raised, vessels of a hundred and fifty tons can arrive at the quay near the walls of the city. The manufactures of Exeter consist of cloths and woollen stuffs; the serge market is held weekly, and with the exception of that at Leeds, it is the greatest cloth market in England.

Dorsetshire, or the county of Dorset, situated on the east of Devonshire, has sometimes been called the garden of England, a name by no means applicable to the whole of it. It is bounded on the north by Wiltshire and Somersetshire, on the south by the English Channel, on the west by Devonshire and Somersetshire, and on the east by Hampshire. The superficial area is supposed to be equal to 1130 square miles. The northern plains were formerly covered with wood; they are now in a high state of cultivation. A ridge of lofty chalk hills, which extends through the south-eastern counties, terminates in Dorsetshire; at least no considerable beds are found on the west of it. Numerous flocks are fed on these hills, and on the downs, which extend to the sea; the number of sheep kept in the county is estimated at 800,000, and the annual export at 150,000. A heathy common extends from the borders of Hampshire to the centre of Dorsetshire, but its want of fertility is amply compensated by the rich vales on the south-western side. A sort of peninsula, formed by the Frome and the sea, has been incorrectly denominated the Isle of Purbeck. It has been long famous for its limestone quarries; the coarser sorts are used in paving, while the finer take a polish little inferior to that of marble. Pipe clay is dug in several parts of Purbeck, and much of it is exported from Corfe-Castle to the Staffordshire potteries.

The island of Portland, another peninsula, is connected with the land by a long and narrow stripe of sand and

^e The magistrates of the town having in their official capacity decided that no citizen of Exeter should be allowed to wear the livery of a nobleman within their township, without having first obtained the consent of the mayor and burgesses, one of the earls of Devonshire,^e offended at this noble spirit of independence in the inhabitants of Exeter, caused large stones and trunks of trees to be thrown into the bed of the Exe, in order to obstruct the navigation between Exeter and Topsham.

* Hugh Courtenay, A. D. 1316.—P.

gravel.^a Some notice has already been taken of the calcareous stones, of which the whole of Portland Isle is composed; it may be added that the stone is white and durable, easily worked, splits freely in every direction, and is well adapted for buildings under water; these qualities render it a very valuable freestone, and great quantities are exported to different parts of England, Ireland and France. A safe road for ships is situated on the north of the isle, but the southern point or Portland Race is one of the most dangerous places in the Channel.

The town of Dorchester, a place of great antiquity, is pleasantly situated on a rising ground above the river Frome. It was in ancient times inhabited by the *Durobrige*,^b who called it *Durnovaria* or the passage of the river. The Romans, who gave it the name of *Durnium*, encompassed it with walls and a deep ditch. Several antiquities have been at different times discovered; a mosaic pavement about four feet below the ground may be considered the most remarkable, but there are also some traces of Roman ways, that terminated in Dorchester. It was formerly a place of some importance on account of its manufactures, which are not so flourishing as they once were. The town is built in the direction of the four cardinal points, the houses are of stone, and the streets are all paved and well lighted. The prison, perhaps the finest of the public buildings, can contain only eighty-eight prisoners, but under the same roof are a penitentiary and a house of correction.

The seaport of Poole, the only other place that requires to be mentioned in this county, rose into importance some centuries ago, when the ancient town of Wareham fell into decay. It now contains more than seven thousand inhabitants; it sends many vessels every year to Newfoundland, which carry out provisions and different commodities, and return laden with fish for Spain, Portugal and Italy.

The maritime county of Somerset is bounded on the north by the Bristol Channel; it is about sixty-eight miles in length from east to west, and forty-eight from north to south. It contains more than a million of acres, of which upwards of 400,000 are arable. Few counties exhibit so great a variety of soil and situation. The north-eastern part abounds with rocks, and is intersected by the Mendip Hills, a lofty mineral tract; the rivers unite near the centre, and form marshes and fens. The Quantock Hills, together with many downs and heaths, occupy the western side, and the bleak and sterile region of Exmoor extends from the north-western extremity. The southern part towards Dorsetshire is high but well cultivated; lastly, vallies of great fertility are scattered in different parts of the county.

Cheese, not inferior to any in the kingdom, is made in the village of Cheddar, and many cattle nearly equal in size to those of Lincolnshire, are bred in the luxuriant meadows near the sources of the Parret. The mineral riches of the county are more important; the Mendip

Hills afford abundance of coal, lead and calamine. The coal is consumed in Bath, Wells, Frome, and other places in the neighbourhood. The lead is mostly exported, and converted on account of its hardness into shot and bullets. The calamine is conveyed to Bristol and other towns, where it is used in making brass.

The conveyance of goods has been facilitated by water communications; the Exe and the Thone are connected by a canal which passes from Tiverton to Taunton; another extends from Bristol to Bath, and the Somersetshire coal canal joins by means of its two branches those of the Kennet and Avon.^c

The small city of Wells, which is now a joint bishop's see with Bath, derives its name from a neighbouring spring, called St. Andrew's Well.^d It took its origin from a collegiate church built by king Ina in the year 704; it was afterwards raised to its present dignity, and the cathedral, one of the most ornamented structures of Gothic architecture in the kingdom, was founded in the thirteenth century. The town is pleasantly situated under the Mendip Hills, but it does not contain more than six thousand inhabitants.

Bath, a more ancient and a more important city, lies on the north-east of Wells, at the distance of about nineteen miles. It is surrounded by an amphitheatre of hills that are intersected by the Avon, which encircles a great part of Bath, and continues navigable onwards to Bristol. The Kennet and Avon canal, which falls into the same river at Bath, completes the inland water communication with the metropolis, extending through Middlesex, Buckinghamshire, Berkshire, Hampshire, Wiltshire, Somersetshire and Gloucestershire, to Bath and Bristol. Bath claims a higher antiquity than any other town in England, and it is remarkable that all the ancient names which have been handed down by tradition, bear some allusion to the quality of its waters. Antiquaries have traced their discovery, with greater ingenuity than truth, to Bladud, son of Lud, eighth king of the Britons, in a direct line from Brute or Brutus, the grandson of Æneas. The springs continued unknown, however, before the arrival of the Romans. The fine situation of Bath, the mildness of the air, the hills which tower above it, and the streams that water the valley, attracted the notice of the Romans, and induced them to found a city, which was often the residence of their governors, and sometimes of their emperors. The city was built in the form of a quadrangle, extending about four hundred yards from east to west, and nearly as many from north to south. It was fortified by a wall twenty feet in height, sixteen in breadth at the base, and not more than eight at the top. The angles were supported by strong towers, and a gate was erected at each extremity of the two principal streets, by which the town was intersected and divided into four parts. The name of *Aqua Solis* indicated the heat and efficacy of the thermal springs, and the magnificence of the Roman works may be traced in the ruins of the baths, which were discovered near the centre of

^a The Chesil Bank.

^b *Durotriges* (D' Anv. Enc. Meth. Ed. Enc.)—This name is said to be derived from the two British words, *duoyr* [*dur*,] water, and *trig*, an inhabitant. (Ed. Enc.)—P.

^c This should be stated thus: the Somersetshire coal canal (with two branches) joins the Kennet and Avon canal.—The Avon is rendered navigable by locks from Bristol to Bath, where the Kennet and Avon canal commences. This canal passes from Bath through North

Wilt to Newbury, where it joins the Kennet navigation, thus opening a communication with the Thames. The Somersetshire coal canal branches from this canal between Bath and Bradford, and extends to the coal-field near the Mendip Hills. It divides into two branches, the northern and southern.—P.

^d The town is so called from the wells or springs that rise in all parts of it. St. Andrew's Well is near the Bishop's palace. (Luckombe.)—P

the city in the year 1775. The virtue of the springs has been acknowledged both for external applications, and internally as a medicine; the highest range of the thermometer reaches to 170° of Fahrenheit. The town has long been a place of great concourse, and such is the reputation of its waters, that it has become of late years, next to the metropolis, the principal resort for the nobility, the wealthy and the indolent. It surpasses every other town in England, in the elegance and splendour of its buildings, but their greatest ornaments consist perhaps in the materials with which they are constructed,—the white stone that abounds in the neighbourhood. In former times Bath was situated in a valley, and the reflection of the sun's rays from the white soil rendered it very hot in summer, but as it became enlarged, houses were built on the steep northern side of the valley, tier rose above tier, and the whole affords at present a singular and striking aspect.^a

The city is divided into four parishes, and in one of them is situated the Abbey Church, the finest edifice in Bath; its architecture is of the florid Gothic, but the great number of its windows has been considered a defect; there are not fewer than fifty-six, and on this account it has been sometimes called the lantern of England. Of its various charitable institutions, the most deserving of notice is the general hospital for patients from every part of the kingdom, who are likely to be benefited by the use of the waters. Other institutions of the same sort, societies of which the end is to provide for the wants of the poor, or to meliorate their condition, prove that charity is not incompatible with gaiety, or even with dissipation.

Although the next town, we have to mention, is not so important as it once was, still it derives its importance from its commerce. The trade of Bristol, long second only to that of London, is now surpassed by other towns, more distinguished for the enterprise and activity of their inhabitants. Bristol stands at the confluence of the Avon and the Frome, at the distance of about ten miles^b from the place where the Avon discharges itself into the Severn. Although only a small portion of it is situated in the northern confines of the county, and although the greater part of it belongs to Gloucestershire, it may be here described, because it was included in Somersetshire before it formed a separate jurisdiction.^c The effects of the tide, or the height to which it raises the waters, enable vessels of considerable burden to arrive at the quay of Bristol; but its trade is mainly supported by its extensive inland communications with the Severn and all its branches, the Avon, the Wye, and many other rivers. It thus possesses the export and import trade of a considerable part of the kingdom, and has thus an outlet for its varied manufactures. As to its foreign trade, it is principally carried on with the West Indies; it furnishes employment to a great many ships, that carry clothing and different articles to the inhabitants, and bring back colonial produce, which gives rise in its turn to different branches of industry. Of these the most important are the sugar-refineries, that serve for the

supply of Wales and all the western counties in England. The other manufactures are different sorts of glass, copper and brass, white-lead, gun-powder and earthen-ware. There are besides works for smelting lead and making shot, iron founderies, tin-works, and also rolling and slitting mills, all of them affording valuable articles for exportation.

Bristol, it may be added, is a place of great antiquity; it appears to have been founded by the Britons; it was the *Brightstowe* or pleasant city of the Saxons. The unfortunate Stephen was imprisoned in the castle of the same city after his defeat by the empress Maud. It owed its prosperity to Edward III., who made it a staple for wool; since his time it has been one of the great commercial cities in England;^d lastly, it was raised to the seat of a diocese in the reign of Henry the Eighth. The Bristol and Matlock mineral waters are of the same quality, their principal ingredients being chalk, *lapis calcareus* and *calaminaris*.^e It is affirmed, on very respectable authority, that a singular phenomenon took place at these wells, in November 1775, during the great earthquake at Lisbon; the water became suddenly as red as blood, and so turbid that it could not be drunk; at the same time the water of a common well near Kingswood, turned as black as ink, and continued unfit for use nearly a fortnight.^f

Before leaving the county of Somerset, it may be remarked that it has given birth to several eminent men. The famous friar Bacon, one of the earliest philosophers, who appears to have been acquainted with the secret of making gun-powder, and who veiled the interpretation of it in an enigma, was born at Ilchester in the year 1214. Cudworth, the well known author of the *Intellectual System*, and the great Locke, were natives of the same county, the one of Aller, and the other of Wrington. Fielding, one of the best of the English novelists, was born at Sharpham, and Bristol was the birth-place of the unfortunate Chatterton. To these names may be added those of Cabot,^g Dampier and Rodney.

The county of Gloucester, partly contiguous on the south to that of Somerset, is naturally divided into three very different districts, the eastern, the middle and the western. The first or the Coteswold district, the largest of the three, is about 200,000 acres in superficial extent. Although a high and bleak tract, it is well adapted for rearing sheep; a fine short grass is produced in many places, and sainfoin, which has been much cultivated, is used both for hay and pasture. The native sheep were of a small light sort with a very fine but scanty fleece; the breed has been greatly altered by mixtures from other counties; the carcass is heavier, and a greater quantity of wool, but of a coarser quality, is now obtained. The Stroudwater Hills, adjacent to the Coteswold, sink gradually into the Vale or middle district, which borders on the Severn. The soil is mostly of a fertile loam, and the pastures furnish the cheese for which the county is celebrated, and of which 12,000 tons are annually exported. The same district is crossed by the Stroud

canal, which connects the Thames with the Severn, and opens a direct communication with every part of the kingdom. The forest of Dean, which once afforded timber for the English navy, occupies the greater part of the western or smallest district. The same forest and that of Kingswood are now mostly cleared of trees; the land is restored to cultivation, and both of them contain iron, coal and limestone; in the latter, different iron-works have been erected; in both, a hundred and fifty coal mines have been opened,^a and their produce is consumed in the neighbouring country and manufactories. The same part of Gloucestershire abounds with orchards; the styre-apple is converted into cider, and the perry made in the district, is said to form the basis of most of the champagne that is sold in the metropolis.

Gloucestershire was inhabited in ancient times by the *Dobuni*, who distinguished themselves by their resistance against the Romans; even at the present day it affords ample materials for antiquarian research. The antiquities of Woodchester have already been ably illustrated by Mr. Lysons. Camps, stations and other remains of Roman times may be traced in different parts of the county.

Gloucester, the capital of the county, and a very ancient town, was the *Caer-Clovi* of the Britons;^b at a later period the Saxons gave it the name of *Gleaucestre*, from two British words, *glaw*, fair, and *caer*, a city. It was made a borough by King John, and a corporation^c by Henry III. Edward I. held a parliament in the same place, and several useful laws were enacted, that have been since called the Statutes of Gloucester. Richard the Third, the famous duke of Gloucester, gave the city his sword and cap of maintenance, and erected it into a county with jurisdiction over the adjacent hundreds of Dudston and King's Barton. These privileges continued in force until the restoration, when the walls were razed to the ground, because the inhabitants had shut their gates against Charles the First.^d Before the memorable siege it sustained in 1643, it contained eleven churches, but at that period six of them were demolished; they have not since been rebuilt. The remains of abbeys and monasteries are scattered over the neighbourhood; they were at one time so numerous as to give rise to the monkish proverb, *As sure as God's in Gloucester.*^e

The abbey church was erected into a cathedral by Henry the Eighth; it has been often repaired, and partly rebuilt, so that it combines the architecture of different ages. It is more than 420 feet in length, and 144 in width. A majestic tower, 198 feet in height, rises from the centre of the building: The interior has a solemn and imposing aspect, and the cloisters are not inferior to any in the English cathedrals. Among the various monuments contained in it, the most remarkable are those of Robert, Duke of Normandy, and the unfortunate Edward the Second; the former is of wood, and the latter of alabaster; from its perfect execution, it is supposed to have been the work of an Italian artist.

Although ill-peopled in proportion to its size, Gloucester possesses many natural and artificial advantages

for commerce; it is situated about thirty miles from the junction of the Severn with the Bristol Channel; it is connected with the great system of canal navigation in the north, and it is united by means of the Stroudwater canal^f with the eastern counties. The principal manufactures are those of hemp and cordage, wool-stapling and pin-making; the last of these is not the least important; it has been estimated that pins to the amount of £20,000 are sometimes sent in the course of a week to London; thus the value of this single branch of industry may be easily computed.

Cheltenham and Clifton in the same county have become flourishing places from the great number of strangers that repair to their mineral springs, which belong to the saline and chalybeate class, of the same sort and by no means superior to those of Gloucester.

The small market town of Stroud, about ten miles to the south-east of Gloucester, may be mentioned on account of the industry of its inhabitants. It is situated on the ridge of a declivity near the confluence of the Frome and the Sladewater, and it has long been considered the centre of the cloth manufactory in the county. Of the 8000 individuals that form its population, the greater number are engaged in trade, particularly in making cloth. The water is celebrated for imparting a scarlet dye and other grain colours; for this reason perhaps, cloth manufactories have been extended upwards of twenty miles along the river, and many fulling mills have been erected on its banks. Cirencester, the *Corinium* of Ptolemy, and the *Durocornovium* of Antoninus, once a place of great importance, and still famous for its antiquities, is now little better than a village; its inhabitants find employment in making edge-tools, in stapling wool, and in manufacturing carpets.

The small town of Berkeley was the birth-place of the celebrated Jenner, but no monument has been erected to announce the honour which it claims, or to record his invaluable discovery. The castle in the neighbourhood of the town, the residence of the Berkeley family, has been the scene of various events in early history, the most memorable of which was the murder of Edward II. in 1327.

The inland county of Wilts is contiguous on the north and north-west to Gloucestershire, on the west to Somersetshire, on the south to Dorsetshire, on the south-east to Hampshire, and on the north-east to Berkshire. It may be readily inferred from what has been already mentioned, that its boundaries are almost wholly artificial; in figure it bears some resemblance to an ellipsis of which the longer axis is from north to south.

The face of the country, and the quality of the soil, are very different in the two great divisions of Wiltshire. The soil of South Wilts exhibits a certain degree of uniformity; the hills are composed of chalk; silex,^g the usual accompaniment of that substance, appears in most places. The sides of the hills from which it has been washed, consist of a chalky loam; flints abound in the lower parts, and the centre of the vallies through which the rivulets run, is covered with a stratum of broken

^a There are 150 coal pits in the forest of Dean. (M. B. Ed. Enc.)—P.

^g Flint.—P.

flints, and black earth deposited from the neighbouring hills. The declivities which have been most washed, are barren and unfruitful; the more level places, and the vallies which have been least exposed to the rapid streams, are the most productive in the district. The Wiltshire downs are situated in the same part of the county; they may be divided into the Marlborough downs and Salisbury plain, the last of which is equal in superficial extent to more than 500,000 acres. Vast flocks of sheep, accompanied by solitary shepherds, wander over this immense plain, in some respects the most remarkable in England. The soil in North Wilts is less uniform; the under stratum in a large portion of it is formed by a loose and irregular mass of flat broken stones, which the country people call corn-grate,^a and which extends without interruption through the north-western part of Wiltshire. It is covered with an upper stratum of red calcareous loam, known by the name of stone-brash, from the loose stones with which it is mixed. A vein of excellent gravel, covered with rich loam, runs in a broken line from Tytherton through Christian-Malford to Somerton; the richest part of it is situated in the neighbourhood of Dantsey. A hard rock of bastard-limestone, on which the soil is by no means fruitful, extends with little interruption through the remainder of the county. Bradon forest, however, forms an exception; a cold iron clay rises to the surface, and of so poor a quality, that the term Bradon land has become proverbial in the county for a barren and ungrateful soil.^b Wiltshire is watered by the Thames, the Upper and Lower Avon, and several other rivers. The Deverill, like the Mole in Surrey, loses itself more than a mile, and appears again in the neighbourhood of Warminster.

Salisbury, the see of a bishop, and the capital of the county, is situated on the Upper Avon, by which and its tributary streams it is nearly surrounded. The cathedral, a fine specimen of the ecclesiastical architecture of the thirteenth century, is a very uniform and regular edifice; its spire, reckoned at more than four hundred feet, is higher than that of any other English cathedral. The small town of Amesbury^c may be mentioned as the birth-place of the great Addison, and also on account of its vicinity to Stonehenge, from which it is not more than two miles distant. It is perhaps impossible to determine the origin of this stupendous structure, but it is most probably the remains of a druidical temple. Seventeen huge stones, still erect, and seven others lying on the ground, form the outer circle of the fabric. The inner circle, about eight feet from the outer, consists of nineteen stones, eight of which have fallen. The circumference between the two circles is about three hundred feet; the stones are from eighteen to twenty feet high, from six to seven broad, and about three in thickness. The whole appears to have been encompassed with a trench, in which the remains of three entrances may still be traced. Around it are many tumuli, and in some of

them human skeletons, urns, armour and weapons have been discovered. Independently of the purposes for which they were erected, it is difficult to imagine the means by which the early inhabitants, ignorant of machinery and the mechanical powers, could have transported such masses to a solitary plain. A Roman camp at no great distance from it, is defended on both sides by the Avon.

Wiltshire possesses an undue proportion of parliamentary boroughs; from these and from the county not fewer than thirty-four members are returned. The towns are more important for their industry than the number of their inhabitants. Wilton is famous for its carpets; Salisbury for its cutlery and woollen stuffs. The inhabitants of Devizes, Bradford, Trowbridge, Warminster, Westbury, and all the adjacent towns from Chippenham to Heytesbury, are occupied in woollen manufactories, principally of fine cloths. There are indeed few villages in which some branch of industry is not carried on. The same county participates in the advantages of inland navigation; the canals, by which it is intersected, are those of the Thames and Severn, the Kennet and Avon, the Wiltshire and Berkshire, the Salisbury and Southampton.^d

Hampshire or Hants, called also the county of Southampton, was in ancient times inhabited by the *Regni* and the *Belgæ*, by the last of whom, it is supposed, the city of Winchester was founded. The county is bounded on the north by Berkshire, on the east by Surrey and Sussex, on the south by the English Channel, and on the west by Dorsetshire and Wiltshire. It might be compared to a square, were it not for a triangular projection at the south-western extremity. Exclusively of this portion, it is about forty-two miles in length, and thirty-eight in breadth. Hampshire is distinguished as an agricultural, although its sea-coast renders it also an important maritime and commercial county. There are several different kinds of soil, but chalk forms the principal ingredient of the greater part; extensive and fertile marshy lands reach to the neighbourhood of the sea. The borders of Dorsetshire are covered with sterile heaths, but abundant crops are raised on those of Berkshire. The products of the county are excellent wheat, barley and the ordinary leguminous plants; hops, which have been much cultivated of late years, may also be reckoned among its staple commodities.

The forests in Hampshire, although formerly more extensive than at present, are too remarkable to be passed over in silence; the principal are the forest of Alice-Holt and Wolmer, that of East-Bere,^e and the New Forest. The first, situated in the eastern part of the county, is bounded by the river Wye;^f the second lies in the neighbourhood of Portsdown, and is not less in superficial extent than 16,000 acres; the last or the largest received the name of the New Forest, because it was added to the others by William the Conqueror,

^a The Cornbrash (one of the upper members of the lower division of the Oolites,) a loose rubbly limestone, of a grey or bluish colour. In Wiltshire it is known by the name of the cornbrash or corn-grit. (Conybeare and Phillips, p. 202.)—P.

^b Davis' Agricultural Report of Wiltshire.

^c Amesbury, or Ambresbury.—P.

^d The Thames and Severn canal (already mentioned) crosses the northern extremity of the county by Cricklade. The Kennet and Avon canal (already mentioned) crosses the middle of the county by Devizes. The Wiltshire and Berkshire canal leaves the Kennet and

Avon canal at Semington, and passes north-east, at the foot of the chalk hills, to the Thames at Abingdon. It is connected with the Thames and Severn canal, by a branch to Cricklade. The Salisbury and Southampton canal connects those two towns.—P.

^e The forest of Alice-Holt and Wolmer is separated into two portions by intervening private property. It is situated on the borders of Surrey and Sussex. That of Bere extends northward from the Portsdown hills, near Portsmouth.—P.

^f The Wey, a branch of the Thames flowing by Guildford in Surrey.—P.

whose injustice in dispossessing the inhabitants of their lands and houses, was supposed to have been avenged by the casual deaths of his sons Richard and William Rufus, and his grandson Henry, within its precincts. It stretches from Godshill to the sea, and the space which it occupies is equal to more than 92,000 acres. The forest was principally valuable on account of the timber with which it supplied the navy, but of late years, the trees fit for that purpose, have decreased in number.

The Isle of Wight, situated at the eastern entrance of Stadland Bay,^a has long been considered one of the most delightful residences in Britain; it is twenty-two miles in length, by twelve and a half in breadth; it contained in 1820, 31,166 inhabitants. The climate is very mild, the land rich and fruitful, and some of the sites, remarkable for their beauty; on that account it has been much frequented during the fine season. The mineral products of the island are numerous; chalk is used as a manure, while limestone, fullers-earth and two kinds of ochre are exported. It has four sides which are nearly rectangular; the two northern front England, and the two others the open sea. It forms a natural shelter to the flourishing ports and excellent roads from which Hampshire derives so much importance.

Southampton Water, a large and deep haven in which the largest vessels may sail, lies opposite the projecting angle formed by the two northern sides of the Isle of Wight. It receives the waters of several rivers, among others, the Anton, the Itchin and the Test. Southampton is built on its shore at the confluence of the Test and Itchin; it was formerly considered the chief town in Hampshire, which is still called the county of Southampton; it contains at present 13,353 inhabitants, and reckons about 187 ships, measuring more than 10,000 tons. It was on the shore near Southampton, that king Canute gave his flatterers a memorable reproof, by showing that all his power yielded to the immutable laws of nature; it was at the same place that Henry the Fifth collected his forces for the conquest of France. The present inhabitants carry on a considerable trade in timber, hemp and tallow with the north of Russia; in wine and fruit with Portugal; and in iron, lead, coal and glass with Wales, Newcastle, and different parts of England. The ship owners send a number of vessels every year to the Newfoundland fisheries, and a regular communication is established between Cherbourg and Southampton, by means of packets.

But Portsmouth is by far the most important maritime town in the county, nay in some respects, in the kingdom. Situated on the western side of the island of Portsea, at the mouth of the bay termed Portsmouth harbour, it consists of the old town of Portsmouth, surrounded with walls and fortifications, and the new town of Portsea, which was only begun about a century ago. As it was found impracticable to enlarge Portsmouth on account of the walls by which it is enclosed, it has become in consequence less populous than Portsea; they may be said, however, to form a single town. The harbour is superior in size, depth and security to any other in the kingdom; it is not much broader at its entrance than the

Thames at London, but it gradually expands into a great width, and into several channels, which may afford a safe shelter and anchorage to almost the whole British navy. The spacious roadstead of Spithead, between Portsmouth and the Isle of Wight, where a thousand ships of the line may ride in security, forms a great addition to its harbour. The natural advantages of its position have rendered Portsmouth, the great naval arsenal of England, and the principal station of the British fleet. The same place has been rendered impregnable by works of art, which were begun at a very early period, continued at distant intervals, and not completed before the reign of George the Third. It is the seat of a naval college and a school of naval architecture, of which the governor is the first lord of the admiralty. The dock-yards are the most complete in the world; within them are contained all kinds of naval and military stores, and all the necessary manufactories for the supply of naval equipments. Some of these works or manufactories may be mentioned. The ropery is a spacious building, three stories high, fifty-four feet broad, and a hundred and ninety-four long; the strongest cables are made there, and the labour has been much simplified by the use of machinery. The rigging-house and sail-loft are fine structures; the former occupying nearly six hundred feet in length, and sixty in width; the two latter 400 feet.^b The two hemp-houses and the two sea-store houses form a line of building 800 feet long. The tarring house and the other appendages of the ropery are on the same scale. The anchor-forge, a vast building in which anchors weighing a hundred cwt. are wrought, may remind a stranger of the fables concerning the work-shop of Vulcan; on approaching it, the ear is stunned with a tremendous noise; it is impossible to examine it minutely without admiring the various substitutes, which ingenuity has devised for the abridgment of labour. Contiguous to the forge are an iron-mill, a copper-mill, and a refinery, in which the old copper is remelted and rolled, and where cast-bolts, gudgeons and other articles of the same metal are made. The wood-mills front the northern dock; the machinery is moved by steam, and that for making blocks,^c is perhaps as curious and worthy of attention as any in Portsmouth. The gun-wharf is an immense depot for guns, carronades and mortars, with shot and shells of every weight and size. The victualling-office, situated in the Portsmouth division of the town, comprehends several extensive ranges of building, among others a large store-house that occupies the whole length of a street, and serves as a repository of the provisions and liquors that are used in the navy. The grain for the consumption of the mariners and the troops is ground at the king's mill on the Portsea side; it is turned by a stream of salt water, admitted from the harbour at full tide, and let off at low water. Such are some of the public works at Portsmouth, and from them a stranger may derive some notion of the resources of a great nation. It may be added that during the last war more than four thousand workmen were constantly employed in the dock-yards.

Fareham, at the head of Portsmouth harbour, has become a place of consequence from its connexion with

^a I do not find any notice of Stadland Bay, on this part of the English coast. Studland Bay is on the east coast of the Isle of Purbeck, between Handfast Point on the south, and the entrance of Poole Harbour on the north. A large bay is, however, formed by the projection of the Isle of Wight on the east, and the Isle of Purbeck on the west. In the north-west part of it, Studland Bay is situated.—P.

^b The range of storehouses on the north-east is about 600 feet long, and the sail-loft and rigging-loft are also huge buildings, both 400 feet long. (Ed. Enc.)—P.

^c Invented by M. Brunel, engineer of the Thames tunnel.—P.

the town. Sloops and smaller vessels are built in it, and the inhabitants carry on a considerable trade in corn and coals. Gosport at the mouth of the same harbour,^a is a populous town, inhabited chiefly by sailors and artificers. It contains a large naval hospital,^b extensive barracks, docks and wharfs for merchant vessels. The produce of the neighbouring country supplies in part the demand created by the government establishments in these places and in Portsmouth.

The ancient city of Winchester is the only other place in Hampshire, that requires to be mentioned. It was the capital of the whole country during the reign of the Saxon king Egbert; it became at a later period the great emporium of the wool trade, but it is long since its commerce has fallen into decay. It declined after the dissolution of its monastery by Henry the Eighth, and it suffered greatly in the course of the civil wars. It stands on the eastern declivity of a hill above the river Itchin; it seems to have derived its original name of *Caer Guent* or the *White City*, from the chalky cliffs which surround it. Although the streets are spacious and well aired, Winchester has the appearance of an ancient city. The cathedral is as remarkable for the antiquity of its foundation, as for the splendor of its architecture. It occupies probably the site of a building raised by the zeal and piety of the Saxons. It was much altered and improved in succeeding ages, and Bishop Fox rebuilt it according to its present form in the sixteenth century. The length of the building is 545 feet; and among the distinguished prelates of Winchester, may be mentioned William of Wykeham, William of Wainfleet, Fox and cardinal Beaufort, whose shrines are works of great magnificence and beauty.

The college of Winchester, founded by William of Wykeham, has now become one of the great public schools in England. The building is divided by two courts; the entrance to one of them is under a large gate-way, adorned with busts of the founder and Edward the Third; the other is admired for its niches and pinnacled canopies: the chapel and hall, which form the south wing, are supported by massive buttresses. The college is founded for a warden, ten fellows, seventy scholars, three chaplains, and six choristers, with masters and subordinate officers. A building has been erected on the west of it for students not on the foundation. Although our limits prevent us from mentioning the other public buildings in Winchester, it may be remarked that the chapel of the ancient castle contains what is denominated Arthur's Round Table, one of the few memorials, whether counterfeit or real, that still remain in England of chivalrous times.

The Isle of Wight, it has already been observed, is under the civil jurisdiction of Hampshire; it is divided into two nearly equal parts by the river Medina, which rises in the southern angle, and discharges itself at the northern extremity of the island; hence the divisions of East and West Medina. The southern coast is edged with steep cliffs of chalk and limestone, hollowed out in many places into caverns. In the neighbourhood of St. Lawrence, a large tract has fallen from the summit, and formed the romantic ledge, known by the name of the Undercliff. The western side is fenced with ridges of rocks,

of which the most remarkable are those that from their sharp extremities, have been called the Needles. The safe roadstead of St. Helens is situated off the eastern side of the island.

Newport, the principal town, is a place of considerable population. The work-people are employed in the manufacture of starch and hair-powder, and also in making biscuit for the navy. Carisbrook castle, at a short distance from Newport, was in former times an important fortress; it has now become the residence of the governor of the island. It was rendered memorable as the place where Charles the First was confined more than a year, while a prisoner of the parliament. The former importance of the borough of Yarmouth, now little better than a fishing village, is attested by its privilege of returning two members to parliament.

The county of Sussex forms a long stripe of land on the southern coast; it is bounded on the north by Surrey and Kent, on the south by the English Channel, which together with Kent, forms also its narrow eastern boundary, and on the west by Hampshire. It measures more than seventy miles from east to west, while its mean breadth is less than twenty; it is equal in superficial extent to 1461 square miles. It is divided into six rapes, a division peculiar to Sussex; the western are Chichester, Arundel and Bramber; the eastern are Lewes, Pevensey and Hastings; these are again subdivided into sixty-five hundreds.

The soil varies between chalk, clay, loam, sand and gravel, according as each of these substances predominates. The northern and middle portions are of the same nature, and may be said to form a continuation of the Wealds in Kent; they were formerly wholly covered with forests, and although many of them have been destroyed, the country still abounds with lofty trees; indeed the oaks of Sussex are said to be better and more numerous than those of most counties; they succeed best in the stiff clay on the Wealds; the chalk-hills are equally noted for their beech trees.

A ridge of hills, extending in a north-westerly direction, is composed of gritstone, limestone and iron-ore. A rich tract of arable and meadow land forms a narrow belt below the middle of the county; beyond it are the downs, a range of green open hills, affording excellent pasture to sheep. It is in this tract, between Lewes and the sea, that the South Down sheep are reared. Different parts of Sussex are equally famous for their cattle, and in no other county are so many oxen used in agriculture. There were at one time many iron works in the same county, and much charcoal was used in smelting the ore; in this way the woods were gradually diminished. The same branch of industry is now abandoned; the works, from the comparatively late improvements in smelting the metal with pit coal, are now confined to the counties, which abound both in the cheaper fuel and in iron-ore. The products of Sussex are hops, corn, wool, cattle, timber, marl and limestone.

The principal rivers are the Adur, the Arun and the Ouse, the latter a name common to other streams in England. They rise in the northern part of the county, and after dividing the chalk hills into four or five different portions, discharge themselves into the Channel; the first

^a On the west side, opposite Portsmouth.—P.

^b The Royal Hospital at Hasler, for sick and wounded seamen.—P

at Newhaven, the second near Shoreham, and the third at Little Hampton.^a Although by no means large, they have been of the greatest utility in affording connecting points to the different canals which have been undertaken or are already completed.

There are few populous towns in Sussex, and the most important are situated at a short distance from the sea. Chichester, the capital, is the seat of a diocese, which was transferred to it from Selsey in the reign of William the Conqueror. The cathedral having been destroyed by fire, a second was built in the twelfth century, which has been at different times enlarged and repaired. It is an elegant Gothic edifice, in the form of a cross, with a spire nearly three hundred feet in height. The town consists principally of four broad and well paved streets, that intersect each other at right angles; it claims some degree of antiquity, for it is said to have been founded by Cissa, the second king of the South Saxons. Traces of an earlier period may be observed in the neighbourhood. A Roman pavement was discovered in Chichester in 1727, and the Brell,^b near the city, is the site of a Roman camp, supposed to have been raised by Vespasian, and which from the nature of the soil must have been a work of considerable difficulty. The finely situated town of Arundel, on the Arun, was formerly ranked with the strong places in England; it possesses a harbour, where many small vessels are loaded with timber for the dock-yards. Horsham, on a branch of the same river, near the Surrey border, derives its name from Horsa, the brother of Hengist, by whom it is said to have been founded. It is now a populous borough, in which the spring assizes are held; it is also the seat of the county jail, a modern and commodious building. Extensive barracks, and a large magazine of arms, are situated in the neighbourhood. Lewes, on the river Ouse, one of the few populous places in the county, has become important from the industry of its inhabitants, from its cannon founderies, and from its corn and paper mills. It was the scene of a destructive battle between Henry the Third and the barons, in which the former was defeated and taken prisoner.

Although Hastings is still the first in rank of the Cinque Ports, it has fallen into decay; it now possesses a wretched harbour, and the only method by which ships can be secured from the waves, is by drawing them on the beach. It may also be mentioned on account of its connexion with a remarkable event in English history. William the Conqueror is supposed to have landed with his fleet near Pevensey, and, after burning his ships, to have assembled his army at Hastings, whence he marched to battle in an adjacent plain. Harold lost his crown and his life, while fifteen thousand of the victors, and many more of the vanquished, were slain.

It is not many years since Brightelmstone or Brighton was inhabited by fishermen; it has now become a populous town, and a place of fashionable resort in the summer season. The preference given to it for sea-bathing was derived from its vicinity to the metropolis, and from its healthful situation; but the principal cause of the great extension of Brighton, must be attributed to the

choice made of it as a summer residence by George the Fourth, when prince regent, in consequence of which a marine pavilion was built at a vast expense. In conformity to an act passed in 1821, a long and convenient chain suspension-pier for the improvement of the harbour was erected. Brighton is much benefited by the numerous travellers to France, embarking there on board the steam-packets to Dieppe, and proceeding onwards through Rouen to Paris, the distance by land being much shorter than by the route through Calais. It was at Brighton that Charles the Second embarked for France, after the battle of Worcester in 1651.

Two individuals, who have shed a lustre on English literature, were natives of Sussex. Collins was born in Chichester about the year 1720. The great and unfortunate Otway, without a rival in the pathetic, was born at Tooting^c in 1651; he died of want in 1685.

Kent, the next county we shall mention, is about sixty-three miles long, and nearly forty broad. The whole area is about 1537 square miles, or 983,680 acres; of these, about 500,000 are arable, and 300,000 pasture lands; the remainder consists of hop grounds, woods and marshes. The soil is different in different parts of the county. The land in the immediate vicinity of the Thames is low and marshy; but chalky heights rise at no great distance from its banks. A hard and unfruitful soil extends to the north-eastern extremity, and thence round to Dover, forming the lofty white cliffs which bound the island, and exhibiting from the sea that striking appearance, from which the ancient name of Albion was derived. The southern part of Kent, or the Weald, is a flat woody tract, of a clayey soil, fruitful, but unwholesome on account of its great moisture. The midland and western districts are intersected by hills and dales, arable and pasture lands, equal in fertility to any part of England.

Kent is almost entirely an agricultural county; it abounds in corn; its other products are large oxen, pigs, hops, fruit, particularly cherries, apples and filberts, with which the London market is supplied, woad and madder for dyeing, samphire, hemp, and oak timber. The manufactures are of secondary importance. Dartford and Feversham, however, are famed for their powder-mills; Maidstone and Dover, for their paper-mills. One of the largest flour-mills in the kingdom is to be seen in Canterbury, and there are also in the same place, silk, cotton and worsted manufactories. The art of bleaching and printing calicoes furnishes employment to many in the neighbourhood of Crayford. Iron furnaces, copperas and salt works, have been erected in different parts of the Wealds;^d lastly, a great quantity of coarse cloth for packing hops, is made in several parts of the county.

The sea-coast, the Downs, the dangerous Goodwin Sands, and other places, illustrative of the physical geography of Kent, have been already mentioned, but no notice has been taken of some of the remarkable towns in the county, and of these the number is sufficiently great. Dover, at no great distance from the South Foreland, is nearer the continent than any other of the British ports, the breadth of the Channel between it and Calais being only seven leagues; it is on that account much frequented

^a The Adur enters the Channel a little below New Shoreham; the Arun, at Little Hampton; and the Ouse, at Newhaven.—P.

^b Brile (Camden.) Brill (Luckombe).—P.

^c Trotting (Trotton,) a village near Petworth. Tooting is in Surrey, near London.—P.

^d There are salt-works near Sandwich and in the Isle of Grain [consequently on the coast;] large copperas works at Whitstable [on the coast, north of Canterbury] and Deptford [on the Thames, near London;] and in that part of the Weald which borders on Sussex, there are furnaces for casting iron. (Ed. Enc. art. Kent).—P.

by the travellers who visit France; for their accommodation not fewer than thirty regular packets have been established, and many of them are steam vessels. The town appears to have been a place of some consequence in the earliest times; it was the *Dour* of the Britons,^a the *Dubris* of the Romans,^b and the *Dovre* of the Saxons.^c It is mentioned in history as a place of the greatest importance at so early a period as the Norman conquest; in a later age it was often called the *Clavis et Repagulum totius Regni*.^d The ancient castle is by some supposed to have been built by Julius Cæsar, while others believe that it was founded by Claudius. It was long deemed impregnable, but in the reign of Charles the First, Drake, a zealous republican, formed a plan to seize the garrison. Accompanied at midnight by ten or twelve men, they reached by means of ropes and scaling ladders, the top of the high cliff without being discovered. Having despatched the sentinel, they threw open the gates, and the garrison, who were in the utmost confusion, supposing themselves to be attacked by superior numbers, surrendered this important castle to a handful of desperate men. The recent improvements connected with the fortress are the subterranean works and casements, capable of containing 2000 men. The town consists of two parts, the upper of which is called the Town, and the other the Pier; they are connected by Snaresgate, a long and narrow street, so named from the lofty rocks that overhang it, and menace the inhabitants with destruction.

A remarkable pile of dry bones, twenty-eight feet in length, six in breadth, and eight in height, is to be seen at some leagues westward of Dover, in a vault under the church of Hythe. According to an inscription, they appear to be the remains of Danes and Britons, who were slain in battle near the place, before the invasion of William the Conqueror. The principal canal in the county is a military work constructed along Romney marsh, in the neighbourhood of Hythe.^e It is thirty-two yards in width and six in depth, with a raised bank or breastwork to defend the soldiers. Although Hythe has fallen into decay by the filling up of its harbour, it retains the privilege of sending two representatives to parliament. The same may be said of Romney; its harbour is destroyed, but in its corporation, consisting of twenty-one persons, is vested the right of returning two members.

The ancient town of Sandwich was once a flourishing port, but from the influx of sand, the harbour is only accessible to small coasting vessels. After its prosperity was destroyed, many refugees from the Low-Countries repaired to it; they established manufactories of baize and other cloths in the town. Among these emigrants were some gardeners, who finding the neighbouring land well adapted for the cultivation of vegetables, applied their skill to that purpose, and succeeded so well that the vicinity is still distinguished for the production of garden seeds, which with several other products are exported from Sandwich.

The seaport of Deal, between the North and South

^a Derived by William Lambard from *Dicfyrrha*, a British word signifying a steep place. (Camden's Britannia. p. 247.)—P.

^c Called by the Saxons, *Dorfa* and *Dofris* [*Dofra*, Camden,] and in Domesday Book, *Docere*. (Rees' Cyc.)—P.

^d The key and bar of the whole kingdom.

Forelands, contains about 7000 inhabitants. It is supposed to have been the *Dola* of the ancients, where Julius Cæsar landed on his first invasion of Britain. It has no harbour, but the Downs, or that part of the sea between the shore and the Godwin Sands, about eight miles in length, and varying in depth from eight to twelve fathoms, afford generally a secure station for vessels. Homeward and outward bound ships of war anchor there to put in letters, set passengers on shore, take in provisions, or wait for orders. The coast is defended by batteries and martello towers, constructed during the late war, on eminences which command every access to the shore. The town is not included among the Cinque Ports; it is supposed, however, to depend on Sandwich; the streets in the upper part are spacious and well built, while the lower are narrow, irregular and dirty. The most important institutions are a naval hospital and a house of industry. It was at Deal that Perkin Warbeck, the famous impostor, landed when he personated the Duke of York. The vicinity of the Godwin Sands renders the frequent service of pilots indispensable, and those of Deal are distinguished for their boldness and activity, qualities which they have acquired by often assisting vessels in distress.

Of the inland towns in Kent, the first in importance is the ancient city of Canterbury, the capital of the county, and the metropolitan see of all England; it was the *Caer-Kent* of the Britons, and the *Durovernum* of the Romans. It is situated in a pleasant valley, between hills of moderate height, watered by numerous springs, and by the Stour, which divides itself into several small streams, and forms different islands, on one of which the western part of the town has been built. Pope Gregory sent a number of Benedictine Monks with Augustine at their head to Ethelbert, king of Kent, for the purpose of converting the king and his people to Christianity. The conversion of Ethelbert took place in the year 597; it was followed by the installation of Augustine as bishop of the see of Canterbury; since that time it has been in possession of the primacy. The strong military causeways leading from Canterbury to Dover and Lymne,^f as well as many Roman relics and coins which have been discovered in the neighbourhood, attest its importance at an earlier period. The whole city was made over to the bishops by William Rufus, but its reputation for sanctity was greatly increased by the murder of Thomas-a-Becket in 1170. The offerings of kings, nobles and other pilgrims at the shrine of the martyr were so numerous, that the whole church and the chapel in which his remains were interred, glittered with jewels. Henry the Eighth seized all these treasures, and by his orders the bones of the saint were burnt to ashes. The present cathedral was commenced about the year 1174, but was not completed until the reign of Henry the Fifth. Kings and princes, among whom are Henry the Fourth and the Black Prince, and also cardinals and bishops, are interred in it. It was much injured during the civil wars, and Cromwell converted

^e It extends from Sandgate, nearly in a straight direction, along the coast, till it passes Hythe, when it follows the course of the hills which skirt the marshes [Romney Marsh,] and terminates at Cliffend in Sussex, a distance of about 23 miles. (Ed. Enc.)—P.

^f Lymme, Linme (Luckombe)—the *Portus Lemanis* of Antoninus; on the coast between Hythe and Romney. The Roman road, called Stane Street, leads from it to Canterbury.—P.

it into a stable for his dragoons; it was imperfectly repaired after the Restoration. Built in the form of a double cross, it is about 514 feet in length within the walls, and 178 in breadth; the height of the vaulted roof is equal to 80, and that of the great tower to 235 feet.

The diocese of Canterbury contains 257 parishes, besides chapels in Kent, and about a hundred more in other dioceses; the last are called peculiars from an ancient privilege of the see, by which wheresoever the archbishop had manors or advowsons, the parishes were exempted from the jurisdiction of the ordinary of the diocese, and transferred to that of Canterbury. The archbishop is primate and metropolitan of all England; he is the first peer of the realm, taking precedence of all the great officers of state, and of all dukes not of the blood-royal. At coronations, he places the crown on the king's head, and wherever the court may be, the king and queen are his parishioners. The bishop of London is his provincial dean, the bishop of Winchester his subdean, the bishop of Lincoln his chancellor, and the bishop of Rochester his chaplain.^a

The city of Canterbury is of an oval shape, and the four principal streets are built in the form of a cross. It is divided into six wards, which are subdivided into 21 streets, 56 lanes and 62 alleys.

The Thames bounds the county on the north; the next river in point of size is the Medway; it throws itself into the former near its mouth, between the isles of Grain and Sheppey, at some leagues below Rochester, a town in which the most remarkable structures are a cathedral and a stone bridge 560 feet in length. A long row of buildings on a gentle eminence, called the Bank, unites the town of Rochester with that of Chatham. The last place is well known for its naval arsenal, the large buildings connected with it, and its docks defended by strong and extensive fortifications. The dock-yard is one of the largest in England, and some of the largest ships in the navy have been built in it. The Ordnance Wharf, in which all kinds of naval stores are deposited, is adjacent to these works, and in order that they might be better secured, the Lines, a series of fortifications, were erected according to act of parliament in the year 1758. It was to guard against the danger of an invasion that these fortifications were raised, and if they had been built in the time of De Ruyter, he might have found it impracticable either to destroy the arsenal, or to burn the ships. Although the present town may be said to have been founded by Charles the Second, it is not remarkable for regularity.

On the banks of the Thames, at the distance of eight miles to the east of London, is situated the town of Woolwich. Henry the Eighth rendered it an important place by building a royal dock, that has been gradually enlarged, and is now provided with every convenience for building men-of-war, of which it has sent out many first-rates. But Woolwich is still better known as a royal arsenal, and as the principal depository of naval and military ordnance; it contains also an excellent foundery for cannon, and a laboratory for cartridges and all sorts of fire-works. It was selected on that account as a fit place for an academy, or place of education for young men destined to the service of the artillery and

engineers. From these buildings, and also from extensive artillery barracks, the town has somewhat the appearance of a large fortress.

Greenwich on the banks of the Thames, and at no great distance from the last town, has several claims to celebrity. It was a royal residence at an early period; a palace was built, and a park enclosed by Humphrey, duke of Gloucester, and it became afterwards a favourite residence of several sovereigns. It was at Greenwich that Henry the Eighth and his daughters, Mary and Elizabeth, were born. As the palace was in a ruinous state at the time of the Restoration, Charles the Second caused it to be taken down, with the intention of erecting another and more magnificent edifice on its site. One wing of the building was finished in his time, and there the king used occasionally to reside. In the reign of William the Third a design was formed of founding an hospital for aged and disabled seamen; on the recommendation of Sir Christopher Wren, the unfinished palace was enlarged and fitted for the purpose. Such is the origin of Greenwich hospital, one of the finest buildings in England, and sufficiently spacious to contain a thousand pensioners, nurses and boys. The park, intended as an appendage to the palace, was laid out by Le Notre in the reign of Charles the Second, and Greenwich observatory is built on one of its most commanding stations, the site of an old tower erected by Duke Humphrey. The eminent men who have filled the office of astronomer royal, have conferred on it a high degree of celebrity, and Greenwich is still the first meridian on the English charts.

It is necessary to omit several places of secondary importance in the county of Kent. It may be remarked, however, that the naval works at Deptford occupy an extent of 32 acres. The town is watered by the small river Ravensworth,^b near its junction with the Thames; the works consist of two wet docks, the one single, the other double, three slips, a basin, and two ponds for masts, with store-houses and the various works for anchors, cables, masts, blocks and the other implements of naval architecture. The manor-house of Say's Court, on the site of the present work-house of St. Nicholas was the residence of Peter the Great when he worked as a ship-wright at Deptford. It was in the same place that the celebrated Drake was visited in 1581 by queen Elizabeth, who conferred on him the honour of knighthood, and gave him the world and a ship for his arms.

Of Gravesend it is only necessary to remark that it is considered the head of the port of London; it is the place where the outward bound ships remain until they are visited by the custom-house officers, and at which passengers commonly embark and land.

Kent retains the name of the people^c who inhabited it in the time of Cæsar; their territory was divided into four small kingdoms, which were united during the Heptarchy. The Saxon kings held their court at Canterbury; after the conquest by the Normans, it was the only part of the kingdom that preserved its ancient laws and usages, of which the most remarkable were gavel-kind and a complete exemption from vassalage.

Although Middlesex may be considered one of the most important counties in England, it is by no means

^a Capper, Idem.

^b Ravensbourn. (Luckombe. Ed. Enc.)—P.

^c The *Cantiæ*.

large; indeed it does not contain more than 282 square miles. It is contiguous to the county of Hertford on the north, while it is separated on the east from Essex by the Lea, on the south from Surrey and Kent by the Thames, and on the west from Buckinghamshire by the Coln. It contains about 180,480 acres; of these, 100,000 are pasture, 40,000 are arable, and not fewer than 15,000 are laid out in market gardens for the supply of the metropolis. Much of the clay round London is made into bricks; an acre is said to yield about a million, and their value to amount to £500. But the greater part of the land has been converted into rich pasturage; there is reason to believe that 8500 milch cows are kept in Middlesex, and 1500 in Kent and Surrey for the supply of the inhabitants of London. To obtain hay for the London market is the principal object of the farmers in the county, and they raise annually on an average a quantity sufficient for 30,000 horses.

Middlesex participates in all the advantages of inland navigation. The immense line of canals and rivers, that extend along and across the kingdom, communicate with the Thames and London by means of the Grand Junction, which enters the county from the north at Rickmansworth, and falls into the Thames at Brentford above, and at Limehouse below, the metropolis. Another branch terminates at Paddington on the north-east of the former.

The verdant fields and the woods extending along the banks of the Thames, almost to the gates of London, form a singular contrast with the movement and activity on the river, with unnumbered masts apparently rising from the water. Other signs announce at a greater distance from the metropolis, the capital of a powerful empire, the most populous city in Europe, and the most commercial in the world. The last assertion may be easily confirmed; indeed the proofs of it may appear to be exaggerated. It has been ascertained that the total value of property annually shipped and unshipped on the Thames, is upwards of £70,000,000; and that in addition to the crews of the vessels, 8000 watermen and 4000 barges are employed in lading and unlading ships. The average number of British ships and vessels always lying in the Thames and docks is about 13,000. It is not less certain that about a thousand steam-vessels sail to and from London in the course of the year. As to the inland trade, 40,000 waggons and other heavy carriages enter or leave the metropolis annually, and the value of the goods, which are thus transported, is not less than £50,000,000. If £10,000,000 be added as the value of goods otherwise conveyed to and from London, and of the cattle and sheep driven to it, the annual amount of the trade may be estimated at £130,000,000. This does not include the various private methods of intercourse with the capital, nor the fifteen hundred methods of leaving London by stage coaches and other public conveyances in the course of a day, nor the mail coach establishment for the conveyance of passengers, small parcels and letters, the most expeditious mode of travelling ever carried into effect in any country, communicating with every part of the kingdom, and travelling continually day and night at the rate of ten miles an hour.^a

^a Capper's Topographical Dictionary.

The foundation of London is generally believed to have been anterior to the Christian era. According to Tacitus, it was the great mart of British trade and commerce in his time. The Romans called it *Londinium*; the *Trinobantes*, the *Atrebates* and the other British tribes, *Lundayn*: under the Saxon domination, it received the names of *Londeuceaster*, *Lunden-Byrig*, *Lundeu-Wye*, and lastly London. The history of its successive additions, and of the privileges that were conferred on it, is not without interest. In the sixth century it was made the metropolis of Essex, or the kingdom of the East Saxons. It became under Alfred the capital of England, and the rights which it had obtained from former princes were confirmed by the Conqueror. Henry the First extended its jurisdiction over Middlesex, and empowered the inhabitants to choose their sheriff and justiciary among the citizens, but reserved to himself the right of nominating the portreeve or mayor. Not long after the death of the same king, the citizens purchased from his successors, the conservancy of the Thames, and the right of electing their magistrates; lastly, the municipal government of London assumed under Richard the First, the same form which it has since retained, if some modifications and additional privileges be excepted. Thus, during the reign of John, Henry Fitz-Alwyn took the title of mayor, instead of *custos* or *bailiff*, under which titles he had held the same dignity during twenty successive years. In the reign of Edward the First, the city was divided into twenty-four wards, every one of which was governed by a magistrate or alderman, and each ward chose some of the inhabitants as a common council, who were sworn to assist the alderman with their advice in all public affairs. Edward the Third united the town with the southern bank of the Thames,^b conferred the title of lord on the mayor, and granted him the privilege of having a gold or silver mace carried before him on public occasions. Richard the Second seized the chartered liberties of the city, which were afterwards restored on payment of a heavy penalty.

Henry the Fourth conferred additional privileges on the city; but his reign is distinguished by the burning of "obstinate heretics," and by a plague which carried off thirty thousand persons in London. The town was first lighted in the year 1416, by lanterns suspended from cords placed across the streets; the same method is still used in France.

The reign of Edward the Fourth is remarkable for the establishment of the first English printing press by William Caxton in 1472; it was erected, however, in Westminster, not in London. Henry the Eighth not only caused the streets to be paved, but removed various nuisances, among others, the crowded monastic institutions. The long and prosperous reign of Elizabeth was marked by rapid advances in trade, industry and wealth, more than by improvements or architectural embellishments of the capital. The Exchange, the principal edifice erected during the reign, was built by a merchant, not by the queen. In 1588, when the country was threatened by the Spanish Armada, the city raised ten thousand troops, fitted out sixteen of the largest ships in the river Thames, and defrayed the charge both of men and ships during the time they continued in the queen's

^b By a charter of Edward III. Southwark was added to the jurisdiction of London. (Ed. Enc.)—P.

service. In 1615, the sides of the principal streets, which had been formerly covered with pebbles or gravel, were laid with flag-stones. Two years before that period, viz. in 1613, the New River was made to communicate with London by Sir Hugh Middleton, an undertaking worthy of a sovereign.^a While Charles the First was actually opposing the liberties of his subjects, he granted the citizens of London several charters, by which he confirmed all their former privileges, and added several new ones. The town embraced the cause of the republican party, and it displayed in the year 1660 the same zeal in bringing about the Restoration. On account of its conduct on the last occasion, Charles the Second granted a confirmation of all its ancient charters, privileges, liberties, rights and customs.

The short reign of James the Second, remarkable for want of faith, corruption and other public vices, is not less so for the establishment of the most important manufacture in London, that of silk in Spitalfields, begun by French protestants who were driven from their native land by the revocation of the edict of Nantes. After the Revolution, to which the citizens of London contributed, all the privileges they had received from former monarchs were anew confirmed by William and Mary; not long afterwards, under the reign of the same princes, the bank of England was established. An act was passed in the reign of queen Anne by which fifty additional churches were built. But it was in the long reign of George the Third that the limits were enlarged beyond example. Two leading causes may account for it; the first, or the great advances in commerce and manufactures, dates from the end of the American war; by the second or the increasing public debt, a new race of capitalists in the funds were naturally attracted to the metropolis.^b

If Constantinople be excepted, it is doubtful that any other city in Europe has suffered so much as London from pestilence, famine and conflagrations. The most dreadful instance of pestilence is perhaps the one known by the name of the *Great Plague*, which was found in the course of five months to have carried off 68,596 individuals. Hardly had it ceased, when a terrible conflagration commenced on Sunday the 2d of September 1666. A violent easterly wind spreading the flames, the fire continued four successive days, and within that time were consumed four hundred streets, 13,200 houses, the cathedral of St. Paul's, eighty-six parish churches, six chapels, the Royal Exchange, the Custom-house, several hospitals and libraries, fifty-two of the Companies' halls, three of the city gates, four stone bridges, as many prisons, and a great number of other buildings. The value of the property destroyed, is said to have amounted to £10,730,500. It is remarkable that six persons only lost their lives during this great devastation. The monument, a fine column 200 feet in height, serves still to record the calamity.

London is divided into twenty-six wards, and each of them is subject to the jurisdiction of an alderman, chosen by the householders or freemen at large, in assemblies termed wardmotes. One of these aldermen is elected

Lord Mayor on Michaelmas day, but he does not enter on his office until the ninth of November following. The two sheriffs elected annually by the livery are appointed both for the city and the county. The recorder, a serjeant learned in the law, is chosen by the lord mayor and aldermen for their instruction and assistance in legal proceedings and matters of justice. The same person is the orator of the city on all extraordinary occasions, and when seated on the bench, delivers the sentence of the court on criminals. Besides these officers, there are several others, as the coroner, the town clerk, the common serjeant, and the city remembrancer. The suburbs in Middlesex are under the jurisdiction of the justices of the peace for the county, and there are besides several courts in which magistrates sit every day for the examination of offences, and the summary determination of various complaints.

The form of London is very irregular; it extends in a direction parallel to the Thames, and the greater part of it is situated on the northern bank of the river. If Westminster and Southwark be included, the length of the town is equal to seven miles, while the broadest part is little more than four, and the narrowest is upwards of two. The streets are for the most part wide, few of them being so narrow as to prevent two carriages from passing abreast, and many of them broad enough to admit of five or six. The finest are those in the west end of the town, the residence of the nobles and the wealthy; the narrowest are in the city, the most ancient and the most central quarter of London, and the principal seat of commerce. But the east end is also inhabited by opulent merchants, particularly by those engaged in the foreign and colonial trade. In the same quarter are situated immense basins or docks, constructed for the reception of ships, and the largest storehouses in the world. The latest additions made to the town are situated on the north, where by means of different streets, several villages have been united to the capital.

The uniformity of the houses, almost all consisting of three stories, and almost all built of brick, and covered with plaster, the cleanness of the streets, the broad pavements for foot passengers, and the brilliant light with which they are every evening illumined, render London unlike most of the continental towns. The finest streets are Oxford Street, Piccadilly, Pall-Mall, Portland Place, Haymarket and Regent Street. The last, both for its length and the magnificence of its buildings, may rival any in Europe.

There is nothing in London like the *Boulevards* which are so much admired in Paris, and there is nothing in Paris like the squares in London. Some of them are very large; Grosvenor Square, surpassing in many respects every other, contains five acres; the buildings, which enclose it, are perhaps the most magnificent in the capital; an equestrian statue of George the Second is placed in the centre, and the ground round it is planted with trees, evergreens and shrubs. Portman Square holds the next rank, but it is smaller, and the houses are not so large. Berkley Square is ornamented with an equestrian statue of George the Third in the costume

^a The New River supplies the metropolis with thirteen millions of gallons of water every day. Although the original projector was ruined by the undertaking, in consequence of the difficulty he experienced in obtaining support, so great, however, is the benefit, which

the inhabitants have derived, that a share in the New River Company, which was at first sold for £100, is now worth £15,000. See Results of Machinery, page 83.

^b Lardner's Cabinet Cyclopaedia, vol. i.

of Marcus Aurelius ; and in Cavendish Square, which is for the most part surrounded with good houses, there is a statue of William, duke of Cumberland. Lincoln's Inn Square, the largest of any, covers the same extent of surface as the Great Pyramid of Egypt.

London contains few monuments worthy of its extent or its wealth. A stranger looks in vain for the public fountains, that he is accustomed to see in other capitals, and to admire not only as architectural embellishments, but as giving the towns in which they are situated, an appearance of freshness and cleanliness. The ornament, however, is all that is wanting ; the use and advantages of public fountains are more commodiously supplied by subterranean pipes, by which abundance of fresh water is conveyed to every dwelling. Although the new buildings in Covent Garden market, render it one of the best in Europe, London, on the whole, is not so well supplied with markets as Paris.

The Royal Exchange, which was founded by a private citizen, Sir Thomas Gresham, is entered by a detached Corinthian portico at its principal front in Cornhill. It has been improved by a new entablature, balustrade and bas-reliefs. The Guildhall is remarkable for its spacious hall, in which the civic entertainments are held. The Mansion House, the residence of the Lord Mayor, is a very clumsy building ; according to Ralph, it looks as if it had been built by a ship-carpenter.^a The Bank of England in the heart of the city, is a vast and characteristic pile, covering an indented area of about eight acres. The prevailing orders are the Corinthian and the Doric. Somerset House, although incomplete, is one of the largest buildings in the metropolis ; it communicates with the Strand by means of three arcades. A vestibule with Doric columns leads into a large quadrangular court with a bronze group in the centre. It has three fronts, of which the one overlooking the court is rich in architectural ornaments, and the one commanding the river, is adorned with a fine terrace. The buildings which bound the quadrangle, consist partly of public offices, connected with the army and navy, and also of the apartments of the Royal Society and Royal Academy. The British Museum, a brick building by the celebrated Puget, in the taste of the age of Lewis the Fourteenth, is a large and imposing rather than a graceful edifice. It is chiefly remarkable for the purposes to which it is devoted, and the interior abounds with objects of antiquity, paintings and statues ; among the last are the Elgin marbles, models of sculpture, comparable to any that have been left by the ancients, and exercising at present a beneficial influence on the fine arts in England. Although the library contains a great many volumes, it is immethodically arranged, and deficient in the selection of editions. The ancient fortress of the Tower contains several streets, and occupies an area of twelve acres and five roods square, within an embattled wall and ditch. It was for many ages the residence of kings, and the White Tower was built by William the Conqueror. The small armoury, a spacious apartment, not less than 345 feet in length, contains complete stands of arms for 200,000 men. The royal train of artillery, the horse

^a The celebrated amateur architect, Lord Burlington, to whose taste London is indebted for some fine private mansions, sent the corporation an original plan for the mansion house, by Palladio. Who is this Palladio? Is he a freeman? said a magistrate. Having been answered

armoury, and the jewel office, where the regalia are preserved, are situated within the Tower. The same building serves still as the great state prison in cases of high political misdemeanour and treason.

The palace of St. James is an ancient brick building of irregular architecture, by no means resembling a royal residence. The exterior forms a singular contrast with the magnificence and costly furniture of the interior. Another palace, originally destined for George the Fourth and his successors, is almost finished, at least more than enough is completed to enable one to judge of its architecture, and to be convinced that it may bear a comparison with the finest structures in London. It was in Whitehall, a large square building formerly inhabited by kings, that the unfortunate Charles the First was beheaded.

Of the three hundred and forty-six churches in London, three are chiefly worthy of notice. The first of these, or St. Paul's cathedral, is confined in a narrow area on the north bank of the river, between Cheapside and Ludgate Street. The body of the church is in the form of a cross ; a stately dome which rises from the centre is adorned on the outside with Corinthian columns, and surrounded at its base by a balcony ; it is crowned by a gilded ball and cross, the highest ornaments of the edifice. The length of the church is five hundred feet, the breadth two hundred and fifty, the height to the top of the cross, three hundred and forty, and the entire circumference, two thousand two hundred and ninety-two. St. Paul's is adorned with three porticos ; the one at the principal entrance faces the west, while the other two at the extremities of the cross aisle, front the north and south. The western portico consists of twelve lofty Corinthian columns below, and eight composite above, supporting a grand pediment ; the whole rests on an elevated base, the ascent to which is by a flight of twenty-two square steps of black marble. The interior of the church is relieved by several statues and monuments that have been erected to the memory of eminent men. It may be added, that St. Paul's was built at the national expense by Sir Christopher Wren ; the sums laid out on it amounted nearly to £750,000. It was completed in thirty-five years, having been begun in 1675, and finished in 1710.

Westminster Abbey was originally founded by Sebert, king of the East Saxons. The present church was begun by Henry the Third, and continued by Edward the First, as far as the extremity of the choir ; the nave and west front were erected in succeeding reigns, and the western towers were completed by Sir Christopher Wren. The length is three hundred and sixty feet, the breadth seventy-two, and the length of the transept or cross aisle, a hundred and ninety feet. The interior of the church cannot be too highly commended ; it is in the form of a long cross, and the choir is one of the finest in Europe. It is there that the ceremony of crowning the kings and queens of England is performed. The sepulchral monuments of illustrious men are situated in twelve small chapels at the eastern extremity of the church, and these memorials strike the beholder with endless variety. It

in the negative, a discussion arose, lasted for some time, and was abruptly terminated by somebody saying, "Palladio is a papist." The result was the building of the Mansion House by the city architect See Lardner's Cabinet Cyclopaedia, vol i p. 26.

is to be regretted, however, that they have been of late profaned by the indiscriminate admission of obscure and vulgar names.

The church of St. Stephen's Walbrook is perhaps the finest monument of the genius of Wren. The area is divided and adorned, and the roof sustained, by sixteen Corinthian columns, eight of which support a hemispherical cupola.

Six bridges communicate with both banks of the Thames. New London Bridge is not yet finished; it is to consist of five arches, and the central one is a hundred and fifty feet wide. Southwark Bridge, at a short distance above it, is a noble structure of cast iron, having three arches, the central spanning two hundred and forty feet. The middle arch, seen from the Southwark side, with the dome of St. Paul's towering in conjunction above it, is perhaps one of the grandest architectural combinations in London.^a Blackfriars Bridge was finished in 1769; it is remarkable for the lightness of its construction, and the length of it is equal to 1100 feet. Waterloo Bridge is massive and simple, and one of the grandest fabrics in the metropolis.^b Westminster Bridge has been deservedly admired; it was finished in 1750, and cost £389,000. The expense of the Waterloo Bridge was upwards of a million.

In addition to these communications, a tunnel,^c a stupendous work, forming a subterranean passage beneath the bed of the Thames, was attempted at Rotherhithe, and suspended when it had reached half way by an irruption of water; but enough had been accomplished to show the practicability of the undertaking, and it is not improbable that London may ere long be indebted to the genius of a Frenchman,^d for a work to which nothing comparable has been achieved either by the ancients or the moderns.

The parks or the most frequented public walks have been happily denominated the lungs of the metropolis. Into them and into the neighbouring villages London discharges its multitudes on Sundays and holy-days to the amazement of foreigners. These parks, although not numerous, are sufficiently spacious. St. James' and the Green Park may be regarded as one. Hyde Park is the resort of the gay and fashionable, promenading in their carriages along the drive, or on foot in Kensington Gardens, which although detached, are supposed to form a part of it. A building, called the Coliseum, but which bears a greater resemblance to the Pantheon, has been erected in Regent's Park. The purpose for which it was built is worthy of notice; it was to exhibit a panorama of London and its neighbourhood on a surface of 4000 square feet, consequently the largest representation of the sort, that has been painted. Adjoining to the building are a covered walk of great extent, gardens, Swiss cottages, and three cascades, one of which falls from the height of sixty feet.

Of the thirteen theatres in London, the most important are Drury-Lane, Covent-Garden and the King's Theatre or Italian Opera. As a building, the last is little inferior to the finest theatres in France and Italy, but it is deficient in machinery and decoration; indeed

the want of scenic illusion, which strikes a stranger so forcibly, would not be tolerated on the continent. The national drama has of late fallen into disrepute; it is affirmed that persons of distinguished rank no longer frequent Drury Lane and Covent Garden, and it is equally true that there are at present no dramatic writers of distinguished merit.^e The stage for which Jonson and Shakspeare wrote, has been degraded by dramas taken from popular novels, or from such French plays as are acted in the minor theatres of Paris. Thus, if the theatres are not well attended, it is because dramatic literature has declined, and not, as has been idly alleged, on account of the increasing morality and piety of the British people.

It may be seen from the following list, which is by no means complete, that London surpasses every other capital in the number of its scientific and benevolent institutions. There are two universities,^f sixteen schools of medicine, and as many of law, five of theology, eighteen public libraries, three hundred gratuitous elementary schools, the royal society, the society for the encouragement of arts, manufactures and commerce, that of antiquaries, those of chemistry, geology and pharmacy, those of horticulture and statistics, that of Palestine for the advancement of geography and natural history in Palestine and Syria, another for the encouragement of discoveries in the interior of Africa, the royal Asiatic society, of which many excellent memoirs have been published, and lastly, the Bible society, which has diffused an immense number of Bibles in a hundred and forty different languages and dialects. To avoid too long details, it may be added that there are a hundred and forty-seven hospitals or houses for the reception of the infirm and indigent,^g seventeen hundred dispensaries where medicine and medical attendance are provided for the poor, and fourteen spacious prisons, in which many improvements have from time to time been introduced in the physical and moral treatment of the inmates; it is still to be regretted that similar improvements have not been adopted on the continent.

If the immorality of a town is always in a direct ratio with its population, it follows that there must be an immense number of profligate and abandoned persons in a capital, which contains, on a surface of more than seven geographical leagues, 1,500,000 inhabitants, 170,000 houses, 8000 streets, fourteen markets and seventy squares. According to the calculations of a London magistrate,^h twenty thousand individuals rise every morning without knowing where to obtain their daily food, or where to find a bed during the night. To the above number it is necessary to add 16,000 beggars, 100,000 sharpers or swindlers, and 3000 receivers of stolen goods. The total number of domestics of both sexes, who are out of place, amounts to more than 10,000. The number of public women is not less than 40,000; the haunts of vice and debauchery which they frequent, must be proportionate to so great a number. Such is the afflicting spectacle that the greatest capital in Europe presents, a capital in which philanthropy is by no means an empty name; on the contrary, the benevolence of pri-

vate individuals is fostered both by public opinion, a powerful engine in England, and by the influence of government. London, however, possesses the sad advantage of being in proportion to its population, infinitely more corrupt than Paris. More than eight thousand individuals are annually put into the different prisons; but a stranger, particularly a Frenchman, may admire the manner in which the business of the police is performed; it is done without ostentation, without military parade, and without any thing that gives the duty of preserving order, the appearance of an abuse of power. The watchmen, to whom the public safety is committed, are very numerous; they walk the streets during the night, cry the hours, give alarm in case of fire, warn the inhabitants, if their doors have been left open by negligence, and arrest those who commit crimes, or disturb the public peace; all this is done without arms, unless their baton or staff can be considered one. Their duties are in a great measure pacific; their number enables them to preserve order, but not to prevent crimes in an immense town, where more than one individual out of every fifteen is a knave, a sharper or a pickpocket.

London has been examined in different points of view; the greater part of it, it has been seen, is situated in Middlesex; some other places in the same county may be mentioned. Hackney, near the Paddington canal, contains 23,000 inhabitants; it was the birthplace of Howard the philanthropist; the same place is also memorable from its antiquity, and the remains of a Roman road may still be seen in the vicinity. St. John's palace, a very ancient building, was inhabited by the prior of St. John of Jerusalem; the Knights Templars had a residence at no great distance from it, but as it has been long converted into flour and lead mills, it is now better known by the name of Temple mills.^a Hampton Court,^b on the banks of the Thames, is adorned with a royal palace and extensive gardens.

Chelsea, about a mile and a half from London on the Westminster side, is also situated on the banks of the Thames. It contains more than 27,000 inhabitants, but it is principally worthy of notice on account of its hospital for decayed and maimed soldiers, one of the finest buildings and the best institutions in the kingdom. Chelsea Hospital was begun by Charles the Second, continued by James the Second, and completed by William the Third. Sir Stephen Fox, the ancestor of the celebrated statesman, was the first projector of the building, to which he contributed £13,000. The pensioners are veterans, who have been either disabled or twenty years in the army. Their number amounts to 336; there are besides 20,000 out-pensioners, and their allowance is proportionate to their length of service. The expenses of the institution are defrayed by a poundage from the pay of the army, and the deficiency, if any, is made good by parliament. The Royal Military Asylum, lately erected in the same town, serves as a place of education for one thousand children of non-commissioned officers and soldiers. The whole army contributes one day's pay per annum in support of this institution.

The county of Surrey, in which that part of London on the left bank of the Thames is situated, was inhabit-

^a Hackney is said to have been the first village near London, to which carriages ran at stated times for the convenience of passengers; hence the term hackney-coach, has been derived.

ed by the *Regni*, and during the period of the heptarchy, it was included in the kingdom of the South Saxons. Contiguous on the north to Middlesex and part of Buckinghamshire, on the west to Berkshire and Hampshire, on the south to Sussex, and on the east to Kent, it covers an area of 758 square miles. As an agricultural county, Surrey is much inferior to many others; of its 485,120 acres, only 80,000 are arable; it is true, however, that the quantity of garden-ground, cultivated for the supply of the London market, exceeds 4000 acres. The mineral products are important; they consist of iron-ore, firestone, limestone, fuller's-earth and chalk. Two sorts of fuller's-earth are obtained, the one of a blue, the other of a yellow colour; the latter is chiefly used in fulling the finer cloths of Wiltshire and Gloucestershire, while the former is sent to Yorkshire for the coarser manufactures. The firestone, obtained in the neighbourhood of Gadstone, Gatton, Mersham and other parts of the county, is extremely soft when first worked, and incapable of resisting a moist atmosphere, but after being kept some months under cover, it becomes so compact as to resist the heat of a common fire; it is therefore in great demand in London. Surrey has four canals, which communicate with London and the sea. The principal manufactures and products of industry are distilleries, vinegar works, potteries, paper, snuff and gunpowder mills, starch, bats and calicos.

Guildford, the capital of the county, does not contain four thousand inhabitants; it is pleasantly situated on the declivity of a chalk hill on the banks of the Wye. The town has often been the residence of English monarchs, and it retains the traces of its former grandeur. Some parts of its ancient castle are still visible, and the square tower or Keep, as it is called, must have been at one time a place of great strength. It is not known by whom it was built.

Kew, on the banks of the Thames, and about six miles west from London, may be mentioned on account of its botanic gardens, which are laid out in a very judicious manner, and contain an immense number of flowers and exotic plants. It is admitted, however, that they have been comparatively neglected since the time of George the Third. Richmond, about two miles to the south of the last village, is peopled by six thousand inhabitants, and in its church are deposited the remains of Gilbert Wakefield and Thomson the poet. The small town of Putney in the same county, is distinguished as the birthplace of Gibbon, the historian.

Berkshire, contiguous on the east to Surrey, is separated on the north from Oxfordshire and Buckinghamshire by the Thames, and bounded on the south by Hampshire, and on the west by Wiltshire. The shape of the county is very irregular, being about forty-eight miles long, twenty-five broad in some places, and in others only six.

Windsor, situated near the eastern extremity of the county, has been for more than seven hundred years the favourite residence of British kings. The castle, erected soon after the conquest by William the Conqueror, was much enlarged by succeeding princes. It was there that Edward the Third was born, and it was there also that he

^b Hampton Court is the name of the palace, adjoining the village of Hampton.—P.

instituted the order of the Garter, of which the knights have always been installed in the chapel of St. George, an addition made by the same king to the palace. It is situated on a height above the Thames, and commands an extensive view of a rich and romantic country; but it might occupy too much space to describe the various parts of the edifice, the additions it has received, the internal decorations, and the valuable paintings. It may be sufficient to remark that a grant of £500,000 was made by parliament in 1824, for the purpose of repairing and embellishing Windsor Castle. St. George's Chapel, which may be considered a part of the building, is not inferior to any Gothic structure in the kingdom.

Reading, the capital of the county, has been the scene of several important events in civil and ecclesiastical history. It is situated on two small eminences, and their declivities terminate in a pleasant valley, through which the branches of the Kennet flow, and join the Thames at the extremity of the town. It possessed since the twelfth century, a magnificent abbey, one of the richest in the kingdom at the period of the dissolution. It was afterwards distinguished by its woollen manufactories, which have fallen into decay, and their loss has been inadequately supplied by the making of sail and sack-cloth. It is still, however, a place of considerable population, and much business is carried on at the wharfs on the Kennet, in the import and export of commodities, particularly of flour, which is sent to the metropolis.

Newbury, on the banks of the Kennet, was famed, in the reigns of Henry the Seventh and Henry the Eighth, for its woollen manufactories, a branch of industry in which John Winchcombe, commonly called Jack of Newbury, rose to celebrity. Abingdon, like many other places in England, owes its origin to a monastery, which continued in great splendour until the dissolution. It carries on at present a considerable trade in malt, with which it partly supplies the metropolis. Wantage, a small market town on the border of the vale of Whitehorse, is remarkable as the birth-place of Alfred the Great, from which it has been inferred, that it was then a royal residence.

The county was inhabited, in early times, by the *Atrebates*, a tribe that migrated from Gaul, probably from the neighbourhood of Arras, before the island was invaded by the Romans. It is impossible, indeed, to examine Berkshire without observing many memorials of different epochs. A Roman camp of a quadrangular form, may be seen near Wantage, on the banks of a canal in the northern part of the county. The remains of a Roman fort are still visible at Lawrence-Waltham, and it is supposed that the castle of Cherbury near Denchworth, was originally founded by king Canute. A range of chalk hills extends towards Oxfordshire, and one part of it, destitute of herbage, bears some resemblance to the gigantic figure of a white horse; hence the plain which these hills enclose, has been called Whitehorse-vale. A white horse, it is well known, was represented on the standard of king Alfred, and the country people still believe that the figure, which covers an extent of more than an acre, was intended to commemorate a victory over the Danes. The inhabitants of the neighbouring villages meet every year on St. John's day, in order as

they say to clean the horse, or in other words, to take away the grass and plants, which might alter its appearance. When their work is finished, the rest of the day is devoted to rural mirth. A number of stones standing on end, at no great distance from the valley, are supposed to indicate the burying place of several Danish kings. It is certain that the neighbourhood has been the scene of frequent battles between the Danes and Anglo-Saxons.

Oxfordshire, contiguous to the northern limit of Berkshire, is bounded on the west by Gloucestershire, on the north by the counties of Warwick and Northampton, and on the east by Buckinghamshire. Like Berkshire, its figure is very irregular; the northern portion is much broader than the southern, and a narrow neck, if it may be so called, extends between the two. The three counties of Berks, Oxford and Buckingham, although separately much broken and indented, form together a figure resembling a circle.^a The soil of the county may be divided into three distinct sorts: viz. 1st, the red land of the northern district, which in fertility is superior to any other portion of equal extent; 2d, the stone-brash district; and 3d, the Chiltern Hills: besides these there are different loams in different parts of the county. The following are supposed to be the proportions of the different soils—red land, 79,635 acres; stone-brash, 164,072; Chiltern, 64,778; different soils, 166,400.^b The same county is watered by not fewer than seventy distinct streams or rivers; few of them, it is true, are large, and the most remarkable have been already mentioned. The products of Oxfordshire are chiefly those of the midland farming counties; corn and malt are exported by the Thames to the metropolis. Good cheese is made in the grazing districts, but it is chiefly used for home consumption. The products of the dairy are more abundant in the central or enclosed districts, and many calves are reared of which the veal serves to supply the London markets. The hills yield ochre, pipe-clay and other useful substances.

Oxford, the capital, has been considered the great glory of the county. Besides the lustre which it derives from its university, the city is venerable from its antiquity. Some have invested it with the honours of fable, and traced its origin to a thousand years before the Christian era. But the authentic history of Oxford dates from the time of Alfred, who resided there. The town was stormed by William the Conqueror on its refusal to admit him, and the inhabitants at a later period took part with King Stephen against the empress Matilda. The ruins of Beaumont palace rise near Worcester College; it was built by Henry the First, and was afterwards the residence of Henry the Second, but it is chiefly famed as the birth-place of Richard Cœur-de-Lion. In later times, Oxford has not only been often inhabited by English kings, but it has been the seat of frequent parliaments. The unfortunate Charles the First held his court there during the whole of the civil wars, and it then became the centre of various military operations in the adjoining country. In the year 1643, in one of these combats,—the skirmish of Chalgrave near Watlington, John Hampden, the celebrated patriot, was slain.

Oxford is pleasantly situated on a gently rising ground in the midst of meadows, at the confluence of the

^a Aikin.

^b Agricultural Survey.

Isis and the Cherwell. It surpasses other cities in the beauty and magnificence of its buildings. The University consists of twenty colleges and five halls; the latter are all that remain of the numerous halls, hostels or inns, which were originally the only academical houses of the students.^a The total number of members in the University books is upwards of three thousand, and of these a thousand are maintained on the revenues of the different colleges. The university is governed by a chancellor, generally a nobleman, a high steward, a vice-chancellor, a province chancellor,^b two proctors, a public orator, three esquire beadles and other inferior officers. To give a view of the system of education would far exceed our limits. Suffice it to say that lectures are delivered on every branch of literature and science. To obtain academical honours requires some degree of capacity and diligence, but the ordinary degree, which qualifies for ordination and the learned professions, may be very easily acquired. It cannot be denied that the university affords the most valuable means of obtaining knowledge, and that the students have it in their power to make a good or a bad use of the advantages which they enjoy. In Oxford, literature is chiefly cultivated; in Cambridge, science. The former was distinguished for its tory politics, the latter for its liberal principles; but the distinction has been less marked in later times than at the period of the Revolution.^c

Vain deluding pleasures are supposed to be banished from Oxford, the abode of useful or intellectual occupations. It is true that there is a theatre, and one which displays the architectural talent of Wren, but the only actors are the students, and the only plays, those of Greek or Roman authors. The same interesting city is indebted to several wealthy individuals for different useful institutions. The botanic garden was founded in 1632, by Henry Danvers, earl of Danby, but it was completed and adorned by Dr. Sherard, who added a library to it, endowed a professorship, and furnished the garden with many rare and valuable plants. The Ashmolean museum was presented to the university in 1682, by Elias Ashmole, together with the manuscripts of Sir William Dugdale, his father-in-law. The Clarendon press^d was erected in 1712, from the profits arising from the sale of

Lord Clarendon's history of the Rebellion. The fund for the Radcliffe library was bequeathed by Dr. Radcliffe in 1749,^e and to the same person the university is indebted for an observatory worthy of Oxford. In an apartment of a quadrangular building, called the Schools, are arranged the famous Arundelian marbles, collected in Greece and Asia by the earl of Arundel, and presented to the university by his grandson, the duke of Norfolk. The Bodleian or university library, added by Sir Thomas Bodley to the remains of the library of Humphrey, duke of Gloucester, may be considered, with the exception of the one in the Vatican, the most valuable in Europe. Oxford contains fourteen parish churches, many chapels for dissenters, some gratuitous schools, and other charitable institutions.

The roads in Oxfordshire have been of late much improved, and its commerce has been increased by the canal which was cut in the northern part of the county.^f The principal manufactures are those of blankets at Witney shag at Banbury, and gloves and polished steel at Woodstock. Many of the poorer classes are employed in spinning or making lace. But notwithstanding the famous forest of Wichwood, the want of fuel is everywhere felt; it is apparent in the condition of the lower orders, and it accounts for their comparative poverty. The county, inhabited in ancient times by the *Dobuni*, included by the Romans in the province of *Flavia Caesariensis*, and forming part of Mercia in the time of the Heptarchy, possesses still two Roman roads, one of which, called Ickenild Street, crosses the Thames at Goring, and then passes north-north-east to Bucks, while the other, called Akeman Street, extends across the county to Burford.

Buckinghamshire is contiguous to Oxfordshire on the west, to Northamptonshire on the north, to Middlesex, Hertfordshire and Bedfordshire on the east, and to Berkshire and a small portion of Surrey on the south. Its greatest length from north to south is about fifty miles, while its greatest breadth is not more than sixteen. It contains 518,400 acres, of which 240,000 consist of clay and loam, and 7000 of sand; the rest is of a very mixed nature, composed of chalk, gravel, sand, clay and clayey loam. The Chiltern Hills run across the county from east to west; the Ickenild way, which has been

^a The following are the different Colleges in Oxford. First, Baliol College, founded in 1269, by John Baliol of Bernard Castle, father of John Baliol, king of Scotland. 2d, Merton College, erected in 1267, by Walter de Merton, Bishop of Rochester and Lord Chancellor of England. 3d, University College, supposed to have been founded by Alfred, but principally restored by William, Archdeacon of Durham, and Walter Shirlaw, Bishop of Durham, and Henry Percy, Earl of Northumberland. 4th, Exeter College, founded in 1314, by Walter Stapledon, Bishop of Exeter. 5th, Oriel College, founded in 1324, by Adam de Brome, Almoner to Edward the Second. A tenement called *L'Orielle* or *L'Oricle*, was annexed to it by Edward the Third, from which the College derives its name. 6th, Queen's College, founded in 1340, by Robert D'Eglesfield, chaplain to Queen Philippa, consort of Edward the Third. 7th, New College, or Winchester College, founded in 1379, by the celebrated William of Wykeham, bishop of Winchester, and Lord High Chancellor of England. 8th, Trinity College, founded by Sir Thomas Pope in 1594. 9th, Lincoln College, founded in 1427, by Richard Fleming, bishop of Lincoln. 10th, Worcester College, founded by Sir Thomas Coke of Bentley in Worcester-shire in 1714. 11th, St. John's College, founded in 1557, by Sir Thomas White, Alderman of London. 12th, All Saints' College,^{*} founded in 1438, by Henry Chichele, archbishop of Canterbury. 13th, Magdalen College, founded in 1458 by William of Wainfleet, bishop of Winchester. 14th, Brazen Nose College, founded in 1502 by William Smith, bishop of Lincoln, and Sir Richard Sutton of Prestbury in Cheshire. Its singular name appears to have been derived from an

iron ring fixed in a nose of brass, and serving as a knocker to the gate. 15th, Corpus Christi College, founded in 1516 by Bishop Fox, Lord Privy Seal to Henry the Seventh and Henry the Eighth. 16th, Christ Church College, founded by Cardinal Wolsey in 1525. 17th, Jesus College founded in 1571 by Queen Elizabeth. 18th, Wadham College, founded in 1613 by Nicholas Wadham of Merrifield in Somersetshire. It was in this College that the plan of the Royal Society was first proposed. 19th, Pembroke College, founded in 1620, by Thomas Tesdale of Glympton in Oxfordshire, and Richard Wightwick, rector of Illey in Berkshire. 20th, Hereford College, founded in 1312, by Walter Stapledon, bishop of Exeter.†

^f The Oxford canal. It leaves the Coventry canal at Longford, four miles N. of Coventry; passes S. E. to Braunton, where the Grand Junction Canal branches off eastwards to London; then passes S. W. to Napton, where a canal branches from it to Warwick; then S. through a tunnel to the valley of the Cherwell at Claydon; then following the Cherwell, by Banbury, to the Isis at Oxford.—P.

already mentioned, lies on these hills, and on the right side of the same road,^a towards the vale of Aylesbury, the soil is much more valuable, letting to the amount of 10s. per acre more than on the left. Lastly, as an agricultural county, Buckinghamshire has been divided into three parts, namely, arable farms, dairy farms, and farms partly grazing and partly arable.

No part of the county is situated at a great distance from a navigable way to London. Thus, the Thames is navigable on the south from Henley by Marlow, Maidenhead, Windsor and Staines; while the Grand Junction Canal, and its auxiliary branches from Wendover, Aylesbury and Buckingham, are equally navigable on the east. The mineral products are not numerous; marble, however, is obtained at Newport-Pagnell, and there are several pits of excellent fuller's-earth on the confines near Woburn, but few of them are worked. Lace is the principal manufacture: it is true that there are many paper mills, and that a cotton manufactory has been erected at Amersham, still more lace is made in Buckinghamshire than in any other county; in this branch of industry, and in plaiting straw for hats, almost all the poor women and girls are employed.^b

Aylesbury and Buckingham are the capitals; the former, much more populous than the other, contains about 18,000 inhabitants. It gives its name to the rich vale of Aylesbury in the middle of the county, one of the most fruitful tracts in the kingdom, extending to the distance of many miles, from Tame on the borders of Oxfordshire to Leighton in Bedfordshire. The town was a strong place in the time of the Saxons, and was included in a royal manor by the Conqueror, who parcelled it out to different tenants, and from the nature of their tenure, some notion may be inferred of the luxury or simplicity of the Norman court; they were obliged to find litter or straw for the king's bed-chamber three times a year, if he passed in that direction so often, and to furnish him besides with three eels in winter, and three green geese in summer. It was erected into a corporation by a charter of queen Mary in 1553. The streets lie round the market-place, in the middle of which a spacious hall has been erected for the quarter sessions and the lent assizes; it is also adorned with a market-house, which is built after the model of the Temple of the Winds at Athens.

Buckingham, the ancient capital of the county, and venerable from its antiquity, was fortified with a rampart and tower in the year 918 by Edward the Elder, to defend it against the incursions of the Danes. It is situated on the river Ouse, over which there are three stone bridges, but the number of inhabitants does not exceed four thousand. Buckingham, indeed, has long been in a state of decline; having lost the privilege of holding the assizes, which were removed to Aylesbury, it was recovered in 1758 for one half of the year. Lace-making is the only manufacture in the town.

Eton, the only other place in the county that shall be mentioned, is situated on the Thames opposite to Wind-

sor, with which it is connected by means of a bridge. It was rendered a seminary of learning by Henry the Sixth in 1440; having been originally endowed for a provost, ten priests, six clerks, six choristers, twenty-five poor grammar scholars with a master to teach them, and twenty-five poor old men. It now supports a provost, vice-provost, seventy scholars, and many officers and assistants. Besides the king's scholars, there are seldom fewer than three hundred noblemen's and gentlemen's sons who are educated at Eton.

Among the eminent men that the county has produced, may be mentioned Francis Atterbury, bishop of Rochester, a prelate distinguished by his wit and learning, but suspected and not without reason, of having been engaged in a plot to bring in the pretender. Richard Cox, bishop of Ely, the framer of the liturgy, was a native of Whaddon. Sir Kenelm Digby, born at Gothurst in 1603, was an elegant scholar, a naval commander, a visionary in philosophy and religion, at one time a protestant, at another a catholic convert; an admirer of Cromwell, and yet imprisoned by the parliament during the civil wars. Believing it practicable to prolong the life of man to the antediluvian period, he laboured to discover the means by which it could be accomplished, and was assisted by Descartes in the vain attempt.

If we cross the Grand Junction Canal near the boundary between Buckinghamshire and Hertfordshire, we may arrive at the capital of the last county, in the vicinity of which the rivers Lea, Maran, Rib and Quin unite, and form the New River, which flows in an artificial channel forty-two miles, supplies the inhabitants of London with water, and communicates with the Thames. Hertford or Hartford bore in ancient times the name of *Durocobriva*, which signifies the Red-Ford, so called from the colour of the gravel at the bottom of the Lea, which waters it. As there were formerly many deer in the county, it has been maintained that its modern name is derived from Hart, a deer. It has been alleged in support of this opinion, that the arms of the town are a hart couchant in the water. This, however, cannot be considered any proof of the etymology, as the arms were devised from the name of the town.^e The Saxon kings often held their court at Hertford; a strong castle was erected in the same place by Alfred, to check the incursions of the Danes, who frequently laid waste the country from the Thames to the Ware. A spacious building, a dependance of Christ's church hospital^d in London, and serving as a country residence to part of the scholars, has been erected in the town. The commerce of Hertford consists principally in the exportation of malt to London, but as a place of trade or industry, it is nowise remarkable. The county was inhabited before the Roman invasion by the *Tauni*, the *Trinobantes* and the *Cassii*, tribes whose territory extended to the shores of the ocean.^e Under the Saxons, it was divided between the kingdoms of Kent and Mercia.^f The traces of several Roman camps may be seen in different parts of the county; the ancient *Duroletum* is supposed to have

^a On the north.—The Chiltern Hills (of chalk) occupy the southern part of Bucks, and the Vale of Aylesbury, the centre; the northern part is diversified with sand hills, connected with those in the west of Bedfordshire.—P.

^e "The county was inhabited by the *Catticuchlani*, by the *Trinobantes*, a people that extended to the shores of the ocean, and by the *Cassii*." (M. B.)—The *Catticuchlani*, called also *Cassivellauni* or *Cattivellauni*, and *Cassii* or *Cattii*, inhabited Bucks, Bedfordshire and Hertfordshire. The *Trinobantes* (*Trinovantes*, or *Trinoantes*) inhabited Middlesex and Essex. (Camden.)—P.

^f Between the kingdoms of Essex and Mercia. (Ed. Enc.)—P.

occupied the site of Cheshunt, and *Cæsaromagus*, that of Braughlin.

St. Albans and Hertford are the only boroughs in the county, and the former is as populous as the latter. It is also distinguished by its abbey church, a very large edifice, formerly the church of a celebrated abbey, founded by Offa king of the Mercians, in honour of St. Alban, the protomartyr of England; and it is certain that the abbots rose to the dignity of taking precedence of all others in the kingdom. When the monasteries were abolished by king Henry the Eighth, the abbey church of St. Albans was offered to the inhabitants by Edward the Sixth for £400. The offer was accepted and the church was preserved. But besides the abbey church, there are two others of great antiquity, those of St. Michael and St. Peter; in the former has been placed the monument of the great Bacon, who with his mother was interred within its walls. The remains of the ancient town of Verulam,^a one of the most important places in England during the Roman period, are situated in the immediate neighbourhood of St. Albans, and many relics of that celebrated people have been found under its ruins.

St. Albans was the scene of two battles during the bloody wars between the roses. The first combat between the parties was fought near the town in 1455, and terminated in favour of the Yorkists. In that engagement king Henry the Sixth was taken prisoner, while the brave Clifford and the great earl of Somerset were slain. In the second battle in 1461, queen Margaret at the head of the Lancastrians obtained a decisive victory. A bloody battle was fought during the same wars on the field of Barnet, between St. Albans and London. Gladmore heath was also the scene of a memorable engagement between the Yorkists under Edward the Fourth, and the Lancastrians under the king-making earl of Warwick, in which the latter lost his life. The action is recorded by a monument raised on the spot, where the roads to St. Albans and Hatfield divide.

The boundaries of the county are nowhere marked by nature, except where the Lea and the Stort separate it from Essex. It is contiguous on the north to Bedfordshire and Cambridgeshire, on the east to Essex, on the south to Middlesex, and on the west to Bedfordshire and Buckinghamshire, with which it is much intermixed. It contains 337,920 acres, of which three-fourths are in tillage, and the rest in pasturage. The northern part of the county is hilly, forming a portion of the chalky ridge which extends across England. The soil throughout is nowhere very rich, but it is made productive by the chalk and lime that are dug and burnt, and by the soot, ashes, bones and other substances that are transported from the metropolis. It is thus rendered very favourable to wheat and barley, the principal agricultural products of the county. The town of Ware in particular sends more malt to London than any other place in the kingdom, but it must not be imagined that it is all the produce of Hertfordshire, part of it is undoubtedly obtained from the adjoining counties. The manufactories are too insignificant to require notice.

Of the eminent persons that Hertfordshire has pro-

duced, not more than two shall be named. The celebrated traveller, Sir John Mandeville, a native of St. Albans, was as remarkable for his credulity as for his enterprise and research. Nicholas Brekespere is better known by the title of Adrian the Fourth; he too was a native of St. Albans,^b and the only Englishman that ever rose to the papal chair. One of his acts is connected with English history, for he issued the celebrated bull, which gave the sanction of the church to the conquest of Ireland by Henry the Second.

The maritime county of Essex is bounded on the north by Suffolk and Cambridgeshire, from the first of which it is separated by the Stour, on the west by the counties of Hertfordshire and Middlesex, from the last of which it is separated by the Lea, on the south by the Thames, which divides it from Kent, and on the east by the ocean. It has been remarked in the account of the coasts that the maritime side is broken and indented. The area of the county is supposed to be equal to 1525 square miles; it is divided into twenty parts, of which fourteen are hundreds, five half hundreds and one a royal liberty. The soil and the face of the country are sufficiently varied. The south-western portion is occupied by Epping Forest, which is covered with rich pasturage, not with trees as its name imports. The same part of the county, watered by the Roddon, that runs parallel to the Lea, yields the best butter that is sold in London. Northwards the country becomes less uniform and level; Saffron-Walden, in this part of Essex, indicates by its name the product for which it is famous. Saffron, which was at one time cultivated in many parts of England, is now almost confined to the country between the last place and Cambridge.

A threefold crop of coriander, carraway and teasel may be mentioned as a singular product of Essex. The two first are cultivated on account of their aromatic seeds, and the last is used in the manufactories of woollen cloth. They are all sown together, but they come to maturity at different periods, and the succession of the whole lasts three or four years.^c

Potatoes are grown in greater quantities in Essex than in any other southern county; but they are mostly cultivated in the south-western portion between the Lea and the Thames, for the purpose of supplying the London market.

The central portion of Essex is in general a fine corn country, varied with hills and adorned with woods. It becomes gradually marshy towards the sea-coast; some parts are exposed to frequent inundations, while others are formed into islands by inlets of the sea. The northern part of the coast is more elevated and more healthy, but the proverbial insalubrity of the Hundreds of Essex,^d is not compensated by their fine pastures, and the same may be said of the marshy tracts along the Thames from the junction of the Lea to the mouth of the river, for they are equally unhealthy.

Essex is but scantily supplied with minerals; the most important are the lime and chalk quarries in the neighbourhood of Purfleet, on the north of the Thames, where they extend across the river from the county of Kent.

^a The *Verolanium* of the Romans.—P.

^b He was born at Abbot's Langley, three miles S. W. of St. Albans.—P.

^c Aikin.

^d The hundreds in Essex, situated near the Lea and the Thames, are emphatically styled the *Hundreds of Essex*. (Ed. Enc.)—The Hundreds of Essex are situated along the southern coast of the county (Rees' Cyc.)—P.

The principal manufactures are those of cloths, baize and woollen stuffs. Calico-print-works have been erected in the neighbourhood of the metropolis, and there are several mills for making sheet lead on the banks of the Lea. Not fewer than two hundred vessels from eight to fifty tons are employed in the oyster fisheries in Essex, and it is calculated that 20,000 bushels are annually sent to the metropolis, or exported to the continent.

Chelmsford claims the rank of capital, but it contains little worthy of notice. Situated at the confluence of the Chelmer and the Cann, the population is little more than five thousand inhabitants. If a great part of the business of the county is transacted at Chelmsford, it may be attributed not so much to the circumstance of its being the chief town, as to its convenient and central position. The most remarkable buildings are a spacious county hall, and a large prison constructed according to the improved plans of the celebrated Howard.

The ancient town of Colchester, much more important than the last, formerly the Roman colony of *Camalodunum*, is situated on the banks of the Colne, in the north-eastern part of the county. It was an important place in the early period of English history, and its venerable castle is supposed to have been built by Edward, the son of Alfred the Great. At the time of the persecutions in the Low Countries under the Duke of Alva, a number of refugees settled in Colchester, and introduced the manufacture of baize, which succeeded so well that the town became not long afterwards the most wealthy and populous in Essex. Although this branch of industry has been abandoned, Colchester may still be considered one of the few important towns in the county. The walls of its old castle are nearly entire, and some notion may be inferred of its ancient strength from their solidity and extent. The same place sustained an obstinate siege during the civil wars, but it was at last forced to surrender to the parliamentary forces under Fairfax, and it may be added that the two commanders of the besieged, Sir Charles Lucas and Sir George Lisle, were shot under the castle wall, for no other cause apparently, than their courage in defending the town. Colchester may also be remarked for its commodious work-house, its large hospital, and for several charity schools and other benevolent institutions. It has long been famous for its oysters; those that are known by the name of Pyefleet, are sold for the highest prices in the London markets.

The position of Harwich, the principal port on the Essex coast, has been already indicated. The harbour, independently of the bay, is not only safe, but very large and commodious. The post-office packets sail and return regularly twice a-week to and from Holland and Germany. More than 5000 tons of shipping, navigated by 500 men, are employed in the North Sea fishery, and other vessels are engaged in the London and coasting trade. Harwich possesses also a yard for the Royal Navy, at which ships of inferior rates are built and repaired.

Coggeshall on the Blackwater, Braintree to the west of it, and Bocking on the north of the last place, were formerly in great repute for their woollen manufactures, the raw material of which was principally supplied from

Lincolnshire. The goods were exported to Spain, Portugal and Italy through the intervention of London merchants; of late years, however, the trade has been diverted into a different channel; it has been transferred to the northern towns. Some other places may be briefly mentioned. It was at Ashburn near Rochford that King Edward Ironside was defeated with great slaughter by Canute, King of Denmark, in 1016. Danbury attests by its name the presence of the Danes; it is built on the highest eminence in Essex. Borking was once the seat of a Benedictine nunnery, of which the abbess was one of the four who were baronesses in right of their station; she lived in great splendour, and had several officers in her household. Tilbury Fort, on the Essex shore, opposite to Gravesend, is the principal defence of the passage up the Thames. It is a regular fortification, mounted with a great many cannon, and well manned in time of war; its principal strength, however, on the land side, consists in the practicability of laying the whole level under water. Purfleet, on the same bank of the river, deserves notice as the great depot of gun-powder for government. A very large magazine erected for the purpose, has been secured by every contrivance against fire and lightning.

The Stour separates the county of Essex from that of Suffolk; the other boundaries of the last county are Norfolk on the north, Cambridgeshire on the west, and the German Ocean on the east. The Waveney and the Little Ouse form the northern limit, and the Stour almost the whole of the southern. The Larkc and another small stream bound it on the north-west, but the greater part of its western limit is not marked by nature. The county is equal in superficies to 1566 square miles; it has been subdivided into twenty-one hundreds.^a

The soil is generally level, but of different qualities; it may be included, however, under three varieties. The coast and the inland districts near it, are for the most part sandy; they consist of arable land, heaths and marshes. The first is fruitful in barley and different sorts of grain; the second are well adapted for sheep, and numerous herds of oxen are reared in the marshes. The inland part from south to north, or the larger portion of Suffolk, is covered with a rich clayey or rather sandy loam, resting on a retentive clay marl bottom. It is very fertile in corn and other plants, and much butter, milk and cheese are obtained from it. The butter is exported in great quantities to London and different parts of England; the Suffolk cheese is said to be the worst in the kingdom, but it is principally owing to the manner in which it is made. The north-western portion is an open, sandy country, forming part of the extensive heath-tracts in this part of England; it is mostly laid out in rabbit-warrens and sheep-walks. Besides the ordinary crops which are raised in Suffolk, turnips, mangel-wurzel and cabbages are in many places as common as in Norfolk.

Some of the domestic animals differ from those in the counties that have been mentioned. The Suffolk draught horse, it has been seen, is middle-sized, short-made and capable of great exertion, but of late years comparatively light active horses, and almost as large as the blacks in the midland counties, have become common. All the

^a Suffolk is divided into two grand divisions, viz. the franchise or liberty of Bury St. Edmunds, and the Guildable land, or body of the county, each of which furnishes a distinct grand-jury for the county

assizes. These are subdivided into 21 hundreds. (Shoberl's Suffolk Ed. Enc.) P.

cows are of the polled kind, and they are inferior to none in England for the abundance of their milk, in proportion to their size. The Suffolk sheep differed little from those of Norfolk, but they are now rare; they have been succeeded by the South Down.

If shell-marl be excepted, by which the soil has in many places been much improved, the other fossils are not very valuable.

Suffolk was once as much distinguished for its manufacturing, as it is now for its agricultural industry. Sudbury was formerly peopled by a colony of Flemings, who were invited by Edward the Third to instruct the English in the art of manufacturing wool. This circumstance accounts for the former populousness and wealth of the town. It continued to flourish during several centuries, and many of the inhabitants were employed in manufacturing different sorts of woollen stuffs. Although it is long since its ancient trade has fallen into decay, Sudbury still exports serges, and possesses an extensive silk manufactory. An additional impulse has been given to the industry of the place since the Stour has been made navigable for barges to Manningtree.

Ipswich, the county town, has also lost much of its ancient splendour; it is situated on the Orwell; it contained at one time not fewer than twenty-one parish churches and other religious houses, in particular, a monastery of Dominican friars, of which the cloisters are still entire. Once noted for its broad cloths, and for the best sail-cloth in England, it had several companies of traders, possessing distinct charters, and according to the unwise policy of former times, exclusive privileges. But the woollen trade began to decline during the latter part of the seventeenth century, and was gradually transferred to a different part of England. The commerce of Ipswich consists at present in malting and exporting corn; it is not without some foreign and coasting trade, but both are inconsiderable. There are two yards for building ships, and vessels of five hundred tons have been constructed in them. Packets sail every tide from Ipswich to Harwich. The famous cardinal Wolsey, a native of Ipswich, endowed a college and grammar school, as a place of education preparatory for his college at Oxford; but his disgrace, before the building was completed, put an end to his benevolent intentions. The same town was the seat of a mint during the heptarchy, and it received a charter during the reign of king John. It still possesses many rights and privileges, among others, an admiralty jurisdiction on the Suffolk coast, and on that of Essex to the neighbourhood of Harwich.^a

Bury St. Edmunds, situated on the Larke, need not be mentioned for what it now is, but for what it was at a former period. Edmund, king of the East Angles, in the latter part of the ninth century, was cruelly murdered

^a The admiralty jurisdiction of Ipswich extends to the coast of Essex beyond Harwich, and to that of Suffolk beyond Landguard Fort, including the estuaries of the Stour and the Orwell.—P.

^b This conduit, from which Cambridge derives so much advantage, was built and given to the town by a very worthy man, Mr. Tobias Hobson, a carrier between Cambridge and London, and the first person who let out horses to the students of the university. Observing that the scholars rode hard, he kept a large stable of horses, with boots, whips and spurs, that the young gentlemen might be speedily equipped. If a person came for a horse, he was led into the stable, where there was a great choice, but he was obliged to take the horse nearest the stable door, in order that "every customer might be served according to his chance, and every horse ridden with equal justice." Hence the proverbial expression, "Hobson's choice," "This or none." A short

by the Danes, and received after his death, the honours of martyrdom: his body having lain unnoted during thirty-three years, became suddenly an object of great veneration, and shortly afterwards an abbey was erected on the spot. Other religious edifices were built at different periods, and at the time of the Reformation, Bury possessed forty churches and chapels, most of them richly endowed. It has at present several charitable institutions; it is still the seat of the county assizes, and if the absence of trade and industry can entitle a town to such a privilege, it is likely to preserve it.

The greater part of Newmarket is situated in Suffolk, but the whole of the race-course lies in the county of Cambridge; perhaps on that account, the claims of the latter county have been preferred, and Newmarket is generally included in the towns of Cambridgeshire. It has been long famous for its horse-races, which take place in April, July and October. The passion of James the First for racing appears to have first rendered it fashionable, and it is well known that he sent for some Cambridge divines, to hold a conference with him at Newmarket. Charles the Second, also a patron of the turf, built a house in the same place, which is still a royal residence. The town consists chiefly of a long and well built street, and the fleetest horses in England are kept in the neighbourhood, and trained for the course.

The ancient Granta or the modern Cam waters the chief town in the county, the *Camboritum* of the Romans, which derives its modern name of Cambridge, from a bridge over the river. The gate-house of a castle built by William the Conqueror, has been converted into a county gaol. The town was destroyed in the reign of William Rufus, and often laid waste during the baronial wars by outlaws from the Isle of Ely, before Henry the Third secured it by a deep ditch. The followers of Wat Tyler and Jack Straw were not idle in Cambridge; having seized the records of the university, they burnt them in the market-place. It is about twice as long as it is broad, and it is not more than a mile in length; old and clumsy houses, and narrow and irregular streets, attest its antiquity. The market-place is formed by two squares, and in that part of it opposite the county hall, is situated Hobson's conduit, which furnishes the inhabitants with a plentiful supply of excellent water.^b

According to an old observation, Oxford is an university in a town, and Cambridge, a town in an university; it is literally true that the buildings of the university encircle the town of Cambridge. The police is jointly governed by the corporation and the university, the vice-chancellor being always a magistrate by virtue of his office. Nay more, the proctors not only attend to the discipline and behaviour of all the under masters of arts, but are also clerks of the market, and have cognizance

account of this extraordinary person appeared in the Spectator, No. 509. The lines on the death of Mr. Hobson, by Milton,* are perhaps the most ordinary of the great poet's productions; unlike his other juvenile performances, they contain few indications of rising genius. Their mediocrity is reluctantly admitted by Dr. Newton, the learned editor of Milton.

* There are two short poems by Milton on the death of Hobson (On the University Carrier, Nos. xi. xii. Occasional Poems.) The criticism above is rather unnecessarily severe, since they can only be considered *jeux d'esprit*, in the taste of the age; not very lively, it is true, but well worthy, for their pun-gency, of a place in Hood's Comic Annual.—

c. g. He died for heaviness that his cart went light—
Yet (strange to think) his wain was his increase.—P.

over weights and measures. It is certain, too, that without this source of prosperity, Cambridge might fall into decay; it is not a manufacturing town, nor is it distinguished in any branch of industry.

The university, it is said, was first founded in the year 630, by Sigibert, king of the East-Angles; but the colleges were not built before the reign of Henry the Third, and as a corporate body, it dates its first charter from the time of Elizabeth. The privilege of sending two members to parliament, conferred on it by James the First, has since been preserved. The senate-house, an imposing edifice, is built of Portland stone, and adorned with pilasters, supporting an entablature. In the same building, the election of all officers takes place, the appointment of magistrates, the admission to degrees, and every important business connected with the university. St. Peter's College claims the distinction of being the most ancient; founded in 1284 by Hugh de Balsliam, bishop of Ely, it is nowise remarkable for its architecture. Clare Hall^a was founded by Richard Badew or Badow in 1326; having been destroyed by fire, it was afterwards rebuilt by Lady Clare. Among the illustrious men educated in this college, were archbishop Tillotson and Cudworth, the author of the Intellectual System of Philosophy. Pembroke Hall was founded in 1363 by the "virgin-wife" of Andomer de Valentia, the unfortunate earl of Pembroke, who was killed in a tilting match on his wedding-day. The chapel built by bishop Wren from a design of his brother Sir Christopher, is one of the finest in Cambridge.^b Corpus Christi College, founded by two societies or guilds, the one called Corpus Christi, and the other the Virgin Mary, was begun in 1344, and completed by Henry duke of Lancaster in 1356. Archbishop Parker enriched it by the addition of fellowships and scholarships, and also by a collection of books and manuscripts. The manuscripts, relative to the ecclesiastical history of England, are considered of great value. Caius College was originally founded by Edward Gonville, rector of Terrington in Norfolk, and afterwards endowed by Dr. Caius, physician to Queen Mary.^c It consists of three courts and as many gates, those of Humility, Virtue and Honour. In the chapel is the tomb of Dr. Caius, and from the epitaph, of which the Doctor himself was the author, it is evident that he formed very high notions of his own merit, a delusion to which the secluded life of a college is by no means unfavourable.^d It is undeniable, however, that several truly great men are ranked in the number of its students; among the divines are the names of Jeremy Taylor and Samuel Clarke; among the physicians, none is more eminent than William Harvey, the great discoverer of the circulation of the blood. King's College, founded by Henry the Sixth, has enabled Cambridge to vie in architectural grandeur with Oxford, and it is very doubtful that King's College chapel has any rival in the sister university. If the intention of the royal founder had been carried into effect, the college might have been one of the most magnificent buildings in the kingdom; but he was prevented from accomplishing his purpose, by

the calamities and misfortunes of his reign. A range of buildings, in the Roman style, was erected to form the side of a quadrangle, which should be afterwards continued, and the whole was recently remodelled and completed. The dimensions of the quadrangle, much inferior to those of the original plan, are 280 feet in length by 270 in breadth. The chapel was begun by the same king; Henry the Seventh completed the outside, and Henry the Eighth, the stalls, relievos and painted windows. It combines extent and solidity with grace, and it is not less admirable for the minuteness of its details. Sir Christopher Wren, it is well known, was in the habit of visiting it every year, and that great man considered it the finest specimen of Gothic architecture in England. Catharine Hall was founded in 1475, by Robert Woodlark, chancellor of the university, and in the chapel belonging to the college are some memorable sepulchral monuments. Jesus College was originally a convent of nuns, established about the beginning of Henry the First's reign, or the end of king Stephen's. Adjoining lands were assigned to it about the year 1160 by Malcolm the Fourth, king of Scotland, and earl of Huntingdon and Cambridge. The monastery was at last dissolved by Henry the Seventh and pope Alexander the Fourth, on account of the illicit conduct of the nuns. The possessions were made over to John Alcock, bishop of Ely, and preceptor to Edward the Fifth, for the maintenance of a master, six fellows and six scholars, but the number has since been increased in consequence of succeeding endowments. Jesus College is not remarkable for its architecture, but it was the place where Crammer and Bancroft, Hartley, Jortin and Flamstead were educated. Christ's College was first built on the site of an hostel called God's-house, by William Bingham, rector of St. John's, London. It was removed to its present site by Henry the Sixth, who intended to increase the number of scholars to sixty, but was prevented from doing so by the ensuing civil wars. His maternal sister, Margaret, countess of Richmond, and mother to Henry the Seventh,^e completed the building, and endowed the college for a master and twelve fellows. Some superstitious objections having been urged against this number, as containing an allusion to our Saviour and his twelve apostles, a thirteenth fellowship was added by Edward the Sixth, and two others by different individuals at a subsequent period. Christ's College boasts of having educated Milton, but from its treatment of that great man, it seems to have been unworthy of the honour. There is still in the gardens a decayed but venerable mulberry tree, which was planted by the poet when a student. St. John's College was also founded by the mother of Henry the Seventh, at the request of her confessor Fisher, bishop of Rochester. It reckons Cecil, the minister of Queen Elizabeth, Ben Jonson, Otway, Prior, Ambrose Philips and John Horne Tooke among the number of its students. Trinity College, founded by Henry the Eighth, is the largest, and in some respects the finest, in the university. It consists of three quadrangles, and is entered by two magnificent portals, adorned

^a Halls and colleges are synonymous at Cambridge.

^b Lardner's Cabinet Cyclopaedia, volume first.

^c Gonville and Caius College, originally founded in 1348 by Edmund Gonville—enlarged in 1557 by Dr. John Caius, who procured a charter of incorporation under its present name.—P.

^d Lardner's Cabinet Cyclopaedia, volume first.

^e The countess of Richmond was interred in Henry the Seventh's chapel at Westminster, where an altar tomb, with a statue of brass, was erected to her memory. Around the monument is a Latin inscription written by Erasmus, for which he received *twenty shillings* from the university of Cambridge.

with statues and lofty towers. In the chapel is Roubiliac's marble statue of the great Newton, and underneath it the following inscription from the third book of Lucretius—"Qui genus humanum ingenio superavit." Emanuel College, an extensive and elegant building, was founded in 1548 by Sir Walter Mildmay, a privy counsellor to queen Elizabeth. Sidney-Sussex College, originally a monastery of Franciscans, was granted at the Reformation by Henry the Eighth, to the master and fellows of Trinity, but it was purchased from them, and endowed as a separate institution by Frances Sidney, countess of Sussex. It reckons Oliver Cromwell among the number of its students, and it may be added that a plaster impression, taken of the protector's face after death, was sent into Italy, and a bust made from it by the celebrated Bernini; the same bust has lately been placed in the library. Queen's College, founded in 1448 by Margaret of Anjou, the intrepid consort of Henry the Sixth, is the one in which Erasmus was professor of divinity. There are besides two other colleges, those of Downing and Trinity Hall; the foundation-stone of the former was laid with much solemnity in 1807; the latter was a hostel for the entertainment of students before any colleges were erected. Thus it appears that there are not fewer than seventeen colleges in Cambridge.^a As an university, it enjoys a higher reputation in the exact sciences than Oxford; and although a long period has elapsed since the time of its great luminary, the advantage may still be attributed to the impulse communicated to these sciences by the genius of Newton.

The town of Ely in the isle of the same name, may be remarked on account of its cathedral, a very large edifice, which affords a striking object to an extensive surrounding country. The revenues of the sea are considerable, and the bishop possesses the rights of a palatine,^b and exercises temporal jurisdiction in the isle. The town is the only episcopal city in England, that is not represented.

The county of Cambridge was in ancient times inhabited by the *Iceni*, and afterwards included in the third province, or that of *Flavia Cesariensis*. It contains about 858 square miles, and the Ouse divides it into two parts. The northern, in which the Isle of Ely is situated, forms an immense plain, broken on the south by some comparatively high hills; on the north, however, the elevations are very inconsiderable, being merely sufficient to raise the villages that have been built on them, above the general level. The whole tract, naturally a marsh, is still in rainy seasons subject to inundations by the rivers, which move slowly through it to the sea. It has been rendered habitable by means of great labour; unnumbered drains are cut through it in various directions, and the water, raised in many places by windmills, is thus pumped from the ditches, which everywhere intersect the low grounds, and which are confined by banks on a higher level than that of the surrounding country. The most remarkable of these works are the Old and New Bedford rivers, so called from the noble family that has given its name to the whole tract,^c which they were so instrumental in improving. These rivers which enclose the Isle of Ely, branch from the Ouse at Earith in Huntingdonshire, and communicate again with

the same river at Denver-sluiice near Downham in Norfolk. The Nen, which waters the north-western part of the county, is also conveyed through an artificial channel. The county is varied by bleak moors, luxuriant meadows and in some places by cultivated fields. In the lower tracts oats is almost the only sort of grain; in the higher, wheat and barley are raised. The drier spots are marked by villages and groups of trees. Coleseed, a common crop in this part of Cambridgeshire and in all the low counties, is valuable as winter feeding for sheep, and also on account of its seed, from which oil is extracted.

The south-western part of Cambridgeshire is a very different country; it is fruitful in corn, particularly in barley, which is malted and exported in great quantities. The south-eastern portion, extending from the Gogmagog Hills to Newmarket, is connected with the vast tract which stretches southwards into Essex, and northwards into Norfolk, and forms one of the largest plains in England. The soil is poor and in many places covered with gravel; saffron is cultivated in some places, and in others scanty crops of barley are raised, but sheep-walks cover the greater portion of the surface. Cherry-Hinton, at the foot of the Gogmagog Hills, is noted for its large chalk-pits, for the marine productions contained in them, and for many rare plants that grow in the neighbourhood.

Washed on the north and the east by the German Ocean, the county of Norfolk is bounded on the south and south-east by Suffolk, and on the west by part of Lincolnshire and Cambridgeshire. Presenting an almost regular curve to the sea, and a convex line somewhat indented to the land, its figure resembles an ellipsis, of which the shorter axis may be about forty-eight miles from north to south, and the other about seventy from east to west. According to the statistical returns, it contains 1,094,480 acres, and of these not fewer than 730,000 are arable. It has been divided into thirty-three hundreds, and these are again subdivided into many parishes, in all 756, a greater number than in any other county in England.

The inland limits are marked by rivers. The Great Ouse forms part of the south-western side, and falls into the sea below Lynn. The Nen, part of the western limit, communicates by several channels with the Ouse, and empties itself into the Lincoln Wash. The Little Ouse rising from a marsh on the southern part of the county, divides Norfolk and Suffolk, flows westwards, and joins the Great Ouse. The source of the Waveney is only separated by a causeway from that of the Little Ouse; it forms the remaining portion of the Suffolk boundary, and falls into the Yare, a short way above Yarmouth. These and other rivers mostly rising in marshy lands, and proceeding slowly through a level country, diffuse themselves over the lower tracts, forming large pools, to which the country people have given the name of *broads*. They are stocked with fish and different sorts of wild-fowl, and the rivers have at least one advantage, they may be easily rendered navigable or converted into canals.

Norfolk has long been distinguished as an agricultural county; cultivation has been extended and improved,

^a Thirteen colleges and four halls.—P.

^b Lord of a county palatine.—P.

^c The Bedford Level.

and, on the whole, the various implements of husbandry are superior to those in many parts of England. The face of the country is more uniform than in other tracts of an equal extent. It cannot be said to be wholly level, for it is broken by gentle inequalities, but there is not a single hill in the county. The low and marshy grounds in Cambridgeshire and Lincolnshire extend from the western extremity of Norfolk to Lynn. On the east, a narrow and humid tract runs from Yarmouth to a considerable distance up the country. Other marshes, less extensive than the former, are situated in the northern part of Norfolk. A considerable tract on the west, from Thetford northwards, consists of open heaths. The other parts are in a state of cultivation, but the soil varies in different districts. In the north-eastern it is composed of a light sandy loam, easily cultivated, and by no means unfruitful; on the south-east the land is deep or humid, and the central and southern districts are covered in many places with a rich clay. The agricultural products depend on the situation and the nature of the soil. The light and sandy districts are fruitful in barley; wheat, on the other hand, thrives best on the strong clayey lands. Norfolk is also noted for its turnips; they are more generally cultivated in the county than in any other part of the kingdom. The field cultivation of turnips dates from the reign of George the First; before that period they were confined to gardens, and merely used as a culinary plant. Lord Townshend, who accompanied the same king to Hanover, as secretary of state, having observed whole fields of turnips in the electorate, brought home some seeds, and recommended them to his tenants in Norfolk. The experiment succeeded beyond expectation; turnips became a common crop, and were afterwards gradually extended to every part of the country. It is not the least advantage of this culture, that the ground never lies fallow, or in other words, the turnips prepare it for corn. The same root is principally used by the farmers for feeding cattle, and numerous herds of oxen, bred in Scotland, are fattened in Norfolk. Thus, there is a weekly market for Scotch cattle at Norwich, and one every fortnight at Setch.^a

Buck-wheat, an ordinary crop on the light soils, is used for feeding poultry, or fattening pigs. A great quantity of butter is exported from the fenny districts, and sold in London under the name of Cambridge butter. The sheep are much valued on account of their mutton, and their wool serves to supply the manufactories of coarser cloth in Yorkshire. The poultry is supposed to be the best in England, and the rearing of turkeys is an object of profit to the small farmers, and a considerable trade is thus carried on with the metropolis. The same county abounds in game, in hares, partridges and pheasants; the latter are so numerous that the crops in many places are injured by them. According to a calculation, which is believed to be correct, the value of the different sorts of grain, and of the flour and malt, exported annually from Norfolk, amounts to more than £900,000. The wool and the provisions that are exported, including merely the profit arising from feeding Scotch cattle, are estimated at £250,000. No better proof need be adduced of the industry and good husbandry of the inhabitants.

^a Sechy, or Seeching—4 miles S. of King's Lynn. (Luckombe.)—P.

Although the ancient city of Norwich was not founded by the Romans, it is by no means unlikely that it owes its origin to that celebrated people. When the camp at Castor, the famous *Venta Icenorum*, was no longer used, the rude beginning of a town became visible on the road which leads from it to the present city. The one increased as the other fell into decay, and Norwich was in all probability a place of some importance, when the first authentic mention was made of it in the Saxon Chronicle, in consequence of its having been laid in ruins by Sweno the Dane, in the year 1004. Some notion of its populousness at a later period, may be inferred from the ravages which the plague made among the inhabitants. It is said that 58,000 persons were carried off by that disease in the year 1348. Although some allowance ought to be made for exaggeration, still the exaggeration cannot be supposed to have been greater with respect to Norwich than to other towns, which suffered from the same calamity. The same city, it is undeniable, bears many traces of antiquity, and although adorned with numerous public buildings, the streets are narrow, ill arranged and ill paved. The cathedral was founded by Herbert de Losinga in 1096, after he had removed with his monks from Thetford to the neighbourhood of Norwich. The general style of the building is Norman, characterised by semicircular arches and short columns; it is likely, however, that it has since been much altered or improved. The number of parish churches in Norwich is greater than that in any other town in England, with the exception of the metropolis. At one period there were not fewer than fifty, but they have been since reduced to thirty-six. The finest are those of St. Peter, St. Stephen and St. Andrew, but the small church of St. Julian is considered the most ancient. It appears as if the number of dissenting chapels and meeting-houses corresponded with that of the churches; both are out of all proportion to the size of the city, or the number of inhabitants. The other public buildings are the ancient castle, the town and guild halls, the theatre, the new corn-exchange, and the hospital or infirmary.

It is as a manufacturing town, and as a place of commerce and industry, that Norwich is chiefly celebrated. The woollen manufacture was first introduced in the reign of Henry the First at a place called Worsted, from which the name of the article was afterwards derived. In the latter part of the fourteenth century, other Flemings, driven from their country by oppressive enactments, settled in Norwich, and laid the foundations of its trade. About two hundred years afterwards, it received an accession of most useful hands, by the arrival of many Hollanders and Walloons, who fled from the sanguinary Duke of Alva. But even before the settlement of the last colony, Norwich had become an important town. According to Blomefield, in the time of Henry the Eighth, the annual sale of stuffs made in the city only, amounted in value to £200,000, exclusively of stockings, which were estimated at £60,000. From an act passed in the fourteenth year of the same reign, it appears that the making of worsteds and stammins, which had greatly increased in the city of Norwich, and county of Norfolk, was now more diligently practised in Yarmouth and Lynn. The wardens of these towns were therefore made subject to the jurisdiction of Norwich. New manufactures were introduced in the reigns

of Edward the Sixth and Mary, and regulations were passed for the making of satins, satins-reverses, Naples-fustians and other articles. The prudent and politic Elizabeth, by the advice of the duke of Norfolk, offered an asylum and protection to the persecuted inhabitants of the Low Countries. These colonists, it has been already stated, formed a great accession to the industry of Norwich; they afforded too an example of the folly of interfering with religious scruples, and the wisdom of an enlightened toleration. New fabrications were made from the intermixture of silk, mohair and wool; new names were also introduced for them, and bayes, sayes, arras and mochades were then first exposed in the English markets. In the year 1575, the Dutch elders presented in court a specimen of a new article called bombazine; such is the earliest date of a manufacture, for which Norwich has since been distinguished above other cities in England. It may be right to add that exclusive privileges were unwisely conferred on the Flemings and the other foreign settlers, and that their descendants enjoy some of them at the present day. The trade of the town was further extended in consequence of a liberal enactment of George the Second. It was determined to open the port of Yarmouth for the importation of wool and woollen yarn. The advantage, however, was insufficient to enable it at a later period to compete with Manchester. The cottons of the latter town, from the cheapness and rapidity with which they are manufactured by the admirable inventions of Arkwright and other ingenious men, proved destructive to the home trade of Norwich. Extraordinary efforts were made by the industrious inhabitants, and new outlets were created for their products. Foreign connexions were improved and extended, the taste of every climate was consulted, and Norwich goods found many purchasers in the great annual fairs of Frankfort and Leipsic. To supply the demand thus occasioned, the distaff and the loom were continually plied in Norfolk and Suffolk; it was calculated that in the former county fifty thousand tods of wool were annually spun; the quantity, however great, proved insufficient, and yarn was imported from Scotland and Ireland. It appears from a computation which has been published, that the yarn then imported every year from Ireland to Norwich was greater than the quantity imported about fifty years before that period into the whole kingdom.^a The trade, however, fell a second time into decay; its connexions were abridged, and its foreign outlets were shut, in consequence of the long and destructive war that followed the French revolution. Norwich has not recovered its ancient prosperity, but it is still a populous and industrious town. It is situated on the Yare, over which six bridges have been erected. The Wensum, which falls into it in the neighbourhood, has lately been enlarged so as to make Norwich a port.^b

Yarmouth, although formerly much more flourishing than at present, is still a place of importance as a harbour and fishing town. Situated on a peninsula at the eastern extremity of the county, it possesses by means

of rivers all the export and import trade of Norwich and other places on the same side of Norfolk and Suffolk. It carries on a foreign trade with the Baltic, Holland, Portugal and the Mediterranean; it sends likewise several vessels to the Greenland fisheries. The home fishing is carried on at two seasons; that for mackerel in May and June, and the other for herrings in October and November. The latter is the more important; not fewer than 70,000 barrels of herrings are often taken and cured in the course of the season. The town was formerly enclosed with walls, and the plan, according to which it is laid out, renders it probable that it was the object of the architect to contain as many persons as possible in a given space. Thus, the streets run from north to south, and are joined by nearly two hundred lanes.^c Yarmouth consists only of a single parish; it is encompassed on the east and the south by the sea, on the north by the main land, and on the west by the Yare, over which a handsome drawbridge, that has lately been erected, unites it with Suffolk.

King's Lynn or Lynn-Regis, at the other extremity of Norfolk, is also a great commercial outlet; it carries on by means of its inland communications, a considerable trade with the neighbouring counties, and supplies them with wines, coal and other articles. These advantages it possesses from its situation at the mouth of the Ouse; but it is likewise watered by four rivulets, over which eleven small bridges have been erected. A custom well deserving praise has been long established in the town; it is usual to hold every month a feast of reconciliation, or in other words, a meeting of the mayor, magistrates and clergymen, who for the purpose of preventing law-suits, hear and determine the disputes that arise between the inhabitants.

The parsonage house of Burnham-Thorpe, a very simple building, may be mentioned as the birth-place of Nelson, the greatest and the bravest admiral of his age. The unfortunate Ann Boleyn, one of the celebrated victims of Henry the Eighth, and the mother of Queen Elizabeth, was born in the old mansion-house of Blickling Hall.

The large maritime county of Lincoln, the third in point of size in England, is bounded on the east by the German Ocean and the Wash, which separates it from Norfolk, on the north by Yorkshire, from which it is separated by the Humber, on the west by the last county and those of Nottingham and Leicester, on the south by those of Northampton, Rutland and Leicester.

It was included in the province of *Britannia Prima* by the Romans, and before the period of their invasion, it was inhabited by the *Coritani*. It was called *Lincollnscyre*^d by the Saxons, and *Nicolshire* by the Normans. The Anglo-Saxons united it first to the kingdom of Mercia, and afterwards to Wessex. The whole county was divided after the conquest among the followers of William.

The area of Lincolnshire is stated to be 1,758,720 acres or 2748 square miles, and the number of inhabitants to each square mile, not more than ninety. The

^a Lardner's Cabinet Cyclopaedia, volume first.

^b Norwich is situated on the Wensum, a little above its confluence with the Yare. (Some accounts erroneously represent Norwich as situated on the Yare. Ed. Enc.) The Wensum, which is navigable for barges, divides Norwich into two unequal parts, the southern the largest.—P

^c It has four principal streets running from N. to S. and 156 narrow lanes or rows intersecting them in the opposite direction. (Luckombe.)—P.

^d *Lincollnscyre*. (Camden.)—P.

discriminating features of the county are strongly marked by nature, and although many parts are now very fruitful, they have only been rendered so by the gradual labour of centuries. Originally covered with fens and marshes, it is now fertile; it abounds in flocks and cattle, but it is destitute of beauty, humid and unhealthy. The heaths on the north and south of Lincoln, the only heights that can be observed, are calcareous hills, commanding an extensive view of the low lying plains.

The whole county has been divided into three districts, those of Holland, Kesteven and Lindsey. The first, by no means unlike the country from which it derives its name, occupies the south-eastern portion of the county, from the neighbourhood of Wainfleet to the shallow inlet of the Wash. It consists of two divisions, Upper and Lower Holland, both abounding in marshes, some still in a state of nature, others intersected by numerous drains or canals, and crossed by raised causeways. The lower or the southern district is the most humid; indeed it is only protected against constant inundations by vast banks raised along the rivers and the coasts. The air is damp and unwholesome, the water, brackish or unfit for domestic purposes, and the inhabitants are therefore provided with cisterns for rain water. Industry, however, has triumphed over every obstacle, and has diffused comfort and wealth; the richest pastures in the kingdom have been formed out of swamps and marshes; nay more, they have been converted into arable lands, and crowned with luxuriant harvests. Much still remains to be done, but some notion may be inferred of what has been accomplished from the fact, that within a period of thirty years, from 1780 to 1810, 100,000 acres in Lincolnshire have been drained, restored to agriculture, and let on an average at a rental exceeding fifty shillings an acre.^a The aquatic fowls that frequent the fens, are wild ducks, teal, widgeon and other birds of a like sort; the largest decoys in England, are kept in these parts, and more than three thousand wild ducks are often sent to London in the course of a week. The same tracts abound in wild geese, grebes, godwits, whimbrels, ruffs and reeves, that find plenty of food in the fishy pools and streams. The avoset or yelper appears in numerous flocks near the Fossdike-Wash, where the knot and the dotrel, that are considered great delicacies, are taken and sent to London.^b

The district of Kesteven, or the south-western portion of Lincolnshire, extending from the centre to the southern extremity of the county, is distinguished by the variety of its soil, and although interspersed with several large heaths, is on the whole a fruitful country. The largest of these heaths are Ancaster and Lincoln, but much of them has of late years been enclosed. The fens in Kesteven are not so numerous or so large as those in Holland. Lindsey, the largest division of the three, comprehends all the country on the north of the Witham and Fossdike. It may be said to be destitute of hills, but it is the highest part of the county. The extensive heaths, called the Lincolnshire Wolds, are situated in the north-eastern part of the district. Many flocks of sheep are fed throughout this tract, and it has been computed that in the whole county, 2,500,000 are reared, which are supposed to yield 22,000,000 pounds of wool. The river isle of Axholme, formed by the Trent, the Dun

and the Idle, a rich low tract in which much flax is cultivated, is situated in the north-western part of Lindsey.

If Lincolnshire is no longer a manufacturing county, it may partly be attributed to the extraordinary decay of its ports, which although once numerous, are now either choked with sand, or wholly deserted by the sea. The higher grounds yield all the ordinary sorts of grain in abundance, and the lower are fruitful in oats, hemp, flax, woad, sainfoin and other plants. But Lincolnshire is chiefly noted as a grazing county, and the domestic animals that are reared in its pastures are the largest of their sort in England. Thus, the ox weighs from eighty to a hundred stone, while the horse and the sheep are distinguished by similar properties. The latter afford a thick coarse wool, well adapted for the worsted and coarser manufactures of Yorkshire.

The Humber and the Trent water the northern and the western sides of the county. Some of the other rivers are the Witham, the Anholme, the Welland and the Glen. The inland navigation of the county has been much extended and improved by means of canals. One from Boston by Brothertoft on the Witham, proceeds to Lincoln, enters the Fossdike canal, and thus communicates with the Trent. The canal from Grantham to Nottingham, which is about thirty-three miles in length, was completed in 1796, and cost £100,000. It passes near extensive plaster beds, and lime is brought in great quantities from Crich in Derbyshire. The Stainforth and Keadby canal commences at the river Don, about a mile west of Fishlake, waters Crowle and Keadby, and passes onwards to the Trent. Thus by means of these works, Lincolnshire communicates with all the manufacturing towns in Lancashire and Yorkshire.

Boston and Lincoln are the most important towns in the county; the first, situated in the district of Holland near the mouth of the Witham, is surrounded by rich pastures and recent enclosures, fruitful in corn. The harbour was almost blocked up about half a century ago, but the channel has of late years been opened and deepened. Thus restored to the purposes of commerce, it carries on a considerable trade with the Baltic, and more than a hundred small vessels sail from it every year in the fishing season. The town was chosen as the site of a monastery by Botolph, a Saxon monk, and the church of St. Botolph is considered the largest parish church in England, being about three hundred feet long within the walls, and a hundred wide. The height of the tower is not less than 282 feet; it is crowned by a very large lantern, which serves as a pharos to the dangerous channels of the Lynn and Boston Deeps. The same place was at an early period more opulent than at present; even in the time of Henry the First, it afforded a rich booty to a gang of robbers, who came to its fair in the disguise of monks, and laid it in ashes. It was incorporated by Henry the Eighth, and Elizabeth gave the corporation a court of admiralty with jurisdiction over the neighbouring coasts. It has already acquired something of its ancient prosperity from the new enclosures and the improvements in its harbour, and it possesses an advantage which was wanting in past times; it communicates with Lincoln, Nottingham, Derby and many other places by means of canals.

^a Stone's View of the Agriculture of Lincolnshire.

^b Aikin.

Lincoln, the capital of the county, is situated on the banks of the same river, about thirty-six miles above Boston. It occupies the site of *Lindum*, a town built in the form of a large square by the Romans. The ancient *Lindum* was surrounded by walls, and defended by towers; one of its gates, still remaining and built in the form of a semicircular arch ten feet in diameter,^a and as many in thickness at the base, has been considered one of the most perfect relics of Roman architecture in Britain. Other monuments of the same period are not wanting: several stone coffins were found in 1739; beneath them was a tessellated pavement, and still lower down a Roman hypocaust; lastly, a sudatory was discovered in another part of the town in 1782. During the earliest struggles between the Saxons, the Danes and the Normans, the name of the town is frequently mentioned; and at the epoch of the conquest, it was ranked with the largest and wealthiest cities in England. The castle, erected by the Conqueror to keep the citizens in awe, was long supposed impregnable, and even at so late a period as the civil wars, the possession of it was eagerly contested both by the royal and parliamentary forces.

The cathedral, a very lofty building, was founded in the year 1086; it has been much injured and in many places repaired. It consists of a nave with its aisles, three transepts, one near the centre, the two others near the eastern and western extremities; there are besides a choir and chancel with aisles; lastly, three chapels and cloisters are connected with the last divisions. On the whole, it is only inferior in size and grandeur to that of York, and the west front is perhaps unequalled on account of the richness and lightness of its Gothic architecture. In former times, it was one of the wealthiest English cathedrals, and according to some authors, Henry the Eighth took from it 2921 ounces of gold, and 4285 ounces of silver. Some of the shrines were of pure gold, others of silver, and the mitre of the bishop was resplendent with diamonds, sapphires and other precious stones. The see of Lincoln, although much reduced from what it once was, is even at present the largest in England. The town, independently of its religious edifices and its vestiges of Roman times, possesses other monuments of past days. Some notion may be formed of the strength and grandeur of the ancient castle from what remains of the massive walls and embattled towers. Fort Lucy^b is now in ruins, but its old tower was connected with the citadel by a subterranean communication. Antiquaries have not determined whether the priory was originally intended as a religious or military edifice. It is known that the house inhabited by John of Gaunt, the celebrated Duke of Lancaster, added greatly to the strength and magnificence of Lincoln, but the site and a few detached parts of the building are all that remain. In the same city Henry the Second repeated the ceremony of his coronation, and it was the seat of a parliament in 1301 under Edward the First. It is certain that in former times Lincoln was a wealthy and magnificent town, but neither its past wealth nor magnificence can be attributed to the industry or commercial greatness of the inhabitants. It appears as if its rise in the darkness of the middle ages was owing to the number of its churches and monasteries,

and also to the choice of it as a place of residence by many noble and royal personages. It is true, however, that particular privileges were conferred on it at different times, and of these the most important, or the one granted by Edward the Third, rendered Lincoln a staple for wool, leather and lead. The present trade consists chiefly in corn and wool, and the latter furnishes employment to many of the lower orders. It has been already remarked that Lincoln is built on the Witham, but that part of the river which passes along the principal street is arched and concealed. The Fossdike canal forms a communication between Lincoln and the Trent, and by means of that river with the principal canals in the kingdom.

The other places in the county may be briefly mentioned. Gainsborough on the Trent, a place famous for its beer, carries on a considerable trade in corn and other commodities, and participates also in the commerce of the Baltic. Great Grimsby, a decayed port near the mouth of the Humber, has become again flourishing in consequence of the improvements made in its harbour. Louth on the banks of the Ludd, rose into importance after a canal was cut parallel to that river from the town to the neighbourhood of Tetney creek. By this channel vessels of considerable burden sail to the metropolis and to different parts of Yorkshire. Stamford, a place of great antiquity, was divided at one time into fourteen parishes. Although now fallen into decay, it derives some advantage from its situation on the great northern road.

In no part of the kingdom are to be found in the same extent, so many early ecclesiastical monuments as in the fenny tracts of Lincolnshire, where stone is wholly wanting, and where the soil does not apparently afford a secure foundation to a building. Their situation, however, was a sort of natural defence against the attacks of freebooters, and the conveyance of heavy materials might have been facilitated by the drains or canals, which must have been cut before such a situation could be rendered habitable.

Lincolnshire has produced several eminent men. Lord Burleigh was born at Bourne in 1521;^c and the two Wesleys, the founders of the Arminian methodists, were natives of Epworth. The small manor-house of Woolsthorpe in the neighbourhood of Grantham, was the birthplace of Newton, who completed what Copernicus and Kepler had left unfinished. In this great man, qualities which are seldom combined, were united; genius with patient perseverance, a most comprehensive mind with great powers of concentration, an almost unerring judgment, and a sagacity that enabled him more than once to lay open the veil of nature, and to predict truths, which were confirmed in a later age.

Yorkshire is out of all proportion in point of size with the other counties. It extends the length of a hundred and thirty miles from Spurn-Head at the mouth of the Humber, to the north-western frontier, while it is ninety miles in breadth from Flamborough-Head to the borders of Lancashire. The circumference is not less than 460 miles, and the superficial extent exceeds 6000 square miles. This great extent gave rise in all probability to its division into three ridings. The North Riding is

^a Sixteen feet in diameter. (M. B. Rees' Cyc.)—P.

^b Lucy-tower.

^c 1520.—P.

bounded on the north by the Tees, which separates the county from Durham, on the east and north-east by the German Ocean, on the south-east by the East Riding, on the south by the ainsty of York,^a and the West Riding, and on the west by the county of Westmoreland. It is eighty-three miles in length from east to west, and thirty-eight in breadth from north to south. The East Riding, the least of the three, is partly separated from the North Riding by the Hertford^b and the Derwent; an irregular line from the Derwent to the Ouse, commencing a short way above Stamford Bridge, forms the rest of the boundary in the same direction; lastly, the Ouse divides it from the West Riding on the south-west.^c The West Riding is the largest of the three; the ainsty of York and the Ouse form its eastern limits, while it is contiguous to the North Riding on the north, to Lancashire on the west, to the counties of Chester, Derby and Nottingham on the south, and to Lincolnshire on the south-east.

The North Riding, it has been seen, comprehends the whole northern part of the country from side to side. The country along the shores of the German Ocean is cold, bleak and mountainous. The cliffs on the coast vary in height from fifty to a hundred and fifty feet, and the neighbouring lands rise very rapidly to the elevation of four or five hundred. The soil consists chiefly of a brown loam, and the hills near the sea abound in aluminous shale, which is worked in many places. The district of Cleveland is remarkable for its fertility; the same may perhaps be said of the vale of York, but both are surpassed by Swale-dale, or the plain on both sides of the Swale. The eastern Moorlands, a wild, barren and mountainous tract, occupy a space not less than thirty miles in length, and fourteen in breadth. They are intersected by ravines and vallies, some of which are very large, and in many of them cultivation reaches to a considerable height. The western Moorlands form part of the mountainous range, which extends from Scotland to Staffordshire. The mineral products of these lofty tracts are not without value; aluminous shale, the most important of any, has been already mentioned, and iron-ore and coal are common to many parts of the eastern Moorlands. It is supposed that veins of copper are scattered in different parts of the western; the fact, however, requires additional confirmation, and it is certain that none of them are worked. Lead is wrought to great advantage, and next to alum, it is considered the most valuable mineral product of the district.

The East Riding admits of almost every variety of soil from the heaviest clay to the lightest sand. The country near the sea from the Humber to the North Riding, is naturally unfruitful, and rendered more so by the climate. But from Spurn-Head to Bridlington, a distance of thirty-eight miles, the shore is low, and the blasting effects of cold winds are less severely felt. The sheep district or the Wolds occupies 300,000 acres, and extends almost from the northern to the southern limits of the Riding. The tract bounded by the Wolds, the Ouse and the Humber, is flat in most places, and the soil consists of a stiff clay or sandy loam. The same may be said of the country watered by the Humber from the

neighbourhood of Hull to Spurn-Head. The whole extent of the Riding is equal to 819,000 acres, and of these 350,000 are pasture, and more than 150,000, arable lands. Agriculture has been much extended of late years throughout this part of the county. Large tracts, formerly flooded the greater part of the year, and yielding nothing but rushes and a coarse scanty grass, are now covered with abundant harvests, and the value of the land has been increased in more than a tenfold proportion. The Wolds have been rendered more fruitful, and the vallies and the declivities of the hills, where oats and barley were lately the only kinds of grain, wave with plentiful crops of wheat. Rabbit-warrens are rapidly disappearing, and the sheep have been crossed and improved with the best breeds of Leicestershire. The manufactures are not so numerous, nor the population so dense as in the other districts; but in point of trade, Hull has become, from its situation, the emporium of Yorkshire, and of several other counties.

The West Riding, the largest of the three, is equal to ninety-five miles in length, and forty-eight in breadth. There is a great variety of soil, but it consists in most places of a strong and deep loam. The number of acres amounts to 1,671,000, and of these more than a fourth are arable. The greatest part of the country is enclosed with hedges or fences, and not the least valuable of its products are corn and cattle. But it is principally as a manufacturing district that the West Riding is distinguished; in this respect it possesses many advantages; it contains within itself the necessary materials, as it abounds in coal and iron-ore, limestone, lead, and other metals and minerals of inferior value. The rivers facilitate its inland navigation, by which the products are not only conveyed to the different ports in the county, but to every part of the kingdom.

In respect of soil, products and the appearance of the country, Yorkshire exhibits in miniature the whole of England. It has been seen that the northern and north-western portions have all the grandeur and variety of mountainous scenery, while a central belt from north to south is little inferior in fertility to the richest plains in the country. Marshes and abundant pastures are scattered in the south and south-eastern districts, and in the numerous list of minerals are found the most valuable and useful that are wrought in England.

It possesses besides all the advantages that water communications afford, and the different rivers are admirably arranged by nature. The Tees separates it from Durham, and cannot be exclusively considered a Yorkshire river, but the greater number rise, continue their course, and discharge themselves in the county. They issue, for the most part, from the lofty tracts in the north and south-west, join each other as they water the central districts, and form a main channel, that terminates in the Humber. Thus, in as much as they can be rendered navigable, all the parts of this large county communicate with each other and with the sea. But independently of these natural advantages, others of the same sort have been obtained by art. The Grand Trunk canal, one of the noblest works of the kind in the kingdom, unites Hull

^a The city of York, which is a liberty independent of either of the Ridings, has jurisdiction over 36 villages and hamlets west of the Ouse, called the Liberty of Ainsty. (Luckombe's Gazetteer.) P.

^b Harford (Luckombe)—rises near Filey Point on the eastern coast, and runs westward to the Derwent.—P.

^c The Ouse first separates it from the Liberty of Ainsty, and then from the West Riding. It is bounded on the south by the Humber and on the east by the German Ocean.—P.

with Liverpool and Bristol, and thus facilitates the interchange of their products. Leeds is united to Liverpool by the canal which bears the name of these two towns, and Huddersfield, by means of its canal, communicates with Manchester.

York, the ancient *Eboracum*, the residence of several Roman emperors, has lost much of the splendour and populousness, that enabled it at an early period to rival London. Although no longer distinguished either by industry or trade, it was long considered the capital of the north of England, and in point of rank the second city in the kingdom. Situated in that part of Yorkshire where the three ridings meet, it forms a county of itself; it is watered by the Ouse and the Fosse; a stone bridge of three arches was erected over the former in 1820, while the other is crossed by three bridges, one of which, the finest in point of architecture, was lately finished. Although by no means a manufacturing place, it is not without importance as the capital of an archiepiscopal see, and the residence of a numerous priesthood. The number of churches is equal to twenty-four, while the population does not amount to twenty-one thousand. York has been stationary or perhaps retrograde, while other towns have made rapid advances; still, as it possesses the courts for the civil and ecclesiastical business of a large province, it is amply provided with proctors and attorneys. The ancient fortifications are in many places entire; the city is entered by four gates and five posterns, and although the walls are falling into decay, they still form an agreeable walk.

The cathedral of York,^a the largest in England, may bear a comparison with any other building of the same sort in Europe. The see had its origin in Roman times, and one of its bishops was present at the council of Arles in the year 347. In the same period the diocesan church of York is mentioned on account of its magnificence; but when the city was taken in the ninth century by the Danes, it was levelled with the ground. A new edifice was raised not long afterwards on its site, but it was destroyed by fire in 1069. A third building, surpassing the two former both in its dimensions and in the magnificence of its architecture, was almost consumed in the year 1137. The calamity, it is said, was soon repaired by the piety and the zeal of the archbishop; but it is equally certain that no part of the church as it then stood, remains at present. The south transept, or the oldest part of the present structure, was built by Walter de Grey in the thirteenth century; succeeding prelates vied with each other in continuing the work which their predecessor had begun, and which was not completed before the lapse of two centuries. The entire length of the cathedral is equal to 524 feet, the breadth of the eastern end to 105, and that of the western to 109; the height of the lantern tower to 213, and of each of the two western towers to 196. The western front is remarkable for its magnificence; the lantern, and the two western towers, exhibit different styles of architecture, and the south transept is distinguished by pointed arches and slender columns. As the building was carried on at different periods, it is marked by the styles of different ages, so that the students of architecture may contemplate the successive progress of their art. But even an uninitiated person cannot contemplate

it without admiring the vastness of its dimensions, the beauty of the several parts, and the majesty of the whole. The late calamity by which part of this venerable structure was destroyed, has shown in what estimation it is held by the English; the expense of restoring it to its original form is defrayed neither by government nor by the church, but by the subscriptions of individuals.

In a county so extensive and so populous as that of York, it is chiefly such places as are distinguished for the wealth, industry or enterprise of their inhabitants, that can be mentioned. But in this point of view no place is more remarkable than Leeds, the most populous town in the county, and the commercial capital of Yorkshire. It is situated about twenty-four miles to the south-west of York, and some notion of its rapid rise may be inferred from the circumstance, that it contained only a single church in the reign of Charles the First. In 1811, the population amounted to 62,534; in 1821, it was equal to 83,796 individuals. Leeds has thus become the principal market of the woollen cloths that are manufactured in the West Riding. The building, which is used as a place of sale for the coloured or mixed cloths, is 380 feet long by 180; it has six double rows of stalls or shops, and the total number of stalls is equal to two thousand. The skill of the architect is displayed in the admirable way in which the building is lighted, an advantage almost essential to the purposes for which it is intended, and one that gives it a great superiority over every other structure of the same sort in France. The white woollen cloths or all those that are not dyed, are sold in a different building, which although less spacious than the former, contains not fewer than 1210 stalls. The market for mixed cloth is held on Tuesday and Saturday; it commences at eight o'clock in summer, and at nine in winter. The different stalls are filled in a few minutes; each vender stands behind his goods, the benches are covered with cloth, and the different pieces are placed as closely together as they can be laid lengthwise, and all this is done without noise or confusion. When the bell ceases to ring, the buyers and agents from different parts of the country enter the hall. According to the regulations of the market, the business is transacted in a whisper; the purchaser fixes on the cloth, leans over the benches, and addresses the clothier in too low a voice to be audible by his neighbour; both, however, agree or differ about the price in a few seconds. In this way, cloth to the amount of £20,000, and sometimes much more, is sold in less than an hour. The market for the sale of white cloths opens as soon as the other is closed, and in both the same regulations are observed.^b The manufactories from which the halls are supplied, extend to a considerable distance from the town; to about ten miles on the south, to nearly fifteen on the south-west, and to more than eight on the north and west. The other branches of industry are of secondary importance; there are, however, several manufactories of linen and cotton stuffs, and of Scotch and Wilton carpets, and also extensive potteries, from which both the home and foreign markets are partly supplied. A considerable trade is also carried on in tobacco, for the preparation of which numerous mills have been erected. Leeds enjoys many advantages for commerce; the long line of canals and rivers extends to Hull on the eastern, and to

^a Called York Minster.—P.

^b Capper, Idem.

Liverpool on the western sea. It is situated in the vicinity of abundant coal mines; it possesses, besides, easy means of communication with the metropolis and every trading district in the kingdom. Such advantages, aided by the spirit and industry of its inhabitants, account sufficiently for its present importance, and it resembles other flourishing towns, in as much as it is not yet represented in parliament.

However great the trade of Leeds may be, it is not sufficient for the numerous woollen manufactories in the west of Yorkshire; these commencing below Craven, occupy a tract of which Leeds, Bradford, Halifax, Huddersfield and Wakefield may be considered the centres. But the principal trade of Bradford consists in its numerous worsted manufactures, which are supposed to be more extensive and varied than those of any other town in Yorkshire. Coal and iron are obtained in the neighbourhood, and the most ponderous articles in malleable and cast iron are wrought. Bradford is pleasantly situated at the junction of three valleys on the south of the Aire, about twelve miles west from Leeds; a navigable canal, drawn from that of Leeds and Liverpool, passes through the middle of the town, and enables the inhabitants to export iron, coal, flagstones and slates.

Wakefield, the handsomest of the trading towns in the West Riding, is finely situated on an eminence above the waters of the Calder, at the distance of eight or nine miles to the south of Leeds. Although long noted for its woollen trade, it has made more rapid advances within the last thirty or forty years than at any former period, and the numerous manufactories that have been erected in the town and in the neighbouring villages, partly supply the markets of Leeds and Huddersfield. It carries on, besides, a great trade in corn and coal, and it is also a mart for the wool that is imported for the Yorkshire manufacturers from different parts of the kingdom. It communicates with Huddersfield by means of a canal, and with Leeds by the Calder, which, having been rendered navigable from Ealand to its junction with the Aire, has greatly contributed to the prosperity of the adjacent country.

Huddersfield, sprung up in the last century, surrounded by bleak moors, and built near the site of the ancient *Cambodunum*, has become the mart of narrow cloths. This manufacture extends ten miles to the south, where the coarser cloths that are exported to the Mediterranean, are made. The Huddersfield canal, which opens a communication with Ashton-under-Line, Manchester and some of the most important manufacturing districts, has been already mentioned; but another extends from the same town to the Calder, whence the river navigation is continued to Wakefield.

Halifax, near the borders of Lancashire, is an ancient and flourishing town. It appears to have possessed no inconsiderable share of the cloth trade during the sixteenth century, while its barbarous gibbet law was in force, by which theft could be punished by decapitation within the limits of its extensive parish. It has been affirmed that the Halifax machine differed little from the guillotine, and that Lord Morton, when regent of Scot-

land, carried a model of it into his native country, where it was used and known under the name of the maiden. The many rivulets that water Halifax have facilitated the erection of numerous mills and extensive machinery. Although it participates largely in the cloth trade, other articles are manufactured. Many shalloons are woven for the Turkey market; they are sent to Hull, and thence shipped to the Levant. Of late years great quantities of woollen stuffs have been exported to the South American states.

Such are the most important of the clothing towns in the West Riding of Yorkshire. The merchants attend the several markets, and deal in the manufactures of other districts as well as of those they inhabit. The woollens not only supply the home market, but are exported to the places that have been mentioned, and also to Holland, Germany, Russia, Italy and Spain.^a The raw materials are obtained from different quarters: Spain, Saxony, and the south of England, Shropshire and Norfolk, supply the wool for the finer cloths; the counties of Lincoln and Leicester furnish an inferior sort for the worsted and the coarser stuffs.

Iron and coal are found in the country in which the manufactures are carried on; in other respects it possesses few advantages. As to climate, it is even more variable than many parts of England. It is naturally difficult of access, and for the most part sterile or unfruitful. The means of communication were formerly few, but at present they are numerous and varied. Hills, on which heath was only found, are now adorned with country houses, surrounded by plantations and verdant pastures. Plains that yielded a scanty herbage, and in which the divisions were marked by loose stones, are enclosed by lofty hedges, and covered with luxuriant harvests. It is not wonderful, then, that the same district was long thinly peopled, and one of the poorest in England; nor is it likely to excite surprise, if the obstacles which industry can surmount be considered, that it is now little inferior to the most populous and wealthy in the kingdom.

But, although all the natural products have been mentioned, it is necessary to enumerate other products of industry. Thus, in Sheffield and the circumjacent villages, more than fifty thousand persons find employment on a soil rich in iron and in coal. The town is pleasantly situated on an eminence near the southern extremity of the county, at the confluence of the Sheaf and the Don, the one bounding it on the east and the other on the north-east. It is regularly built, and adorned with several public buildings, and two modern bridges; but the stranger who enters it for the first time, is less likely to admire its edifices than the extensive works and unnumbered forges, that are never suffered to remain at rest. The town was famed for its hardwares at so early a period as the thirteenth century, and it is more than once mentioned in the writings of Chaucer;^b its rise, however, dates from modern times. An enterprising townsman began to trade with the continent in 1750, and much about the same period the navigation of the Don was extended and improved. Not long after-

^a It might be added, to America.—P.

^b Chaucer, who wrote in the reign of Edward III., mentions the "Sheffield Whittle" in one of his poems. (Rees' Cyc.)—

A Shefeld thwitid bare he in his hose.

(The Reve's Tale, line 13.)

Thwitid. In the Cholmondely MS. and the former editions, it is *Thweetell*, *Thwytell*, or *Thwittell*, a whittle. Ang. Sax. *hwitel*, a little knife. (Urry's Chaucer. Poems, p. 31. Glossary, p. 66.)—P.

wards, the silver-plating of brass and copper buttons was introduced, and the profitable manufacture of plated goods has been gradually carried to an unparalleled extent. The situation of the town, the two rivers that water it, and the abundance of coal, have facilitated the use of machinery, by means of which, and the improvements that the workmen have made in their art, the manufacturers of Sheffield are now able to undersell every market in Europe. According to the census of 1821, the town contains 42,000 individuals, but the whole parish, of which it forms a part, is peopled by 62,015 persons. It may be added, that it possesses ample means for the instruction of its inhabitants, such as mechanics' institutions, numerous schools, and a Lancasterian one for the education of eight hundred children. It requires, indeed, but a superficial knowledge of the present state of England to be convinced that the education of the people in the different towns is everywhere in the ratio of their commerce and industry.

Although the East Riding is neither so wealthy nor so populous as the one that has been described, Hull^a may be ranked with the most important towns in Yorkshire. It owes its foundation to Edward the First, who, on his return from the conquest of Scotland, visited the confluence of the Hull and the Humber, and thought the position well adapted for a place of defence. It has also been supposed that the king entertained other and nobler views, and discovered in the future port the centre of commerce between the north and south of Britain, and between the interior of England and the coasts of Flanders, Holland, Denmark and Sweden.^b

Notions so enlightened accord ill both with the times in which Edward flourished, and with the bent of his genius, which excited him to war and conquest rather than the useful arts of peace. It is certain that he built a strong town, to which he gave the name of Kingstown, and that it became the place of a garrison, and was considered impregnable; as a proof of the last assertion it may be remarked that even at so late a period as the civil wars, the royal troops made many attempts to take it without success. It is equally certain that its commerce first rose into notice, when it became of secondary importance as a garrisoned town.

Little more than fifty years ago Hull had no other harbour than the bed of the river,^c and as it has but little depth of water, vessels were left aground at low tide. In 1774, a company was authorized by act of parliament to build within the period of three years a dock and warehouses on the northern front of the old fortifications.^d The new works on the dock, quays and warehouses occupy a surface of thirty-three acres. Another

dock was commenced in 1807 on the western front of the old fortifications;^e it is a hundred and twenty yards long, and three hundred and twenty wide, and the quays and warehouses belonging to the New Dock Company cover a space of three acres. A third dock, which was begun in 1814, and left unfinished, was commenced anew in 1817; it is provided with an admirable ballast machine, that is set in motion by a steam-engine.^f Thus, in place of fortifications the old town is surrounded by the three docks and the waters of the Humber and the Hull. The prosperity of the place may be attributed to its situation, which affords it the means of a very extensive intercourse with the interior, communicating by the Humber with all the navigable rivers and canals in Yorkshire, and connected by means of the same river with the Trent and its numerous artificial ramifications. Possessing such advantages, it retains the export and the import trade of many of the midland and northern counties. It carries on an extensive traffic with the Baltic, for which it is very conveniently situated, and it has also commercial relations with the southern countries of Europe, and with America. The act of parliament by which individuals are permitted to undertake on their own account certain branches of commerce with the Indies, has laid open a new and an important trade to the inhabitants. But its earliest trade and the first sources of its wealth were derived from the Greenland fisheries, and more ships are still fitted out for that country than from any other port.^g The streets in the old town are narrow, dirty and irregular, but in the new town, or the part beyond the ancient ramparts, the streets are clean, spacious and well-built.

Other towns might be added to the above list; thus, a number of vessels are fitted out from the port of Scarborough, and Doncaster has become wealthy from its manufactures; still, however, they must be considered of secondary importance in comparison of those that have been mentioned. If the populous county of York has risen to a state of prosperity, to which it is vain to look for a parallel in its past history, it may serve to illustrate the importance of a liberal government and free institutions, promoting the arts of peace, encouraging private industry, giving full scope to individual enterprise, and rendering property inviolable. The present state of the country forms a remarkable contrast with its history during the darkness of the middle ages, and even at a later period. The venerable city of York was destroyed by the Conqueror, and a great part of the country converted into a desert. Afterwards exposed to the incursions of the Scots, the habitations were burned, and the country laid waste by David king of Scotland, who was at last defeated with great slaughter in the battle

^f Idem, *Ibid.*

^g The inhabitants of Hull began to frequent the coasts of Greenland about the end of the sixteenth century; but afterwards about the middle of the eighteenth century, that lucrative trade declined not only in Hull but in all the ports of England.—Mr. Standidge, a persevering and speculative merchant, and a native of Hull, was anxious to promote this important branch of commerce. He fitted out a vessel on his own account, which he sent to Greenland, an enterprise that had never before been undertaken by any but companies. The success of

his undertaking was long doubtful. From her first voyage, the vessel returned with one whale and four hundred seals. At this period the skin of the seal was considered useless, and the sailors threw them into the sea. It appeared to Mr. Standidge, that they might be tanned with profit; but the tanners of Hull refused to soil their pits with the skins of fish. Having applied to the tanners of a neighbouring town, whose notions about the purity of their pits were less scrupulous, the plan succeeded beyond the projector's expectations, and shortly afterwards he and his family wore seal-skin shoes. Mr. Standidge had thus the merit of having enriched his country with a new product and a new article of trade, which has become an important branch of revenue to the government. Seal-skins, that were formerly sold at most for 2d. or 3d. each, now rose in value to five and six shillings. The Greenland fisheries, which had fallen into decay, began to be carried on again with fresh vigour. (C. Dupin, Force Commerciale, volume 1st.)

of the Standard. It was destined to become the scene of the wasteful conflicts between the Yorkists and Lancastrians, and Edward the Fourth gained a victory near Sherburn, which was purchased by the slaughter of 35,000 men. It was alternately pillaged by the king's troops and the parliamentary forces during the civil wars; and the rise of Cromwell, and the continued adverse fortune of Charles, date from the battle of Marston-Moor, which was fought in the neighbourhood of York.

The *Brigantes* formed one of the most powerful nations in ancient Albion; originally settled in Thrace, they diffused themselves over Germany and Gaul, and passed from those countries into Britain. They occupied almost the whole of Durham and Yorkshire, and a part of Northumberland and Cumberland, in which last county, one of their tribes assumed the name of *Cumbri*. The migrations of the same people are attested by ancient authors;^a but history takes no notice of the causes which induced them to leave their native land. It is apparent from a very slight examination, that neither the excellence of the climate, nor the productiveness of the soil, were likely to attract them to these northern regions. Much less can it be supposed that the mineral treasures in which the country abounds, possessed any value in the estimation of barbarians. In the Roman period, Durham was included in the province of *Maxima Cæsariensis*, and in the time of the heptarchy it formed part of the kingdom of Northumberland. But when the sovereigns of that petty kingdom embraced Christianity, the superstition of the period induced King Egfrid to make over the whole county in the year 685, to St. Cuthbert, bishop of Lindisfarne,^b and his successors. The donation was confirmed by the Conqueror, who conferred the title of counts palatine on the bishops, and invested them with so great authority that they were said to be as powerful in their diocese as the king in his dominions. Hence it happens that the county is frequently styled the Bishopric of Durham.

Durham, situated between the rivers Tees and Derwent, is contiguous on the east to the German Ocean. It is bounded on the north by Northumberland, from which it is separated by the Derwent and the Tyne,^c on the south by the river Tees, which divides it from Yorkshire, and on the west by Cumberland and Westmoreland. The superficial area has been computed at 1040 square miles, and it is divided into the four wards of Chester, Durham,^d Easington and Stockton.^e The air, which is cold and piercing, might be still more so, if the ice and snow were not dissolved by the vapours from the German Ocean. The northern part of the county is barren, and in many places thinly peopled; the western is bleak and hilly, being crossed by the central ridge, which, however, is no where very lofty in Durham. But these heights give rise to numerous streams that flow eastwards, and lower eminences, connected with the higher, extend in different directions. The southern as well as the eastern districts are fruitful and, although the farms are in

^d Darlington. (Rees' Cyc. Ed. Enc.)—P.

^e Besides the main body of the county, there are two detached portions, viz. a larger portion on the north of Northumberland, bounded S. by that county, N. W. by the Tweed, which separates it from Scotland,

general small, well cultivated. The abundance of coal has been already mentioned; the other mineral products are iron and lead, which are obtained in Teesdale from upwards of forty mines,^f excellent mill-stones, fire-stones for ovens and furnaces, freestone for building, and slates for roofing.

The city of Durham was founded by the monks of Lindisfarne, who removed to it in the year 995, and carried along with them the bones of St. Cuthbert. It is situated on an eminence, and almost surrounded by the windings of the Wear, of which the banks are covered with woods, or broken by precipices. The loftiest part of the city is enclosed with walls, and in the same quarter the cathedral and the castle are the most conspicuous buildings. The first is worthy of notice for its size and costly ornaments, but the architecture is of a mixed sort, and the Norman style is contrasted with the additions of later ages. It may have a solemn and imposing effect, but as it is inferior to other English cathedrals, it does not correspond with the character of the see, its great wealth and extraordinary privileges. The castle is converted into an episcopal palace, and although very different from the last building, it must at least be considered a more perfect specimen of Norman architecture. Besides the cathedral, there are six other churches, two catholic chapels, and several meeting-houses for quakers, presbyterians, methodists and other dissenters. Some of the improvements in the town date from a very recent period; the principal streets are now covered with broad pavements for foot passengers, all of them are lighted with gas, old and ill built houses have been pulled down, and others more commodious and elegant are erected on their site. Few of the episcopal cities in England are distinguished by the trade or industry of their inhabitants, and Durham forms no exception to the general rule. It possesses manufactories of shalloons, flannels and carpets, but they are not supposed to be in a flourishing condition.

An old cross^g at no great distance from the town was erected by Ralph, Lord Neville, to commemorate a victory gained by the English over the Scotch; the former were commanded by Philippa, the wife of Edward the Third; the latter were routed with great slaughter, and David Bruce their king, together with many of the nobles, was taken prisoner.

Sunderland, at the distance of thirteen miles to the north-east of Durham, may be considered a more important town than the capital of the county. It is situated at the mouth of the Wear, and although now populous and prosperous, it was at one time merely a part of Wearmouth parish. The High Street, the principal one in Sunderland, is about a mile in length, and not less than thirty yards in breadth; it is adorned in many places with well built houses. The Low Street which extends parallel to it, and along the banks of the river, may be termed the Wapping of the town; it communicates with the other by a great many narrow and dirty

and N. E. by the German Sea, and divided into Islandshire on the east, along the coast, and Northshire on the west, along the Tweed, and a much smaller portion, on the coast of Northumberland, between the rivers Coquet and Blyth.—P.

^f This clause should refer only to the lead mines.—There are about 86 lead mines wrought in this county, of which 48 are in Teesdale. The iron mines are in the western part of the coal district, which occupies the north-eastern part of the county, and does not extend to Teesdale. (Ed. Enc.)—P.

^g Neville's cross.

lanes, where it is in vain to look for the cleanliness which characterises English towns. The trade arises principally from the exportation of coal, and in that branch of industry, it is only inferior to Newcastle; the other exports are lime, glass, grindstones and copperas; the imports consist of Baltic produce and various articles for domestic consumption. The Wear, it has been already remarked, does not admit merchant ships of a great tonnage, but vessels get much more readily out to sea than from the Tyne. The manner in which the harbour is constructed adds to its security; it consists of two piers, one on each side of the Wear. In common with the great commercial towns in England, it possesses charitable institutions, and others of which the object is to diffuse knowledge among the lower orders.

Bishop Wearmouth, a place of antiquity, and situated in the immediate vicinity of Sunderland, may now be said to form a part of the modern town; the inhabitants participate in the same trade, and are engaged in the same branches of industry. It is there that an iron bridge, one of the wonders of modern art, crosses the Wear, and connects Sunderland with Newcastle and Shields.^a The dimensions of the bridge have been already mentioned; it may be added that it was erected in consequence of the patriotic exertions of Rowland Burdon, the member for Durham. Monk-Wearmouth, which is not more than a mile from Sunderland,^b derives its name from a monastic institution of the seventh century, some remains of which may still be traced. The town is not very populous, but the inhabitants are industrious; they are employed in building ships, and in other branches of industry connected with the Sunderland trade.

On the north of Sunderland, and on the southern bank of the Tyne, is situated the town of South Shields, which is separated from North Shields by the river, the boundary between the counties of Durham and Northumberland. Some of the largest coal vessels in England take in their lading at the same place; indeed its principal business consists in providing vessels for the coal trade, and on that account several naval yards and docks for the construction of ships have been at different times erected. The making of salt from sea water furnished employment to a great number of hands, but that branch of industry has declined, since an abundant and strongly impregnated brine spring was discovered near Newcastle. More glass, however, is now made than at any former period, and there are at present upwards of twelve large glass-houses. The town consists chiefly of a long, narrow and crooked street almost two miles in length; a square near the centre of it, which serves as a market place, is adorned with the town hall and other public buildings. From what has been already said, it may be inferred that South Shields is a dirty town, but independently of its smoke-covered houses, and the narrow and crooked street, which is never very clean, it has an unseemly appearance from many artificial hillocks, formed by ballast and the refuse of the glass, salt and soap works.

The many lives that had been lost at sea near Shields, induced a number of the inhabitants to form themselves into a society for the purpose of saving mariners from

shipwreck. A reward was proposed by the society to the person who should furnish the model of a boat better adapted for resisting the impetuosity of the waves than any that had been hitherto used. The result of the proposal was the invention of the Life-Boat by Mr. Greathead.

No port has been built at the mouth of the Tees on account of the breadth and shallowness of the river; but Stockton, at no great distance above it, may be considered its harbour. A fine bridge of five arches, of which the central one is about seventy-five feet wide, was erected over the Tees at Stockton in the year 1777. The town, on account of its well built houses and numerous public buildings, has been considered one of the finest in the north of England. The manufactures are sail-cloth, ropes, damask, diaper and linen, and it carries on a great trade in proportion to its population; thus it has extensive commercial relations with the Baltic, Hamburg, Norway and Holland, and many small vessels are every year built in its docks. The ancient castle was taken and destroyed during the civil wars, and the only stone houses in the town are built of its ruins. Stockton, it may be added, serves as a port to the manufacturing and industrious town of Darlington, which has been long noted for its table and napkin linen, made partly of English and foreign flax.^c It possesses besides two iron founderies, several mills for spinning wool, and others for grinding optical instruments. The most remarkable building is a large church of ancient and curious architecture, erected in the twelfth century by Hugh Pudsey, bishop of Durham.

It may be remarked that the small island of Lindisfarne, which has been already mentioned, and which is better known by the name of Holy-Island, from having been the ancient residence of monks, is under the civil jurisdiction of Islandshire, a detached portion of Durham, on the north-eastern side of Northumberland.^d No towns of any importance are situated in that part of the county, where Lindisfarne forms part of the mainland at low water, and is surrounded at full tide by the sea. The extent of the island is equal to 1000 acres, and of these more than five hundred consist of sand. The village at the south-western extremity, and all the other houses, do not contain more than 700 inhabitants.

Such are the most important towns in the county of Durham, and the products of industry for which they are distinguished. In many places various articles of wrought iron are made, while in others there are founderies for casting iron and brass; the glass-houses and potteries, and the salt, copperas and sal-ammoniac works, furnish the materials of an extensive trade; linen, cotton and woollen stuffs are made in the county, coal-tar is exported, and paper-mills and other manufactories have lately been established.

Northumberland, the most northern county in England, is washed on the east by the German Ocean; it borders on Scotland and Cumberland on the west, and is bounded by the last county and by Durham on the south.^e Included by the Romans in the province of *Maxima Caesariensis*, the Saxons raised it to the rank of a kingdom, and called it *Northan-Humber-Land*, a name, which with little varia-

^a It connects Sunderland immediately with Monk-Wearmouth.—P.

^c Partly of English, and partly of foreign flax?—P

^d See note ^e p. 1205.

^e It should be added: and by the detached portion of Durham, including Islandshire and Northamshire, on the north.—P

tion it has since retained. But its ancient limits have been much contracted, for in the time of the heptarchy it included Yorkshire, Durham, Lancashire, Westmoreland and Cumberland, and extended northwards to the Clyde and Forth in Scotland. The modern boundaries, exclusively of the coast, are marked in most places by mountains or rivers, and even in its present reduced form, it must be considered a large county. Thus, the greatest length from north to south is nearly equal to seventy miles, and the utmost breadth is not less than forty. It appears from a return made to the House of Lords, that it contains 1850 square miles, or 1,157,760 acres.

The face of the country is sufficiently varied, and a considerable portion of it is unfit for cultivation. The sea-coast is nearly level, while the central districts are more diversified; they are intersected or broken by rocky hills, running into ridges, of which the bases are watered by the principal rivers. Open hills, moors, waste land and marshes form by far the greater portion of the western districts. The Cheviot Hills near the Scottish border have a more agreeable aspect; they rise in unnumbered forms, and are covered with verdant pastures, and their sloping sides enclose fruitful vales or ravines. They extend from the head of the Coquet to Allentown, and onwards to Prendwick, Brunton, Elderton, Wooller and Mindrim.^a These hills have some influence on the climate, for the snow remains on them several months after it has disappeared in the plains. The most fruitful tracts are the vallies on the eastern side, through which the rivers take their course. The eastern or level part of the country is covered with a strong and fruitful clay, which reaches in general beyond the great northern road. A sandy and dry loam forms the vales of Breamish, Till and Beaumont, and the same sort of soil may be observed in the neighbourhood of Newburn, on the Coquet both above and below Rothbury, and on the Aln from Alnwick to its mouth. A dry loam, mixed with gravel, is the most common soil in the Cheviot tract; but moist loams on a wet cold bottom occupy a great portion, particularly the central and south-eastern districts. Black peat earth, the prevailing soil on most of the hills, extends in many places through the lower parts of Northumberland.^b

Enough has been said to render it apparent that neither the climate nor the soil is favourable to the production of food, but these natural obstacles have been surmounted by perseverance and industry; many hills and lofty tracts, formerly barren or covered with useless plants, are now cultivated, agriculture has been brought to a high degree of perfection, and more than 140,000 acres have been enclosed within the last fifty years. The farms were formerly small, but they are now large, and the advantages that have been gained by uniting many into one, are infinitely greater than the temporary evils which were occasioned by the change. The growth of grain from the investment of capital on the soil has been increased, and large corn tracts in which wheat takes its rotation,

have thus been added to the arable lands of the county. The progress of improvement has been accelerated by the great quantity of lime in almost every part of Northumberland, and by the stone or shell marl, which in some districts is equally abundant.^c The farmers in the pastoral tracts on the Cheviot Hills devote themselves to the breeding of cattle, and oxen not inferior to the finest in the kingdom, have been reared by the graziers on the Scottish border. But however much the agricultural riches of Northumberland may have been increased, they are secondary in importance to its mineral treasures. If the value of an article be estimated by its utility, the coal, for which the county is distinguished, and of which the mines have been already described, forms its real wealth. It accounts in a great degree for that facility and rapidity of production, which has rendered England the emporium of the world, and for the great accumulation of capital, which has enabled the inhabitants to increase the fertility of their soil, and to improve and extend communications of every sort. The most valuable of the metals holds the next rank, and an almost inexhaustible supply of iron-stone is embedded in the strata of the coal districts. The same substance is shipped from Holy-Island to different parts of England and to Scotland.^d Lead ore is found in abundance in the mountainous districts on the south-west, and most of the veins from which it is obtained are rich in zinc, and from some of them silver is extracted. Although the country offers such advantages to industry, and although it is watered by numerous rivers, still many of them are ill adapted for inland navigation, and the deficiency is very imperfectly supplied by means of canals. The Tyne and the Tweed have been long famed for their salmon fisheries, and the metropolis is principally supplied with their produce.^e The fish are packed in pounded ice, and conveyed by this means almost as fresh to the London market as when they were taken from the water. The sea coasts, which afford the means of subsistence to many of the poorer inhabitants, abound with a great variety of fish, such as cod, ling, turbot and soles.^f

Newcastle, the most important place in the county, is situated on the banks of the Tyne, at the distance of about ten miles from its mouth; it is connected by means of a bridge with Gateshead, which although on the other side of the river, and consequently in Durham, forms part of the town. Situated in a country abounding in coal, Newcastle has become the centre of an extensive trade, and a place of great manufacturing industry. The advantages of such a situation are the causes of its wealth and increasing population; but at an early period, while the island was in the possession of the Romans, the ancient *Gabro-Gentum*^g was distinguished for the importance of its military position; it was one of the principal stations connected with the vallum of Adrian, or the old Picts' Wall, which was built to defend the inhabitants

^a Their eastern outline extends from the Coquet by Alnham, Prendwick, Brandon, Elderton and Wooller, to Mindrum. (Atlas Soc. Useful Knowledge.)—P.

^b Agricultural Survey of Northumberland, by Messrs. Bailey and Culley.

^c Both stone and shell marl are likewise extensively diffused. (Ed. Enc.)—Stone and shell marl are distinct varieties. Shell marl is an aggregate of decomposed shells; stone marl, an indurated variety of earth marl, and of an uniform texture.—P.

^d "The iron mines furnish considerable quantities of that metal, which are exported from the island, called Holy-Island, to the neighbouring countries." (M. B.)—P.

^e "The Tyne and the Tweed have been long famous for their salmon fisheries. This fish is exported from the small port of Berwick to London—" (M. B.)—Salmon are no longer caught in the Tyne, but are still taken in great quantities in the Tweed. (Ed. Enc.)—P.

^f Capper, Idem.

^g *Gabrosentum*. (Camden.)—P.

of the south against the incursions of the barbarous hordes in the north. When the province was abandoned by the Romans, and the English had to trust to their own resources, Newcastle was fortified with great care, and the old walls were flanked with towers, of which several are even at present in a state of preservation. It bore the name of *Monkcester*^a not long before the Norman invasion, and it derives its present name from a castle erected by Robert, son of William the Conqueror,^b after his return from an expedition into Scotland in the year 1080.

Many works and manufactories are situated in the town and neighbourhood; hardwares and wrought iron are exported, and several potteries might be enumerated, in each of which more than a hundred persons are constantly employed. It carries on a considerable trade in the finer sorts of glass: its chemical works are not without importance; they consist chiefly of white-lead, minium and vitriol. The total number of vessels belonging to it is about 850; their burden is not less than 200,000 tons, and they are manned by 9000 men. It has a share in the Greenland fisheries; it imports wines and fruits from the south, and timber, hemp and other articles from the north of Europe. In the coal trade it is the first port in Britain, and waggons for the conveyance of coal were first set in motion by steam in the neighbourhood of Newcastle. Such were the germs of an invention, which has led in its improved and developed state to the rapid communication between Manchester and Liverpool. More than twenty packets sail regularly between the same port and London, and others sail to the principal harbours in England and Scotland.

The town possesses several charitable institutions, one of which, the keelmen's hospital, is wholly supported by contributions from the coal-workers. The children of the poorest inhabitants may reap the advantages of instruction; for their benefit different schools have been erected, and a Lancasterian one was built by subscription to commemorate the fiftieth year of the reign of George the Third.^c

Many yards for building ships are situated on the banks of the Tyne, and the workmen are chiefly employed in constructing vessels for the coal trade. The river is navigable for ships of three or four hundred tons from its mouth to the bridge at Newcastle, but the largest coal vessels anchor off Shields. The bed of the Tyne from the same town to the bar at Tynemouth, may be considered a vast basin in which ships sheltered from the sea and from every wind, receive the valuable products of the mines and manufactories.

Two places below Newcastle, and on the same river, may be briefly mentioned. It has been already seen that North and South Shields are connected with each other by means of an iron bridge.^d The inhabitants of both towns are engaged in the same trade, and employed in the same branches of industry. At no very remote period the former place consisted of only one or two dark alleys, with a few dirty and wretched fishing huts; these

have been succeeded by spacious and airy streets, and by commodious and well-built houses. The trade, which keeps pace with a rapidly increasing population, may soon vie with that of the great towns in England; even at present more than four hundred vessels are annually laden at the harbour. Tynemouth, the other town, is situated about a mile and a half from North Shields, and, as its name imports, at the mouth of the Tyne. It is built on a promontory, which rises almost perpendicularly on the side of the sea, and it is defended by a castle which is chiefly worthy of notice on account of its fine military position, an advantage that did not prevent it from falling into the hands of the Scotch during the civil wars. The bar, a dangerous sand bank, extends across the mouth of the river, and it is broken in several places by rocks. To obviate the danger which might be otherwise occasioned, a light-house has been erected; it is about sixty feet in height, and stands on a promontory nearly two hundred feet above the sea. It is supposed that nearly 800,000 chaldrons of coals are annually shipped from Tynemouth to London.

The other towns in Northumberland are of secondary importance. Hexham, finely situated in the vale of the Tyne above Newcastle, was once an episcopal city, and its ancient cathedral is still its most magnificent ornament. The inhabitants are industrious, and many of them are employed in tanning leather. Morpeth, on the north road, about fourteen miles beyond Newcastle, may be mentioned on account of its cattle fairs. The town of Alnwick, the titular capital of the county,^e is situated midway between Newcastle and Berwick. It is a borough by prescription, but it contains little worthy of notice except its ancient military castle, which has long since been converted into the residence of the Northumberland family. The same place was more than once disastrous to the kings of Scotland. Having been strongly fortified in the reign of William Rufus, it resisted a long time the forces of Malcolm the Third, by whom it was besieged. It was at last delivered from this danger by the cowardly treachery of a soldier, who pretending to give up the keys to the Scottish king, drew his dagger, and pierced him to the heart.^f Edward, the son of Malcolm, wishing to avenge the death of his father, was defeated and slain in the neighbourhood. In the year 1167, Henry the Second of England gained a decisive victory at Alnwick over William the Lion, king of Scotland, took him prisoner, and compelled him to pay a large ransom. The town exhibits a singular spectacle on the day of St. Mark, and one not very creditable to the state of society, or at all events proving the observance of the ridiculous customs that prevailed in the dark ages. Those who are to acquire the freedom of the town, or according to the phrase, *to leap the well*, appear on horseback at an early hour in the market-place. Each man is dressed in white, with a sword by his side, and wears in place of a hat, a white nightcap on his head. The cavalcade, accompanied by four chamberlains in the same costume, proceed to a neighbouring moor, where the future free-

men dismount, run through a muddy pool, and perform other foolish ceremonies.

Berwick-upon-Tweed was an important and strong fortress when England and Scotland were hostile nations, to each of which it belonged according to the chances of war. Although the greater part of it is situated in Northumberland,^a it has never been annexed to any local jurisdiction;^b it is not supposed to be either in England or Scotland, but is separately named when included in public acts. It is defended on the north and east with flanks, bastions and a ditch, and on the south and west by high walls, to which the river serves as a moat. The harbour is by no means commodious; vessels drawing more than twelve feet of water cannot cross the bar, and there is no safe riding in the offing. But in spite of this disadvantage, Berwick carries on a considerable trade with the metropolis, and of late years different branches of industry have been extended and improved.

Cumberland, like the last county, borders upon Scotland on the north, from which the maritime part is separated by the Solway Firth, and the inland by a small brook and the river Liddel;^c on the east it is contiguous to Northumberland and Durham, and the limits in that direction are for the most part artificial; it is washed by the Irish Sea on the west, and it is bounded on the south by part of Lancashire and the whole breadth of Westmoreland. The greatest length of the county is about eighty miles, and the greatest breadth nearly forty. In superficial extent it is equal to 1178 square miles, or 945,920 acres; but of these little more than a half are arable, and the greater part of the remainder is wholly unfit for cultivation, consisting either of lofty mountains, barren moors, or the romantic lakes, of which some mention has been made in a former chapter. The civil divisions form five wards, so called from the inhabitants having at one time been obliged to keep watch and ward against the Scottish borderers.

The various sorts of soil have been classed under four different heads: viz. 1st, a strong rich loam, of which there appears to be but a small portion; 2d, a variety of loams from the rich brown to the light sandy; under this division a great part of the county is included; 3d, wet loam, generally on a clay bottom; and 4th, black peat earth, the most common in the mountainous districts, particularly those in the neighbourhood of Northumberland and Durham.^d

A mountainous ridge in Cumberland forms part of the chain, which runs north and south between the eastern and western sides of England, and another tract in the south-western part of the county is little inferior to the former in height. In the first, and not far from the borders of Durham, is situated Cross-Fell, which rises to the elevation of 3400 feet, and is consequently the highest mountain in England; in the second, Helvellyn attains the height 3324, Skiddaw, or *Skyday*, is equal to 3270, and Saddleback is not supposed to be lower

than 3048 feet. In the former are obtained various minerals useful for different purposes, and also coal, limestone and lead. The last substance is chiefly worked near Aldston-Moor^e on the borders of Durham. The second tract, composed for the most part of the schistus that affords the blue slate for covering houses, is also rich in plumbago or wadd;^f the name which the miners have given to this valuable substance, of which the finest kinds are so abundant in the neighbourhood of Borrowdale, that the mines are opened and closed after certain intervals,^g lest the price of the commodity should be diminished by too great a supply. The quality of the metal^h accounts sufficiently for the superiority of the English pencils, which are so much prized in France and other countries on the continent. It is not many years since copper mines were wrought at Caldbeck and in the neighbourhood of Keswick. Iron ore is obtained at Egremont and in the country between it and Whitehaven.

It appears that Cumberland is in proportion to its size, one of the least populous counties in the kingdom, and the cause of it may be discovered in the nature of the country, and in the difficulty of multiplying communications through a lofty and rugged district. Agriculture in consequence of these natural disadvantages, is in a less advanced state than in other parts of England; the land is for the most part divided into small farms, and much capital has not been laid out in the improvement of the soil. Mountain-torrents or impetuous streams are abundant, but the county is ill supplied with navigable rivers.

Carlisle, the capital of Cumberland, is situated at the confluence of the Eden and Calder,ⁱ of which the united streams fall into the Solway Firth, about five miles below the town. Although the navigation of the Eden is interrupted by shallows, it was not before the year 1823 that an artificial channel was cut between Carlisle and the sea. The name of the town seems to have been derived from the Saxon word *Caerlyall*, signifying the town near the wall,^k and thus indicating its vicinity to the vallum, from which it was only distant a quarter of a mile. As a frontier town, it was exposed to frequent attacks, and for its defence it was fortified with a castle, a citadel and massive walls. The walls were first built in the seventh century by Egfrid, king of Northumberland; the castle and citadel were erected by William Rufus. The former, situated at the north-western extremity of the town, is still kept in repair, and contains, among other buildings, a magazine for gunpowder, and an armoury, in which more than 10,000 stands of arms are generally deposited. It was in the castle that the unfortunate Mary Stuart was confined in the year 1568, and a neighbouring garden which she used to frequent, is still known by the name of the Lady's Walk.^l The principal streets communicate with the market-place which is much disfigured by a guard-house that was built during the civil wars, when Cromwell occupied the town. The ancient fortifications, like other works of the

^a This is not true. It is situated on the north side of the Tweed, at its mouth, and originally belonged to Scotland, of which it was one of the four principal boroughs. It is separated from Northumberland by the detached portion of Durham, called Islandshire.—P.

^b It forms a town and county of itself, with its own separate sizes.—P.

^h Plumbago is not a metal. It is composed of carbon with a small quantity of iron.—P.

ⁱ Caldew.

^k The name is most probably derived from the Celtic, *Caer*, a city, and *Luel*; signifying the town or city of Luel. Gibson's Camden. (Ed. Enc.)—P.

^l During her imprisonment, the royal captive used to walk in front of the castle, which yet retains the name of the Lady's Walk. (Ed. Enc.)—P.

same period, are certainly imperfect, and inadequate to the purposes of modern warfare; the same remark is equally applicable to the comparatively late additions which have been erected for their defence; still, however insignificant both may appear, Carlisle was twice besieged in the rebellion of 1745; it was first taken by the Scotch, and afterwards by the English under the Duke of Cumberland, in both times not without a siege. It may be remarked that it was once a Scotch town, and that Henry the Second received at Carlisle the honour of knighthood from David the First. One or two instances may be mentioned to show how much it has suffered from its frontier position; having been taken by the Scotch in the time of Henry the Third, the greater part of it was destroyed by fire, and it was twice exposed to a similar calamity in the succeeding reign; at a later period Henry the Eighth laid siege to it with an army of 8000 men, inflicted unjust punishments on many of the inhabitants, and reduced the rest to obedience.

The cathedral, for Carlisle is an episcopal city, having been built at different periods, displays different styles of architecture, and although some detached portions of it may be admired, it can neither vie in size nor in magnificence with other buildings of the same sort. Part of the western wing was demolished during the civil wars; the breach or opening thus made was afterwards closed, and the space between the transept and the new wall has been transformed into the church of St. Mary.^a

The population and trade of Carlisle were long inconsiderable, but the latter has been greatly extended within the last forty years, and different manufactures have been introduced by the enterprise of different individuals. Various branches of the cotton trade are carried on with success, printed linens are exported to different parts of the country, and iron works and founderies are established. If the impulse which was first given, has been maintained, it may in part be attributed to the comparative cheapness of labour.

The other inland towns are too insignificant to require notice; they are so in point of population, still some branch of industry is carried on in every one of them. Penrith possesses some trade in fancy woollen stuffs; the inhabitants of Wigton are employed in manufacturing cotton, and extensive waste lands in the neighbourhood have of late years been enclosed. Hats, shalloons, coarse woollens and linens are made at Cockermouth, and several cotton-works have been erected in the romantic town of Keswick.

The maritime town of Whitehaven, situated at no great distance from the promontory of St. Bees Head, and now much more important than the places which have been last mentioned, consisted only of six fishermen's huts in the year 1566. The cause of its prosperity dates from the reign of Queen Anne, when several moles and bulwarks were erected, by which vessels are secured against the Corfe rocks. But these works have been

since much improved, and Whitehaven possesses at present not fewer than six yards for building ships. The same port carries on a considerable trade with the West Indies, and nearly two hundred vessels belong to it. The coal, which is chiefly exported to Ireland, is obtained from neighbouring pits that have been dug to the extraordinary depth of 130 fathoms,^b and extended to so great a distance below the sea, that ships of large burden sail above the miners.

The small town of Workington near the mouth of the Derwent, was the landing-place of the unfortunate Mary, when in an evil hour she fled for refuge to the dominions of her rival.

An island in the Irish Sea,^c about thirty miles from the English coast, is considered a dependence of Cumberland.^d In superficial extent it is not equal to more than 220 square miles, but it is in some places thirty miles in length, and in others more than twelve in breadth.^e The climate, although humid, is mild and salubrious; frost and snow are never of long continuance, but the harvests are retarded by cold and variable summers. The two extremities of the island consist of good arable and pasture lands; the southern side is composed of loam; the soil varies in other parts, but clay and sand form perhaps the most common sorts. The fisheries afford the most important occupation, and so many men are engaged in them, that the cultivation of the ground is generally committed to women. The sea-weed is used for manure, and furze, heath and peats for fuel. Excellent mutton, good poultry, eggs and fish, it is said, are much cheaper than in England.

Ramsay, one of the principal ports, is situated on the north-eastern coast of Man, in the neighbourhood of a bay, which may afford a safe anchorage to a large fleet; but the present harbour is inconvenient, and only fit for small vessels. Douglas, on the south-eastern coast, and about sixteen miles distant from Ramsay, is the most populous town, and contains nearly six thousand inhabitants. The harbour can admit the largest vessels, and it is defended by a strong fort, which renders the place impregnable on the side of the sea. Castletown is the capital of the island, but its port is difficult of access, and its population does not exceed two thousand inhabitants. It is chiefly remarkable for a castle, built on a rock in the middle of the town, and encompassed with so thick walls, that three persons can walk abreast on them. The black marble steps of St. Paul's cathedral were obtained from a quarry in the neighbourhood.

Westmoreland, the next county that shall be mentioned, is bounded on the north and north-west by Cumberland, on the east by Yorkshire and Durham, and on the south and south-west by Lancashire.^f The limits are for the most part formed by lakes, rivers or streams, and mountains. Thus, Winandermere, the largest lake in England, and one remarkable for its romantic beauty, separates it from Lancashire, and the Lune, which rises near the sources of the Eden, is the boundary between it

^a The opening was afterwards closed with a wall, and the space within the wall, and the transept fitted up as the parochial church of St. Mary. (Rees's Cyc.)—P.

^b Capper, *Idem*.

^c The Isle of Man.

^d The Isle of Man is not legally dependent on the county of Cumberland, nor is it even considered a part of England. It has a governor appointed by the king, a council of five persons *ex officio*, two deem-

sters or judges, and a house of commons, called the House of Keys. These, united, form what is called the Tinwald Court.—P.

^e It is about 30 miles in length, and about 10 miles at its greatest width. (Ed. Enc.)—P.

^f It is bounded in that direction, for a short distance, by the head of Morecambe Bay, and thus separates the district of Furness from the main body of Lancashire.—P.

and Yorkshire.^a The area is equal to 763 square miles or 488,320 statute acres, but of these more than two thirds are uncultivated. The county may be briefly described; indeed its name indicates its nature. Westmoreland or the *west-moor-land* consists of bleak mountains, naked hills and sterile moors or heaths, which are better known in the north of England by the name of fells.^b The vallies, which are watered by the rivers, are not unfruitful, and a plain of considerable extent in the northern part of the county yields abundant harvests. The rest of the cultivated land is made up of glens or ravines, surrounded by lofty heights. No great quantity of corn is raised, and no sort of grain is so common as oats. Herds of Scotch cattle are fattened by the farmers, and many milch cows are kept, by which the inhabitants of London are supplied with excellent butter. Sheep are reared on the mountains, and numerous flocks of geese wander on the moors. Great attention is paid to the rearing of pigs, and the hams of Westmoreland are not the least valuable of its exports.

The mineral riches of the county are not great; it is almost destitute of coal, and the metallic ores lie so deep as to render the working of them unprofitable. Limestone and freestone are by no means uncommon, but slate is perhaps the most abundant and most important of the mineral products. Few of the towns require to be mentioned. Appleby, the county-town, a place of no great consequence, occupies the site of *Aballaba*, a Roman station which communicated with a military way. The market-house, a handsome Gothic edifice, was finished in 1811; each of the two extremities of the town is now adorned with a stone obelisk, and on one of them the following inscription has been placed:—"Retain your loyalty, preserve your rights." It is only in free countries where such inscriptions are observed, and it is only in free countries, that they appear to be unnecessary; thus the English are not unmindful of their duty to their king, still less are they forgetful of their rights and liberties.

In the country between Appleby and Orton, there is a calcareous cavern, which winds to a great distance through numerous galleries; many of these are filled with pools, and others are watered by streams that escape at last by chasms, of which the extent has never been measured, and which the country people have denominated the Badger's den.

Kendal, or more correctly Kirkby in Kendal,^c the church in the dale of the Ken,^d is situated in a pleasant valley about twenty miles to the north of Lancaster. It is the only populous and commercial town in the county; it was one of the places to which Flemish weavers were invited in the fourteenth century, and the cloths made by

them were held in such repute that they were long known by the name of the town. It retained its manufacturing industry, although it was long deprived of the advantages of water carriage, and it possesses at present not fewer than seven trading companies, each having its hall. The present manufactures consist of cottons, coarse woollens, linseys, druggets, worsted stockings, serges and hardwares.

It is not many years since the Lancaster canal was completed, a work which has greatly contributed to the prosperity of Kendal by affording a convenient outlet to its products. It commences at West Houghton in Lancashire, and intersects the Leeds and Liverpool canal between Wigan and Preston, then waters Preston, Spital Moss, Barton and Garstang, crosses the Wier at the last place, and proceeds to Lancaster. It is carried over the Loyne^e above Skeriton by means of a stone aqueduct, supported by five arches, 664 feet in length; from Skeriton it passes to Burton, and onwards through a tunnel to Kendal, a course of seventy-six miles. It communicates with Liverpool by the Leeds and Liverpool canal, and from the last place by the Mersey and the Duke of Bridgewater's canal, with Preston brook, where the Staffordshire canal joins the Trent and Severn, and extends from thence to the Thames by the continuation of the Oxford and Coventry canal,^f an inland navigation of more than 500 miles.

Lancashire, a maritime county, and a county palatine, is bounded on the north by Westmoreland and a part of Cumberland,^g on the east by Yorkshire, on the west by the Irish Sea, and on the south by Cheshire. It is of a very irregular shape, and it has already been remarked, that one portion is separated from the rest by an arm of the sea. The greatest length inclusive of the detached part, is nearly seventy-four miles, and the greatest breadth about forty-five. According to a return made to the House of Lords in 1818, the area is said to be equal to 1831 square miles. The former scantiness of the population may be inferred from the small number of parishes into which Lancashire was divided, and other facts are not wanting to prove that few counties are less favoured by nature, while none are more important by the industry of their inhabitants. Thus, in confirmation of what has been asserted, it may be remarked that the climate is almost proverbial for its moisture, and what is worthy of notice, the eastern part of the county is more humid than the western or the coast. The reason may be easily assigned; the eastern boundary that separates it from Yorkshire, forms part of the ridge which has been often called the *Back-bone* of England, and the clouds that are wafted by the Irish Sea from the Atlantic Ocean, are first checked in their course by the same heights, of

^a Winandermere, for about half its length on the north, separates it from the district of Furness, and the Lune, for only a short distance, from Yorkshire.—P.

^b *Fell* properly signifies mountain (Dan. *feld*, Swed. *fjäll*), and is applied to different ridges and summits of the great chain dividing the eastern from the western counties in the north of England.—P.

^c Kirkby- or Kirby-Kendal.

^d Properly, the church (*kirk*) town (Dan. *by*) in the dale of the Ken.—P.

^e Lune, Lone.

^f This should be stated thus: From Liverpool, a communication is opened by the Mersey, the Duke of Bridgewater's canal, as far as Preston Brook, the Grand Trunk (Staffordshire) canal, the Coventry canal, and the Oxford canal, or the Oxford canal and the Grand Junction canal, with the Thames.—The Duke of Bridgewater's canal extends

from the Mersey at Runcorn to Manchester. The Grand Trunk canal branches off from it at Preston Brook, and extends to the Trent, at the mouth of the Derwent in Derbyshire. The Staffordshire and Worcestershire canal leaves the Grand Trunk at Heywood, east of the town of Stafford, and passes by Wolverhampton, to the Severn at Stourport. The Coventry canal leaves the Grand Trunk near Lichfield, and extends to Coventry. Four miles north of Coventry, the Oxford canal branches off to the east, and extends to the Thames at Oxford. The Grand Junction branches off from the Oxford canal at Braunston, and extends to London.—P.

^g The main body of the county is bounded on the north by Westmoreland. The detached district of Furness, on the south by the sea on the west by Cumberland, and on the north and east by Westmoreland.—P.

which the western side is exposed to frequent and heavy showers. The soil offers few attractions to the husbandman; it is in many places unfruitful, and even in the fruitful parts, the crops are frequently destroyed by incessant rain. The detached portion, or the Hundred of Furness, as it is called,^a abounds in iron, but it is a wild and bleak district, covered with underwood, of which the cuttings are only useful in supplying the numerous furnaces that have been erected. Connistone Meer,^b a lake in the same part of the county, occupies no inconsiderable space, for it is more than seven miles in length. The most fertile part is situated in the neighbourhood of the sea, and near the ancient abbey of Furness; but even there, the land, which is only moderately fruitful, is protected against the boisterous waves of the Irish Sea, by the long and narrow isle of Walney, in all probability, once a part of the coast. The main part of the county is naturally divided into two unequal portions; the smaller extends from the Westmoreland border to the Ribble, while the larger includes the country between the last river and the Mersey. The former has been long known to agriculturists on account of its oxen, which are not inferior in symmetry to any in England. The Fild or Field,^c a low tract between Garstang and Preston, is not unfruitful, but the remaining or eastern portion, in which the ancient forests of Wiersdale and Bowland are situated, is mountainous and barren. The southern part of the country between the Ribble and the Mersey, although neither sterile nor broken by hills, is disfigured in many places by large morasses. They seem to have originated from the stagnation of springs in low grounds, where a perpetual accumulation of vegetables, successively growing and decaying, produces a spongy soil, of which the upper part forms a slaking bog, while the lower consists of a black moss, affording turf or peat for fuel. These moving marshes are liable to disruptions after heavy rains, and on these occasions the neighbouring country is inundated or laid waste by their debris. Some of the bogs are very large; others, not without much labour and great expense, have been drained and rendered productive. The fruitful tracts are well adapted for the growth of potatoes, many of which, it is well known, have been exported to Ireland. But the nature of the soil, and the wetness of the climate, must prevent Lancashire from ever being a corn country; oats is the most common grain; the rest are insufficient for two months consumption of the inhabitants. What then are the causes of the prosperity of Lancashire, of its commercial greatness, and of a population in which, according to the last returns, the ratio to the surface is more than six hundred and twenty persons to the square mile?^d It is certain that if it had been destitute of coal, and if numerous rivers had not afforded many facilities to inland navigation, it might still have been what it was in past times, poor and thinly peopled. Inexhaustible beds of coal, it has been already seen, are wrought in the southern and central districts, particularly in the two southern

hundreds of Derby^e and Salford, which traverse the whole breadth of the county. Products of industry, almost as varied as they are numerous, and every mechanical contrivance by which labour can be abridged, owe their origin to the abundance of so valuable an article over so extensive a tract. The other minerals are of secondary importance in comparison of coal, but limestone is obtained in great quantities in the northern and north-eastern districts, and one sort of it, dug near Manchester and also near Leigh, has been found to resist the effects of water, and is therefore much used in subaqueous works. A quarry of excellent freestone near Lancaster has afforded the materials of which the town is built, and a more extensive quarry near Liverpool has furnished the stone for its public edifices. Flag-stones and whetstones are the products of different districts, and slate abounds in the mountainous tract near Hawkshead.^f

The principal rivers are the Mersey, which rises in Derbyshire, receives several small streams, separates the last county from Cheshire,^g and falls into the sea at Liverpool. The Ribble rises in Yorkshire, crosses the county, and discharges itself into the Irish Sea near Preston. The Wier^h has its source in the moors on the north-eastern border, is enlarged by several small streams, and enters the same sea about twelve miles to the north of the Ribble. Lastly, the Lune or the Loune,ⁱ rising near Kirkby-Lonsdale in Westmoreland,^k waters Lancaster and falls into the sea at no great distance below it. Thus all these rivers rise from the mountainous ridge which has been called the Back-bone of England, and all of them form estuaries at their entrance into the sea. But by means of the system of inland or canal navigation, Lancashire communicates with all the neighbouring counties, with numerous rivers, with the western and eastern seas, with Liverpool and Hull, with the Severn and the Thames.

Lancaster, the capital of the county of which it bears the name, is situated on the banks of the Lune; it contains a population of more than 12,000 individuals; it reckons 85 vessels measuring 9111 tons, but the shallows in the river below Lancaster prevent the larger vessels from reaching the town; they anchor at the mouth, and are unloaded by means of lighters. The same place has been long celebrated for its manufacture of sail-cloth, merchant vessels are built in its docks, and other branches of industry are cultivated, but the principal trade is carried on with the British colonies of North America. A long quay has been built on the left bank of the river for the accommodation of ships; the suburbs rise on the opposite bank, and communicate with the town by a bridge of four arches.

Numerous antiquities dug up in the neighbourhood at different periods, prove that Lancaster had been a station of some consequence in the time of the Romans. It was not, however, before it was made over by Edward the Third, with ducal privileges, to John of Gaunt, that it began to assume the importance which it has since retained. The castle, which is generally believed to have been

erected about the same period, added to its military strength during the wars between the Roses; but these disastrous convulsions had the effect of desolating the town, which is said to have been inhabited many years afterwards by a few poor husbandmen. The castle, too, was laid in ruins, and it is merely from the walls, which are still mostly entire, that any notion can be formed of its strength and extent. The principal entrance by the eastern gate, under a fortified tower, conducts into a spacious court-yard, surrounded by other strong towers. The keep, a square building, containing several large apartments, and formerly defended by strong military works, is now converted into the county gaol and courthouse of the assizes.^a

Preston, nearly twenty miles to the south of Lancaster, has long been considered one of the best built towns in the county; situated in a fruitful district, on the banks of the Ribble and the Lancaster canal, at a short distance from the sea, and at the junction of six important roads, it derives many commercial advantages from its position. The inhabitants are employed in different branches of industry, principally in weaving and spinning cotton; no small number, however, are occupied in the silk manufactories, and the town has long been distinguished for the excellence of its weaving machinery. An imperfect notion may be formed of the varied commercial relations of Lancashire, from the immense number of public coaches, carriages and stage waggons that are continually travelling to and from Preston. Although the trade of the same place dates from a comparatively recent period, it is by no means a modern town; on the contrary, it appears to have risen while Ribchester, the ruins of which are at no great distance, fell into decay, and it was inhabited during the dark ages by so many monks and ecclesiastics, that it received the name of Priests'-town, which has been gradually changed into Preston.

The Ribble, which waters Preston, and the Mersey, at the mouth of which Liverpool is built, are separated by a considerable tract of coast, and no part of any consequence is situated between them. It is a remarkable fact that there is no important town in England, of which the early history is more involved than that of Liverpool. The numerous conjectures that have been made concerning the etymology of its name, indicate how little is known on the subject. In the reign of Henry the Eighth, Liverpool was "a chapelry or hamlet to the parish of Walton. The king," continues the same author, "hath a castlet there, and the erle of Derbe hath a stone house there. Irish merchants come much thither as to a good haven. Good merchandise at Lyrpool, and much Irish yarn that Manchester men do bye there. Little custom is paid, that causeth merchants to resort."^b The inhabitants petitioned Queen Elizabeth to exempt them from certain impositions, and used the humble title of "her majesty's decayed town of Liverpool." It is known from the rates of ship money that was levied by Charles the First, that it then held a secondary rank among the commercial towns of England. Thus, Chester is rated at £26; Bristol at £1000; and Liverpool at £25. It is equally certain that the first parochial church was built in the reign of William the

Third. Some notion of its progressive population may be inferred from the following table:—

Years 1700.		1750.		1780.		1800.		1820.	
Baptisms.	Burials.	Bap.	Bur.	Bap.	Bur.	Bap.	Bur.	Bap.	Bur.
162	117	824	1031	1579	1486	2905	2782	4540	2944

The next table indicates the progress of its commerce:—

Years	1760.	1770.	1780.	1790.	1800.	1810.
Ships (number)	1245	2073	2271	4223	4746	6729
Customs (duty)	£2330	4143	3528	10,037	23,379	65,782

The disadvantages of its position are a dangerous bay at the mouth of the river, where it was necessary to overcome many natural obstacles. But it is also situated in the centre of the western coast, thus forming the most convenient point of communication with the east of Ireland, and becoming, with the extension of its trade, the mart of the western coasts of Scotland. It received from Ireland an accession of useful hands, when the laborious and peaceable inhabitants left their native land, from which industry was banished, and where the effects of a policy as unwise as it was unjust, are but too apparent at the present day. It was after these men had settled in Liverpool, that the circle of its commerce was enlarged; it competed with Lancaster and Chester, which from their vicinity were the first to yield, and the wealthy merchants of these places removed to the rising town.^c The contest between Liverpool and Bristol was of longer duration. These great ports on the western coast are the depositaries of imports, which are diffused over different parts of England, and the exports by which these imports are obtained, are the products of neighbouring towns and districts. The extent of country through which their home trade circulates, corresponds with their means of communication; in other words, the exports that are more easily conveyed to Bristol, are not sent to Liverpool, neither does the former place receive such as are transported at a less expense to the latter. Having obtained a share of the home trade, proportionate to their local advantages, and to the roads and canals, which have been since multiplied in every direction, the inhabitants of Liverpool sought wealth from the same channels by which it flowed to Bristol, and so extended their commerce with foreign countries. Bristol imported the manufactures of Germany, and sent them out to the American colonists. The merchants of Liverpool found as good, if not better manufactures, in their own country. Ireland supplied them with linen, and Scotland with different articles, which were exported to the same settlers. Much about the same time, the neighbouring town of Manchester made gigantic strides in various branches of industry, and its manufactures, of which Liverpool became the natural outlet, were found to be cheaper, and of a better quality, than any others. This victory, of which Liverpool still reaps the fruits, prepared the way for new contests. The privilege of importing goods into the Spanish colonies having been conferred on a limited number of individuals, they exacted a duty equivalent to four times the amount that the consumers had been

^a Lardner, Id. Ibid.

^b Leland's Itinerary, vol. ii.

^c C. Dupin, Force Commerciale, volume 1st.

accustomed to pay. So great a hardship gave rise to a smuggling trade between the English possessions in the West Indies and Spanish America, and this fraudulent traffic was continued by means of Liverpool vessels with perseverance and success.

The slave trade was not the least lucrative one in which the merchants of Bristol were engaged, and their rivals sought wealth from the same source. The different articles exported to the South American colonies were rendered so many monopolies by the Spanish cabinet, and although the trade in slaves was committed to a company, the profits arising from it served to enrich Liverpool smugglers, who engaged in the traffic of human beings with as much indifference as in any ordinary branch of commerce, and it is undeniable that the resources of the town were increased by immense capitals, which were in this way accumulated.

It may be easily inferred that the war of independence with the British colonies in North America, retarded the prosperity of Liverpool, but no sooner was that war terminated, than the same port became the European emporium of the United States, and the trade thus begun, has since corresponded with the increasing importance, population and wealth of the American republic. England obtained the monopoly of the Brazil trade, in terms of the Portugal treaty, and that vast territory became a new outlet to the exports of Liverpool.

If these facts be considered, the following statement cannot excite surprise:—Liverpool possessed about a century ago only a two and fortieth part of the trade of England; it now possesses a sixth. Thus, it has increased in a ratio seven times greater than that of a nation, whose advances in commerce and industry are unparalleled in Europe.^a It is obvious that the flourishing state of the port is intimately connected with the prosperity of other towns, to which its admirable communications extend; it accounts for the rise of Manchester, Birmingham and other places, in as much as they are in some respects the workshops of Liverpool.

Some of the public buildings in the same place may be briefly mentioned. The exchange may bear a comparison with the finest structures which the mercantile inhabitants of any city have erected from their own resources. The area which it occupies, is twice as great as that of the Royal Exchange in London. The portico of the principal entrance is formed by eight double Corinthian columns, each equal to twenty-five feet in height, and each cut from a solid mass of stone. The inner fronts on the east and west, are composed of a rustic basement, supporting pilasters and Corinthian columns that are surmounted by a balustrade. The northern front corresponds with the opposite one of the town-hall, which completes the quadrangle formed by the two structures. Within the space thus enclosed, three piazzas fifteen feet wide, communicate with apartments for the underwriters, with counting-houses, and with extensive ware-rooms.

The town-hall exhibits an extensive line of pilasters and columns alternating with windows, and the capitals of the columns are divided by basso-relievos emblematical of commerce. A dome, lighted by large lateral windows, and like the Pantheon at Paris, surrounded by

a colonnade of the Corinthian order, rises from the centre of the building, and is crowned by a female statue, holding a spear on which the cap of liberty is attached; this statue represents Britannia.^b

Institutions of merited celebrity prove that the varied occupations of commerce are by no means incompatible with higher pursuits. The Royal Institution of Liverpool resembles the Royal Institution of London, and both are founded on the model of the ancient Lyceum in Paris. The one in Liverpool was formed by a number of subscribers, and professors were appointed to deliver lectures on different subjects. It is, besides, the object of the institution to encourage similar societies and to render assistance to undertakings for the advancement of the sciences and arts. It was opened in 1817, and an excellent discourse, giving a view of the objects of its founders, was delivered by Mr. Roscoe, the enlightened historian of the Medici and Leo the Tenth. It might be difficult to estimate such institutions too highly by judging of the future from the past, by reflecting that since the sciences have been made to minister to the arts, the sphere of commerce has been enlarged, while the products of industry have been so much multiplied and improved that articles which princes could not formerly command, are now deemed essential to the comforts of the lower orders.

The Liverpool Athenæum is the oldest institution of the kind in England; the library consists of more than 20,000 volumes; wise regulations are enforced, and every convenience is afforded to the studious.

The Lyceum is formed by two classes of subscribers, the one to the room for newspapers, and the other to the library. A remarkable fact relative to this institution is mentioned by M. Dupin. In 1807 the news-room had 800 subscribers, and the library 893. This is worthy of notice in a country where the passion for news is, if possible, greater than in France.

The benevolent institutions are not unworthy of the town. More than fifteen hundred persons are received into the public infirmary in the course of a year. The wants of the indigent mariners that frequent the port are relieved by the Seamen's Hospital, of which the principal resources are derived from the monthly tax of sixpence, that every seaman who sails from Liverpool is obliged to contribute out of his pay. A hundred and seventy boys and sixty-six girls are boarded, clothed and educated at the Blue Coat School.^c It was at the school of industry^d in Liverpool, the earliest institution of the sort in England, that an asylum was first opened to the blind. Lastly, the simple mode of tuition adopted in the schools of Bell and Lancaster has been introduced with great success, and in one large building more than a thousand children are instructed.

But the most striking features of the town, and its most important works, are yet to be described. The provisions that have been made for the different ships that frequent the port, may bear a comparison with the first in Europe. Some notion may be formed of them from their dimensions, which shall be briefly stated. The old dock at the east end of the custom-house was constructed in 1710; it is 195 yards long, and 92 wide at the broadest part. The quay of the dry docks is 360

^a C. Dupin, Force Commerciale de la Grande Bretagne, vol. i.

^b C. Dupin, Force Commerciale, vol. ii.

^c Blue-Coat Hospital.

^d The School of Industry for the Indigent Blind.

yards in length, and they communicate with the graving docks, in which vessels are repaired. The quay of Salthouse dock, the second that was constructed, is 640 yards long. George's dock is 246 yards in length, and 100 in breadth, and its quays, which extend to the distance of 700 yards, are lined with storehouses. A communication leads from it to the graving docks, so that vessels can pass from the one to the other without entering the river. The King's dock, which is set apart for all vessels from America, the East Indies and the Baltic, is 270 yards long and 95 broad. The Prince's dock is also one of the largest, and its locks are so constructed as to let vessels in and out at half tide. The gates of the docks are 42 feet wide and 26 deep, and they are each of them provided with a cast-iron bridge. Besides these, the Duke of Bridgewater has a small dock for the vessels that frequent his canals; and the length of the quays which bound all these docks is greater than in any other town in Europe, and consequently on the globe. The management of the revenues derived from these works is vested in the corporation, but their accounts are annually examined by seven commissioners.

The manufactures of Liverpool are of secondary importance, still it possesses extensive works for making ropes and sail-cloth, numerous iron founderies, large buildings in which sugar is refined, and potteries that furnish employment to many of the poorer inhabitants.

Manchester, situated in the south-eastern angle of Lancashire, has become the great centre of the cotton trade, the greatest manufacturing town in the kingdom, and, with the exception of the capital, equal to any other in the number, industry and wealth of its inhabitants. It is besides a very ancient town, and its early history has afforded a subject of research to a learned and laborious, although not very impartial antiquary.^a It has been maintained that it was founded by an ancient British tribe, who gave it the name of *Mancenion*. It became a Roman station in the time of Agricola, and many remains of the ancient *Mancunium* have been discovered since the seventeenth century. It is mentioned as a manufacturing town in the reign of Edward the Sixth, and in the year 1560 its trade is said to have afforded employment to men, women and children. Salford bears to Manchester the same relation that Southwark does to London; and in 1757, nearly a century after the period that has been last mentioned,^b Manchester and Salford contained 19,800 inhabitants; in 1773, 42,900; in 1782, 50,000; in 1791, 70,000; and in 1811, 104,000. But with the extension of the town different villages have been united to it, and the population of Manchester and its suburbs amounted in 1821 to nearly 200,000 persons. Thus within a period of sixty-four years the number of inhabitants has increased in a greater ratio than one to nine.

To account for its rapid and extraordinary rise, much must be attributed to the advantages of its position, which have only been developed by art and ingenuity within a comparatively recent period, and in proportion to their development the population has increased. Manchester is watered by a navigable river;^c it is sur-

rounded by immense fields of coal; and lastly, it is situated near the centre of the kingdom, and numerous communications have been facilitated by the nature of the country. Thus it lies in the line of inland navigation, which extends from the western to the eastern sea, and it is equally open on the north and south by the numerous branches of the Great Trunk. The Irwell and the Mersey afford an easy access to Liverpool; it has three distinct lines of navigation through Yorkshire, and it communicates in the same manner with Nottingham, Birmingham and Bristol.

No article appears to have been made of cotton in Great Britain before the middle of the seventeenth century; even about the middle of the eighteenth, cotton, as an article of commerce, was little used in the country, and the value of the manufacture was estimated at less than £200,000. It now affords employment to more hands than any other manufacture, and it has become the most important of British exports. Europe is thus made tributary to England; the western world is supplied with the same articles from the same country, and the cottons of Manchester find a ready market in Africa and in Asia. But before the trade was so much extended, before the manufactures were so greatly multiplied and so much improved, ingenuity was exerted, and difficulties were overcome. Cotton yarn was first spun on the one-thread wheel, and the quantity obtained by this method was not only very small, but of a coarse and irregular texture. The spinning jenny by which thirty or forty threads can be woven^d at once, was at last invented by Hargreave,^e and it was next discovered that two or three threads thus woven, might be substituted for the warp, which until then had been made of linen. The admirable invention of Hargreave was brought to perfection by the celebrated Arkwright, who in the year 1775, took out a patent for machinery by which any number of spindles could be worked, and a single thread made sufficiently strong and fine for the warp. The two distinguished individuals, who have been mentioned, are deservedly considered the benefactors of their country; they have laid open new sources of wealth, created new elements of productive power, and diffused increased comfort over every class of the community. It has been seen that about the middle of the eighteenth century, the cotton manufactures were estimated at less than £200,000, but not many years after the date of these inventions, their annual value exceeded £7,000,000. The various branches of these manufactures, so diversified in their forms and uses, and which have given rise to so extensive a system of machinery, centre in Manchester, and extend around it in all directions to Carlisle and Derby on the north and south, and to Leeds and Liverpool on the east and west. Manchester is besides the depot from which the raw material is distributed over the district, and in which all the scattered manufactures are again collected to be again diffused over a wider circle, reaching to Liverpool, Hull and London, whence they are exported to every quarter of the globe.

The various means of instruction, which Manchester

^a John Whitaker, in his History of Manchester?—P.

^b More than two centuries.—P.

^c The Irwell, a branch of the Mersey.—P.

^d Spun?—The machine at first contained 8 spindles, but by modify-

ing its construction, a single person was enabled to work 40 spindles.—P.

^e Richard Hargreaves, of Blackburn. He invented the Spinning Jenny in 1767. (Ed. Enc.)—P.

possesses, have greatly contributed to its manufacturing spirit; the children of the poorest inhabitants receive an elementary education, and mechanics' institutions are open to the workmen. The modern history of Manchester affords abundant proofs that the culture of the sciences, and the theory of the useful arts, are essential to the practice and perfection of the latter. The Literary and Philosophical Society of the same place, instituted in 1781, has been raised to its present eminence by the labours of Henry, Dalton and others, who rank with the philosophers of their age.

The town is watered by the Ashton, Bolton, Manchester and Bridgewater canals,^a and by the Irwell and two of its feeders, the Irk and the Medlock. The suburb of Salford communicates with Manchester by three bridges,^b while six have been erected over the Irk, and nine over the Medlock, so that there is an easy access to every part of the town. Fine buildings and spacious squares mark the additions that have been made of late years, but in too many places it is distinguished by densely peopled streets and lanes, built apparently without regularity. It has been remarked in the account of Leeds, that it is not yet represented; in that respect it resembles Manchester, but it is not imagined that a long period can elapse before the elective franchise is extended to these important towns.

It is not many years since the numerous communications between Liverpool and Manchester were found inadequate to the conveyance of goods from the one place to the other. It was then known that the average quantity of goods thus transported, exceeded daily a thousand tons, and that in dry summers, the supply of water being diminished, the barges were not loaded with their usual freights, while in winter the navigation of the canals was sometimes retarded or interrupted by frost. The delay thus occasioned led to a very important result, or rather, to one of the greatest inventions of the age, the successful application of steam to carriages. But the projectors of this great work had to encounter many difficulties even at the outset; the bill for the Liverpool and Manchester rail-road was lost in one session, nor was it carried afterwards without much opposition, nor without incurring an expense of £70,000 in parliamentary proceedings. The most persevering opponents were those, whose influence and exalted station might have led them to support every great work, and to encourage every useful undertaking.

The Liverpool extremity of the railway terminates in a tunnel near the northern end of the Queen's Dock. The excavation, about twenty-two feet deep and forty-five wide,^c affords space to four lines of rails, and between them are lofty cast-iron pillars that support an extensive range of warehouses. The warehouse keepers receive or deliver the finer goods through hatchways in

^a The canals centering in Manchester, are: 1. the Duke of Bridgewater's canal—two branches; one towards Liverpool, entering the Mersey at Runcorn; the other (Worsley canal,) to the Worsley coal mines, continued by Leigh to the Leeds and Liverpool canal at Wigan, forming the Leigh and Manchester canal: 2. the Rochdale canal, extending by Rochdale to the Calder at Halifax: 3. the Ashton and Oldham canal, passing by Ashton under Line, and terminating at Duckenfield, in the Huddersfield canal; it sends out a branch to Stockport, and another ($\frac{1}{4}$ mile in length) to the Peak Forest canal: 4. the Bolton and Bury canal—two branches, one to each of those towns.—P.

^b Over the Irwell, on the north-west of which Salford is situated.—P.

the floors, and the waggons are propelled to the very spots beneath the hatchways, by means of turning rails communicating with the main lines, and attached to moveable wooden circles. Beyond this area or court, the breadth of the tunnel is twenty-two feet, while the height of the arch that supports it, is equal to sixteen, and the radius to eleven.^d The height from the roof of the tunnel upwards to the surface of the ground, varies from fifteen to seventy feet, and the total length of the subterranean work is not less than 2240 yards. Another tunnel, at no great distance from the former, is of smaller dimensions, about fifteen feet in width, twelve in height, and 290 yards in length. On the open road to Manchester and in the neighbourhood of Wavertree, the railway extends along deep marl,^e and beyond it, a ravine seventy feet in depth, has been cut through the solid rock of Olive Mount. This portion of the work is not the least wonderful; the perforation, if it may be so called, is little short of two miles; the traveller advances on a level twenty feet in width, and enclosed on both sides by stone walls that rise almost perpendicularly to the great height that has been already mentioned. The materials dug out of Olive Mount, have served to construct an embankment about fifty feet above the valley of Roby. A bridge that rises above the Rainhill level, and crosses it at an angle of thirty-four degrees, forms part of the turnpike road from Liverpool to Manchester. The line is carried across the Sankey valley and canal,^f and over the top masts of the barges, by a viaduct of nine arches, each fifty feet in diameter. Another viaduct of four arches conducts the railway above the valley of Newton, and a few miles beyond it, the Kenyon excavation commences, from which more than 700,000 cubic yards of sand and clay have been removed to form the neighbouring embankments. It is in this part of the work that the Kenyon and Leigh junction rail-way meets the main line, and by this means Bolton is united to Liverpool and Manchester.^g

The Chat Moss part of the work is not inferior to any other, and cultivation is now extending over this hitherto dreary waste, of which the surface is not less than twelve square miles. These green spots and cultivated fields have appeared within the last two years, forming a sort of oasis in a surrounding desert, destined ere long to become productive, and to afford a striking example of the combined power of agricultural and mechanical resources. The railway is raised above the Worsley canal by a viaduct of two arches; it then proceeds through Eccles and a portion of Salford under six bridges, crosses the Irwell by means of a handsome stone bridge, and is carried over twenty-two brick arches to Water Street, Manchester, a distance of thirty-one miles from the Liverpool station.

It is a remarkable fact in the history of rail-way com-

^c This is an open cutting (at the entrance of the great tunnel,) above which the company's warehouses are erected.—P.

^d The tunnel is 22 feet wide and 16 feet high, the sides being perpendicular to the height of five feet, and surmounted by a semicircular arch, of 11 feet radius.—P.

^e Through a deep marl cutting.—P.

^f The Sankey canal extends from the Mersey below Warrington, to the collieries near St. Helens, 12 $\frac{1}{2}$ miles.—P.

^g The Kenyon and Leigh junction joins the main line by two branches, leading to the two towns respectively. The Kenyon branch joins the Bolton and Leigh railway, and thus serves to connect Bolton with Liverpool and Manchester.—P.

munications, that the first experiment on a great scale succeeded beyond the most sanguine expectations. It was not imagined that resistance could be diminished to so great a degree, nor consequently that the engines could proceed at so great a velocity, and for the same reasons their powers of traction could not have been anticipated. It is unnecessary to add that they afford advantages until then unknown for the conveyance of goods, and that they have changed our notions of distances, for if distances be estimated by the times of performing them, Manchester is brought as near to Liverpool, as the two extremities of the metropolis are to each other. Such encouragement has been thus afforded to similar works, that surveys, plans and sections have been already made for rail-roads from Liverpool to Birmingham and onwards to London.^a

It would occupy much space to mention all the other flourishing towns in Lancashire, but some of them are too important to be passed over in silence. Bolton, about twelve miles to the north-west of Manchester, has been distinguished by the addition of Le Moor,^b from its situation in a bleak and dreary country. It contains more than twenty-five thousand inhabitants, and it is believed to have been the first place in which the improved machinery of the cotton manufactories was introduced. The town has rapidly increased in wealth and population, and its muslins and various products of industry supply the markets of Manchester. Blackburn, not more than eight miles to the east of Preston, has become one of the great marts for calicoes. The first calico-printers in the county reside in the town or the neighbourhood, and every department of this useful and curious art has been brought to a high degree of perfection.

Cheshire, or the county of Chester, is bounded on the north by Lancashire and part of Yorkshire, on the east by Staffordshire and Derbyshire, on the south by Shropshire and a detached portion of Flintshire, and on the west by Denbighshire, Flintshire and the river Dee. One of the hundreds, however, situated between the estuaries of the Dee and the Mersey, is bounded at its north-western extremity by the Irish Sea. Although the form of the county may be compared to an oval, two horns extend to the west and east on the northern side: the one or the hundred of Wirral has been already mentioned; the other, a portion of the Macclesfield hundred, stretches between Derbyshire and Yorkshire.

The former inhabitants of Cheshire appear to have lived under a separate government from the rest of England. Thus, after the conquest of the Danes by Alfred the Great, that monarch appointed Etheldred, duke or governor of the county, and it is well known that there were earls of Chester in the time of king Canute. William continued the government of the earls after the conquest, made it a county palatine, and vested Hugh Lupus with sovereign authority. The earls held an independent council or parliament and courts of law in which treason and other offences against the *Sword of Chester* were cognizable, and it is believed that the sword of Lupus is still preserved in the British museum. Barons were created by Lupus; they had their separate courts, in which they exercised the power

of life and death in offences not connected with the earl's sword or the royal authority. Some alterations were introduced by Henry the Third, and the earldom was then vested in the king's eldest son, who is to this day earl of Chester. But Henry the Eighth first made Cheshire subordinate to the crown; as it is still, however, a county palatine, the privileges which it formerly possessed are not wholly destroyed.

The area is equal to 1052 square miles, or 673,280 acres, of which less than a third part are arable. The county is in general flat, but towards the eastern borders some considerable elevations form a chain with the Derbyshire and Staffordshire hills. Another ridge, crossing the county from north to south on the western side, commences near Frodsham, extends along Delamere Forest, and terminates in the neighbourhood of Malpas. The extent of the waste lands appears the more extraordinary, as there are few or no heights in other parts of the county. It is watered by many streams, all of which find a passage to the Irish Sea by the Dee, the Weaver or the Mersey.

The brine springs form a remarkable feature in the physical geography of Cheshire. They are mostly observed in the valleys, which the Weaver and Wheelock water, and generally at no great distance from their banks. The springs near the former river are not strongly impregnated above Nantwich, but at that place they yield a great quantity of salt. They occur at irregular intervals between Nantwich and Weverham, a distance which, if the course of the river be taken into consideration, is nearly equal to six miles. The brine springs on the Wheelock extend to a greater distance, and are scattered over the tract from Lawton on the confines of the county, to Middlewich, where the river falls into the Dane. The proportion of muriate of soda in some of the springs has been found equal to 26.566. It is not wonderful that the brine springs were known to the inhabitants at a very early period, but it may excite surprise that the first bed of fossil or rock-salt was discovered so lately as the year 1670. The miners of Marbury, while they were searching for coal in the neighbourhood of Northwich, observed a bed of rock-salt thirty yards in thickness, and resting on indurated clay. The same substance, it was ascertained by repeated trials, extended to the distance of nearly half a mile in all directions from the place where it was first discovered. In 1781, the proprietors of one of these mines sunk through the indurated clay, and new beds of rock-salt were found below it. But the strata are not confined to the vicinity of Northwich; others are worked near Lawton, and in different parts of the county. Thus, in the township of Wilton, a circular excavation, 108 yards in diameter, is supported by twenty-five immense pillars of rock-salt, and yields annually about 156,000 tons. It has been already seen that the south-eastern portion of Cheshire abounds in coal; the other mineral substances are of secondary importance, but it may be remarked that lead, cobalt and copper are obtained at Alderley Edge, and that the last metal has been worked on the Peckforton hills.

The soil is very various, but clay and sand are perhaps the most common, and according as one or other of them

^a Booth's Description of the Manchester and Liverpool Railway.
VOL. III.—NO. 59. 68

^b Bolton le Moors, or Bolton in the Moor.—P.

predominates, they form sandy or clayey loams. The heaths or marsh lands are extensive, and the largest tracts are those of Macclesfield or Delamere Forest, Frodsham marsh and others on the north-eastern border.^a Great quantities of potatoes are raised in the county, and a ready market is obtained for them in the towns of Liverpool and Manchester. Every branch of husbandry connected with the dairy is well understood, and not fewer than 11,500 tons of cheese are annually made in Cheshire, and of these more than four thousand are exported.

Chester, the capital of the county, contains more than twenty thousand inhabitants, and it reckons sixty-two vessels, measuring more than 4071 tons; these are all that belong to Chester, at a former period, one of the most flourishing ports in the west of England, the mart of the Irish linens and other products that were exchanged for English produce; it is almost unnecessary to add that the trade has been transferred to Liverpool. The town is situated on an eminence, which commands an extensive view of a romantic country, and the Dee waters its ancient ramparts on the south. *Castrum*, the ancient name of Chester, shows that it was once a Roman military station. The two principal streets which cross each other at right angles on the summit of the hill on which the city stands, were formerly the roads that communicated with the ancient camp. These streets lead to the four gates of the city; they were cut out of the hill, which is composed of a soft stone, that is easily worked. The ground floors form a range of shops, and an open portico or piazza above them is surmounted by one or two stories. The story on the level of the portico, forms the ground floor on the back part of the houses. The manner in which the streets are built, may be uncommon, but it is by no means convenient; the shops are small and narrow; the porticos low, irregular and supported by massive columns. The preceding remark is inapplicable to the suburbs, which are not only larger than the town, but much better built.

Chester is watered by two canals; the one communicates with Nantwich, where a branch leads to Shropshire and Montgomeryshire; the other passes to Liverpool, and connects the Dee with the Mersey.^b The making of gloves forms the principal branch of industry, but shot, lead and white lead are manufactured on a great scale. In the shot works there is a tower more than a hundred feet high, and the melted lead is let fall from its summit into a receiver filled with water at the bottom.

The cathedral, an irregular and heavy pile, appears as if it were fallen into decay from the mouldering quality of the stone with which it is built, and a considerable portion of the original structure, now in the state of a

^a Macclesfield Forest is on the borders of Derbyshire, near the town of Macclesfield. Delamere Forest is in the western part of the county, on the ridge of hills separating the valley of the Dee from that of the Weaver. Frodsham is situated near the junction of the Weaver and Mersey. A range of heathy hills runs along the eastern border of the county, connected with those of Staffordshire and Derbyshire.—P.

^b These canals form parts of a system called the Ellesmere and Chester Canal. It commences in the Mersey at Ellesmere Port, and crosses the Hundred of Wirral to Chester (this part called the Wirral line of the Ellesmere canal;) thence extends to Nantwich (forming the Chester canal,) whence the Birmingham and Liverpool canal extends by Wolverhampton to Birmingham: the Ellesmere canal leaves the Chester canal at Harleston, two miles west of Nantwich, and proceeds by Ellesmere to Frankton, where it divides into three branches—one south-east to Shrewsbury (incomplete on the Shrewsbury side,) one north-west to Llandisilio on the Dee, in Denbighshire, and one south-west to Llanymynech, where the Montgomeryshire canal com-

picturesque ruin, forms part of the abbey of St. Werburgh, out of which the see of Chester was founded at the dissolution. The castle of Chester was long one of the petty fortresses in the kingdom, but the greater portion of it has been taken down, and a county-hall, courts of justice, and a prison, are erected on its site. The last building is worthy of notice on account of its interior, which is constructed according to a panoptic plan, so that the keeper can survey the whole of it from the windows of his apartment. The cells are situated in a semicircular building, divided into six equal parts, and each of them communicates with a garden; by this means the prisoners are kept apart from each other, and divided into classes according to the nature of their offences.

In the north-eastern part of the county, and near the wild and bleak tract, that is still called Macclesfield Forest, is situated the market town of Macclesfield, which although important from the industry of its inhabitants, was formerly little better than a village. Not fewer than sixteen silk mills are erected in the town or neighbourhood, and different branches of the cotton manufacture have been introduced with success.

The small town of Nantwich^c may be mentioned on account of its salt mines, which have been worked since the beginning of the last century, and which are little inferior in extent to those at Wieliczka.^d

The Grand Trunk canal, which has been more than once mentioned,^e pursues a course of thirty miles in the county of Chester. A tunnel, which it enters at Preston on the Hill, is equal to 1241 yards in length, eighteen feet in height, and fourteen in width. The same canal passes through two other tunnels in the neighbourhood of Saltersfield; the one is three hundred and fifty yards in length, and the other more than five hundred and seventy.^f

The inland county of Derby is bounded on the north by Yorkshire and part of Cheshire, on the east by Nottinghamshire, on the south by Leicestershire, and on the west by Staffordshire and Cheshire. The limits of the county, it may be easily supposed, are very irregular, and it is doubtful that its superficial extent has been correctly determined; according to one of the latest measurements it is not less than 720,640 acres, and of these a great number are cultivated. The most prominent part of the central chain, which extends southwards from Scotland, and forms a natural boundary between the eastern and western sides of England, covers a considerable portion of Derbyshire, particularly the northern and western districts, and terminates in the same county. Of the numerous rivers that water it, the most remarkable are the Derwent, the Dove and the Trent. The first, which

mences, and thence extends up the valley of the Severn by Welshpool to Newtown.—P.

^c Nantwich.

^d "The Chester canal extends to Nantwich, a town of 5000 inhabitants, which carries on a great trade in cheese and salt. Near the town is a large salt mine, which has been wrought for more than a century, and which, although of less extent, presents a spectacle analogous to that of Wieliczka." (M. B.)—This is a mistake. The salt works at Nantwich are brine springs. The mines of rock salt are near Northwich; the largest in the township of Wilton. The pits of rock salt in Cheshire were first discovered in 1670.—Northwich is the only salt town in Cheshire, that possesses mines of rock salt. (Ed. Enc.)—P.

^e See note ^f p. 1211.

^f There is a tunnel at Barton in Great Budworth, 572 yards long, and another at Saltersford or Saltersfield, in the same parish, 350 yards long.—(Rees' Cyc. art. Canals.)—P.

must not be confounded with the three rivers of the same name in Yorkshire, Durham and Cumberland, rises in the High Peak, almost divides the county, and joins the Trent on the borders of Leicestershire. The second runs nearly parallel to the former, between Derbyshire and Staffordshire, and falls into the same river. The Trent crosses the southern angle of the county, and separates it from Staffordshire and Nottinghamshire.^a

The loftiest hills are the Axe-edge and the Kinder-scout, but they are much inferior in elevation to the mountains in Cumberland, Westmoreland or Wales. Although Derbyshire does not possess romantic lakes and waterfalls, it abounds in natural curiosities which are not to be found in the northern counties. A laborious writer^b has collected an alphabetical list of 700 hills in the county and its confines, fifty narrow valleys or ravines, ninety mineral springs, and five hundred collieries, of which, however, not more than a half, and many of these no longer worked, are situated within the limits of Derbyshire. The caverns, the natural excavations, and the wonders of the Peak, as they are called, have been described by numerous writers. The most remarkable of the caverns may be briefly mentioned. Poole's Hole near Buxton, is a fissure in a calcareous mass, where a narrow and winding entrance forms a passage into a spacious cavern, of which the roof, floor and sides are adorned with stalactites. A cavern near Castleton,^c a village in the Peak, forms a subterranean passage of 750 yards, which is broken in several places by narrow pools. The sides are composed of different coloured spars, and a petrifying water continually exudes from them. Mam-Tor in the neighbourhood of Castleton has been called the Shivering Mountain, on account of the decomposed shale, that falls from a precipice into the valley below it. Elden Hole, a perpendicular chasm, not more than three miles from the last place, was long considered unfathomable, but by more correct examinations, its depth has been reduced to seventy yards.

The mineral products of the same hills are numerous and valuable. Lead, the most important of any, has been obtained in great quantities, and one sort of it,^d which appears to be confined to Derbyshire, is found in a vertical position, and explodes in mining. Many of these mines are exhausted, but calamine is still obtained in their vicinity. Lime of the best quality is burnt in the Lower Peak,^e and conveyed to considerable distances. Iron ore is chiefly dug on the north-eastern side, and it has already been observed that coal is most plentiful on the same side, and that the strata extend from north to south. The Derbyshire spar^f is wrought into a variety of ornamental articles, and the neighbouring hills are rich in marble, of which the finest kinds are worked at Ashton. The numerous quarries yield different kinds of stone, and gypsum, not the least valuable of their products, abounds in the neighbourhood of Chellaston. Of the numerous mineral springs, the

^a The Trent first separates Staffordshire from Derbyshire, then crosses the southern extremity of the latter, and finally separates it from Leicestershire, and for a shorter distance, from Nottinghamshire.—P.

^b Farey.

^c Called Peak Cavern, or Peak's Hole.—P.

^d Called *Slickenside*.—P.

^e Particularly in the neighbourhood of Crich.—P.

most celebrated or those of Buxton and Matlock belong to the sulphureous class.^g The first were known to the Romans; they are used both externally and internally, and are chiefly resorted to on account of scorbutic, nervous and rheumatic affections. Their temperature is about 82° of Fahrenheit, and the principal difference between them and those of Matlock, consists in the lower temperature of the latter.

Derby, the capital, and almost the only populous town in the county, is situated in the southern part of Derbyshire, and watered by the Derwent, of which the streams set in motion the machinery of the silk and cotton manufactures in the town and neighbourhood. The raw materials and the manufactures are conveyed by means of the Derby canal, which consists of three branches that meet in the same city. The first crosses the Grand Trunk, and falls into the Trent at Swarkstone, the second extends northwards, and the third communicates with the Erewash canal. It was on the banks of the river that the first mill for winding and twisting silk was erected in 1718, by John Lombe, who having discovered the secret from the Italians, is supposed to have been poisoned by them. It may be doubted that there is at present any mill in Italy, of which the machinery is so perfect; a single wheel puts in motion more than 25,000 reel bobbins, and nearly 2000 star-wheels. It may be added that any one of the reels can be stopped at pleasure, and that every time the wheel goes round, which is thrice in a minute, it makes 73,728 yards of thread. The silk and cotton manufactures do not, however, afford occupation to all the industrious inhabitants; the same place is also famous for its porcelain, which in brilliancy of colour, and fineness of texture, may bear a comparison with that of China. Many persons find employment in the marble works, or in turning vases, urns and other ornaments of the spar, which abounds in the vicinity. Other individuals are employed in the iron and lead works, and it is calculated that four-fifths of the inhabitants are engaged in these different branches of industry.^h

Derby is divided into five parishes, and the Church of All Saints is considered the finest in the town, although a rich Gothic tower appears out of place in a Grecian building. Of the other edifices, the most remarkable are the county hall, the town hall and the county gaol, and it may be observed that the infirmary, which was finished in 1810, is one of the most perfect institutions of the kind in England.ⁱ

Chesterfield, the only other important place in the county, rises on the western side of the Rother. Like Derby, it is noted for its cotton and silk manufactories, but several potteries and iron works have been established in the neighbourhood, from which the fuel and the ore are obtained. The products of the lead and the coal mines are conveyed by a canal, that extends from the same place to the Trent.

It has been supposed that the celebrated Sir Richard

^f Fluor spar.—P.

^g Buxton and Matlock waters are simply thermal, with scarcely more mineral impregnation than common water. There are, however, several sulphureous springs in the county, of which the most noted is that of Keddlestone.—P.

^h Capper.

ⁱ The town of Derby is mentioned in history, as the furthest point to which the rebels of 1745 advanced.

Arkwright was a native of the county; this, however, is a mistake; he was born at Preston in Lancashire. But the small town of Tunstead in Derbyshire, was the birth-place of Mr. James Brindley, the greatest engineer of his age, and who in some respects may be compared with Arkwright; both were self-educated, both rose to eminence from the humblest rank, and the genius of both is displayed in the increased resources of their country.

The inland county of Nottingham is bounded on the west by Derbyshire, on the north by Yorkshire, on the east by Lincolnshire, and on the south by Leicestershire. The area does not amount to more than 800 square miles, but the greatest length of the county is equal to fifty, and the greatest breadth to nearly twenty-six. Situated between the Lincolnshire flats on the one hand, and the Derbyshire hills on the other, the climate is comparatively dry, wholesome and not unfavourable to the growth of useful plants. The soil and the face of the country are sufficiently varied, but the former may be included under four divisions. The limestone and coal district is formed by a narrow stripe, which commences at the Derbyshire border, and stretches in a south-east direction to Bilborough and Wollaton. A much broader belt, which extends to the northern extremity of the county, consists chiefly of sand and gravel. The length of this district is about thirty miles, and the breadth varies from seven to ten. In this part of Nottinghamshire is situated the ancient royal forest of Sherwood, the scene of many fabulous adventures. It remained long destitute of trees, and without cultivation, but the greater part of it has been enclosed, and many large parks have been granted to different proprietors by the crown; these have been brought into tillage, and adorned with thriving trees. The turnip husbandry has been introduced with great success in the same district, which is equally fruitful in barley and other sorts of grain. If the level land along the banks of the Trent and the Soar be excepted, the clay district occupies the rest of the county. The former, which appears on both banks of the river throughout an extent of thirty miles, with an average breadth of nearly six, is in general a fruitful vegetable mould, resting on a bottom of sand or gravel, that appears in some places at the surface. The clay thus divided into two parts, which are generally called the North and South Clay Divisions, is not of so tenacious a quality as in other counties, a circumstance which must be attributed to its mixture with sand. The northern division includes the picturesque vale of Belvoir,^a which is little inferior in fertility to any other in England. The Nottinghamshire

^a The Vale of Belvoir is situated in the South Clay Division to the south of Newark.—The natural divisions of the county may be better defined thus: the Coal and Limestone District forms a belt of about two miles wide, along the borders of Derbyshire, from the Trent northwards; the Sand and Gravel District forms a parallel belt, about seven miles wide, from the Trent to the northern boundary; the Clay District occupies all the eastern part of the county, with the exception of the valley of the Trent, called Trent Bank, which divides it into two parts—the North Clay, and the South Clay Divisions, each about five miles wide; the former on the north of the Trent, from Nottingham to Gainsborough; the latter on the south, from Newark to Leicestershire, including the Vale of Belvoir and the Wolds.—P.

^b Lowe's Agricultural Survey of Nottinghamshire.

^c The Nottingham canal extends from the Trent, near Nottingham, north-west fifteen miles, to the junction of the Cromford and Erewash canals, at Langley bridge. From this point, the Cromford canal pro-

ceeds eighteen miles north-west, chiefly in Derbyshire, by Crich to Cromford, and the Erewash canal, south 11½ miles, to the Trent, opposite the mouth of the Soar.—P.

Wolds extend on the south; they were formerly unproductive, but are now enclosed and in a state of improvement.^b The farmers devote their attention to the raising of grain for home consumption or exportation; the rearing of cattle, and the management of the dairy, are objects of secondary importance. Hops are much cultivated in many parts of the North Clay, and in the central districts, particularly in the neighbourhood of Ollerton and Betford. They are inferior in value to the Kentish hops, and are supposed to be of a coarser and stronger flavour.

Coal, lime and gypsum are the most valuable of the mineral products. The first commences near Teversall, and runs southwards to Trowell and Wollaton, including in its range almost every parish within two or three miles of the Erewash. The second lies on the east of the former, between it and the sand district; it forms an equally long but somewhat narrower stripe, and covers the coal, which sinks beneath it. Much gypsum is raised near Newark, and converted into plaster of Paris.

The same county abounds in rivers, but none is so celebrated as the Trent, which after crossing Staffordshire and Derbyshire, enters the south-western extremity of Nottinghamshire, winds along the eastern side, and diffuses fertility over the meadows, which it waters. The same river, to which the others are tributary, partly separates the county from Lincolnshire. The Mann, the Meden and the Poulter, flowing from the middle and north-western part of Nottinghamshire, unite and form the Idle, which falls into the Trent near its confluence with the Ouse.

The artificial channels, which have been cut at different periods, have greatly contributed to improve the trade, agriculture and industry of the inhabitants. The most of them run in different directions from the Trent near Nottingham. The Nottingham canal extends from the town, fifteen miles in a north-west direction, through the county, and onwards to Cromford in Derbyshire.^c The Trent canal proceeds from Nottingham in a south-west direction, unites the Trent with the Mersey, and communicates with the former by different branches.^d Lastly, by means of the Leicester and Grand Junction canals, the first of which enters the Trent a short way above Nottingham, the inland navigation extends to the metropolis.^e

Although the inhabitants of Nottingham are engaged in different branches of industry, the staple manufacture is that of silk and cotton stockings. They are all wrought on the stocking frame, a simple and ingenious machine, which, it has already been remarked, was

ceeds eighteen miles north-west, chiefly in Derbyshire, by Crich to Cromford, and the Erewash canal, south 11½ miles, to the Trent, opposite the mouth of the Soar.—P.

^d The Trent canal is a side cut of 10 miles, along the Trent, from Trent bridge, near Nottingham, to the commencement of the Grand Trunk (Trent and Mersey) canal at Sawley. (See note ^c p. 1211.) It is connected with the Nottingham canal by the Erewash canal.—P.

^e This line is formed by the Loughborough and Leicestershire navigations, (the former commencing in the Trent at the mouth of the Soar, and proceeding up the course of the last river to near Loughborough, and the latter continuing it up the same river to Leicester;) then the Union canal, from Leicester to Market Harborough; the Grand Union canal, (leaving the Union canal near Foxton, two miles W. of Market Harborough, and entering the Grand Junction canal near Buckley wharf, north-east of Daventry;) and lastly, the Grand Junction canal, to London.—P.

invented in the reign of Queen Elizabeth, by Mr. William Lee, a native of the county. It appears that the number of frames amounted about the middle of the last century to twelve hundred, and that exclusively of weavers, they furnished employment to four hundred workmen, to many winders, sizers and seamers. The present number exceeds twelve thousand, and in consequence of the demand for silk and cotton in the manufactories, the spinning of these stuffs has been introduced into the town, into different parts of the county, and also into Derbyshire. Many hands are employed in manufacturing shawls and lace for veils, but the other branches of industry, the tanning and malting trades, for which Nottingham was formerly distinguished, have fallen into decay. It contained 34,253 inhabitants in 1811; ten years afterwards, in 1821, the number had increased to 40,415; but about thirty years ago, when the population was comparatively small, the mechanics attributed low wages and want of employment to the use of machinery; conspiring to abolish it, they became incendiaries and frame-breakers. The vanity of the attempt was only equalled by its injustice, and experience shows what have since been the results of machinery in the same town, for the manufactories are now more than doubled, a half is added to the population, and the condition of the working classes is improved. It is not improbable that most of the English workmen are now aware that the abridgment of labour, or additional facility of production, tends both to diffuse wealth and to increase their comforts.

The town rises on a rock above the meadows watered by the Trent. The same rock is of so soft and porous a texture, that all the cellars are cut out of it, and in the largest are deposited the malt liquors, for which Nottingham was formerly distinguished. It is long since the ancient walls, the fortress and the gates were destroyed; a castle, however, was erected near the site of the fortress by the Duke of Newcastle in the short reign of James the Second. It was on a neighbouring hill that Charles the First hoisted his standard in 1642, the signal for the commencement of the civil wars; but the same height is now intersected by four streets, those of King, Charles, Standard and Hill.

The infirmary is a large building to which additions have been made, in consequence of a donation of £20,000 from an unknown individual. Other institutions, such as hospitals for the relief of the aged and the poor, have been founded by benevolent persons.

Newark, the town next in importance to the capital, is watered by a branch of the Trent, and situated on the great northern road near the eastern confines of the county. It is considered the greatest market for corn in this part of the kingdom, and it carries on an extensive trade in malt, wool, cattle and coal. Limestone and gypsum abound in the neighbourhood; the latter is converted into plaster of Paris, and exported by sea to London.

The august ruins of a castle form the finest ornaments of the place. It is said to have been built by a bishop of Lincoln in the reign of king Stephen, and it is added

that it was long called the *New-Work*, a name which was given to the town. It is certain that king John died within its walls in the year 1216, and at the same place the unfortunate Charles surrendered himself after the defeat at Naseby to the Scotch army, that were then besieging Newark. At no very remote period, the great road in the vicinity was often impassable in consequence of inundations. To obviate this inconvenience, an act was obtained for a new one in 1770. Thirteen bridges of various sizes, and consisting of ninety-four arches, now carry it above the reach of the floods to Muskham bridge, a distance of a mile and a half. This excellent road, which forms a fine approach to the town, is the work of the celebrated Smeaton.

The ancient town of Mansfield, the only other place of any consequence, is situated on the western side of Sherwood Forest, about fourteen miles from Nottingham. It carries on a trade in corn and malt, and the inhabitants are occupied in different branches of industry, but principally in cotton spinning, hosiery, lace and stocking manufactories. The largest cotton mill has 2400 spindles, and furnishes employment to nearly 200 persons. An easy outlet to these manufactures and to the mineral products that are worked in the neighbourhood, is obtained by means of a cast-iron rail-way, which extends from Mansfield to the Pinxton canal, a distance of more than seven miles.

The county of Leicester is contiguous to Nottinghamshire and Derbyshire on the north, to the latter county and Warwickshire on the west,^a to Northamptonshire on the south, and to Rutlandshire and Lincolnshire on the east. The limits are for the most part artificial; but the Soar and the Trent form part of the northern boundary, while the small river Anker, and Watling Street, a celebrated Roman road, are the limits on the Warwickshire side, and the Avon and the Welland separate it from Northamptonshire. According to a return to the House of Lords, the superficial extent is equal to 804 square miles, the greatest length to forty-five, the utmost breadth to thirty, and the circumference to a hundred and fifty. It was inhabited by the *Coritani* before the invasion of the Romans, who included it in the province of *Flavia Cæsariensis*. It formed part of Mercia in the time of the Heptarchy, and its present name is supposed to be derived from the Saxon word *Ledcesterscyre*, which signifies a fortress on the *Scyr*, the ancient name of the Soar.^b

The country is varied by hills and plains; the declivities of the former serve to carry off the water, but their altitude is in few places a barrier to cultivation. The capital is situated on a plain in the centre of the county; the land rises towards the east and the south, but the loftiest heights are those in the west towards Charnwood Forest. Their elevation, however, is not great, for it appears from the Trigonometrical Survey, that no part of Leicestershire is higher than nine hundred or lower than one hundred feet above the level of the sea. The central plain is watered by the Soar, the principal river in the county, and the outlet of the streams from the surrounding hills. All the waters of Leicestershire

(lea,) and *ceaster* (Lat. *castrum*;) a city—the Roman stations or camps (*castra*) having become the sites of the old Saxon towns.) (Bailey's Dict.)—The Soar, anciently the Leire. (whence the name of the county.) (Luckombe.)—P.

^a It is contiguous for a short distance on the west to Staffordshire.—P.
^b *Ledcestrescire*. (Rees' Cyc.)—This signifies the shire (Sax. *scirc*, from *scyr*, to divide) of *Ledceastre*.—Leicester was formerly written *Lege-cestria*, *Legeo-cestre*, and in the Saxon annals, *Leger-cestre*. (Rees' Cyc.)—Leicester (Saxon, *Leagceaster*, from *leag*, fallow ground

serve to enlarge the Trent,^a and thus to form that admirable system of inland navigation, which has so much contributed to the prosperity of England.^b But Leicestershire is more distinguished as a pastoral than a manufacturing county, and the soil has been described as a fine mixture of clay and sand, without the sterility of the one, or the too great tenacity of the other. It is remarkable that the highest districts are in general the most productive, and the lowest, the least fruitful; in other words, the clay of the valleys does not appear to be tempered with a sufficient proportion of sand. According to the agricultural survey, many farms in the south-eastern and central districts are wholly pastoral, but in the north and west a portion of each farm is generally reserved for grain and other crops. The number of acres under occasional tillage is supposed to be equal to 240,000.^c At no distant period, before the fields in this fruitful county were enclosed, it produced plenty of corn, but grass has been found to be more profitable, and every branch of husbandry is now subservient to the rearing of stock. Of the sheep there are three varieties, the Forest, the Old Leicester and the New Leicester; the two first, however, are almost superseded by the last, which are now scattered over most parts of England. This valuable variety was the result of experiments undertaken by Mr. Bakewell of Dishley, who appears to have made the most valuable properties not only of that useful domestic animal, but also of the horse and the ox, subject to his control.

Stilton-cheese is made near Melton-Mowbray, and about two hundred tons of it are sold at the Leicester October fair. Five thousand tons of cheese are annually exported by the Trent from this and the adjoining counties, and it is not supposed that Leicester contributes less than 1,500, the produce of 7,500 milch-cows.^d Coal and lime, the most valuable minerals, are obtained on the borders of Derbyshire. Iron ore is common on the Ashby wolds, but as it is only found below the depth of six hundred feet, the metal does not pay the expense of extracting it. Granite is exported from Mount Sorrel, and slate from the eastern side of Charnwood Forest.

The manufacture of wool is the staple one of the county, and Leicester, the capital, is only inferior to Nottingham in this department of industry; the coarser goods are more common in the former place, and the finer sorts in the latter. It is calculated that the different branches of the hosiery manufactures furnish employment to seven or eight thousand inhabitants of Leicester, and it is certain that in prosperous seasons more than five thousand dozens of stockings have been made in a week. The same place boasts of a high antiquity; anterior to the Roman invasion, it was the chief town in the country of the *Coritani*, and it was known at a later period as the *Rata* of Antoninus. Situated on the Fosse-way, many valuable antiquities have been found near it, and coins, which might afford a complete series from the reign of Nero to that of Valerius. It was afterwards the seat of

a mint, and Saxon money struck at Leicester, is still preserved in more than one collection. The town became memorable at a later period as the seat of a parliament, that enforced by law the burning of heretics. Lastly, in an abbey, of which the ruins still adorn the neighbourhood, the ambitious Wolsey ended his days in poverty and disgrace.

It appears from Domesday book, that Leicestershire then contained 36,000 inhabitants. The extent of surface is equal to 816 square miles, so that the ratio of the population to the surface, must have been about forty-four to every square mile; but according to the returns of 1831, the present number is greater than two hundred and forty. This fact is the more remarkable as Leicestershire has been surpassed by many counties in the career of commerce and wealth.

The small county of Rutland, the least in England, is encompassed on the north by Lincolnshire, on the west by Leicestershire, and on the south-east by Northamptonshire. It contains an area of 200 square miles, but it is nowhere more than eighteen miles in length, and fifteen in breadth. The vale of Catmose, in the central district, is the largest and most fruitful in Rutland, but numerous small vallies are intersected by gently sloping hills, extending from east to west, and bounding many varied and romantic views. Different parts of the county are fruitful in corn, while others are well stocked with sheep. The most prevalent soil consists of a strong red loam, mixed with keal,^e and resting on clay. But in the vale of Catmose, the same loam is mixed with clay, and to that circumstance its fertility has been ascribed.^f Although there are many sorts of soil in the southern and south-eastern districts, they are on the whole the least fruitful in the county. The mineral products are of secondary importance; limestone is worked in different places; numerous chalybeate springs denote the existence of iron ore, but it has not yet been discovered in any part of Rutlandshire. Many brooks and streams enlarge the two principal rivers, the Welland and the Guash.^g The first separates Rutlandshire from Northamptonshire, while the second flows through the middle of the county. No branch of manufacturing industry is established on a great scale; but the trade of different places has been improved, and the conveyance of agricultural products facilitated, since the Oakham canal was completed. It commences at the Melton Navigation,^h waters Wymondham and Market-Overton, and extends to Oakham on the north of the vale of Catmose. Of Oakham, the chief town, it may be sufficient to remark that it contains only 1700 inhabitants.

The inland county of Northampton is bounded on the north by Leicestershire, Rutlandshire, and Lincolnshire, on the east and south by Cambridgeshire, Huntingdonshire, Bedfordshire, Buckinghamshire and part of Oxfordshire, and on the west by Oxfordshire and Warwickshire. As it touches on not fewer than nine counties, it may be inferred that it is of a very elongated and irregular form.

^a The streams on the south-eastern border flow into the Welland, and on the south-western, into the Avon.—P.

^b "The most elevated district, called Charnwood Forest, gives rise to six rivers, all of which unite with the Trent, and may thus be considered the centre of that great system of inland navigation, which has contributed so greatly to the progress of agriculture and manufactures." (M. B.)—P.

^h At the termination of the Melton-Mowbray navigation.—This last leaves the Leicester navigation 8 miles above Loughborough, and follows the course of the Wreake and the Eye rivers, twelve miles, to Melton-Mowbray.—P.

It appears indeed that it is sixty-five miles long, twenty-five in breadth in some places, and only eight in others. According to the same measurement, it contains 965 square miles, and according to the last population returns, the number of inhabitants to each square mile is greater than a hundred and eighty-five. It has been long noted for its healthful climate, its varied sites, and the number of country-houses with which it is adorned. The ancient forests, still of considerable extent, and still well wooded, occupy nearly 80,000 acres; of these the largest are that of Rockingham on the north, and those of Salcey and Whittlebury^a on the south. They afford shelter to different sorts of game, and the wild cat, the fiercest of the English quadrupeds, still frequents them. They must be considered, however, a very inadequate compensation for the advantages of coal, of which the county is destitute, and of which the high price presses severely on the lower orders. Northampton is principally distinguished as a grazing county, but the grain that is raised for exportation forms no small portion of its products. Wheat, flour, oats, beans and woad for dyeing are exported. Fruitful meadows are scattered in different directions, and the largest tract extends on both sides of the Nen from Northampton to Peterborough. The north-eastern districts, contiguous to Lincolnshire and Cambridgeshire, abound in marshes, and the Peterborough Fen, which reaches to the neighbourhood of Crowland, is not inferior to the richest meadows in England. Many large horses of the Leicestershire breed, are reared in these pastures; the oxen too, are remarkable for their size and weight; they are, however, of no particular kind, but are bought at different fairs, and fattened in the county.

The ground rises on the north and north-west, and becomes gradually lower towards the south-eastern boundary. The loftiest eminences extend along the north-western borders, and in the neighbourhood of Daventry, they reach the height of more than eight hundred feet above the level of the sea. The Nen, the principal river, has its source in this part of Northamptonshire, traverses it nearly its whole length, and is enlarged by many streams. The Cherwell, which like the Nen, flows into the eastern sea, and the Leam, which discharges itself into the western, rise in the same part of the county. Communications have been improved or extended by numerous canals. A branch of the Oxford canal, the first which was cut in Northamptonshire, extends westwards, and communicates with others in the populous districts round Birmingham.^b The Grand Junction commences in Northamptonshire,^c and advances southwards in an unbroken line to the Thames.^d The Leicester canal proceeding in an opposite direction, opens a communication with the Trent and Mersey. These opposite lines are joined by the Grand Union, which enters the Junction near Daventry, and the Leicester at Market-Scarborough.^e

Northampton, the capital of the county, is pleasantly situated on an eminence above the waters of the Nen.

^a Whittlewood or Whittlebury.—P.

^b The Oxford canal runs a short distance in Northamptonshire, on its western confines, near the origin of the Grand Junction canal. The branch, here referred to, is the Warwick and Napton canal, leaving the Oxford canal at Napton in Warwickshire, and extending to the town of Warwick, where it joins the Warwick and Birmingham canal.—P.

It consists of four principal streets, with which several others communicate, and the houses are uniformly built of a kind of freestone that hardens by exposure to the air. The inhabitants carry on a trade in shoes, stockings and lace, but more individuals are employed in making boots and shoes than in any other branch of industry. The mart for these articles is not confined to London; many of them are exported to the colonies. The market-place is built in the form of a square about six hundred feet in length; it is there that the horse fairs are held, to which the dealers from London and York repair, and which for carriage and saddle horses, are considered equal to any in England. The same town is mentioned in history on account of the number of councils which were held in it, and also on account of its monastic institutions, its formidable castle, and its military importance. King John, offended with the citizens of London, commanded the exchequer to be removed to Northampton in the tenth year of his reign. Edward the First made it frequently a place of residence, and one of the numerous crosses, which that monarch erected to the memory of Queen Eleanor, is still to be seen in the neighbourhood. In the year 1460, a memorable battle was fought in the adjoining meadows on the banks of the Nen, between the forces of Henry the Sixth, and the Yorkists, in which the former were defeated, and the king taken prisoner by the earl of Warwick.

The small town of Peterborough on the borders of Huntingdonshire, was formerly distinguished for its monastery, which Henry the Eighth changed by letters patent into an episcopal see, and in the same manner, the conventual church was converted into a cathedral. It is a building of irregular architecture, in which the Norman style predominates; the interior may be mentioned for its sepulchral monuments, particularly for those of Catharine of Arragon, and the unfortunate Mary, queen of Scotland, who was buried there in 1587.^f Peterborough is the least episcopal city in England, but it is a place of considerable industry and trade; many of the inhabitants are engaged in manufacturing stockings, and the commerce consists in coal, corn, malt and timber, that are transported by means of the Nen, which is navigable for barges. The same town was the birth-place of Dr. William Paley, and it may be added that the celebrated Dryden was a native of the county. The ruins of Fotheringay Castle may be traced near the village of the same name. It was there that Richard the Third was born, and it was there also that the queen of the Scots terminated her wretched fate, and suffered with the utmost fortitude the death to which she was unjustly condemned. The same castle was demolished by James the First, and little more than the moats remain to mark its site.

The county of Huntingdon is enclosed by those of Bedford, Cambridge, and Northampton. The first is contiguous to it on the south-west, the second on the south-east and north-east, and the last on the north and west. The boundaries are very irregular and mostly artificial;

^e See notes ^d and ^c p. 1220.

^f The remains of the queen were afterwards removed by her son to Westminster Abbey.

the area is supposed to be equal to 310 square miles, so that if Rutland and Middlesex be excepted, Huntingdonshire is less than any other county in England. It is only distinguished as a farming county; its manufactures are too insignificant to require notice. The Ouse, which enters Huntingdonshire from Bedfordshire, passes by St. Neots, Huntingdon and St. Ives, is navigable throughout its course, and waters meadows that have been long noted for their fertility; of these, Portholme-mead^a in the vicinity of Huntingdon, is not the least celebrated; such too, are the south-eastern districts;^b the central and the western are more varied, fruitful in corn, and by no means destitute of trees. The uplands were formerly covered with woods, and well adapted for the chase; hence they were denominated the *Hunting-Downs*, from which the county derives its name. The Nen, which separates Huntingdonshire from Northamptonshire, forms several lakes or meres,^c and the marshy districts on the north-east are composed of fens which are connected with those of the last county, and with the extensive tract that has been denominated the Bedford Level, that passes through Cambridgeshire and Lincolnshire. Whittlesea-Mere, although much smaller than it once was, is equal in length to six miles, and in breadth to three, and covers an area of 1570 acres; like the others in the same county, it abounds with wild fowl. The fen-lands have been estimated at 44,000 acres, or rather more than a fifth part of the surface but of these more than 10,000, which have been drained, afford good pasturage. Although the village of Stilton is famous for its cheese, the cattle are admitted to be of an inferior kind.^d

The county contains no towns of much importance, but it may be remarked that Huntingdon, the capital, is finely situated on an eminence above the rich and verdant meadows on the northern bank of the Ouse, which being navigable for barges and small vessels, enables the inhabitants to carry on a trade in coals, timber and other articles that are imported at Lynn. The town consists principally of a single street, extending more than a mile in a north-western direction from the bank of the river. It is connected by means of a causeway and three bridges with the ancient village of Godmanchester, of which it is said to have been originally a dependence. It is probable, however, that it was once more important than at present, as it formerly contained fifteen parishes, a number which has since been reduced to two. Huntingdon is well known as the birth-place of Oliver Cromwell, and the parish register of the year 1599, in which his baptism is recorded, is still preserved with great care.

The inland county of Bedford is bounded on the north by Huntingdonshire and Northamptonshire, on the west by Buckinghamshire, on the south by the same county

^a Portsholme Mead (Ed. Enc.) Portsholm, or Portmead (Luckcombe).—P.

^b The borders of the Ouse, flowing across the S. E. part, consist of a tract of most beautiful and fertile meadows, of which Portsholme Mead, near Huntingdon, is particularly celebrated. (Ed. Enc.)—P.

^c The Nen forms the northern boundary of the shire. On the north-eastern confines are several large meres or pools. The Nen sinks into the fens below Peterborough, but it is not directly connected with the meres, nor can it be considered as forming them.—P.

^f Lignite, or Brown Coal—in the Iron sand formation, between the Chalk and Oolitic formations.—P.

^g "A Roman way, called Ickenild Street, traverses the county and passes by the small town of Dunstable; a second crosses the former,

and Hertfordshire, and on the east by the last county and Cambridgeshire. The Ouse and a small river are the only natural limits; the first bounds it a short way on the east and west, while the second waters the south-western confines. The figure of the county, although very irregular, bears some resemblance to an ellipsis, of which the longer axis is about thirty-six miles, and the shorter about twenty. It contains about 296,000 acres, and of these, according to a recent return, more than 80,000 are in a course of tillage, and 168,000 in pasturage. There are few extensive plains, but the country is varied by hill and dale. The ridge of chalk hills rises to a considerable height on the south, and in many places projects abruptly into the valleys. A tract of comparatively sterile land extends beneath the chalk to a considerable distance, but the soil has been improved by the chalky earth, which is used as a manure. A stripe of good land passes from the south-eastern corner to the middle of the county, and terminates northwards in sandy hills. The western part is in general flat and sandy, and well cultivated according to the Norfolk method. Large tracts of deep and barren sand in the vicinity of Woburn appear to be only fit for plantations. Lastly, the cultivation of garden vegetables furnishes employment to many of the inhabitants between the town of Biggleswade and the village of Sandy.^e The minerals are not numerous, and with one exception, not very important. Limestone, coarse marble and imperfect coal^f are obtained in many places, and also a variety of petrifications, particularly different shells and *Cornua Ammonis*. Mineral waters are common, but none of them are held in great repute; some are saline, and others chalybeate, but the greater number have not been analyzed. Fuller's earth, which has been long worked, and is still obtained in great abundance, must be considered the most valuable of the mineral products.

Bedfordshire, like Huntingdonshire, was inhabited in early times by the *Caticuchlani*, better known perhaps by the name of the *Cassii*, who sent ambassadors to Cæsar, and declared their willingness to submit to the Romans. Traces are left not only of the Roman, but of the Saxon and Norman domination. The village of Sandy near Potton stands on the site of the *Magiovinium* of Antoninus. The remains of a Roman amphitheatre may still be observed in the neighbourhood of Bradford-Magna; one Roman way passes by the small town of Dunstable, another extends on the north of the same place, and a third crosses the Ouse and leads to Newport-Pagnel.^g The name of *Bedicanford* in the Saxon annals,^h attests the antiquity of Bedford, the capital of the county, which is watered by the Ouse, and finely situated in a fruitful tract, that is called the vale of Bedford. It is said to have been the burying-place of Offa, king of the

to the north of that town;* and lastly, a third passes the Ouse and leads to Newport-Pagnel." (M. B.)—Only two Roman roads are generally represented as crossing Bedfordshire, viz. the Ickenild and Watling Streets. But there is a difference in tracing the course of the latter through the county. The Ed. Enc. represents it as entering at Dunstable, and leaving it between Heath [near Leighton-Buzzard] and Potsgrove [near Woburn.] Luckombe (Gazetteer, Append. Roman Roads) says it enters at Luton; then turns westward, till it intersects the Ickenild Street, near Dunstable; then northward, by Barton, Sheldford and Sandy, to Bedford, where it crosses the Ouse, and leads to Newport-Pagnel in Bucks. The Ickenild crosses the southern border of the county by Dunstable.—P.

* The Watling Street.—The old Roman Watling Street is crossed by the Ickenild Street at Dunstable. (Luckombe.)—P.

^h *Bedanford*. (Camden.)—P

Mercians; at a later period, it was made over by William Rufus to Pain de Beauchamp, who fortified it with a strong castle. The possession of it enabled Faukes de Brent to sustain a siege against the army of Henry the Third. The castle was destroyed, but the favourite escaped; and the details of the event, at the same time that they illustrate the state of society, are of as singular a nature as any in English history. The town is an ancient corporation, and its first charter bears the date of 1166. It is now divided into five parishes. The charitable institutions are not without importance; a free grammar school, founded in 1556, by Sir William Harpur, a London alderman, was endowed with thirteen acres of land,^a which, having been since let for building, yield a yearly rent of £6000. The surplus funds are applied to different purposes, and among others, £800 are annually distributed as marriage portions among forty poor maidens; each receives £20, but if any do not marry within a month afterwards, the money is forfeited. The town is greatly indebted to the late Mr. Whitbread for its gaol and infirmary. Although the manufactures are of little value, Bedford carries on a considerable trade in corn, coal, iron and timber, which are conveyed by the Ouse from Lynn and Yarmouth. It may be added that the northern and southern parts of the same town are connected by a handsome stone bridge, which was erected over the river in 1814.

The popular author of the pilgrim's progress, a person almost as much distinguished for the profligacy of his youth, as for the religious fervour of his maturer years, officiated long as the anabaptist minister of Bedford. The courage of the man is worthy of admiration; persevering in defiance of the unjust laws that were enacted against dissenters, he incurred the sentence of transportation. It is true that the sentence was not put in execution, but Bunyan passed more than twelve years of his life in prison.

The small town of Woburn near the Buckinghamshire border, was well known in past times on account of an abbey, founded in the twelfth century by Cistercian monks. The same abbey, on the suppression of the monasteries, was granted by Henry the Eighth to John Russel, the founder of a family that has since become illustrious in the annals of English freedom.

Warwickshire, a county of an irregular form, terminating in a point on the north and south, is surrounded by six other counties, namely, by Leicestershire on the north-east, Northamptonshire on the east, Oxfordshire on the south-east, Gloucestershire on the south-west, Worcestershire on the west, and Staffordshire on the north-west. Equal in some parts to fifty miles in length, and to thirty-five in breadth, the area is not more than 902 square miles. Almost a half of the county consists of pasture lands, nearly a third part is arable, and 154,530 acres are in a constant course of tillage. The same county is adorned with many picturesque sites, hills alternating with vallies, woods, limpid streams and rivers. The highest lands are situated in the hundred of Hemlingford, and in the neighbourhood of Packington. The

streams from this ridge descend on one side to the Avon, and onwards to the Bristol Channel, and on the other, to the Blythe, the Tame and the Trent. The Brailes and Edge Hills form part of another ridge on the south-east, less elevated than the former.

The soil, in common with that of other midland counties, is very variable, and it cannot be denied that the varieties occur frequently within a very limited space, or that many of them may be observed in a single field. Agriculture, it may easily be imagined, is modified by these natural causes, and different methods or different rotations are followed according to the nature of the land. The common crops are wheat, barley, oats, leguminous plants and turnips; rye, potatoes and flax are of rarer occurrence. It is also distinguished as a feeding and dairy county; much cheese is made in the northern districts, and the different breeds of cattle have been crossed and improved. The plantations are extensive; the woodlands in the ancient forest of Arden are now under excellent management, and oaks as lofty as any in England may be seen in the parks of different proprietors.

The minerals are coal, limestone, freestone, ironstone, flagstone and marl. The best coal, it has been observed, is wrought near Bedworth. Limestone is common in many parts, and freestone abounds in the light sandy districts. Extensive quarries of blue flagstone, which is much used in paving streets, are worked near Bidford and Wilnecote. The western districts abound in marl of a good quality, and ironstone was formerly wrought in the neighbourhood of Oldbury.

The rivers are the Avon, the Tame, the Leam, the Stour, the Alne, the Blythe, the Cole and the Dove. But if the Avon be excepted, these and other rivers, although they enrich the pastoral districts, and add greatly to the beauty of the country, are too insignificant to facilitate the purposes of commerce. And as Warwickshire is conspicuous for the enterprise of its merchants, and the skill of its artisans, it may readily be supposed that the industrious inhabitants have availed themselves of the advantages which artificial channels afford. The county may bear a comparison with any other in the number and importance of its canals, and the history of its commerce proves that almost simultaneously with the completion of these modern works, great accessions have been made to its products of industry. Although it might occupy too much space to mention all the canals, some of them need not be omitted. The town of Birmingham may be considered the point from which the numerous ramifications diverge. The Birmingham canal,^b extending from the Staffordshire and Worcestershire canal near Wolverhampton, terminates in the Birmingham and Fazeley canal; coals are thus conveyed from Staffordshire, and Manchester and Liverpool receive the manufactures of Birmingham. The Birmingham and Fazeley canal serves for the transportation of the same manufactures to Hull and London, and the boats return laden with grain and other commodities to Birmingham.^c The Warwick and Birning

^a In St. Andrew's parish, Holborn—now forming Bedford Row and the adjoining streets.—P.

^b The Old Birmingham canal.—It is now continued, beyond the Staffordshire and Worcestershire canal, in the Birmingham and Liverpool canal, to the Chester canal at Nantwich.—P.

^c The Birmingham and Fazeley canal terminates in the Coventry canal, near Fazeley; it communicates with Hull, by the Coventry, Grand Trunk and Trent canals, and the river Trent, and with London, by the Coventry, Oxford and Grand Junction canals.—P.

ham canal extends from Warwick to the Digbeth cut;^a the distance between London and Birmingham is thus shortened, and the capital of the county is supplied with coal.^b Lastly, by the circuitous course of the Coventry canal to Birmingham,^c the products of the neighbouring country are placed in the line of communication with London in one direction, and with Manchester and Liverpool in the other. Such are some of the works which the inhabitants have constructed from their own resources to facilitate their commerce.^d

Warwick, the capital, is finely situated on the banks of the Avon in the central part of the county. The streets are regular and well built, and most of them meet on an eminence in the middle of the town. It contained formerly six parish churches, but of these two are all that remain. St. Mary's church, a magnificent Gothic building, was granted as a place of worship to the inhabitants by Henry the Eighth at the dissolution of the monasteries. It was almost destroyed by fire in 1694, and afterwards rebuilt; but of the original structure, the Beauchamp chapel still remains, and it is little inferior to any English building both in its exterior and interior ornaments. Among the latter are several monuments of the earls of Warwick, and one of the Earl of Essex, the unfortunate favourite of Elizabeth. The other church, or that of St. Nicholas, is by no means remarkable for its architecture.

Although the town has been the scene of important events in English history, its origin seems to be unknown; it is probable, however, that it was not founded before the time of the Saxons. It is mentioned after the conquest as a borough containing 261 houses, and not long afterwards it was erected into an earldom, and to this distinction it owed in a great measure its future consequence and prosperity. The fame of Warwick is intimately connected with its castle, which is supposed to have been built in the tenth century^e by Ethelfleda, queen of Mercia.^f It was enlarged, fortified and repaired by the Conqueror, who granted it to Henry de Newbury, the first earl of Warwick. At a later period, during the baronial wars, it was nearly destroyed by Gifford, the governor of Kenilworth Castle; a few years elapsed before it was rebuilt, and it was a second time enlarged by Beauchamp, Earl of Warwick. It is unnecessary to mention its succeeding vicissitudes, but it may be remarked that it was degraded into a common prison, until it was granted by James the First to Sir Fulke Greville, afterwards Lord Brooke, who restored it to its original purpose. It stands on a rock on the northern bank of the Avon; the broad deep moat, which once formed an almost insurmountable obstacle to an invading foe, is now covered with grass, and adorned with trees; the stone bridge is now unguarded, and the battlements are clothed with ivy, but the edifice is still the greatest ornament to the town, and perhaps the finest castle that remains in England.

The city of Coventry is situated between Warwick

and Birmingham,^g and although its antiquity may not remount to Roman times, it is mentioned at a very early period of English history. It owed its origin to a neighbouring convent that was pillaged by the Danes, and it is probable that it was a place of some consequence in the time of Edward the Confessor, or at the date of the legendary story of Leofric and the pious Godiva.^h The obduracy of the count is not forgotten; the strange manner in which the countess displayed her benevolence or piety, and the misfortunes of "Peeping Tom," are still represented in a procession that takes place in Trinity week. Not long after the conquest, the lordship of Coventry was attached to the earls of Chester, and it received many advantages during the middle ages from the protection of these powerful barons. It has been the seat of two parliaments, one in 1404, the other in 1459. The first has been since called *Parliamentum Indoctorum* (the Unlearned Parliament), from the circumstance of lawyers being excluded from it; the second was known by the name of *Parliamentum Diabolicum* (the Devil's Parliament), on account of the attainders that were passed against Richard, duke of York, the earl of March, and the most eminent of the Yorkists. In the time of Henry the Third, and in consequence of disputes between the chapters of Coventry and Lichfield, it was determined that both were entitled to elect, but that the precedence in the episcopal title should be given to Coventry. Matters continued in this state until the Reformation, when it was ordained that the dean and chapter of Lichfield should be for ever the sole property of the bishopric of Coventry. Not long afterwards, the cathedral of the same place, which is said to have been little inferior to any in England, was destroyed by order of Henry the Eighth. Of the three churches that remain, that of St. Michael is a very perfect specimen of its kind, and its lofty steeple, which reaches to the height of 303 feet, is perhaps its greatest ornament.

The same town was early distinguished for the industry of its inhabitants, and it carried on during the fifteenth century a considerable traffic in cloths and other articles, which remained its staple manufactures until the destruction of the Turkey trade at the close of the seventeenth. The present branches of industry are of comparatively recent origin. The making of watches was first introduced about forty years ago, and it is probable that more watches are now made in Coventry than in London. The silk manufactures, which date from the eighteenth century, are more important, and it may be mentioned that in the year 1808, there were 2819 silk and ribbon looms in the city. But the inhabitants have made great improvements in the art since that period, or more definitely, since it became legal to import foreign manufactures. An able and impartial judge, having been examined by a committee of the House of Commons, declared that he should now blush for the work which his best hands had formerly furnished, and that in his opinion the manufactures of Coventry were now equal to those of

foreign rivals, and might successfully compete with the finest fabrics of Lyons.

Birmingham, situated on the north-western side of the county, is by far the most important town in Warwickshire. It has been asserted that some branches of industry were cultivated at a very early period, and that it afterwards carried on an extensive trade in leather; but these facts are at best doubtful, and it is certain that the sources of its present prosperity existed only in modern times. Carpenters' tools, nails and coarse agricultural implements were the only products of its forges until after the Revolution. William the Third having expressed his regret that his people were dependent on the continent for arms, the member of parliament for Warwickshire engaged that arms should be obtained in sufficient numbers from Birmingham. Such is the origin of a manufacture by which the wealth of the town has been greatly increased, for since the comparatively recent period of its introduction, Birmingham has become, if it may be so termed, the armoury not only of Britain, but of Europe. The rapid rise of this branch of industry may be attributed to the judicious management of a few enterprising individuals, and the extent to which it has been carried, may be estimated from the following facts. About the beginning of the last war, 5,000 stand of arms were seldom made within a month; but before the close of the same war, 14,500 muskets were delivered weekly into the ordnance offices for the supply of government and the different powers that were subsidized by England. The industry of the inhabitants is directed to the working of metals, from the smelting of the largest masses to the execution of the most delicate trinkets in steel, copper, silver and gold. The immense quantity of goods, which are sent from the same place, and exposed in the markets of every quarter of the world, are wrought by 25,000 families, but many hundred times that number might be insufficient for the task, without the aid of inorganic matter in the abridgment of labour. To give even a superficial notion of the different processes that are adopted, or of the various substitutes for human labour, might occupy several pages. They comprehend every contrivance from the most ponderous machines, from steam-engines, wheels, cylinders and levers, of which the vast power cannot be witnessed without admiration, down to those delicate instruments that are formed for operations of the minutest accuracy. One fact is certain; Birmingham without its means of communication could never have been the third manufacturing city in Britain, inferior only to Manchester and Glasgow. Numerous rail-ways and lateral canals extend from different iron and coal mines to the old Birmingham canal,^a and their products are thus conveyed to the town. To keep these works in an efficient state is by no means so easy as might be imagined; thus, the proprietors of the mines are obliged to turn into their respective canals, the water drawn from these mines by steam-engines. The Horsley mine is drained at a depth of 660 feet, by an engine of a hundred-horse power, but the water obtained from it is not sufficient for the supply of the principal channel; ten other steam-engines are necessary to feed it.

It is only of late years that the mechanical products

of Birmingham have attained their high degree of perfection, and it is only of late years too that the wealthy inhabitants have contributed to the happiness and welfare of the poor, by providing for them the means of education. It now possesses a great many elementary schools, and there are besides three on the Lancasterian plan, in which two thousand children may be instructed. In addition to its numerous benevolent institutions, one has been established for the relief of persons labouring under bodily deformities, and it is not improbable that its example may ere long be imitated in other towns, where the nature of the occupations is injurious to the human frame. It might be wrong, however, to consider Birmingham unhealthy; although perpetual smoke rises from its forges, and although so many persons are employed in working metals, the average mortality is only one in fifty, while in London, it is one in thirty-one, and in Manchester, one in thirty-seven. It is not unpleasing to contemplate the rapid progress of the town in industry, riches and population; it is little more than two centuries and a half since Edward the Sixth endowed a free school with a revenue of £30 from land; the present revenue exceeds £3000, an increase of a hundred-fold. It had a population of ten thousand inhabitants about the beginning of the eighteenth century; a hundred and ten years afterwards it contained 85,733 persons, ten years later the number amounted to 106,722, and according to the returns of 1831, it is now equal to 146,986. It is unnecessary to add that the products of industry have advanced in a much greater ratio than that of the population.

The small town of Stratford on Avon, about eight miles to the south-west of Warwick, might be passed over in silence, had it not been the birth place of Shakspeare, "the pride of Englishmen, and the glory of their theatre." The house in which the poet was born, and a hall in which his jubilee is celebrated, are the only objects that excite the curiosity of strangers.

The midland county of Stafford forms a long and narrow tract on the east of Cheshire and Salop, on the west of Derbyshire and Warwickshire, and on the north of Worcestershire. A range of hills runs along the north-western border, and spreads out towards the north over the whole breadth of the county. These hills, which are termed the Moorlands, form part of the chain, that extends northwards through Yorkshire to the borders of Scotland. According to the Trigonometrical Survey, some of the hills in the Moorlands are upwards of 1200 feet in height. The southern, central and eastern parts of the county, being in general fruitful and level or only varied by gentle undulations, form a striking contrast with the cold and bleak hills in the northern and north-western districts, where Cannock-Chase, which was formerly covered with woods, presents the appearance of a naked and desolate waste, almost without a single tree to enliven the scene. The rivers rise from these heights, but within the limits of the county, none of them are large. They have, however, contributed materially to that extensive system of inland navigation, by which the cultivation of the land has been improved, the products of industry multiplied, and the commerce of the inhabitants extended. The Trent, the principal river, and the one to which most of the others are tributary, rises from the Moorlands near the northern

^a See note ^b p. 1225

extremity of the county, and in its winding course first southwards to the vicinity of the Potteries, then eastwards to its junction with the Tame, and lastly north-eastwards to the borders of Derbyshire, waters sites as picturesque as any in Leicestershire. Although much of the soil is fertile, and although waste lands have been restored to cultivation, Staffordshire is of secondary importance as an agricultural county; its treasures consist in its minerals; they form the sources of its trade, and the raw materials of its various manufactures. Coal, iron and limestone are the most valuable, and the most extensively distributed. The coal, it has been seen, is obtained in a district not less than 50,000 acres in extent, and in some parts of it, the seams are found to be thirty-six feet in thickness. The strata of iron ore lie under, and alternate with the coal; the most abundant mines and those of the best quality are situated in the neighbourhood of Wednesbury, Tipton, Bilston and Sedgely. Copper is worked at Ecton-hill near Warslow, and at Mixon near Leek; veins of lead have been opened at no great distance from the same hill, and in different parts of Stanton moor.^a But these metals are of little value in comparison of the first, from the abundance of which the county has been denominated the *Chalybia* of England. Limestone is perhaps the most common of the mineral products; the Sedgely and Dudley hills on the south afford an inexhaustible supply; the same remark is applicable to the upper banks of the Dove, to the north-eastern Moorlands, and to the neighbourhood of the Weever hills, whence the greatest consumption does not lessen the supply in any perceptible degree. The same substance is used extensively in Staffordshire for manure, and a great quantity is exported to other counties, in which it is chiefly used for mortar. The limestone passes in different places into marble; the ronce sort is the most common, but grey and black varieties are by no means scarce, the former at Stanshope and Pokehill, the latter in the neighbourhood of Bentley. Lastly, the sulphate of lime, known by the name of alabaster, is obtained from many quarries near the banks of the Dove. Potter's earth is found in different places, and also in the district of the Potteries.^b But the principal supply of Staffordshire is derived from Dorsetshire and Devonshire; four sorts of clay are imported from these counties, and that from the Isle of Purbeck in Dorsetshire is sold for the highest price. Mineral substances, similar in their properties to the porcelain earths in China, were discovered in England by Mr. Cookworthy in 1768, the first person by whom real porcelain was made in Britain. It is unnecessary to add that the mineral substances were decomposed feldspar or the kaolin of the Chinese, which is now sent from Cornwall to Staffordshire.

The district in which almost all the English earthen ware is made, commences near the borders of Cheshire, and extends from the village of Golden-Hill to Lane-End, a distance of seven miles. Between these two places are situated Newfield, Smithfield, Tunstall, Longport, Burslem, Cobridge, Etruria, Hanley, Shelton, Stoke, Lower Lane and Lower Delf. All these places were formerly distinct from each other, but with the increase of the staple manufacture, so many new potteries

and dwelling-houses have been built, that the different villages are now united; the whole exhibits the appearance of a large town, and in every part of the kingdom, except the district itself, they are all included under the general name of the Potteries. It might be shown that about the beginning of the eighteenth century, the earthen wares of Staffordshire, and the trade to which they gave rise, were in a national point of view, wholly insignificant. The traffic was either carried on by the workmen themselves, or by pedlars, who carried the wares in baskets through the adjoining counties. Not long afterwards the art was improved by the use of salt in glazing, a practice that was first introduced into Staffordshire by the two Elers; at a still later period the ingenious and self-educated Mr. Astbury added calcined flint to the composition of the ware, and it cannot be denied that these improvements were accompanied with a corresponding extension of the trade. Such was the state of an art, which was afterwards so much advanced by the celebrated Wedgwood, who found the products of the Potteries inferior and flimsy in their materials, inelegant in their forms, and grotesque in their ornaments. Before his time, foreign wares were largely imported; since his successful labours, the Potteries not only supply all England, but export their products to every quarter of the globe. Some notion of the change produced in the trade and in this branch of industry by a single individual, may be formed from the following statement of M. Faujas de St. Fond. "The excellent workmanship, the solidity, the advantages which it possesses of sustaining the action of fire, the fine glaze, impenetrable to acids, the beauty of the form, and the cheapness of the price, have given rise to a commerce so active and so universal, that in travelling from Paris to St. Petersburg, from Amsterdam to the furthest extremity of Sweden, and from Dunkirk to the south of France, the traveller is served at every inn on English ware. Spain, Portugal and Italy are supplied with it, and vessels are loaded with it for the East Indies, the West Indies and the continent of America."^c But the extent to which the same branch of industry had arrived even some years before the period that this intelligent traveller visited England, may be better appreciated from the statement of Mr. Wedgwood himself. Having been examined in 1785 by a committee of the privy council, and at the bars of both houses of parliament, Mr. Wedgwood declared "that the manufacturing part alone furnished in the Potteries and their immediate vicinity the means of subsistence to twenty thousand persons; but that this was a small object, when compared with the many others dependent on it: 1st, The immense quantity of inland carriage to which it gave rise throughout the kingdom both for the raw materials and the finished goods; 2d, the great number of people employed in the extensive collieries for its use; 3d, The still greater number employed in raising and preparing its raw materials in several distant parts of England, from the Land's End in Cornwall, one way along different parts of the coast, to Falmouth, Teignmouth, Exeter, Poole, Gravesend and the Norfolk coast, and the other way to Biddeford, Wales and the Irish coast; 4th, The coasting vessels, which after having been employed at the proper season in the Newfoundland

^a Ecton-hill has likewise a considerable vein of lead, and another of the same mineral has been found near Stanton-moor. (Rees' Cyc.)—P.

^b Potter's clay of various sorts is found here, particularly in the vi-

fisheries, carry these materials coastwise to Liverpool and Hull, to the amount of more than 20,000 tons yearly, and at times when without this employment, they would be laid up idle in the harbour; 5th, the further conveyance of these materials from those ports by river and canal navigation to the Potteries, situated in one of the most inland parts of the kingdom; and 6th, The reconveyance of the finished goods to the different ports of the island, where they are shipped for every foreign market, that is open to the earthen-wares of England." Important as the advances made by Mr. Wedgwood were, he repeatedly declared that the progress of improvement was still in its infancy; and although it would be idle to deny that successive improvements have been made since his time, or that the trade has been greatly extended, still it cannot be affirmed that any individual has since distinguished himself by so many and so valuable inventions in this useful art.

Although it is evident, from what has been already said, that Staffordshire holds a high rank among the industrious and commercial counties of England, it is equally true that few of its towns are important. Stafford, the capital, is situated on the bank of the Sow, about three miles from its junction with the Trent. The principal branches of industry consist in making shoes, and in tanning leather, both for home consumption and exportation. It contains at present only two churches, St. Mary's and St. Chad's; it had formerly a priory of Black Friars, a convent of Franciscan, and another of Augustine monks. It appears from the Saxon Chronicle that a castle was built at Stafford in 913 by Ethelfleda, countess of Mercia, and sister to Edward the Elder; but of this castle no vestiges remain. It seems to have been a place of some consequence in past times, for in Domesday-book it is mentioned as a city; and it is certain that the ancient custom of borough-english is not unknown to the inhabitants.

Lichfield,^a which participates with Coventry in the dignity of an episcopal town, is situated on a feeder of the Trent, near the ancient *Etocetum*, a Roman station. The cathedral, the greatest ornament of the place, is surrounded with walls like a castle, and stands on an eminence that commands a distant view. It is about 412 feet in length, and 154 in breadth. A spire, 256 feet high, rises from the centre, and two towers terminating in spires, form the western front. Although the interior is richly adorned, the monuments that attract most attention, are those of Samuel Johnson and David Garrick, both natives of Lichfield. Other monuments have been erected in the same church in honour of Lady Wortley Montague and Anna Seward. A free school founded by Edward the Sixth, may be mentioned as the place where Addison, Ashmole, Johnson, Garrick and Wollaston were educated.

Newcastle under Line, situated in the centre of the Potteries, and watered by a branch of the Trent,^b is important from its commerce; it carries on a considerable trade in cloth and felt,^c and has become the mart of many articles that are consumed in the Potteries. Wolver-

hampton, a place of great antiquity, in the southern part of the county, is the most populous town in Staffordshire. It has risen in consequence of its trade in locks, keys and other articles of the same sort, for which it is more celebrated than any town in the kingdom. But however ingenious the artisans may be, they do not confine themselves to one branch of industry. Many farmers in the neighbourhood have their forges, where they labour when not employed in the field, and where women assist them, and work with the file. The goods thus made are exposed in the market, bought for different parts, and sold in every country in Europe. To these products of industry, japanned goods and the heavier sorts of iron work are added, and in the manufacture of them, Wolverhampton possesses the advantage of cheap fuel and a canal navigation to the Grand Trunk and to Birmingham.^d To account for the comparatively slow increase of the same place, it should be remembered that almost all the land in the neighbourhood is church-land, of which the tenure affords but little encouragement to building.

The inland county of Salop or Shropshire is contiguous to Staffordshire on the east, to Denbighshire, a detached portion of Flintshire, and Cheshire, on the north, to Radnorshire, Montgomeryshire and Denbighshire on the west, and to Worcestershire and Herefordshire on the south. It is about forty miles in length from north to south, and thirty-five in breadth from east to west; in superficies, it is not less than 1340 square miles, and it bears some resemblance in figure to a parallelogram. It is memorable from its historical associations and numerous remains of antiquity, interesting from the variety and beauty of its scenery, and important from the value of its mineral products, and from the extent of an artificial navigation, which has rendered it in some degree the emporium of the inland trade between England and Wales. The face of the country is very diversified, and the capital is situated in the large plain of Salop, which, although flat in comparison of the surrounding districts, is by no means level or monotonous. Hills, of which some attain a greater elevation than 1800 feet above the level of the sea, bound the plain on the south-west, and are connected with the great western range. It has been remarked in a former chapter, that the Severn flows through the middle of the county; it may be added, that the length of its winding course within Shropshire is estimated at more than seventy miles, and that it is navigable for barges in every part of it. The different soils are so much intersected, that it might be difficult to define their limits; suffice it to say, that except chalk and flint, few sorts are wanting. Although other counties may be better cultivated, it produces a large quantity of grain, and the surplus is exported by the Severn. Many cattle are fed in the plains or low districts, and much of the cheese, sold under the name of Cheshire, is made in Shropshire. Numerous flocks of sheep are reared in the hilly districts, and the wool from the neighbourhood of the Wrekin, Bridgenorth and Clun, is little inferior to that of Leicestershire. Although much timber is cut every year,

^c Hats.

^d It communicates with Birmingham by the Old Birmingham canal, and with the Grand Trunk canal by the same canal to its junction with the Staffordshire and Worcestershire canals, and then by the latter till

there are still many lofty oaks and extensive tracts covered with coppice-wood for the use of the iron-works. On the whole, Shropshire is comparatively free from waste lands, most of the cultivated districts are enclosed, and the commons are every year decreasing.

But it is the mineral products, and the trade and manufactures to which they have given rise, that constitute the chief wealth of the county. It has been already seen that coal is found in abundance in different districts. It may be repeated that the Coalbrook-dale field is about eight miles long, and two broad; in every part of it coal is found at different depths, and the strata alternate with ironstone, sandstone and other substances. The northern extremity of a long range of limestone is almost contiguous on the south to the coal districts. Thus although the ironstone is not rich, it is accompanied with a great quantity of coal and limestone, and on account of this conjunction of the fuel and the flux with the ore, the most extensive iron-works in the kingdom have been established in Coalbrook-dale and the neighbourhood. The rocks that bound or separate the coal fields, consist of sandstone, limestone, trap and schistus, and the metals that they contain, are lead and calamine. The Wrekin, the Acton Burnel and Hope Bowdler hills, the Frodesley, the Lawley, and the Cær-Caradoc, cross the Severn, extend southwards, and are composed of trap rocks.^a The vale of Stretton separates these hills from the schistose hills of Longmynd. The Skipperstones^b form the most elevated peak of a high tract between Bishop's Castle and the vale of Montgomery, and it is there that the lead mines of Shropshire are situated. The matrix is crystallized quartz, sulphate and carbonate of barytes, and carbonate of lime. The ore is sulphuret of lead, carbonate of lead, red-lead ore and blende, which contains besides calamine or zinc.^c Quartz and clay are worked at Cardington, and the former is said to be superior to that exported from Caermarthenshire to the Staffordshire Potteries. Lastly, the sandstone that occurs so extensively in the county, is in general well adapted for building.

The most important products of industry are returned from the iron-works in the great coal and iron districts, east of Shrewsbury, at Ketley, Oakengates, and in Coalbrook-dale, a winding valley, enclosed by hills, breaking into various forms, and covered with hanging woods and thick foliage. In this sequestered vale, the noise of forges, mills and vast machinery is heard, flames issue from the furnaces, and clouds of smoke rise from the lime-kilns. A bridge made entirely of cast-iron, and stretching across the Severn, heightens the romantic effect of the scene. Several potteries have been established in the same dale; Broseley is noted for coarse earthenware, and Caughley and Coalport for porcelain and queen's-ware. Numerous mills for dyeing woollen cloths, are situated in different parts of the county, and cotton and linen manufactures have of late years been established.

The ancient town of Shrewsbury, the capital of the county, rises on a peninsula formed by the Severn. The

origin of it is attributed to the Britons of the fifth century, who founded it on the ruins of the still more ancient *Uriconium*. It continued in the possession of the Britons, until some centuries afterwards, when they were conquered by the Saxons, and these invaders changed its old name of *Pengwerne* into *Scrobbes-Byrig*. If, at a later period, it became one of the principal cities in England, and as such, often visited by English kings, it was owing to the military importance of its situation on the Welsh marches. Thus it is well known that Edward the First made it the residence of his court, while he was employed in the subjugation of Wales, and that he removed thither his courts of exchequer and king's bench. Like other old towns, many of the streets are narrow, ill planned, and of a singular appearance from the ancient and modern buildings, which compose them. Others, however, of a more recent date, are wide and clean, well paved, well lighted and adorned with good houses. Two stone bridges have been erected over the Severn; the eastern or the New Bridge, an elegant structure, consists of seven semicircular arches, in all more than 410 feet in length. The other or the Welsh Bridge, so called from its leading into Wales, was lately rebuilt; it is ornamented with a handsome portal; the number of arches is five, their length 270 feet, their height twenty, and their breadth forty. The parish churches are six in number, and one of them belonged to an ancient abbey, of which some ruins still remain, among others a curious relic known by the name of the stone pulpit, and supposed to have answered the purposes of an oratory. The infirmary, which is managed with great credit, is one of the earliest institutions of the kind in England. The other buildings are a county hall, completed in 1785, and a new county-gaol, after the plan of Mr. Howard. The public walks are the greatest ornaments of the town; they are shaded by lofty lime-trees, they cover a surface of more than twenty acres, and they extend between the old walls and the banks of the Severn.

The staple trade consists in fine flannels and in Welsh webs, which are manufactured at Welshpool and finished in Shrewsbury, from which last place they are distributed over England, and exported to foreign markets. Spinning and fulling mills are erected in the neighbourhood, and there are besides several linen manufactories and extensive iron-works.

It was on the field of Shrewsbury that the valiant Hotspur was slain, and that Henry the Fifth, then Prince of Wales, gave the first indications of that military talent which proved afterwards so calamitous to France. During the later period of the civil wars, Shrewsbury was distinguished by the loyalty of its inhabitants; Charles the First came to it, and was welcomed; but the parliamentary army having succeeded in taking the town by surprise in 1645, the communication with North Wales was cut off, and an end was put to a loyal association then forming in the western counties.

The county of Worcester, contiguous to Shropshire and Staffordshire on the north, to Herefordshire on the west, to Gloucestershire on the south, and to Warwick

^a The Wrekin, an insulated mountain of a sugar-loaf form, [north of the Severn, above Coalbrook-dale,] rises from a plain to the height of 1324 feet. From it there proceeds southward, across the Severn,* a range of trap mountains consisting of the hills of Acton-Burnel,

* On the south side of the Severn.

^b Skipperstones. (Luckombe. Ed. Enc.)—P.

^c Blende is sulphuret of zinc.—P.

shire on the east, is perhaps more irregular in its form than any other in England, and as it is nowhere marked by natural limits, several detached portions of it are enclosed by neighbouring counties. It might be difficult on this account to determine its area correctly, but according to an official return, it is equal to six hundred and seventy-four square miles.

The face of the country is varied by hill and dale. Of the hills, the most remarkable are the Lickey near Bromsgrove, the Aberley on the west, the Malvern on the south-west, and the Bredon on the south-east. The vale of Evesham on the banks of the Avon, and the vale of the Severn, are the most fruitful tracts; in the former, in addition to the ordinary harvests, great quantities of vegetables are grown and exported to the neighbouring towns. In the same part of Worcestershire, the mildness of the climate depends in some degree on the lowness of the situation, and the crops are reaped a fortnight and sometimes a month earlier than in more elevated counties. The products of the county are corn and cattle, fine wool, hops, cider and perry; the last, in particular, is held in high repute, and exported to most parts of the kingdom. The brine-springs yield a large quantity of the whitest salt, and the mineral springs of Malvern, Kidderminster and other places are frequented on account of their medicinal properties. Limestone abounds in the high grounds, but from the scarcity of coal, little of it is burnt or used for manure. The soil is watered and fertilized by many streams, by the Severn, which enters the county from Shropshire, and flows through its whole length, and by its tributary rivers, such as the Avon, the Stour and the Teme. The same rivers have facilitated the construction of several canals, which have contributed to the prosperity of Worcestershire. It has thus been placed in the line of communication with the adjacent mining and manufacturing counties, and has become in consequence a sort of depot for their products. Leaving the verdant hills, the woods and the fruitful meadows, which have been described by tourists, we shall make some remarks on the industrious towns in the same county.

The Staffordshire and Worcestershire canal,^a which passes through Kidderminster, has added greatly to its trade and industry by opening a communication with Hull, Liverpool, Manchester and Bristol. The town was noted in the reign of Henry the Eighth for its broad cloths, at a later period for its walseys, and afterwards for its crapes and poplins. The manufacture of Scotch and flat carpets was introduced about the middle of the eighteenth century; in the year 1772, the number of looms in the town and neighbourhood amounted to 250; at present there are 1000 carpet, and nearly 700 silk looms, and these afford the means of subsistence to a third part of the population. The small town of Droitwich, which may be seen from a canal that communicates with the Severn,^b has been long famed for its brine springs, which are said to contain a greater quantity of culinary salt than any others in England, and which yield annually a revenue of £150,000. The barges that descend the Severn, pass beneath a stone bridge that communicates with Worcester,^c the capital of the county, which is little

more than three miles distant from the last place.^d It is watered by the Severn, situated in one of the finest parts of the county, and remarkable for the salubrity of its climate. The cathedral, a spacious and lofty edifice in the simple Gothic style, is built in the form of a double cross. It is 514 feet in length, 78 in breadth, and 68 in height. The tower rises from the centre of the cross aisle, and is adorned with many curious and highly finished ornaments. The most remarkable of the sepulchral monuments are those of King John, and Prince Arthur, the son of Henry the Seventh. The trade of Worcester does not consist merely in its manufactures nor in the surplus products of the county; it has been increased by the numerous conveniences, which its water communications afford. Extensive works, in which porcelain is manufactured, have been established in the town, and gloves are sent from it to most parts of England, and exported to the colonies. The city suffered greatly during the sanguinary contests between the houses of York and Lancaster; and it is memorable as the scene of a battle, in which Cromwell and the English defeated the Scotch army that invaded England, for the purpose of placing Charles the Second on the throne. This battle was what Cromwell called his *crowning victory*; two thousand of the Scotch fell on the field, and 8000 were taken prisoners, most of whom were sold and transported as slaves to the American colonies.

Part of Wales forms the western boundary of Herefordshire, which is contiguous to Gloucestershire and Monmouthshire on the south, to Worcestershire on the east, and to Salop on the north. It is almost unnecessary to remark that the limits are mostly artificial and very irregular, and that some detached parts are enclosed by the adjacent counties. It is principally distinguished as an agricultural county; it produces plenty of wheat, barley, oats and leguminous plants. The meadows are covered with the richest pasture; the Ryeland sheep are famed for their mutton, and more so for their wool, and the oxen have been considered the finest in the kingdom. If Dorsetshire is the garden, Herefordshire is the orchard of England. The apples producing cider grow in greater abundance than in any other county, and they are plentiful even in the hedge-rows. The various kinds yield liquors of different qualities; some of them are sent to every part of Britain, and the styre or the strongest is exported to the East and West Indies. It may be added that it was not before the reign of Charles the First that the county was distinguished for this product, and if it has now the appearance of an orchard, it was owing to the exertions of Lord Scudamore and other patriotic individuals. The same county is in some places covered with woods, and hop plantations are scattered in different directions.

The appearance of the country indicates its fruitfulness, there are no lofty heights, but gentle eminences swelling in every direction, and enclosing vallies covered with plantations and orchards, or fruitful fields bounded by hedges or rows of trees. The lowest lands are those in the south, while the highest are situated on the east and west. The general character of the soil is that of clay mixed

^a Extending from the Grand Trunk, near Stafford, to the Severn at Stourport.—P.

^b "Droitwich is situated on a canal that communicates with the Severn." (M. B.)—The Droitwich Canal extends from the Severn at Hawford to the town of Droitwich, about six miles.—P.

^c Worcester is situated on the east bank of the Severn; from the bridge a new street has been opened, leading to the middle of the town. (Rees' Cyc.)—P.

^d Droitwich is $5\frac{1}{2}$ miles from Worcester. (Rees' Cyc.)—P.

with marle, and its great fertility is partly attributable to the calcareous subsoil on which it rests. The total number of acres are estimated at 580,000, and of these 500,000 are cultivated; of the remaining 80,000, 30,000 are occupied by towns, buildings, roads, canals and rivers, and 50,000 are waste lands or covered with woods. The Wye, a feeder of the Severn, enters from the west, flows eastwards, and is enlarged by the principal streams that water Herefordshire.

Hereford, the capital, is situated on the northern bank of the same river near the centre of the county. It is a place of great antiquity; some writers affirm that it received the name of *Ercinna* from the *Silures*, who inhabited Herefordshire before the Roman invasion.^a It is also affirmed, that it occupies the site of *Ariconium*, an ancient town, mentioned by Antoninus, and which, it is added, was destroyed by an earthquake. The present name is derived from two Saxon words, which signify the ford of an army;^b in allusion, perhaps, to the Saxons crossing the Wye in pursuit of the Britons, who fled for refuge to Wales. It began to flourish about the year 825, after a church was built by Milfred, king of Mercia, in memory of Ethelbert, king of the East Angles, who was murdered by the wife of Offa while he was courting her daughter in the neighbouring village of Marden.^c The same church was soon afterwards raised to the dignity of a cathedral, but the present building was begun by Robert de Losin, the second Norman bishop, after the model of the church of Aix-la-Chapelle in Germany, and completed by his successor. Although the city is confessedly ancient, it bears few marks of antiquity; the streets are in general spacious, clean and well built. The manufactures are of secondary importance; they consist of gloves, hats and flannels.

None of the other towns are so large as the capital. Lcominster, situated to the north of it, and in the fertile vale of the Lugg, although insignificant in point of population, still sends two members to parliament. Ledbury, Ross and Bromyard formerly sent representatives, but the privilege was voluntarily declined on account of the pecuniary burdens then attached to elective rights. Ross, the second of these places, is chiefly remarkable for its situation on an elevated rock, above the valley of the Wye, and for the fine prospect which it commands. It is also known as the native town of Mr. John Kyrle, *the Man of Ross*, whose benevolence and public spirit are celebrated by Pope.

The Wye, it has been seen, waters Hereford, and Monmouth is also situated on its banks. The last place is the capital of a county, which was added to the others by Henry the Eighth, but it was supposed to form part of Wales until it was visited by the judges of the Oxford circuit in the reign of Charles the Second. The Welsh is still spoken by the common people, and the same language is still preserved in the names of the towns and villages, mountains and rivers. It is contiguous to Herefordshire and Brecknockshire on the north, to the last county and Glamorganshire on the west,^d to Gloucestershire on the east, and to the Bristol Channel on the south and south-east.

^a Herefordshire was called by the Britons, *Ercinuc*. (Camden's *Britannia*, p. 685.)—P.

^b Sax. *here*, an army, and *ford*.—P.

^c This church was erected, about 825, by Milfrid, a viceroy or provincial governor under Egbert. Offa (king of Mercia, A. D. 755—794) has been considered its founder, from the large gifts left by him for that

A considerable portion is thus bounded by the sea, while the other limits are mostly formed by rivers, namely, by the Wye and Mynnow on the east and north-east, and by the Rumney on the west. If the boundary rivers be excepted, the Usk is the only other of any importance, and it traverses the county in its whole length from north to south. The construction of the canals, which have contributed so much to the extension of the trade, and also to the working of the mines in Monmouthshire, has been facilitated by the rivers and their tributary streams. The land rises towards the north and the north-west, where it joins the mountains in Wales, and the loftiest elevations are more than 1500 feet above the level of the sea. In an agricultural point of view, it may be divided into three portions. The first or the southern consists partly of marsh lands, of a rich loamy soil in some places, and of a black peaty earth in others; a large proportion of it is fit for cultivation. But towards the coast, the fields are subject to inundations, and to protect them large dikes have been erected along the extensive levels of Caldecot and Wentloog. The second or the eastern portion, consisting of the finest land, and in appearance resembling a garden, extends along the banks of the Usk, and to a considerable distance on each side of them. The third or the western portion is hilly and unfruitful. The commerce and different branches of industry are dependent on, or connected with, the mineral products of the county. Situated on the eastern border, and including a considerable portion of the great mineral basin of South Wales, it abounds in iron ore and in coal. The latter is more than sufficient for the use of the inhabitants, and a considerable quantity is exported. The iron works were first established in the prosperous reign of Elizabeth, but they began to decline from the deficiency of fuel, that of wood being thought indispensable to the extraction of the metal. It was not before a comparatively recent discovery had been made, by which it was ascertained that coal might be used as a substitute for wood, that the same branch of industry was pursued with increased vigour, and it might be shown that the greatest number as well as the most extensive works in the county have been erected within the last fifty years. Such are the principal works at Blenavon, Nant-y-Glo, Abercorn, Pontypool and Caerleon. The other metals are tin^e and lead, and the tin works are perhaps next in importance to those of iron. Limestone is so common that it is generally used as a manure; quarries of breccia afford excellent millstones, and different kinds of freestone are used in building. It may not be out of place to remark that the art of japaning goods was first practised and made known to the English at Pontypool and Usk, and although it was long confined to these two places, they have been unable in later times to compete with Birmingham.

The towns are neither large nor well peopled, and the capital, of which the situation has been already indicated, forms no exception to this remark; for although it is the most populous place in the county, the number of inhabitants does not amount to more than six thousand. It derives its name from its position at the confluence of the

purpose, in expiation of the murder of Ethelbert, king of the East Angles. (Rees' *Cyc.*)—P.

^d More properly, to Herefordshire on the north-east, to Brecknockshire on the north-west, and to Glamorganshire on the west.—P.

^e Tin is not found in Monmouthshire; but there are extensive manufactories of tin plate.—P.

Mynnow and the Wye, which join each other at the extremity of a valley, that is enclosed by thickly wooded hills. These rivers are crossed by three bridges, and a fourth has been erected over the Trothy, which is also tributary to the Wye. The town consists of one principal street and several small ones. Many of the inhabitants are occupied in manufacturing iron and tin, while others are employed in preparing the bark, which is conveyed from the forests on the upper banks of the Wye, and after having been prepared at Monmouth, is sent to Chepstow, whence it is exported to different parts of England and Ireland. The town has given birth to two distinguished men, namely, to Geoffrey of Monmouth, the old chronicler of the Britons, and to Henry the Fifth, who is frequently called Henry of Monmouth, and whose statue still adorns or disfigures the modern town-hall. Troy-house, the seat of the Beaufort family, is not more than half a mile from Monmouth, and there, it has been affirmed, the cradle of Henry the Fifth is preserved, and the armour which he wore at the battle of Agincourt.

Following the course of the Wye to the distance of two miles from its junction with the Severn, we enter the romantic town and port of Chepstow. Advantageously situated for commerce, it has become the port of all the towns on the Wye and the Lugg. Timber, bark, iron and other articles are sent from it to Portsmouth, Plymouth and Deptford;^a the imports are wine from Oporto, and planks, hemp, flax and pitch from the Baltic. The harbour admits vessels of 700 tons, but the adjoining buildings have been more than once inundated, and a cast-iron bridge over the river has been damaged by the tides. Thirty or forty feet are not uncommon, and on one occasion the tide rose to the extraordinary height of seventy. A well in Chepstow is mentioned by old writers as a phenomenon, for which they are at a loss to account; it may contain about fourteen feet of fresh water, but it empties itself as the tide flows, and fills as it ebbs. A tower of an old castle is also shown as a curiosity to strangers; it was there that Henry Martin, one of the judges of Charles the First, was confined from the time of the Restoration until that of his death in 1680.

The principality of Wales resembles a peninsula; it is contiguous on the east to the counties of Monmouth, Hereford, Salop and Cheshire, while it is washed on the north and west by the Irish Sea, and on the south and south-east by the Bristol Channel. The length from north to south extends from one hundred and thirty to one hundred and eighty miles, and the breadth from fifty to eighty, including an area of nearly 8125 square miles. Thus the superficial extent is not equal to a sixth part of England, and although the inhabitants have increased greatly within the last twenty years, they do not amount to a sixteenth part of the English population. It might be easy from these data to show that the mean size of each Welsh county is little more than one-half the mean size of each English county, and that the mean population of each county in the former country is considerably

less than a fourth, or nearly a fifth part of the mean population of each county in England. If it were necessary to be more definite, it might be stated that Wales, according to the census of 1831, contains 805,236 inhabitants,^b consequently that the population of the whole principality is much less than that of Lancashire, Middlesex or Yorkshire. It is well known that the whole of Monmouth and a considerable portion of several adjacent English counties,^c were at one time included in Wales, which now consists of twelve shires, and all of them except three touch the coast in some part of their boundaries. Thus it appears that the counties are comparatively thinly peopled, and much smaller than those of England; on that account it may be as well to adhere more to geographical than artificial divisions, and to examine the principality as it is naturally divided into North and South Wales.

Although the height of the Welsh mountains cannot be compared with that of the Alps, the country has sometimes been styled the British Switzerland. The resemblance between them consists in steep descents, broken and perpendicular sides, deep and narrow vallies, limpid lakes and numerous streams, which in some places form cascades, and in others roll slowly in the midst of meadows. The humid mists that rise from the surface of these waters, and rest sometimes on the highest summits, and the snow that remains frequently until the end of spring, render them, (although the highest does not exceed 3600 feet), not unlike the stupendous masses that obstruct the clouds in the high chains of the globe, and serve as the abode of perpetual snow.

The general arrangement of the mountains may be described in a few words. Two primitive chains, those of Snowdon and Cader-Idris, extend from north to south. As the primitive and secondary mountains approach each other, the calcareous ridge follows an irregular course. It may be said, however, to commence near the port of Crickhaeth, whence proceeding northwards in an uninterrupted line along the coast, it arrives at Caernarvon, from which it extends along the Menai, and bounds the eastern shore as far as Bangor Ferry. Between the last place and Ormes-Head, it is broken by the northern extremity of the Snowdon range, which terminates in the Bay of Conway, at the heights of Penmaen-mawr and Penmaen-bach.^d Appearing anew in the lofty promontory of Ormes-Head, it bounds the coast to the mouth of the Dee, takes a westerly direction, passes by Holywell and the upper end of the vale of Clwyd, and is again broken near Oswestry by the Ferwyn heights.^e It appears a third time in the neighbourhood of Llanymynech, and is at last terminated by a line of primitive mountains stretching northwards from Radnorshire. Schistus occupies the intermediate space between the calcareous and primitive ridges.

It is not too much to assert, that the shape of these mountains indicates the formations to which they belong. The primitive rocks are craggy, steep and tending in

^a Great quantities of timber are sent from Chepstow to Portsmouth, Plymouth, Deptford and Woolwich; grain is exported for the Bristol market; and oak-bark, cider, coals, grindstones, millstones and iron, to several parts of Ireland, Liverpool, and other places. (Ed. Enc.)—P.

^b 823,100, in the Statistical Tables.—P.

^c Gloucestershire, Herefordshire and Shropshire. By an act (34 Henry VIII.) the Welsh marches (borders) were partly divided into new counties, and partly annexed to old counties, both in England and

Wales. The new counties were Monmouthshire (English,) and Brecknockshire, Radnorshire, Montgomeryshire and Denbighshire (Welsh). The annexations were to the three English counties just mentioned, and to all the remaining Welsh counties. (Ed. Enc. England.)—P.

^d Great and Little Rocky Promontories.—Welsh, *pen*, head or head-land; *maen*, stone; *mawr*, great; *bach*, little.—P.

^e Berwyn mountains.—P.

many places to a peak or pointed summit. The loftiest heights are generally about the middle of the chains, which commence and terminate in abrupt precipices. These and the insulated peaks that are continually breaking the outline, form a very distinctive character. The slate or schist is distinguishable from the primitive heights by its inferior elevation, and by the uniformity of the hills and the regularity of the outline. The calcareous hills are much lower than the last, more varied in their forms, rising gradually from one extremity, or terminating abruptly in the other.^a

The nature of the country presented many obstacles to communications, and it is only of late years that they have been extended and improved. One of the most remarkable has been cut along the high range of Snowdonia; the interior districts of North Wales have thus been made to communicate with the coast, and in the same manner the great thoroughfare from London to Dublin by Holyhead, has been diminished twenty-five miles in length.^b Other roads that were formerly almost impassible in many places, have been widened, shortened and rendered of easy access by means of drains, arches and bridges, which have contributed much to the convenience of travellers, and more to the prosperity of the country. The same remarks are not inapplicable to the canals, which shall be afterwards mentioned, for the advantages of artificial navigation were reaped in England long before they were known in Wales. It may be inferred from what has been said of the different chains, that the northern region is much less fruitful and populous than the southern. In the former, the produce of the land is little more than sufficient for the wants of the frugal inhabitants. The climate is modified in the central districts by the height of the mountains; near the shores on the south, the west, and the north, the weather is mild but humid; no part, however, is considered unwholesome.

Manufacturing industry and maritime commerce have

^a Aikin's Tour through Wales.

^b This has doubtless reference to the new Irish road, cut transverse-ly across the Snowdon range, from the Menai bridge to Capel-Cerrig. The old Irish road to Holyhead led from Bangor Ferry around the promontory of Penmaenmawr to Conway.—P.

^c The copper is brought from Anglesea, Cornwall and Devon. (Ed. Enc.)—Copper is, however, wrought to a considerable extent in the counties of Wicklow, Waterford and Cork, in Ireland.—P.

^d The following is a general view of the principal canals in Wales. 1. The Brecknock and Abergavenny canal leaves the Monmouth canal at Pontypool, and passing through a tunnel, proceeds up the valley of the Uske to Brecknock. Several side rail-ways extend from this canal. Together with the Monmouth canal, it forms a line extending 45 miles from Brecknock to Newport near the mouth of the Uske. The Brinore rail-way, connected with the Sirhowy rail-way in Monmouthshire, crosses the Black Mountains from the Romney iron-works, in that county, and extends to Brecknock, and thence to Hay on the Wye. 2. The Glamorganshire (Cardiff) canal commences by a sea lock for vessels of 300 tons, at Pennarth-Head, at the mouth of the Taff, and proceeds up the valley of that river, by Cardiff, twenty-five miles, to Merthyr-Tydvil. A rail-way runs parallel to it up the same valley. 3. The Aberdare canal branches off from the former at the mouth of the Cynon, nine miles below Merthyr-Tydvil, and proceeds seven and a half miles north-west, up the vale of the Cynon, to Aberdare, whence there is a communication by a rail-way and inclined plane with the Neath canal. 4. The Neath canal commences at the shipping port of Britton-Ferry, three and a half miles below the town of Neath, and proceeds up the valley of the river Neath by the town, fourteen miles to Aberfergwn, where a rail-way connects it with the Aberdare canal. 5. The Crumlin canal, on the west side of Neath river, proceeds from the port at Britton-Ferry, three and a half miles on a level, through the Crumlin Bog, to New Chapel collieries. It was the first canal opened in Wales. 6. The Swansea canal proceeds from the town of Swansea, about eighteen miles up the western side of the Taaf, to the Henoyadd lime-works in Brecknockshire. Several rail-ways com-

been so much increased in the principality within the last twenty years, that the population has increased more than a fourth during that period. Glamorganshire, particularly the portion of it near the sea, is so fruitful that it is styled the garden of Wales; but if it has become more populous, commercial and wealthy than any other Welsh county, it must be attributed less to its fertility, than to its inexhaustible fields of coal, ironstone and lime. A considerable quantity of the coal is exported, but enough is left for the supply of the many iron-works in the county, and of other large works established by enterprising men for the smelting of copper, which is conveyed from Cornwall, North Wales and Ireland.^c Merthyr-Tydvil has become the seat of the principal iron-works; next to them are those of Aberdare, Neath and Swansea; and the metal is transported along canals that communicate with these places. The first passes from Merthyr-Tydvil to Pennarth Bay below Cardiff, and a branch from Aberdare joins it near the river Cynon. The Neath canal communicates with Britton-Ferry, and the Swansea canal passes from the port of the same name into Brecknockshire. The nature of the country does not afford many facilities for such works, and they could not have been constructed without frequent recourse to the expensive and tedious method of locks; but it would be incorrect to suppose that these are the only canals; the line of coast is joined by others and by excellent roads to the immense founderies in the interior.^d And it is only since they have been completed that tin was exported from Cornwall, and that extensive manufactories of tin-plates were erected near the iron-works.^e Lastly, as to the geological position of the minerals, it may be remarked that they are contained in a calcareous basin, of which Glamorganshire occupies the central portion, and that the same basin is not less than a hundred miles in length, and about twenty in average breadth.^f

Besides the metals^g that have been already mention-

communicate with the collieries along its course. The Oystermouth rail-way proceeds south-west from Swansea, seven miles along the coast, to the Oystermouth lime-works. From Llanelly, on the Burry River, the Caermarthenshire rail-way extends fifteen miles through a coal country to Llandeibie. Besides the above, several short lines of canal and rail-way extend to particular collieries, iron and lime-works, &c.

In North Wales, the only important canals are the two branches of the Ellesmere canal (see note ^b, p. 1218,) one of which proceeds up the valley of the Dee to Llandisilio, and the other to Llanymynech on the Severn, where the Montgomery canal commences, and proceeds up that river twenty-five miles to Newtown. These canals, particularly the Dee branch, have several side cuts and rail-ways to collieries, iron and lime-works, &c. The Dee branch is carried over the river Dee, at Pontcysylte, on an aqueduct 1007 feet long, and 126 feet high, said to be the largest in the kingdom.—P.

^e Particularly in the vicinity of Neath and Cardiff.—The tin-works of Melyn-Gryffydd, four miles from Cardiff, are perhaps the largest in the kingdom; producing not less than 30,000 boxes of tin-plates in one year. (Ed. Enc.)—P.

^f The great coal formation of South Wales is included in a limestone basin, the form of which is an irregular oval. It extends 100 miles in length, from Pontypool on the east, to St. Bride's Bay on the west, and where broadest, from 18 to 20 miles in width; but in Pembrokeshire, it is not more than five miles broad. Its greatest breadth is at Neath, in Glamorganshire. The superficial extent of the basin is about 100 square miles, containing 95 feet of coal, yielding, by calculation, 64 million tons per square mile. This basin includes parts of Monmouthshire, Glamorganshire, Brecknockshire, Caermarthenshire and Pembrokeshire. (Ed. Enc. Conybeare and Phillips, Geol. Eng. and Wales.)—P.

^g Minerals?—The southern border of Brecknockshire is included within the great coal basin of South Wales, and abounds in coal and iron-ore. The basin is there bounded on the north by a belt of limestone.—P.

ed, copper and lead are found in Brecknockshire, a county different from the last, inasmuch as it is the most mountainous of any in South Wales, and also because it is intersected by two lofty ranges, the one on the north and the other on the south.^a The products of the mines are of secondary importance; still they are much more valuable than formerly. Thus it appears that the rent of the iron mines in 1711 amounted to L.20, and in 1807 to L.2000; within the same period, and in the same county, the price of provisions has been doubled, and the price of labour more than quadrupled.^b As a pastoral county it is more productive than Glamorgan-shire; numerous flocks are reared on its hills, and the principal branch of industry consists in the manufacture of stockings and woollen stuffs.

Caermarthenshire is famed for its barley and oats; the climate is less favourable for wheat, but good crops even of that grain are raised on the low grounds. The oats are much more than sufficient for the consumption, and the surplus produce is sent to Bristol. Many oxen are bred in the county, and much butter is made for exportation. Limestone is wrought near the coast; it extends also towards the Black Mountains,^c and the produce of the works has contributed to the improvement of the soil. Large blocks of marble of a dark blue colour, and susceptible of a high polish, are obtained from the quarries in the parish of Llangydeirn. The other products are iron, lead and coal, and the exportation of the last substance is now rendered easy by means of a canal that extends from the collieries to Kidwelly, a small town on a creek near the mouth of the Towy.^d

Fruitful corn-fields, extensive meadows, and a sea that abounds with fish, are perhaps so many obstacles to the development of manufacturing industry in Pembroke-shire. It might be difficult otherwise to reconcile the low state of industry, with the advantages it possesses for commerce, with its numerous harbours and extensive coast. It may be added that the calcareous basin which contains the iron and coal of South Wales, terminates in Pembroke-shire; the depth of the strata diminishes as they approach the boundary, and their quality is impaired, consequently the mineral riches of the county are by no means great.

As a metalliferous county, Cardiganshire is more distinguished, and silver, lead and copper are contained in its mines. The lead mines yield a considerable proportion of silver; some of them not less than thirty-five or forty ounces per ton, and it appears that during the reign of Elizabeth, seventy and even a hundred ounces were occasionally obtained. The ore is also rich in lead,

and about 1250 pounds of metal are extracted from the ton. The mines were in a flourishing condition during the seventeenth century, and from the profits then derived from them, Sir Hugh Middleton was enabled to accomplish his great undertaking, namely, to bring the New River to London, and to confer a lasting benefit on his country. Not long after the death of that great man, the produce of the mines began to decline, and they have since been gradually neglected, but it is probable that they might still be worked with advantage, were it not for the scarcity of fuel.^e The agriculture of the county, in common with that of most others in the principality, is still susceptible of much improvement; the land near the coast is fertilized by sea-weed, and it is affirmed that sixty successive crops of barley have been raised on the same field.

The small county of Radnor forms an exception, for although it may be more sterile and less populous than any that has been mentioned, it is certainly better cultivated. The sinuous course of the Wye determines its figure,^f and it waters pastoral and arable vallies, in which the land is good and the climate tolerable. But in most places the inhabitants have had to resist the effects of a barren soil and a chilling atmosphere. The north-western angle forms still an almost impassable desert, which at an early period afforded shelter to Vortigern after the direful effects of his invitation to the Saxons.

The county of Montgomery in the northern part of the principality is diversified and mountainous. The nature of the climate and the soil has hitherto proved an insurmountable obstacle to the improvement of the midland, western and south-western districts. But the narrow vallies that are enclosed by the heights yield rich pasturage and plentiful crops of corn. The vale of the Severn, extending along the course of the river in the south-eastern part of the county, has long been noted for its fertility; and it is not now less distinguished by its improved husbandry. The ground rises from the same vale towards the north-west, and the heights are connected with the ridge that meets the lofty Plinlimmon. It is not improbable that the county is still better wooded than any other in North Wales; but the finest oaks in Montgomeryshire were cut during the last war, and transported to the dock-yards of Deptford and Plymouth. The metals are lead or galena and silver,^g but the most valuable of the mineral treasures, those at least that yield the greatest revenue, consist in the slate quarries, of which the largest are situated near Llangynnog and near the confluence of the Virnwy and Severn.^h

^a The northern range is primitive or transition; the southern, which includes the Vanns or Beacons of Brecon, consists of old red sandstone.—P.

^b Agricultural Survey.

^c The range of the Black Mountains extends from the eastern part of Caermarthenshire, along the southern border of Brecknockshire.—P.

^d Kidwelly stands on both sides of the Lesser Gwendraeth, near its mouth. The Great and Lesser Gwendraeth* are two small creeks which enter the bay of Caermarthen by the same estuary.—P.

* Welsh, *Gwendraeth-vawr*, and *Gwendraeth-vag* or *vach*.—*Gwen*, fair; *traeth*, frith or estuary, a tract of sand left bare at low tide; *mawr*, great; *bach* or *bag*, little. This example illustrates a striking peculiarity of the Celtic languages, especially the Welsh; namely, the change of initial consonants, according to the word preceding in construction—here, *t* to *d*, and *m* and *b* to *v*.—P.

^e During the reign of Elizabeth, the mines were wrought by a company of Germans. Sir H. Middleton wrought his mine in the reign

of James I. A Mr. Bushel, a distinguished royalist, in the time of Charles I., is said to have made immense sums by his mines. These mines were, however, soon after exhausted; but in 1690, other mines were discovered on the estate of Gogerthan, so rich as to have obtained the appellation of the Welsh Potosi. They have been, however, long neglected. (Ed. Enc.)—P.

^f The Wye rises on the south side of Plinlimmon in Montgomeryshire, and entering Radnorshire at *Savan-y-Coed*, flows across its north-western corner; after which it separates the county on the south-west and south from Brecknockshire, till it enters Herefordshire.—P.

^g There are several lead mines in the county, the ore of which is galena containing a portion of silver (argentiferous galena).—P.

^h From the lofty rocks of Llangynnog, a considerable quantity of coarse slates is obtained. Slate is also procured near the junction of the Firnwy and Severn, and sent down to Bristol. (Ed. Enc.)—P.

The adjacent county of Merioneth, still more romantic than the last, possesses all the features of a wild and mountainous region. The Berwyn heights^a rise above the fruitful valley watered by the Dee, which may be traced to its source in the lake of Bala,^b almost surrounded by hills, and forming an expanse of clear and limpid water. The lofty tract commences on the south of Bala;^c deep and narrow vallies extend between the heights, and the moors afford plenty of peat, the only fuel in the county. Cader-Idris held long the first rank among the heights in Merionethshire, but it appears from the trigonometrical survey that it is only 2914 feet above the level of the sea, while Arran Fowdey^d is 2965. The mountains are rugged and precipitous, and although their peaked summits seem to approach each other, their bases are separated by intervening spaces of considerable extent. Many of them are enlivened with woods, and watered by torrents or cataracts. Although the herbage is coarse, still it reaches to the summits, and affords pasture to numerous flocks. The high region is composed of granite, porphyry and other primitive rocks; different schists form the hills, and schistose clay is found in the vallies.^e

The rugged and mountainous scenery of Merioneth is softened in Denbighshire by a greater extent of fruitful and well cultivated land. The hundred of Yale in the northern part,^f although hilly and destitute of trees, is rich in pasture and abounds with oxen. The vale of Clwyd, commencing in the centre of the county, stretches towards the sea, a distance of about twenty miles; enclosed by mountains on every side except the north, its breadth varies from three to eight miles. It is remarkable for its fertility, cultivation reaches to a considerable height,^g and it is studded with towns, villages and country houses. The Dee passes along fruitful meadows on the south-eastern confines, and the cheese exported from them is not inferior to any from the neighbouring county of Cheshire. The other products are corn and cattle, while wool forms the material of the staple manufacture. Lead is found on the eastern borders; iron ore is dug on the Rualion^h hills, and on both sides of the Berwyn ridge; and coal, another product of the same county, is rendered available for the smelting of the ore.

Flintshire, a small stripe, more level than the rest of

Wales, is watered by many streams, and varied by hills passing into vallies. The low tract near the Dee consists of a clayey soil, fruitful in corn and well stocked with wood. But the heights near the estuary of the river extend in a direction parallel to its course, and decline on the opposite side into the rich vale of Mold, from which wheat and other sorts of grain are sent to Liverpool. The commerce of the county is derived from its metals;ⁱ it supplies Chester with coal, which was formerly exported to Ireland. Rich mines of lead and calamine are wrought beneath the barren surface of the hills. Some of the lead ore contains a small proportion of silver, and several thousand ounces of silver have been annually exported from Flintshire to the manufacturing towns of Sheffield and Birmingham.^k

The Snowdonian range runs in an unbroken line across Caernarvonshire, the most mountainous of the Welsh counties, and the ridge, which it forms from Traeth-mawr to Penmaen-mawr, is varied by conical peaks, that have been compared to the needles of the Alps.^l Of these, the highest or the famed Snowdon reaches to the height of 3570 feet above the level of the sea, and the others descend gradually on either side of it. This lofty region abounds in precipices, deep ravines, lakes and moors; but it is now destitute of trees, the climate is bleak and piercing, and the character of desolation is impressed on its romantic scenery. The extremity of the chain, or Penmaen-mawr, which it has been observed, was formerly impassable, is now traversed by a secure road, about two hundred feet above the sea, that lashes the base of the mountain. A narrow pass between the same height and Penmaen-bach, leads to the long and narrow vale of Conway, equally romantic and beautiful; clothed with woods, corn fields and rich pastures, and forming a fine contrast to the bleak heights that tower above it. The minerals of the county are not without importance; a considerable revenue is derived from the slate quarries, and copper is the most valuable of the metals in the Snowdon chain. The country is better adapted for the rearing of cattle than the culture of grain, and its wealth consists in its oxen, sheep and goats. The life of the inhabitants in the rural districts resembles that of the mountaineers in Switzerland. In the month of May they leave the vallies, and drive their herds and flocks to the mountains, where they reside during the

^a The Berwyn or Ferwyn mountains [Berwyn; by initial mutation, Ferwyn, as *Mynydd Ferwyn*, mountain of Berwyn,] extending from east to west along the borders of Denbighshire, Montgomeryshire and Merionethshire. They consist of argillite.—P.

^b The Dee rises from two sources in the eastern part of the county, near the sides of the Arran mountains. These, after uniting and passing through the lake of Pemblemeer (Bala pool,) run north-easterly into Denbighshire. (Ed. Enc.)—P.

^c The Berwyn mountains extend along the southern side of the valley of the Dee. A higher chain, including the summits of Cader-Idris and the Arrans, extends in a north and north-easterly direction, from the coast in the southern part of the county, nearly to its northern extremity.—P.

^d Properly, Aran Fowddwy.—*Aran* is a Welsh word signifying height or alpine summit. There are other mountains in the same range, bearing the name, viz. Aran Benllyn, Aran-nig, &c.—P.

^e The mountains consist principally of granite, porphyry, and other unstratified rocks. The secondary hills are composed of mixed schistus; the valleys contain schistose clay, and the level parts of the county abound with peat earth. (Ed. Enc.)—The range including Cader-Idris, and a mountainous tract, connected with the Snowdon range, and occupying the central portion of the northern half of the county, is marked in Conybeare and Phillips' map, as sienite and trap (primitive or transition.) The remainder of the county is marked in the same map, as greywacke and clay-slate (argillite.)—P.

^f Iâl is a small hilly district between the upper part of the vale of Clwyd on the west, and Wrexham on the east; including Vale Crucis and the sources of the river Alen. (Camden's Britannia.)—P.

^g It is in a high state of cultivation, and is, moreover, naturally very fertile. (Ed. Enc.)—P.

^h Ruabon. (Cyc. Ed. Enc.)—The iron works and collieries near Ruabon Brook, are connected by a rail-road with the Ellesmere canal, at Pontcysyllte. (Ed. Enc.)—P.

ⁱ The importance of Flintshire is derived almost entirely from its mineral productions; of these, the lead mines in the vicinity of Holywell are the most valuable. (Ed. Enc.)—P.

^k The geological position of the metals in Flintshire has been accurately determined by the celebrated Pennant, a native of the county.

^l The Snowdon range extends from north-east to south-west through the whole length of the county, from Penmaenmawr on the bay of Conway, to Aberdaron Bay. The range makes a curve to the south-east near the centre of the county, where the highest peaks are situated, and thence communicates with the mountains of Merionethshire. This range consists of sienite and trap, like that of Cader-Idris. Traeth-mawr and Traeth-bach (Great and Little Friths) are two inlets at the head of Cardigan Bay, which are bare at low tide, leaving dry a large tract of sands. In 1807, the former, consisting of 3500 acres, was granted by the crown for embankment, and in 1820, 2000 acres had been recovered.—P.

summer,^a and subsist chiefly on the produce of the dairy. In autumn they return to the vallies, and in winter they manufacture from the wool of their sheep, the coarse cloth which they wear. The Menai Straits separate Caernarvonshire from the Isle of Anglesea, which is also included in the Welsh counties; but both are now united by one of the wonders of modern art.^b The properties of the catenary,^c which afforded a subject of intellectual research or speculation to mathematicians, were discovered long before it was imagined that it could be applied to practical purposes, or before a chain describing the same curve was extended over the arm of the sea that separates Anglesea from the rest of Wales. The distance between the piers, or points of suspension, is equal to 580 feet, and the height from the surface of the water, to 100. The chains,^d all made of wrought iron, are fastened to vertical rods, of which the ends are bolted in iron sleepers or transverse bars. There are 111 of these sleepers, in each of which four vertical rods are fixed, making the total number of rods amount to four hundred and forty-four. The road-ways consist of two carriage lines, each twelve feet broad, and a foot-path between them, four feet wide, and enclosed by iron railings, to secure passengers from accidents.^e This stupendous work, almost as remarkable for its solidity as for its novelty, and which is likely to perpetuate the name of Telford,^f was opened on the 30th January, 1826, by the London and Holyhead mail-coach crossing it with the bags for Dublin. On the first of February, the first three-masted vessel sailed under the bridge with all her spars up, and her top-masts cleared twelve feet and a half below the centre of the road-way.^g While this great work was in progress, its accomplishment was considered doubtful or hopeless by many; but the end for which it was erected has now been attained, and the communications from London to Dublin by Holyhead are no longer retarded by the inconvenient ferry of Bangor. The part of Anglesea bordering on the Menai is covered with thick woods; at no great distance in the interior, the scene changes into a naked tract, destitute of trees, but fruitful in corn, varied by hills and watered by many streams. Grain and cattle are the principal agricultural produce, and it appears that about a hundred and fifty years ago, nearly 3000 oxen were annually sent to England; the number has since been increased to fifteen or twenty thousand.^h The coasts are well provided

^a They reside during the summer in *hafod-tai*, or summer dairy houses, as the farmers of the Swiss Alps do in their *sennes*. (Ed. Enc.)—*Hafod* or *harod* (Welsh,) a summer dwelling, a dairy; *tai*, houses, (plur. of *ty*, a house.)—P.

^b The Menai bridge—a chain or suspension bridge.—P.

^c The Catenary Curve (*Catenaria*) is the figure which a heavy chain or rope assumes, when suspended at its two extremities. This, when inverted, is the proper form for an arch.—P.

^d There are four chains, from each of which a vertical rod descends to each sleeper.—P.

^e Historical Description of the Menai Bridge, by Dr. Pringle.

^f The bridge was constructed by Mr. Telford. He was first commissioned by the government in 1810, and in 1811, he reported his plans and estimate.—P.

^g Historical Description of the Menai Bridge, by Dr. Pringle.

^h It finds annually several thousand head of cattle to the English market. They are driven to the port of Aethwy, the principal ferry to Caernarvonshire, and are there compelled to swim across the Menai. (Ed. Enc.)—This was before the construction of the Menai bridge.—P.

ⁱ Found in the stratum of earth that covers the copper ore. (Ed. Enc.)—P.

^k Fifty-seven ounces. (Rees' Cyc. Ed. Enc.)—P.

The coal formation of Anglesea, which is of very small extent, lies

with harbours, and the neighbouring seas are abundantly stocked with fish. The metals are not the least valuable products. Copper ore was found within a few feet of the surface, not in veins, but in a continuous mass sixty feet deep, over a large portion of the Parys mountain. The quantity formerly obtained varied from 40,000 to 80,000 tons; but of late years it has been greatly reduced. Lead ore, another of the products,ⁱ yields from six to ten hundred weights per ton, and from a ton of ore thirty-seven ounces^k of silver may be extracted. The other minerals are coal in the neighbourhood of Maltreath,^l excellent millstones, which are obtained from different quarries, and green marble not unlike the verd-antique of the Romans. The greatest length of the island from north-west to south-east is more than twenty miles, and the greatest breadth about eighteen; the circumference is not less than eighty, and the area is said to be equal to 320 square miles.

To regulate the administration of justice, Wales has been divided into four circuits, in each of which the assizes are held twice a year. The first, or the circuit of Chester, comprehends, besides the English county of the same name on the borders of Wales, the Welsh counties of Flint, Denbigh and Montgomery. The second, or the northern circuit, includes the counties of Anglesea, Caernarvon and Merioneth. The third, or the south-eastern, extends over those of Radnor, Brecon and Glamorgan. The last, or the south-western, comprehends those of Pembroke, Cardigan and Caermarthen.^m As to the ecclesiastical polity, the principality is under the province of York,ⁿ and is divided into the dioceses of St. David's, Bangor, Landaff and St. Asaph.

We shall principally confine our remarks in the account of the Welsh towns to the capitals, and the few places that are distinguished by the industry of the inhabitants; and it may here be observed that all the counties except those of Glamorgan, Merioneth and Anglesea, derive their name from their capitals.

Cardiff, the chief town of Glamorganshire, is situated on the Taff, the banks of which are united by a handsome bridge. The harbour of Pennarth, on the banks of the same river, and about three miles lower down,^o is considered a dependence of the town. It receives vessels of the largest burden, and those of three hundred tons sail up to Cardiff.^p It may be affirmed without exaggeration that additional buildings have altered the ap-

in a valley that crosses the island, from north-east to south-west, parallel to the Menai, and at no great distance from it. This valley is bordered by parallel belts of limestone, and in the hollow, coal has been wrought near the Maltraeth estuary (on the south-west coast,) and probably extends throughout the valley. Besides this coal formation and its surrounding belt of mountain limestone, there are two tracts of sienite and trap on the Menai, (one opposite Bangor, and the other at its southern entrance,) and a small tract of old red sandstone on the shore of Conway Bay. The mountain limestone is bounded on the north-west by a belt of old red sandstone. All the rest of the island, to the north-west, is transition, consisting of graywacke and argillite, with a small tract of granite, near its southern border, and a belt of serpentine crossing it near the north-western extremity. (Conybeare and Phillips.)—P.

^m In Myers' Geog. (1822,) Wales is divided into four circuits, in which the counties are arranged as in the text. The two first circuits are called the north-eastern and north-western. Cheshire, as a county palatine, is not included in any circuit.—P.

ⁿ The province of Canterbury. (Pinkerton. Myers.)—P.

^o At the mouth of the river.—Pennarth (Eng. Bear's Head,) from *pen*, head, and *arth*, bear.—P.

^p Vessels of 300 tons ascend to the quay of Cardiff, by the Glamorganshire canal, which has been so far deepened for that purpose. This canal terminates in a floating sea dock in the Severn, at Pennarth Point. (Rees' Cyc.)—P.

pearance of the town, and that the pursuits of the inhabitants have been changed, since the Cardiff canal was completed. It extends from Merthyr-Tydvil, a distance of twenty-five miles, and the head of it is 608 feet higher than the tide-lock at Cardiff.^a An immense quantity of cast and wrought iron is thus conveyed from the works to the town, and onwards to Pennarth, whence it is shipped for different parts of England. From other extensive works not more than four miles from the town,^b 30,000 boxes of tin plates are annually exported to Bristol.^c It appears then that the capital of Glamorganshire is now a place of commerce, but it was chiefly known during the middle ages on account of a fortified castle, where Henry the First confined his own brother,^d the rightful heir to the throne, and where he died after an imprisonment of twenty-six years.

It is further evident that the recent prosperity of the same place must be attributed in a great degree to the products of the iron-works. But the same remark is applicable to the whole of South Wales. The relative importance of that part of the principality and of the county of Monmouth, has within a recent period been much increased by the great number of new, and by the enlargement of old works. These works extend in a line of about twenty-five miles long, in the direction of north-west and south-east, and they yield annually between two and three hundred thousand tons of iron. The works at Hirwain in Brecknockshire and at Aberdare in Glamorganshire form the western points; on the east of them are situated the important works and the populous neighbourhood of Merthyr-Tydvil; from the last place a chain of furnaces is formed by the works of Dowlais, Romney, Tredegar, Sirhowey, Beaufort, Nant-y-Glo, Blaenafon, the Vorteg, Abersychan and Pont-y-Pool, where the mineral range terminates. It may be necessary to indicate more fully the site of Merthyr-Tydvil, at no very remote period an obscure village, now by the industry and enterprise of its inhabitants, the first town in Wales.^e It is situated in the same county as Cardiff, on the northern borders, on the bank of the same river, and at the distance of nine miles from its source. But the houses are still mean, dirty and irregularly built; in most places they are not connected by streets, and the market-place is ill adapted for the business that is transacted in it. Llandaff,^f at no great distance from Cardiff, resembles a village more than the seat of a diocese. The ancient part of its cathedral may be considered a fine specimen of Gothic architecture, but it accords ill with the modern part, which resembles a Grecian building. An excellent road, about thirty-nine miles in length, leads from Cardiff to Neath, a port that

^a The expense of the work amounted to L.500,000. (C. Dupin, *Force Commerciale*.)

^b The tin-works of Melyn-Gryffydd.—P.

^e Population, 22,083, in 1831.—P.

^f Properly, Llandaff—the church on the Taff. The word *llan*, prefixed to so many Welsh names, signifies church or church-town.—P.

^g On the Lower Taafe (Taff, Taw, Tawey, or Towy)—a river which rises in the south part of Brecknockshire, and flows southerly, across Glamorganshire, into the bay of Swansea. The town is called, from its position near the mouth of the river, Abertaw, by the Welsh. The name of the river, variously modified, is common to many rivers in South Wales. It is said to signify a stream or river.—P.

^h 13,694, in 1831.—P.

ⁱ This is a mistake.—Caermarthen stands on another river Towy, which rises in the south-eastern corner of Cardiganshire, and flows

admits vessels of two hundred tons, and built on the river of the same name, which throws itself in the neighbourhood into the bay of Swansea. But the town of Swansea on the last mentioned bay, and at the mouth of the Towy,^g is the most considerable port in the county; and the commerce, industry and number of its inhabitants^h render it better entitled than Cardiff to the rank of capital. The products of the county are conveyed to it by several canals, which account in some degree for its rapid extension and for its present trade in coal, iron, limestone and other articles. To facilitate that trade, the harbour has been enlarged, stone piers have been erected, the river has been deepened, and obstructions have been removed from its entrance into the sea. The establishments of industry are potteries, iron-founderies and several large copper-houses, in which more than fifty thousand tons of ore are annually smelted.

If we ascend the last river,ⁱ we may arrive at the county town of Caermarthen, which is adorned with a handsome stone bridge of sixteen arches.^k It boasts of a high antiquity, and there is good reason to suppose that it occupies the site of *Maridunum*, a town of the *Demateca*.^l It was once fortified with walls and a strong castle, of which the gate only remains; it is long since the rest of the building was levelled with the ground, and a county gaol, a modern edifice of hewn stone, now rises on the place where the old fortress stood. It is also a place of considerable industry and trade; the first is directed to the products of the mines, that are situated in the neighbourhood,^m and the second is carried on by means of the river, which is navigable to vessels of three hundred tons. The same town is the supposed birth-place of the famous Merlin. A hill in the neighbourhood is still known by the name of Merlin's hill, and a rock on the brow of it forms Merlin's chair, on which he is said to have proclaimed his prophecies. Not more than fifteen miles to the south-east, and at the southern extremity of the county, is situated the flourishing town of Llanelly, where a neighbourhood abounding with coal and iron, has given rise to extensive manufactures. The harbour on the estuary of the Loughorⁿ has in consequence been much improved, and numerous rail-roads passing in different directions into the interior facilitate the conveyance of the mineral products.

Continuing our journey along the coast, we arrive at the county town of Pembroke, which is built on a neck of land that bounds the small estuary of Down-Pool,^o a branch of Milford-Haven. Although in antiquity it may rival Caermarthen, it is much inferior to it in commerce and industry. An ancient castle on a high rock at the western extremity of the town, forms a grand object,

south-westerly, through the centre of Caermarthenshire, into the bay of Caermarthen.—P.

^k There is a long narrow bridge over the Towy, of six arches, with other four in the parapet at the south end, to allow the water to pass when the river is swollen. (Ed. Enc.)—P.

^l Caermarthen—the *Maridunum* of Ptolemy, and the *Caer-ryrddin* of the Britons. (Ed. Enc.)—*Maridunum* was the chief town of the *Demateca*, who occupied the three south-western counties of Wales. (Martiniere, *Dict. Geog.*)—*Caer-ryrddin* (*Caer-mardhin*) is a Welsh word, signifying the fortress of Merlin (Welsh, *Myrddin*).—P.

^m The principal manufactures are those of tin-plate and cast-iron. (Ed. Enc.)—P.

ⁿ The Loughor is the boundary between Caermarthen and Glamorganshires. Its estuary, called also Burry River, forms the eastern extremity of Caermarthen Bay.—P.

^o On a neck of land, that divides the estuary of Down-Pool. It terminates on the west, in the rock on which the castle is situated.—P.

even in its present dilapidated state. It is now useless as a place of strength, but at so late a period as the civil wars, it was taken by Cromwell after a siege of considerable duration. It was built by Arnulph de Montgomery, in the time of William Rufus, and the cavern of Wogan beneath its ancient chapel, is remarkable for an echo that repeats several syllables. Milford-Haven, a bay surrounded by mountains, cutting deeply into the land, and resembling a lake from its placid waters, has been already described; but it may be remarked that in consequence of an act of parliament, passed in 1790, a town of the same name was founded on the northern side of the bay, about six miles to the north of Pembroke.^a As its foundation dates from so recent a period, it may be easily inferred that it is well and uniformly built, and although its commerce is not yet considerable, it is likely ere long to be extended, because it possesses many advantages in its situation at the south-west point of Wales, and in a harbour as commodious as any in Britain, and which, with its numerous creeks, inlets and roadsteads, may contain in security a thousand ships. The distinguished author of the commercial resources of Great Britain^a observes that Milford-Haven may become a very important place, whenever England engages in a war with America, or whenever the state of Ireland calls for active vigilance by sea. Such events, however much they might be deplored, are not unlikely to increase the naval or military importance, and add to the number of government establishments in the town; but it is not likely by such means to become a commercial port. It is now one of the royal docks; it has its dry docks, and thirteen building slips, from which the vessels are sent with ballast to Plymouth to be rigged and fitted out.^b

The metropolitan see of Wales was translated from Caerleon to St. David's on the promontory of the same name, the *Caput Octopitarum* of the Romans. St. David's, although a city, does not contain 3000 inhabitants, and nothing can be more mean and squalid than its appearance. The cathedral, once visited by noble and royal pilgrims, is an edifice of mixed architecture, in which the Gothic predominates. A leek, the plant of the saint to whom it is dedicated, is worn by the inhabitants on the anniversary of his birth; and although it might be difficult to account correctly for so singular an emblem, Welsh theologians have assigned to it different and contradictory meanings.

The port and county town of Cardigan gives its name to a large gulf,^d which is broken by several small bays or harbours, and by the Aeron,^e the Ystwith, the Rheidolf and other streams formed by brooks that are shallow in dry weather, but swollen by rains into impetuous torrents, that lay waste the vallies in their course. The

^f The Rydol or Rhyddol. This river and the Ystwith enter the sea by the same estuary in Cardiganshire.—P.

^g Called also Tivey, Tivy, Taw, Taff and Tave—in Welsh, *Tivi*. (See note 5, p. 1238.) The town is called by the Welsh, from its situation, *Aberteivi*—the word *aber* signifying a river's mouth or haven.

^h The Tivy rises in the eastern part of Cardiganshire, and below Llan-

town is built on a steep bank about two miles from the mouth of the Teivey,^g which is crossed by a bridge of seven arches. Once a place of considerable extent, it was surrounded with walls, and defended by a strong castle now in ruins. It carries on an active commerce with different parts of England and Ireland; and although the burden of the largest vessels that pass its bar at spring tide, does not exceed 300 tons, it finds trade for more than 10,000 tons of shipping.

Brecon or Brecknock, the capital of Brecknockshire, is situated at the confluence of the Hondey and the Uske, the last of which is crossed by one bridge, and the former by three. It contained 4190 inhabitants in 1821. and ten years afterwards the number amounted to 5026. It had a castle and a monastery in the time of Henry the First,^h but of the former, a single towerⁱ and part of the walls are all that remain. The same tower has been converted into an armoury, in which fifteen thousand stand of arms, and fifteen hundred swords, are arranged in the same manner as the arms in the tower of London. It is supposed that nearly half of the inhabitants are engaged in trade or manufactures, and the latter consists principally of cloth, hats and stockings. Old and New Radnor, situated in a narrow pass between two high conical hills, about two miles distant from each other, are too insignificant to require any particular notice. It may be remarked, however, that although the assizes are no longer held in New Radnor, it still returns a representative. It is mentioned as a strong place in early times, and the destruction of its walls and castle is attributed to Owen Glendower. The assizes are held at Presteigne, the Welsh Llanandrew,^k on the borders of Herefordshire, and if it be not the nominal, it may be considered the real capital of the county, for it is better built and more flourishing than Radnor.

A castle rising on a lofty rock near the right bank of the Severn,^l is seen from a great distance; it was built by the conqueror, and it became the scene of various actions in subsequent reigns. At so late a period as the time of Charles the First, it was garrisoned for the king by Lord Herbert of Cherbury, who abandoned it on the approach of the parliamentary army, and it was soon afterwards dismantled. Such is the state of Montgomery Castle, still imposing in its ruins. The town of Montgomery is neatly built, but small, and nowise remarkable for any branch of industry or trade.^m Welsh pool, near the eastern boundary of the county, and in the picturesque vale of the Severn,ⁿ is the principal place of trade in Montgomeryshire, and the great mart for the flannels which are manufactured in the town, and in the mountainous country near the sources of the river.^o The small and picturesque town of Machynlleth in the same

beder (Eng. *St. Peter's*.) forms the boundary between that county, and those of Caermarthen and Pembroke.—P.

^h Its castle was built in the reign of Henry I. On the banks of the Uske are the ruins of a Benedictine priory, and on the east of the town is a collegiate church, once a Dominican priory. (Ed. Enc.)—P.

^o The principal manufactories for flannels are within twenty miles round Welshpool. (Ed. Enc.)—P.

county, and on the banks of the Dovey, is famed in history as the place where Owen Glendower was crowned king of Wales in 1402.

It has been seen that almost all the towns in the principality are crowned by the ruins of ancient castles. Those of Denbigh Castle, with its vast enclosure on the top of a hill, form a striking object above the romantic town of the same name in the vale of Clwyd. It resembles Flint, the chief town of an adjoining county, in the style of its houses, recalling the period of the middle ages, and in the circumstance that both of them are overtopped by ancient fortresses. But Flint Castle rises on a solitary rock in a marsh on the Dee, which washes its walls at high tides. It is known as the place where the unfortunate Richard the Second was seized by the Duke of Lancaster, afterwards Henry the Fourth, to whom he surrendered his crown. Both Denbigh and Flint are insignificant in point of population, and if the former contains a greater number of inhabitants, the latter is more frequented in the summer season. The small town of Caerwys, not more than five miles from Flint, and once the capital of the county, does not contain more than 1200 souls. Four streets meet in the middle of the town,^a where it was customary for the bards to assemble, and to contend for a silver harp, which was annually given by the princes of North Wales; and it may be added that the custom was not wholly abolished before the reign of Elizabeth.^b Holywell, a market town near the mouth of the Dee,^c and containing about nine thousand inhabitants,^d is enriched by its mines and manufactures. It is likewise celebrated for the well of St. Winifred, a copious stream bursting with great impetuosity from the foot of a hill, and emitting 40,320 pints in a minute.^e It was known on account of its wonderful cures, but the waters, it is certain, are not different from those of any other spring in a similar situation. The faith in its miraculous virtue has passed away, and it has of late years been applied to useful purposes. The power of the stream now serves to turn a series of mills for working copper into sheets and bolts, for drawing brass into wires, manufacturing paper, grinding tobacco, and spinning cotton. The mines that are wrought in the neighbourhood, consist of lead, calamine and copper.^f St. Asaph, at the confluence of the Elwy and the Clwyd, is entitled a

^a The town consists of four spacious streets crossing each other at right angles, and corresponding to the points of the compass. (Ed. Enc.)—P.

^b Caerwys, as appears from its etymology (*caer*, town, and *grwys*, summons,) was in early times a seat of judicature. It is more noted, however, for its *Eisteddfod*,* or session of bards and minstrels, which was held there for many centuries. The judges, who awarded the prizes, were at first commissioned by the princes of North Wales, but after the conquest by Edward I., by the kings of England. In 1568, an *Eisteddfod* was held by commission from Queen Elizabeth, and 55 degrees conferred, in vocal and instrumental music. From that time, these meetings were neglected till 1798, when one was held by public notice from the Gwyneddigion† or Venedotian Society of London for the encouragement of Welsh Literature.‡ On that occasion, 20 bards, 18 singers and 12 harpers exhibited their performances in the presence of a large assembly in the town-hall. (Ed. Enc. Rees' Cyc.)—The *Eisteddfod* (annual bardic session and musical festival) is still held at Denbigh. (Bell's Geog.)—P.

* *Eisteddfod*, a session or assembly, from *cistedd*, to sit, and *bod*, to be.—*Eisteddfod y beirdd*, meeting or congress of the bards. (Owen's Welsh Dict.)—P.

† *Gwyneddigion*, plural of *Gwyneddig*, a Venedotian or North Welshman, from *Gwynedd*, one of the three native divisions of Wales, including all North Wales, except Montgomeryshire—in Latin, *Venedotia*. Montgomeryshire formed a part of *Powys*, which with South Wales, in Welsh *Deheubarth* (*deheu*, the right, the south, and *parth*, a part, a region—i. e. the south country,) included the rest of Wales and the Welsh marches. (Owen.)—P.

city, because it is the seat of a diocese; it consists merely, however, of a single street, and contains only 2000 inhabitants. The cathedral, which is falling into decay, is no longer used as a place of worship. The Merioneth assizes are alternately held in Bala and Dolgelly. The first place is ill peopled and meanly built; it claims, however, a high antiquity, which is verified by the remains of three Roman camps in its vicinity. It gives its name to the lake on which it is situated,^g and which although larger than any other in the principality, is not more than four miles in length, and about one and a half in breadth.^h Caernarvon or Carnarvon was founded in the year 1285ⁱ by Edward the First near the site of the Roman *Segontium*, of which some vestiges still remain. Situated on the southern coast of the Menai Strait, its port can admit ships of 700 tons, its quays afford great facility to the lading and unloading of merchandise, and many trading vessels resort to it from different parts of the kingdom. But it is not perhaps so well known on account of its commerce as on account of a castle, that was built by the insidious conqueror of Wales, who, having promised a native prince or ruler to the Welsh, and having afterwards appointed his own son, Edward the Second, the first prince of Wales, assured the people that he had fulfilled his promise, as the young Edward was born in Caernarvon Castle. The same ancient castle is not only the most magnificent, but the most entire of any in the principality. Equally remarkable for the extent and solidity of its walls, contrasting well with its light and graceful turrets, that rise above an embattled parapet, it may be considered a very creditable monument of the architecture of the period. Bangor, like the other episcopal towns in Wales, consists of mean and dirty houses; the old cathedral, which towers above the other buildings, was partly destroyed by Owen Glendower.

Beaumaris, which may be seen on the eastern coast from the neighbourhood of Bangor,^k is the only town that is represented in the Isle of Anglesey. But Amlwch on the northern coast is the most important maritime place in the island; its population amounts to nearly 6000 inhabitants, and its port, cut out of the solid rock, and capable of containing 30 vessels of 200 tons, was constructed by the Anglesea Mining Company.^l Lastly,

‡ Besides this and other efforts for the encouragement of their native literature, the Gwyneddigion Society has published in a work called the *Myvyrian* (Poetical) *Archæology*, a large and very complete collection of its oldest monuments.—*Myvyr*, study (particularly of poetry,) the muse. (Owen.)—P.

^c On the slope of a hill, rather more than a mile from the estuary of the Dee. The well of St. Winifred is at the foot of the hill, below the town.—P.

the small island of Holyhead, near the eastern point of Anglesea, is united to it by means of a bridge. It is the station of the government packets to Dublin, and it is frequented by travellers as the most convenient place of embarkment. A headland that protects its port, forms a sort of precipice, hollowed by caverns, and frequented by sea-fowl.^a

Having mentioned all the towns of any consequence in Wales, some notice may be taken of the manners and customs, peculiar to the inhabitants on the western side of the Severn. It has been often observed that civilization and knowledge have not made the same advances in the Highlands and the Lowlands of Scotland, and the observation is perhaps as applicable to Wales and England; in other words, the Highlanders are to the Lowland Scots what the Welsh are to the English. The limits in which the dialects of either country are spoken, are rapidly contracting, and the English language might have been still more widely diffused, had it not been for the too great zeal of public associations, and amiable but not very judicious individuals.^b But although knowledge is gradually dispelling the darkness in which the inhabitants of both countries were so long benighted, it is worthy of remark that there are few absurd superstitions or ridiculous customs, believed or observed by the Welsh, to which analogies may not be found in the mountains of Caledonia. The Welsh raptures, and the second sight of the Highlanders, derive their origin from the same source, and both may be traced to the period of the druids. In Wales indeed, the *Awenyddion*^c appears to have undergone fewer changes by the lapse of ages. The prophet is carried out of himself, or is possessed by a spirit, and the only difficulty consists in attaching a meaning to his wild and incoherent rhapsody, for so soon as he returns to his usual state, he is supposed to forget all that passed, all his prophetic or insane effusions. It is but right to add that such oracles are now seldom consulted, and only in the most sequestered and thinly peopled parts of the principality. Witches are believed to exist in many parts of Wales, and numerous are the

charms, which are more or less efficacious in averting the wrath of these wicked beings. A horse-shoe, a cross or a circular stone may be seen in different parts of the house, and the *hypericum*, which has now almost as many mystical virtues as were formerly attributed to the *veronica* of the druids, is scattered at the entrance of many a cottage on the vigil of St. John, from which custom, its popular name of St. John's wort has been derived. Witches are believed to be malevolent, and it is of much consequence to conciliate them, for they have it in their power to commit great mischief; they prevent the cows from giving milk, and the butter from forming in the churn, and it is equally certain that they have often spread diseases among men and cattle. The spirits of the mountains, celebrated by the Welsh bards and in the poems of Ossian or rather Macpherson,^d are on the contrary benevolent beings; they protect the good and punish the wicked; and the same may be said of the elves, fays or fairies, that still dance by the light of the moon, and describe their circles, on the green hills of Wales. Mountainous scenery, it has often been asserted, accounts for the belief in these ideal existences; it is certainly not unfavourable to similar delusions; but before they can be wholly attributed to such a cause, mountainous scenery must be made to signify want of communications, want of intercourse, and want of the means by which knowledge is diffused, and education extended to every order of the community.

Pride of ancestry is common to the Welsh and Highlanders. It was customary for the Briton to commit to memory the names of his progenitors, and to trace them to some individual distinguished by his skill in war, his success in plunder, or any other quality that is considered a virtue by the savage. The same barbarous custom is partly preserved; it is not confined to the lower ranks, it extends to the gentry, and persons of whom the English and the Lowland Scots would not certainly be disposed to boast, are often included by the Welshman and the Highlander in the long list of their progenitors.

^a The town of Holyhead stands on a harbour on the north side of the island of the same name. The promontory, here alluded to, is called the Head; it rises, however, at the west end of the island, the port being protected by another peninsular rock, on which the churchyard is situated. To the west of the Head is an insulated rock, called the South Stack, on which a light-house, with a revolving light, has been lately erected. The island of Holyhead is called by the Welsh, *Inys-Cybi* (island of Cybi,) and the town, *Cacr-Cybi* (fortress of Cybi).—P.

^b The Welsh language is still spoken by the middle and lower classes in all the Welsh counties, and in the western part of Monmouthshire. It is a Cimbric-Celtic dialect, immediately connected with the Cornish and Armoric or Breton, and more remotely with the Gaelic-Celtic (Irish, Highland Scotch and Manks.) The Welsh call themselves *Cŵmrŷ* (*Cymry*;) their country, *Cŵmrŷ* (*Cymru*;) and their language, *Cŵmrâg* (*Cymraeg*).—P.

^c *Awenyddion*, plural of *awenydd*, a man of genius, a poet, a rhapsodist, from *awen*, genius, particularly poetical genius, inspiration, the muse. The *Awenyddion* were a class of persons in Wales, who indulged in poetical raptures, and like the ancient sibyls, prophesied in incoherent rhapsodies. (Owen. Rees' Cyc.)—They were doubtless the origin of the Welsh Ranters and Jumpers.—P.

^d The question about the authenticity of Ossian's Poems was set for ever at rest by the late Mr. Malcolm Laing, but not before Dr. Henry used them as historical monuments. It is not to be denied that traditions, however much they may have been obscured or perverted to suit the purposes of the poet, were handed down from generation to generation both in Ireland and Caledonia.

A portrait or a print of Ossian, it may be remarked, was lately sent from Scotland to the Royal Institute of France. It is at least within the limits of probability that the portrait resembles the original, particularly as there is much left to the imagination both in his character and existence.

A portrait or a print of Ossian, it may be remarked, was lately sent from Scotland to the Royal Institute of France. It is at least within the limits of probability that the portrait resembles the original, particularly as there is much left to the imagination both in his character and existence.

BOOK CLV.

EUROPE.

Europe Continued.—Description of the British Islands.
—Second Section. *Scotland.*

THE coasts of Wales are separated from those of Scotland by a distance of about thirty leagues. The navigation of the Irish Sea is not without danger, but both the Welsh and Scotch mariners are accustomed to it, and a stranger may safely confide in their experience. Besides, the numerous inlets by which the western coast of Great Britain is so deeply indented, form so many places of shelter against the impetuosity of the waves. The voyage from Wales to the Solway Frith^a may be made in a short time, but before describing the district in the neighbourhood of the same frith, some remarks may be made on the nature of the country which is to form the subject of the present chapter.

Scotland extends from 54° 37' to 58° 41' north latitude, or from the Mull of Galloway to Cape Dunnet.^b If the Orkney and Shetland Islands be included, it stretches to 60° 52' north,^c and from 1° to 7° 50' west from Greenwich.^d The mainland is almost isolated from England by a mountainous chain, and by the rivers Tweed, Liddel, and Esk; in every other direction it is bounded by the sea. The greatest length from north to south, measuring along the meridian of Kirkcudbright, is equal to 244 miles. A straight line drawn along the coast from the Mull of Cantyre to Cape Wrath is little more than 220 miles, and in other directions the distance is not so great.^e The breadth is very various; from Burchan-ness in Aberdeenshire to the western point of Ross-shire, it is 137 miles, while it is only 36 from Dornoch Frith to Lochbroom. The former is the broadest, and the latter the narrowest part of the kingdom. The same country is naturally divided by three mountainous ranges. The first or the northern is separated from the second or the central by the friths of Moray, Linnhe and the intermediate lakes;^f the low country that extends from the Frith of Forth to the mouth of the Clyde, lies between the southern heights and the central ridge.

^a This word is properly and more usually written *Firth*, and is the same as the Scandinavian *fiord*, a bay, inlet, or estuary. *Frith* is derived from the Latin *frctum*, which properly signifies a strait or narrow passage.—P.

^b Dunnet Head, in Caithness.—P.

^c 61° 11' (Bell's Geog.)—61° 13' (Ed. Enc.)—P.

^d The mainland of Scotland extends from Peterhead, in 1° 40' W., to Ardnamurchan Point, in 6° 10' W. of Greenwich. (Bell's Geog.)—Longitudes 1° 47' and 6° 7' west. (Ed. Enc.)—Including the islands, the extreme longitude east is 52' W. (that of the Shetlands,) and the extreme longitude west 8° 18' W. (that of St. Kilda.) (Ed. Enc.)—The extreme longitude west, of the Hebrides (not including St. Kilda,) is 7° 40' W. (Bell's Geog.)—P.

^e Its greatest length on any one meridian is 275 miles, viz. from the Mull of Galloway to Farout Head; but the distance between the two extreme parallels of the mainland is 284 miles. (Ed. Enc.)—P.

^f The valley separating the two ranges is called, in Gaelic, *Glenmore na Albin* (the great glen of Caledonia,) and it forms the line of the Caledonian canal. Beginning at the north-east, its bottom is occupied successively by the head of Moray Firth, the river Ness, Loch Ness, Loch Oich, Loch Lochy, the river Lochy, and the inlet of Loch

A chain stretching from south-west to north-east, and crossing the southern portion of Scotland, commences at Port-Patrick and terminates at St. Abb's Head. The highest summits are situated near the northern limits of Dumfries-shire; Hartfell reaches to an elevation of 3302 feet above the level of the sea, and several others are higher than 2000. But the heights on both sides, as they recede from these lofty hills, become gradually lower; thus the Moorfoot, Soutra and the Lammermuirs on the east, and the hills of Kirkcudbright or Galloway on the west, vary from 1800 to 800 feet.^g

The wall of separation between the two kingdoms of Great Britain, extending first to the east, and afterwards to the north-east, is connected with the same central group, and terminates in the Cheviots, which have been mentioned in a former chapter. Another series stretches in a north-west direction, to the low hills near the mouth of the Clyde.

Criffel, which is nearly 2000 feet above the level of the sea, forms part of a different branch that separates the counties of Kirkcudbright and Dumfries. The small chain of the Pentlands is connected with the common centre; the group of Tintoc^h is in some places more than 2300 feet in height, but the eastern extremities of the Pentlands are nowhere higher in the neighbourhood of Edinburgh than 1700,ⁱ and in some places so low as six or seven hundred feet.^k

The populous and fruitful valleys of Scotland are situated between the mountainous chains or branches that meet in Hartfell and the Leadhills; but even the valleys are in some places crowned by considerable heights. This remark is applicable to the western coast, to the southern part of Ayrshire, to the county of Dumfries, where the low districts are subdivided by the Eildon and Garleton hills.^l Numerous small valleys are enclosed by these heights, and all of them are watered by streams, the tributaries of the principal rivers that rise from the vicinity of the central chain.

Linnhe (on the south-west.) The waters of the opposite seas are separated by a small space of level ground between the heads of Loch Oich and Loch Lochy.—P.

^g The Muirfoot Hills, on the southern border of Mid Lothian, rise to 1850 feet. Soutra Hill, in the south-west corner of E. Lothian, is 1716 feet high, and Cockburn-law, near the eastern extremity of the Lammermuir ridge, in Berwickshire, 900 feet high. Clint Hill, at the north-western extremity of the same ridge, is 1544 feet high. Spartleton Hill, in the parish of Spott, south of Dunbar, rises to the height of 1615 feet. The granite ridges of Cairnsmuir, between the Ken, the Dee and the Fleet, in Kirkcudbrightshire, rise in their highest points to 2597 and 2329 feet.—P.

^h Tinto Hill, a detached summit or group in Upper Clydesdale, round the base of which the Clyde winds on the east and north.—P.

ⁱ Eastside Blackhill, the highest of the Pentlands, near the middle of the range, is 1878 feet above the level of the sea.—P.

^k Boué, Introduction à l'Essai Géologique sur l'Ecosse.

^l The Eildon Hills, remarkable for their three-forked summit, rise south of Melrose, in the north-western part of Roxburghshire. The Garleton Hills form a ridge in the low country of East Lothian, near Haddington.—P.

The country on the north of the Forth is crossed by two lofty chains, the Grampians and the mountains of Inverness-shire, connected with each other by the pass of Drumochter, and imperfectly separated by the valleys of the Orchy^a and the Spey, and the sterile plain or moor of Rannoch. The first of these chains derives its name from the *Mons Grampius* of Agricola, and the determination of its site is still an object of research to antiquaries.^b The ridge forms a belt about forty miles in breadth, stretching in a north-east direction across the island from Cantyre to the coast between Stonehaven and the mouth of the Spey. In the group of Cairngorm are situated the highest summits; ^c Ben-na-Muich-Duidh^d is about 4300 feet in height, and some others in the neighbourhood are nearly equal to 4000.^e The mountains descend on the east of the same group, and Morayshire and Banffshire are in many places comparatively low or level; but a line of bold heights, (some of 3000, and on an average not less than 2500 feet,) ^f extends on the west of Cairngorm, and terminates in hills near the shores of the Atlantic Ocean.

The Grampians are separated from the more civilized part of Scotland by a parallel and lower chain, of which the crest forms a line from Aberdeenshire to the southern extremity of Loch-Lomond.^g It is naturally divided into three sections. The Sidla hills, which pass from Redhead^h in Angus-shire to the neighbourhood of Perth, and which are in few places higher than 1000 feet,ⁱ enclose with the Grampians the fruitful valley of Strathmore. The Ochils, or the second group, extend from Parton Craigs^k to Stirling, and are connected with the Grampians by their highest summits on the west, which are equal to 2200 feet in height;^l on the east, however, their altitude is not in general greater than that of the Sidla hills. The third section consists of the Campsie hills, between Stirling and Dumbarton; in some places they are 1500 feet high, but on an average little more than 800. The northern heights^m that run parallel to the Caledonian canal cover a space about thirty miles

^a The Orchy (Orchay or Urchay) is a small river, flowing through Glenorchy into the head of Loch Awe.—P.

^b That is, the site of *Mons Grampius*. Some have placed it in Stormont (Perthshire,) between the Tay and the Isla; others, near Stonehaven, on the sea-coast, in Kincardineshire.—P.

^c This group is situated at the western extremity of Aberdeenshire, near the source of the Dee.—P.

^d Ben-muc-dhu (Ed. Enc.)—Ben na Muc Dubh, or Beinn na Muich Duibh (Peak of the black boar.)—P.

^e The summit of Cairngorm is 4060 feet high; that of Cairntoul 4220.—P.

^f In this line are Cairn-Gower (3690 feet,) Schihallion (3564 feet,) Ben-Lawers (4015 feet,) Ben-More (3980 feet,) and Ben-Lomond, (3176 feet.)—P.

^g The south front of the Grampians extends from the north-eastern corner of Kincardineshire to Ben-Lomond; the lower chain here mentioned, from Redhead in Forfarshire, or rather from Stonehaven in Kincardineshire, to near Dumbarton.—P.

^h The Redhead is a promontory on the coast between Montrose and Aberbrothock. The Sidla range properly extends along the coast of Kincardineshire to Dunottar, south of Stonehaven.—P.

ⁱ The highest of the Sidla Hills is 1406 feet high.—P.

^k Ferry-Port-on-Craig, on the south side of the Tay, at its mouth. The Ochils skirt the south shore of the Tay to near the mouth of the Earn.—P.

^l The Ochils, after skirting the south shore of the Tay to near Abernethy, extend south-westerly, between Perthshire on the north, and Fifeshire, Kinross-shire and Clackmannanshire on the south, nearly to the banks of the Forth, opposite Stirling. They swell into a very lofty group, north of Clackmannanshire, where the highest summit is Benclough or Benclach (2420 feet above the sea.) On the south side of the Forth the same range is continued by the rock of Stirling, the hills of Gargunnoch, and the Campsie Fells, towards Dumbarton. The Ochils, at their western extremity, are not immediately, if at all,

in breadth, and the principal summits are situated in the western part of the chain; there Ben-Nevis, the loftiest of the British mountains, reaches to an elevation of 4380 feet. If the intermediate valleys be not taken into account, the mountains that extend from Ben-Nevis to the Murray Frith, descend very gradually, while a line in an opposite direction, from the same point to the inlet of Etive,ⁿ or even to the islands of Jura and Isla, which rise, however, to the height of 2400 feet,^o forms a sufficiently rapid declivity.

The Dee and the Don rise in the Cairngorm heights, from which many streams descend and join other large rivers. The Garry, the Spey and the Roy^p have their sources near the pass of Drumochter, one of the highest valleys in Scotland, and one which forms, as has been already indicated, the connecting line between two chains that were probably at a former period united. In another direction, the inequalities in the surface are concealed by numerous lakes, whence several rivers take their source; among others, the Forth, of which the basin separates the Grampians from the southern chain. In the same part of Scotland, and besides the valleys of the Dee and the Don, are those of the Earn, the Tay, and other large streams, of which the course is not less than sixty miles. The same valleys are connected with others of smaller dimensions, that are watered by the feeders of the principal rivers.

If the plain which covers the greater part of Caithness be excepted, the rest of the country on the north of the Caledonian canal is very mountainous. The heights form a broad belt almost parallel to the other chains, and extend from the Hebrides along the confines of Ross-shire and Caithness to the Ord of Caithness on the shores of the German Ocean. Stretching northwards, they run into the North Sea, and appear anew in the islands of Shetland.^q Their arrangement in another respect resembles that of the Scottish chains; for the highest summits are situated on the west, and they descend gradually on the opposite side of the island.^r

connected with the Grampians. They are there bounded on the west and north-west by the vale of the Allan, a part of the great vale of Strathmore, which skirts the whole southern foot of the Grampians.—P.

ⁿ The mountains of Inverness, mentioned in the preceding paragraph. They form the eastern boundary of Glenmore na Albin.—P.

^o Loch Etive, in Argyleshire.—P.

^p The mountains of Jura terminate on the south-west, in four conical summits, called the Paps of Jura; of which the two highest, viz. Beinn an Oir (golden mountain) and Beinn Shianta (consecrated or holy mountain) are respectively 2359 and 2476 feet high. Some of the mountains in the east and north of Isla rise to the height of 1800 feet.—P.

^q The Garry, a branch of the Tay, descends to the eastern coast, the Spey to the northern; and the Roy, a branch of the Lochy, to the western.—P.

^r The language here used is certainly very inaccurate. The heights, here mentioned, are of primitive formation, and occupy the western part of Inverness-shire, and nearly the whole of Ross and Sutherland. They terminate, on the north-east, nearly on the line between Sutherland and Caithness; the greater part of the latter county being a comparatively level tract, and composed of old red sandstone. The north-eastern extremity of these heights thus forms a range of high lands, overlooking the low country of Caithness, and extending from the Ord of Caithness on the south-eastern coast, to Reay on the northern coast. The northern coast of Caithness consists thus of red sandstone, which forms nearly the whole of the Orkneys, and reappears in the Shetland Islands, particularly on the eastern coast of the Mainland. The northern coast of Sutherland consists of primitive rocks, which reappear in the Shetlands, forming the greater part of those islands.—P.

^s For a more complete and full account of the Scotch mountains, the reader may consult the excellent essay on the geology of Scotland, by M. A. Boué.

The principal rivers in Scotland communicate with the German Ocean; the Clyde forms the only exception; the others on the west, are mostly torrents or mountain streams that fall into the Atlantic at no great distance from their source. And this fact is confirmatory of what has been already said concerning the height of the mountains on the west, and their descent or total absence on the east. It follows also, from the same fact, that the fruitful plains, or rather the large and populous vallies in Scotland, are situated near the eastern coast. In a statistical point of view, the Forth, the Clyde and the Tay are the most important of the Scottish rivers, but it must not be inferred that they are the largest; others in the northern part of the country, may bear a comparison with the two former.^a

The following tables indicate the actual population and the dimensions of the basins of the three rivers:—

Basin of the Forth.

Counties.	Inhabitants.	Square miles.	Inhabitants per square mile.
Haddington	36,145	272	136
Edinburgh	219,592	354	624
Linlithgow	23,291	121	192
Stirling ^b	72,621	502	144
Clackmannan	14,729	48	306
Kinross	9,072	78	116
Fife (½) ^c	42,450	158	268
Total	417,900	1533	mean 273

Basin of the Clyde.

Counties.	Inhabitants.	Square miles.	Inhabitants per square mile.
Dumbarton	33,211	259	124
Renfrew	133,443	227	587
Lanark	316,819	945	335

Total	628,528	2553	mean 246

Basin of the Tay.

Counties.	Inhabitants.	Square miles.	Inhabitants per square mile.
Fife (¾) ^d	85,600	316	270
Perth	142,900	2638	54
Angus or Forfar . .	139,600	892	156
Kincardine ^d	31,430	382	82
Total	399,530	4228	mean 94

^a The Spey is said to be the longest river in Scotland. Its length is 90 miles in a direct course, and 120 including its windings. The Dee and the Don are the next longest rivers in the north of Scotland.—P.

^b The south-western part of Stirlingshire lies in the basin of the Clyde.—P.

^c If Fife-ness be taken as the boundary between the basins of the Forth and Tay, at least one half of Fife will lie in the basin of the former. No part of the county, south of that line, can be reckoned in the basin of the Tay, and nearly the whole of the county, north of that line, lies in the basin of the Eden.—P.

^d The basin of the Tay must be extended to the mouth of the Dee, to include the counties of Forfar and Kincardine. Only the western border of Forfarshire lies within the proper basin of the Tay; the greater part of the remainder lies within the basins of the North and South Esks. No part of Kincardineshire lies within the proper basin of the Tay; its northern border is included within the basin of the Dee.—P.

^e Inch Garvey, Inch Colme, Inch Keith, Cramond Island, Fidrie Island, Bass Rock, and the Isle of May, in the Forth; the latter, six or seven miles from the coast of Fife, with a light-house. Bell Rock, off

It appears from the above tables that the basin of the Forth is the least in extent, and the greatest in relative population; the basin of the Clyde is more extensive, and holds the next rank in point of population; while that of the Tay, although greater than the two others together, is both relatively and absolutely less populous than either.

The Tay, however, is the largest of the Scottish rivers, and it is related that the Romans, under the command of Agricola, having crossed the first mountains on the north of the Lowlands, entered the fruitful valley of the Tay in the neighbourhood of Perth. A majestic river, and a country rich in comparison of the one they had passed, awakened emotions natural to men, who are reminded of their native land by sensible objects in a distant and unknown region. Imagination created or discovered some resemblance between the cold Caledonia and the sunny Italy, and no sooner was the Tay descried by the soldiers, than they shouted with one accord, *Ecce Tiberim!*

The number of islands enclosed by the seas that bound Scotland, is too remarkable to escape observation; they appear always in groups, are confined to the western and northern coasts, and are not seen on the eastern, unless indeed a few detached and barren rocks that rise above the surface of the water in the friths of Forth and Tay,^e can be dignified with the name. The larger islands are separated from each other in some places by very deep water, in others by so shallow a sea as to render it probable that they were formerly united. This remark is applicable to the sea between Tiree^f and Coll, and between several islands in the group, that has been denominated Long Island.^g The connexion between others is indicated by shelving rocks, or by a strait that is left dry at low water. Violent currents occasioned by the flux and reflux of the tides, such as the impetuous Corry-Vrechan,^h rush between some of them, and the effect of the great Atlantic current is made manifest by plants, pieces of wood, or other products, which are occasionally carried from the New World to the shores of the Hebrides. But the sea between the islands and the coasts of Scotland is subject to the most rapid currents; the waters in the arm of the sea that separates the island of Mull, one of the Hebrides, from the district of Lorn, are thus impelled with great velocity. The Pentland Frith, the “Scylla and Charybdis” of Scotland, is exposed in certain seasons to opposite currents. “The current,” says Mr. Playfair, “is exceedingly strong dur-

the mouth of the Tay, about 11 miles distant from the nearest coast, has also a light-house.—P.

^f Tiry, Tirey, Tیره, Tyrie.—Gaelic, *Tir*, land; *I*, Iona; i. e. land belonging to I or Iona. (Statist. Acc. x. 393.) Rather, *Tir*, land, and *I*, island; Iona (Gaelic *Ithann*) being itself a compound of *I*, island, and *ton*, wave: i. e. island of waves. Tiree is very low and level; so low, indeed, that the breakers on one coast can, in some places, be seen from the opposite; hence it is also called, in Gaelic, *Rioghachd bar fo* (*fuiddh*) *thuin*, kingdom of summits below the waves.—P.

^g The Long Island, so called, forms a chain of islands, extending north by east, parallel to the west coast of Scotland, from the rock, called Barra Head, on the south, to the north point of Lewis, called the Butt of Lewis, on the north. It includes, besides numerous small islands and rocks, the larger islands of Barra, South Uist, Benbecula, North Uist, and Lewis (including the peninsula of Harris, on the south.) The passages, from east to west, between these islands, are generally shallow, and encumbered with rocks and shoals; hence the whole chain has been supposed to have originally formed a single island.—P.

^h Corryvrechan—whirlpool of Brechan, a son of a king of Denmark, who perished in it.—P.

ing spring tides. The flood tide runs from west to east, at the rate of ten miles an hour, at full and new moon. It is then high water at Skarfskerry, (whence the ferry-boat crosses from Dunnet to Orkney), at 9-8 o'clock A. M.; but in the middle of the frith, the tide continues to run eastward till mid-day, while the current along the shore flows in an opposite direction. The same phenomena are reversed about three o'clock, and they thus continue in succession."^{a b} These causes account for the danger to which mariners are exposed in the Pentland Frith, but the necessity of its navigation has been fortunately superseded in a great measure by the Caledonian canal.

The eastern coast of Scotland is naturally divided into two large gulfs, the one stretching from the shores of Northumberland to Kinnaird's Head, and the other from the latter promontory to Duncansby Head. In figure both resemble each other; they form two triangles, of which the southern is larger than the northern, although the base of the latter is upwards of sixty-five miles in length.^c In other respects they are not unlike, and the neck of land that separates the friths of Dornoch and Murray may be compared to the extremity of Fife, the boundary between the friths of the Forth and Tay; but there is no inlet in the one, like the frith of Cromarty in the other. There is, however, a considerable resemblance in the sinuations that are observed in the two divisions, in the course of the rivers, and the direction of the streams.

The outline of the western coast is very different; the large frith of the Clyde, and the extent of sea between the island of Mull and the shores of Lorn may perhaps resemble the two great divisions on the eastern coast. But all the numerous bays in the west, are small in comparison of those in the east. The inlets penetrate far into the land, and might be mistaken for lakes or rivers, if it were not for the loud noise occasioned by the flux and reflux of the tide, and for the *algæ* that decay on their surface.^d The extraordinary depth of these narrow inlets at great distances from the open sea, may perhaps be considered characteristic of the western coast. Thus, Loch Fine in the neighbourhood of Inverary is sixty fathoms deep, and Loch Goyle,^e although not much broader than a mile at its upper extremity, is at least fifty-seven fathoms.^f The shores are in general bold and lofty, a fact that might have been inferred from the height of the mountains towards the south-west, and the dip of the strata in an opposite direction, a conformity which is observed both in continents and islands, although the cause cannot be explained in the present state of geological science. But the same shores appear as if they had been broken or shattered in many places, and to account for the phenomenon, something must be allowed for the violence of the western waves. The opposite coasts are only lofty at the places where the extremities

of the chains extend to the eastern limits of the kingdom. Thus, precipices of several hundred feet in height may be observed along the shore from Redhead to Aberdeen, and at Peterhead, Portsoy, the Ord of Caithness, St. Abb's Head and Tantallon Castle.

However numerous and different the depths that are indicated by the sounding line near the opposite sides of Scotland may be, they depend more or less on the phenomena that have been mentioned. Near the low shores on the east, the depth increases by an almost imperceptible descent, while the line sinks several fathoms near the bold rocks on the west. There are, however, exceptions to the rule, and at no great distance from the flat and level shore of Irvine, the water is thirty or thirty-five fathoms deep. The eastern coasts are more extensive than the western, and they are relatively more populous, consequently industry has made more rapid advances, and the land is more productive. But the same fact which is ascertained by statistical results, might also have been determined by the nature of the coasts and the country in their vicinity.

The northern coast, the least in point of extent, is bounded by bold rocks, or indented by numerous bays and headlands, and difficult of navigation on account of a tempestuous sea and opposite currents. The correspondence of the rocks and soils on the southern and northern limits of the Pentland Frith, and onwards between the Orkneys and the Shetland Islands, renders it highly probable that the two groups formed once part of the mainland of Scotland; but the period when the convulsion that separated them took place, and the agent by which it was effected, are alike unknown. Lastly, if the area of Scotland were bounded by straight lines, the length of the lines might be less, at all events not greater, than 600 miles, whereas the coasts are so much broken and indented, or so extensive in proportion to the surface, that the actual distance is equal to two thousand.^g

The mineral kingdom in Scotland has been the subject of much research to geologists, and it has consequently been examined with greater accuracy than that of most countries. The riches which are obtained from it, have increased the resources, commerce and industry of the inhabitants, and part of Scotland must have been less distinguished for wealth and civilization, had it not been for the products that are contained beneath its surface.

The coal district is situated in the populous and fruitful country between the transition chain in the south, and the loftier primitive chains in the north. It may be almost said to be confined to this part of the kingdom, for although it occurs elsewhere, it is only observed in inconsiderable quantities and of an inferior quality.^h The quantity of coal consumed annually in the country, is more than two millions and a half, and considerably less than three millions of tons. Of these, two millions are

^a This sentence in the original stands thus: "This phenomenon is reversed at three o'clock."—P.

^d Boué, p. 10.

^e Loch Fyne—Loch Goyl or Goil. The latter is a long and narrow inlet, penetrating north-west into Argyshire, from Loch Long.—P.

^f Jameson's Travels, vol. i. p. 139.

^g Playfair's Description of Scotland, vol. i. p. 7.

^h Besides the great coal-field, here mentioned, there is a small coal

formation, forming a very narrow belt along the shore, at Brora, on the eastern coast of Sutherland, and resting almost immediately on granite; also, another small formation, on the western coast of Caithness, near Campbelltown, appearing to lie immediately on mica-slate; and lastly, a series of coal strata, of little or no value, covered and intersected by trap rocks, extending in a narrow line through the Shiant Isles, Raasay, the eastern part of Sky, Egg, Muck, Mull and Morven. These formations are independent of the great coal-field. Coal is also wrought in a basin on the lower part of the Esk, in Canobie (Dumfries-shire.)—P.

necessary for domestic purposes, and the remainder is consumed in the iron and lime works, and in different manufactories. Besides, a considerable quantity is exported to Ireland, and a good market is obtained for the better sorts in some parts of England. The superficial extent of the great coal-field that stretches in a diagonal direction from the Frith of Clyde at Dumbarton to St. Andrews in Fife, and to East-Lothian,^a has been estimated at 620,000 acres or nearly 1000 square miles; and it has also been calculated that according to the present consumption, it may be worked with advantage during 3000 years.

Although iron is not uncommon in many counties, and although it abounds in the coal districts, all the produce of the mines is insufficient for the supply of the different iron-works, and metal is still imported in considerable quantities from the south, and in particular from Wales. It appears from a comparatively recent account of the country, that there are at present twenty-one blast furnaces in Scotland, yielding annually about 33,000 tons, and furnishing employment to nearly 8000 inhabitants.

The principal lead mines are those at Leadhills and the village of Wanlockhead, on the confines of Lanark and Dumfries. Evidence is not wanting to show that lead was wrought by the Romans in some parts of the sister kingdom, and it is very probable that other works of the same sort were carried on in Scotland by the Danes. It is worthy of notice, therefore, that the most productive lead veins in Scotland were not known before the year 1540. Long after that period, however, the discovery of mines depended on chance, fortunate accidents and fortuitous circumstances. Galena is the principal ore which is obtained by the miners of Leadhills and Wanlockhead. The matrix is generally calcareous spar, quartz, manganese and clay, and the accompanying metallic ores are blende, calamine, iron and copper. Other mines are worked at Strontian on the west coast, and in the island of Isla, one of the Hebrides. The mines of Strontian traverse gneiss rock, and are remarkable for the mineral substance which derives its name from that of the place.^b The veins of Isla run in primitive limestone, and it is supposed, not without reason, that they were wrought by the Danes.^c The annual produce of the mines in Leadhills and Wanlockhead varies from three to four thousand tons; and it has been estimated that the price obtained for the lead, which is yearly obtained from all the Scotch mines, is not less than L.136,000.

The silver extracted from the lead is not equal on an average to ten ounces in each ton. Little more than thirty years ago, the inhabitants were ignorant of the method of extracting the silver, and for that purpose it

^a The great coal-field extends across the island in a south-west direction, from the coast of Fife and East Lothian, to that of Ayrshire. It is bounded on the north by a chain of trap mountains, including the Ochils, the Lennox Hills, and the ridge of hills extending from the Clyde opposite Dumbarton, along the east shore of the Frith, to Ardrossan. The south boundary extends along the northern base of the transition chain in the south of Scotland, through Ayrshire, Lanarkshire, Peebles-shire, Mid Lothian and East Lothian, nearly to St. Abb's Head in Berwickshire.—P.

^b Strontianite, Carbonate of Strontian—found in veins in gneiss, with galena, carbonate and sulphate of barytes and calcareous spar. In this mineral, Dr. Hope first discovered the new earth Strontites, in 1791.—P.

^c Williams' Mineral Kingdom.

^d Granite is extensively quarried near Aberdeen, both for home

consumption and exportation. Great quantities are shipped to London. There are very extensive quarries of excellent sandstone, near Edinburgh, with which all the new houses in that city are constructed.—P.

was sent to Holland. The work, however, is now done in the country, and nearly L.10,000 worth of silver are extracted by the Scotch from their lead mines. Although other metals are observed in the same country, and although some of them have been worked at different periods, they are not in a national point of view of much importance.

Granite, basalt, sandstone and other stones used for building are so common in most districts, that they are only valuable in the vicinity of ports or large towns.^d Slate is wrought on a great scale in the Hebrides, in Argyleshire and different counties.^e Lime is abundant, and it appears from the compendium of the statistical account that 12,000,000 bushels of slaked lime, worth more than L.350,000, are wrought in different places, particularly in the neighbourhood of the coal-works. Much marble might be obtained from the Hebrides,^f the western coast of Argyleshire, Sutherland and other parts of the country. But its value is diminished by the foreign substances with which it is mixed, and by the same cause the labour of working it is increased.

It is affirmed that the greater number of precious stones have been discovered in the mountainous districts of Scotland. The ruby, it has been said, is found in the counties of Fife, Banff, Inverness and Aberdeen, the emerald in the mountains of Cairngorm, the aqua-marine or precious beryl in Inverness-shire and the Orkney Islands, the sapphire in different parts of the Highlands, and the amethyst in Strathspey. Lastly, the topaz occurs in the same strath, in Cairngorm, and in the Isle of Arran, and the garnet is common in Aberdeenshire. Stones, to which the above names have been applied, are certainly found, and it is equally true that most of them are incorrectly designated. Thus, the ruby of Fifeshire and the other counties is a species of garnet; the emerald of Cairngorm and Strathspey, and the aqua-marine of the Orkneys, are varieties of precious beryl; the sapphire of the Highlands is a pale green coloured topaz; while the topaz of Cairngorm, the Isle of Arran, and other places, is rock crystal of different colours, such as brown, wine-yellow and orange-yellow.^g

Having entered into details concerning the climate of England, or rather Britain, it need only be observed that the difference in this respect between the two countries, may be explained by the more northern situation of the latter,^h by mountainous groups and other local causes. The difference, however, is by no means inconsiderable, and it is plainly exhibited in the phenomena of vegetation. The crops in Scotland are not reaped with the same certainty, and the expectations of the farmer are more frequently disappointed. Neither do the ordinary kinds of grain arrive at the same perfection; thus, al-

consumption and exportation. Great quantities are shipped to London. There are very extensive quarries of excellent sandstone, near Edinburgh, with which all the new houses in that city are constructed.—P.

^e Slates of an excellent quality are wrought to a very great extent, in the islands of Seil, Luin and Easdale, between the north point of Jura and Lorn; also in Glenco, and in the islands of Bute and Inch Marnoch. Slate is also wrought in various places along the southern border of the Grampians, from Loch Lomond to Blair-gowrie.—P.

^f The island of Tiree furnishes a beautiful green marble, in high estimation.—P.

^h Scotland.

though Scotch and English barley may be of the same weight, the former is not sold at so high a price; it contains less saccharine matter, and yields a less quantity of malt. Fruits, which ripen in the one country, seldom arrive at maturity in the other, and never in the same perfection; while different berries acquire somewhat of that delicious flavour which distinguishes them in still higher parallels. Independently, however, of the climate, communications are rendered difficult by the nature of the surface, and the labour of cultivating the land is necessarily increased. It is stated in the supplement of the Statistical Account, that "the total number of English acres in the kingdom, amounts to 18,944,000; of these 5,044,450 have been cultivated, leaving 13,900,550, (including 913,695 in woods and plantations), in an uncultivated state." Of that immense tract the elevation is in general so high, and the soil and subsoil so barren, that there are not probably above three millions of acres, which can ever be rendered arable. In round numbers, therefore, there are nineteen millions of acres in Scotland, of which five are in cultivation, three capable of being brought into it, about one in woods and plantations, and the remaining ten millions, or more than one-half of the entire surface, are doomed to remain in sterility.

Remains of antiquity may be discovered in almost every parish of the kingdom; mention has already been made of the Roman wall between the friths of Forth and Clyde; it is called in the country *Graham's dyke* from the first Scottish warrior, who is supposed to have crossed it. The remains of Roman camps are situated in the neighbourhood, and one of them is believed to have been the camp of Agricola.^a The conical towers that crown the lofty summits, and the subterranean dwellings attributed to the Picti,^b belong probably to the same epoch. It is uncertain whether the old towers, some of them round, others square, and all remarkable for the solidity of the cement by which they are united, were raised by the Romans, or by natives, whom the Romans instructed in the art of building; it has never, however, been doubted that they were erected at a very early period.^c Several monuments of Saxon architecture date from the ninth and tenth centuries, but the religious edifices and the old castles, which became asylums to the nobles during the civil wars, were mostly erected in the thirteenth and fourteenth.

Such are the relics of the three most obscure periods of Scottish history. It appears from the earliest historical researches that the original inhabitants of Scotland were Cimbri, who left the Cimbric Chersonesus or the present Denmark about two centuries before the Christian era. These tribes continued in possession of the country until the *Caledones*^d or *Picti*, whom Tacitus

^a The camp at Ardoch, the largest and most complete in Scotland, has been considered the camp which Agricola occupied, before his engagement with Galgacus. It is situated in the parish of Muthil, in Perthshire, between the Teith and the Erne, near the south foot of the Grampians.—P.

^b The Picti.

^c The lofty circular towers of Abernethy and Brechin, the only monuments of the kind in Scotland, have been attributed to the Picti. Abernethy was the capital of the Pictish kingdom. These monuments, however, stand in the churchyards, and may be compared with the detached belfries in Italy.—P.

^d *Caledones* or *Caledonii*. Tacitus does not use either of these terms, or that of *Picti*, but employs the expression "Caledoniam habitantes" (inhabitants of Caledonia), including them under the general term *Britanni*.—P.

includes among the Germans,^e sailed from Norway, and landed on the northern coasts; by these new settlers the Cimbri were driven into the southern districts of Scotland.^f The Picti became the ancestors of the inhabitants of the Lowlands, who have ever been distinguished from the people in the Highlands. It was about the year 258 that the Dalriads of the venerable Bede, or the Attacotti of Ammianus Marcellinus and the Roman writers, passed from Ireland to Argyleshire, and became the germ of the Highlanders, who speak the Irish or Celtic language, while the Lowlanders have always used the Scandinavian or Gothic.^g The country having been subdued by Agricola, the conquest was not preserved, but Caledonia continued a nominal province of Rome during 300 years. It was governed by the chiefs of different tribes, their peculiar customs were preserved, and that of painting the body was retained by the Picti.

The Cimbri and the Attacotti leagued against the Picti after the fall of the Roman empire, and in many a battle contended for sovereignty. An alliance was at last concluded by the chiefs of the opposite parties, but it was not before the year 843 that all the inhabitants submitted to Kenneth II. king of Scotland. The country during several reigns after this period, became the prey of Danes and Norwegians, but its independence was secured by the courage of the inhabitants. The northern part of the kingdom retained the name of Pictland until the beginning of the eleventh century; the southern was styled Valencia and Cumbria, names which recalled the period of the Roman domination. The vallies at the base of the Grampians were inhabited by the descendants of the Attacotti. These distinctions continued until the eleventh century, when the name of Scotia was applied by the Irish to modern Scotland. This new confusion of names must be attributed to the vanity or nationality of Hibernian clergy, then settled in Scotland, and then the sole instructors of the Scots. It has, however, been maintained that the Attacotti, who were an Irish tribe, gave the name of Scotia to Pictland or the country which they subdued. The fact appears very doubtful, and it is certain that the name was unknown and never used by the Irish and Saxon writers during three centuries after the event is said to have taken place.^h But the reign of Malcolm III. is not only remarkable in this respect, it forms the commencement of a period distinguished by greater cultivation or less barbarism and more authentic history. The extinction of the ancient line of kings in the person of Margaret of Norway, occasioned the arbitrary interposition of Edward I. of England, the origin of the enmity that afterwards prevailed between the two kingdoms. The English monarch, availing himself of the opportunity afforded by the death of Alexander the Third, destroyed the prin-

^e Tacitus simply observes that their German origin is proved by their red hair and large frames, contrasting them with the *Silures* of Wales, whose Iberian origin, he says, is rendered probable by their dark complexion, curled hair, and position opposite Spain. (Vit. Agr § 11.)—P.

^f "So far as historical researches can discover, the original population of Scotland consisted of Cimbri, from the Cimbric Chersonese. About two centuries before the Christian era, the Cimbri seem to have been driven to the south of Scotland by the Caledonians or Picti, a Gothic colony from Norway." (Pinkerton's Geog. vol. I. p. 94. 4to. London, 1811.)—P.

^g Pinkerton's Geography, vol. 1st, page 150.

^h Pinkerton. Idem. Ibid.

principal archives of Scotland, that he might lay claim to a sovereignty, which his predecessors had never possessed. John Baliol was decorated with the vain title of king, but he was forced to acknowledge his dependence, to submit to many indignities, and to appear six times before the English parliament. Such a policy, it was thought, might excite the king of the Scots to war, and lead to the forfeiture of his crown, and the event was not different from what had been anticipated. Baliol resisted humiliating concessions, and proclaimed the independence of his country. Edward, master of all the strong places, subdued a nation without the means of defence, led the king in captivity to London, and carried off the insignia of royalty, along with the famous stone of Inisfail,^a the palladium of Scottish freedom. The Scots were in vain roused against their oppressor by the brave Wallace; in so unequal a contest, the slight chance which the weaker party had of success, depended on their union, but they were divided into parties, and the patriot, betrayed and delivered to the sanguinary conqueror, suffered the last punishment. When too late, the Scots deplored that they had not conferred an authority on Wallace of which he was worthy; but the honour of avenging him was reserved for the celebrated Bruce, who having been proclaimed king in 1306, gained eight years afterwards the decisive battle of Bannockburn, by which the independence of Scotland was secured.

Anarchy and revolt became afterwards of frequent occurrence in Scotland. It was the object of James the First, an able prince, and of a refinement above that of his subjects, to extend the influence of the crown, and to improve the government of his kingdom by introducing institutions, which he had observed in England. To weaken the power of the nobles, the estates of some were seized on account of defects in their titles, while the lands of others were confiscated on account of alleged crimes. But this policy proved fatal to the monarch; the nobles united against him, an insurrection took place, and the king was slain. To humble the nobles was likewise the policy of his son James the Second, but his conduct was marked with greater ferocity, cruelty and perfidy. If he escaped the danger of a formidable rebellion, it was owing to the treachery of some, and the irresolution of others. Having improved the advantages, which follow from a subdued revolt, he was suddenly cut off by the bursting of a cannon at the siege of Roxburgh. The incapacity of his successor, James the Third, was evinced in the choice of low and worthless favourites; despised by his subjects, hated by the nobles, whom he oppressed, they entered into a conspiracy, and freed their country from a weak and wicked prince. Very different was the character of his successor, James the Fourth; if the father was satisfied with vulgar amusements or pleasure, to attain military glory was the great ambition of his chivalrous son. Generous and free from deccit, he confided in his nobles, gained their attachment, secured their fidelity, and lived

with them in that sort of intimacy, which was common in feudal times between a warlike leader and his vassals. The effects of his policy are remarkable, for it is admitted that the nobles suffered more during this reign from their devotedness and attachment than they had done on any former occasion from the jealousy or enmity of the crown. Lewis the Twelfth meditated an invasion of England; to facilitate his project, James made an incursion into the same country, and fell with the flower of his nobility on the field of Flodden.

James the Fifth alienated the affections of his people and nobles by favouring the pretensions of the clergy. But neither the king nor the clergy could compete against the haughty barons. Having incurred their resentment, he was unable to bear repeated disappointments, a degraded authority, and the more degrading spectacle of ten thousand Scotchmen laying down their arms to five hundred Englishmen.^b A fever brought on by grief terminated his days a week after his queen had given birth to the unfortunate Mary Stuart.

The religious reformation was the most important event in the succeeding reign,^c and one which formed the commencement of a new series of calamities that befell the house of Stuart. If the new system was of a more democratical tendency than could have been anticipated from the government, institutions and state of knowledge in Scotland, it arose from many causes, of which the following are perhaps the most obvious. The reformation took place at a comparatively late period; other countries were liberated from the Roman hierarchy before the new opinions and the excitement that prevailed, penetrated into Scotland. This effect, probably of a remote and isolated situation, was attended with important results; it gave rise to more exalted notions of purity, and to greater horror of abuses, and was the means of establishing the tenets of the Genevese theologian,^d the last and most exclusive of the reformers. In England the king was the leading reformer, and the new system was adapted to strengthen monarchy; for that purpose the ancient hierarchy was preserved. But in Scotland the change was more complete, and the actors were very different. The mother of Mary, and her uncles of the house of Guise, all rigid catholics, directing public affairs, and exerting their influence over the young queen, became the authors of the powerful and uniform opposition against the progress of the reformation. The enthusiasm of the people, inflamed by the obstacles against which they had to struggle, made them recede further from the ancient faith. However wild their zeal, however exalted their notions, their firmness is worthy of admiration, and their sufferings of compassion. It cannot be denied that the people were assisted in their great work by the nobles, although it need not be imagined that the latter were actuated by the same sincere motives. It appears that immediately before the reformation commenced, the secular and regular clergy possessed in tithes and land more than half the landed rent in the kingdom.^e It is well known that the clergy had

^a The fatal stone of Scone, inserted in the seat of a marble chair on which the Scottish kings sat at their coronation—still preserved in Westminster Abbey. This stone is said to have been originally placed in the seat of the kings of Munster at Cashel. *Inis-fail* is one of the old Gaelic names of Ireland.—P.

^b James had sent a body of 10,000 men into Cumberland, against the English. He had given a commission to Oliver Sinclair, one of

his favourites, to assume the chief command on entering England. Soon after crossing the Solway, he read his commission, which so dissatisfied the army, that they abandoned all discipline. In this state of disorder, they were suddenly attacked by five hundred English horse, when the Scotch took to flight, and although few were killed in the rout, great numbers were taken prisoners.—P.

^e Forbes on Tithes

been the favoured order during the reign of James the Fifth, and that they co-operated with the king in humbling the nobles. Animated by resentment as well as by avarice, the latter appropriated the wealth of their enemies; and, perhaps to gratify bad passions, became apparently as zealous in the new cause as the people, who embraced it from principle. Thus the new religion was more firmly settled in Scotland than in the sister kingdom; even the nobles became members of the General Assembly, the supreme ecclesiastical court; and when James the Sixth introduced afterwards a sort of episcopal government, they took care to prevent the restitution of the church lands; lastly, when, at a still later period, the measures of the unfortunate Charles menaced the subversion of the presbyterian system, the nobles took a principal part in forming that *solemn league and covenant*, in which the whole nation was enlisted against the monarch. In the long contest for religious liberty, begun in the reign of Mary, and not finally settled before the revolution, men submitted to all sorts of privation, even to tortures and death, rather than profess a faith which they abhorred. But, however great their energy in the cause of religion, the civil institutions of the Scots were not so favourable as those of England to freedom, knowledge or civilization.

The Scottish parliament, as far as it can be traced in the records of history, appears to have been composed of the greater barons or independent land-owners. Boroughs were probably represented before the time of Robert Bruce; at all events they were so during his reign. The character of the assembly, however, was not altered by this innovation; the towns were long insignificant, the number of their representatives was inconsiderable, they appeared only on extraordinary occasions, and the low state of commerce and the arts prevented them from weakening the influence of the rude and warlike barons.

A more important change was introduced by James the First, an accomplished and able prince, whose long captivity in England enabled him to observe the institutions of that country, and to confer a benefit on his kingdom. It was provided in his reign that the smaller vassals of the crown should be excused from personal attendance in parliament, on condition of their sending representatives, and maintaining them at the common expense. The poverty of the barons led them to consider this enactment an important immunity to themselves, and from the same cause, they seldom fulfilled the conditions which it imposed, in other words, they either neglected to send representatives, or having sent them, refused to defray their expenses. The statute does not appear to have been made imperative before the reign of James the Sixth. But although an imitation of the English plan was thus introduced into Scotland, they differed from each other in some important particulars. Thus, in the one country, all who held lands of a certain value, under the crown or under a subject, even all who enjoyed liferents to the same amount, were entitled to elect representatives for counties. But in Scotland, the elective franchise was confined to the immediate vassals of the crown, or the tenants *in capite*, while the other proprietors, or those who held their lands by a different tenure, whatever might have been the extent or value of their estates, were necessarily excluded. Other differ-

ences in the parliaments of the two kingdoms were not less remarkable. The members of the lower house in England, the knights of shires and burgesses, formed a numerous body, invested with no ordinary powers, enjoying valuable privileges, and representing distinct but important interests; by such means a barrier was raised against the encroachments of a feudal nobility. But in Scotland there were no knights of shires, and the burgesses, forming only a small proportion of the whole, sat and voted in the same house. This confusion of different orders, whose powers ought to have been as distinct as their interests, this assembly of nobles, ecclesiastics and burgesses under the same roof, modified in no slight degree the character of the government. The burgesses never asserted their rights, or never acted in opposition to the aristocracy; on the contrary, enactments were passed at different periods, by which their dependence was established. Thus, it was ordained in the reign of James the Third that the old council shall elect the new, and that the old and new council jointly shall elect the officers of the borough. The effect of this law was to render the town-councils, or municipal authorities, the creatures of a noble, whose lands lay in the vicinity. It is true that after the union of the two crowns, the power which had been thus acquired was gradually transferred from the aristocracy to the sovereigns of the house of Stuart, and accordingly it is said in the Claim of Rights, that "the abdicated family had subverted the rights of the royal boroughs, by imposing upon them the magistrates, the town-council and the clerks and the other officers, contrary to their liberties and express statutes." Thus at one period, the town-councils were subservient to the aristocracy, and at another to the crown, and so long as the laws which were enacted to mould them to such purposes, continued in force, the representation of Scotland, so far as the inhabitants of towns or burghs were concerned, was rendered illusory.

The custom of committing the whole business of parliament to a few members, a custom unknown in every period of English history, proved equally detrimental to free institutions. In the year 1367, a parliament having assembled at Scone, a committee was appointed by the three estates; full powers were conferred on it, and the other members returned home on account of the late period of the season. The same precedent was followed in the succeeding year, and if any cause or pretext was alleged in favour of such an innovation, it does not appear to have been mentioned. The powers of the committee were first modified in the year 1369; but even then it was appointed to determine all matters that should be treated in parliament, and to put them into "a fit shape" for the decision of the three estates on the last day but one of the session. It happened frequently in the subsequent period of Scottish history that the three estates never met, and consequently the whole business of parliament was transferred to a committee, of which the members were distinguished by the name of Lords of the Articles.

It is not difficult to discover the causes that gave rise to so important a change. The rude barons were as impatient of the restraints of a parliamentary attendance as they were ill-qualified for the duties which it imposes. And it was undoubtedly to dispense with personal attendance, which they considered a hardship, that the

whole business of parliament was arranged in such a manner as to require nothing more than their assent or dissent. The effect of the change, it may be naturally supposed, was to weaken the aristocracy. The Lords of the Articles were generally chosen from the nobles of the court, or the ministers of the crown; and by such means the kings of Scotland eluded many subjects of discussion, that it was their interest to keep in the shade, and carried measures that could only have been passed by a Parliament, in which the members were ignorant or neglectful of their duties.

The Scottish Parliament was composed, after the union of the crowns, of the nobility, the bishops, the knights of shires and the burgesses. But in Scotland the great officers of state sat in Parliament in virtue of their office, not by right of representation—a practice never resorted to in England. In the same period, successive changes were introduced in the mode of appointing the Lords of the Articles, and the end of all of them was to render that committee more effectual in controlling Parliament. The accuracy of the last remark is obvious from the following facts: James the Sixth obtained an act of the legislature, ordaining that before the meeting of Parliament, four persons should be named out of each estate as a committee to consider previously, and to determine the business to be laid before the house; and as this committee was nominated by the king, he might indirectly exclude from the consideration of Parliament the measures he opposed. But as this indirect method was irksome to his successor, the appointment of the Lords of the Articles was brought directly under the guidance of the crown. According to an act passed in the reign of Charles the First, the peers were empowered to choose eight bishops, the bishops eight peers, and those sixteen persons to elect eight knights of shires, and eight burgesses, to whom were added the officers of state. The bishops were, during this period, uniformly in the interest of the crown. From the ordinary state of the peerage, they might always elect one or two peers in the same interest; a majority of the sixteen, and consequently of the whole committee, became thus necessarily the adherents of the prerogative.^a

It is unnecessary to enter into details, or to describe the calamitous period between the union of the crowns, and that of the kingdoms in 1707,^b an event fortunate for both nations, and one by which the subsequent history of Scotland was merged into that of Britain. But while an end was put to the committee of the Lords of the Articles at the Revolution, another, perhaps a greater evil was allowed to continue long after the union. The heritable jurisdictions were not abolished in Scotland before the year 1755.^c They were exercised according to the genius of the feudal system by territorial proprietors under royal charter or prescription, and their authority was so vague or so great, that they could fre-

quently set at defiance the highest tribunals of the land. Their abolition cannot be attributed to the necessity of any improvement in the administration of justice, to a more advanced state of knowledge, or more liberal opinions among the people, or to increased wealth and commercial importance. Scotland might have retained still longer its hereditary judges, had not the danger of their influence been acknowledged in the rebellion of 1745. To prevent the recurrence of such scenes, heritable jurisdictions were annulled, and the consequence was to establish the peace of the country, and to lay the foundations of its subsequent prosperity.

The lords, who possessed these jurisdictions or regalities, as they were called, could recall any of their vassals who were summoned before another court, and judge them for capital offences. The regular tribunals were thus necessarily limited both in the degree of their authority, and in the extent of country over which they reached. The kings had their *aula*, and in some cases supreme authority was committed to it; their bailiffs administered justice within the royal domains, and sheriffs in the counties, if their authority was not excluded by grants of regality. An appeal might be brought from the baron's court to that of the sheriff, and from the last to the parliament. This appellate jurisdiction was transferred in 1532 to the Court of Session,^d which was then established, and consisted at first of fifteen judges,^e of whom seven besides the president were churchmen. Two innovations happened much about the same time; the use of juries in civil cases was discontinued, and many principles of the Roman law were adopted. Hence the laws of Scotland and England are in many respects different; but the use of juries has lately been introduced in civil cases, and other improvements have been at different times effected. The Court of Session still styles itself a supreme court, although its decisions may be reversed by the upper house of the British parliament.

The Justiciary Court consists of five judges, who are likewise Lords of Session.^f It is the highest tribunal in criminal cases, which are determined by the majority of a jury, and not by unanimity as in England. The sheriff-courts are unknown in the sister kingdom, but all the advantages which such institutions might afford, have not been experienced in Scotland, because the judges do not reside within the limits of their jurisdiction, and the business of their courts may be committed to substitutes. The expense of administering justice to the middling and the poorer classes is thus necessarily increased.

The Presbyterian religion was finally established in Scotland at the revolution of 1688. The ecclesiastical divisions are parishes, presbyteries and synods; several parishes form a presbytery, and the synods are made up of contiguous presbyteries. There are 941 parishes, 69 presbyteries, and 15 synods.^g The presbyteries and

^d The Court of Session was established in the place of two other

courts, viz. the Daily Council and the Session, by a statute in 1537. (Ed. Enc.)—P.

^e The judges are now, as at first, fifteen in number. (Ed. Enc.) This includes the Lord President and the Lord Justice Clerk.—The court is familiarly called by the Scotch, the Fifteen.—P.

^f The High Court of Justiciary consists of six judges, who are also Lords of Session, the Lord Justice Clerk presiding. It has a nominal head, the Lord Justice General, who however never presides (Ed. Enc.)—P.

^g 893 parishes; 78 presbyteries; 15 synods; 938 clergymen. (Sir

synods are ecclesiastical tribunals subordinate to the General Assembly, which meets every year in the month of May, the king appointing a commissioner as his representative, and the members nominating their moderator as president. Laymen are admitted into this venerable council under the name of ruling elders, and their number is nearly equal to a third part of the members. The Scottish clergy are men of moderate incomes, without the great revenues of the English priesthood, and on that account better qualified for the duties of their sacred office. Eminent names both in literature and philosophy might be found in their ranks, and of their information as a body, they have left a creditable monument in the statistical account of their country.^a The Scottish church is superior in other respects to the English; pluralities are unlawful, and the minister must reside within the limits of his parish. It is of little consequence whether episcopacy be or be not of apostolic origin; the name is certainly preserved in England, but the Scottish plan is more accordant with the spirit of Christian institutions. Accordingly the number of sectarians is comparatively small; the Methodists, the most important sect that has appeared in modern times in England, have not made a great impression in Scotland. The prejudices of the people, it is true, are not in favour of Arminianism; still the repeated and unsuccessful attempts of the followers of Wesley cannot be solely attributed to that cause, but partly to the greater vigilance and usefulness of the clergy.

The mode of education is still more admirable, and the diffusion of knowledge among the lower orders affords the best proof of its excellence; in no other country is the plan of tuition attended with so many practical advantages. The nature of the system is not to be discovered in the towns; in these places the youth are educated as in England, in private or public schools and in colleges; the fitness of the plan for the wants of the people can only be observed in the country. A schoolmaster is as necessary as a clergyman to a parish; a salary is attached to the office, and indigent persons are thus enabled to give their sons an education at a small expense, and there are few poor parents in Scotland who do not send their children to school. If the Scotch have long been ranked among the best informed people of Europe, it is owing to their parochial schools, and as, in the present day, much is done for the diffusion of knowledge, a similar or modified plan ought perhaps to be introduced into the remote districts of England. The expenses attending it are not great; at all events, the public money has seldom been laid out with the reasonable expectation of so much advantage.

The occupations of commerce and industry were long incompatible with the unsettled government of the Scots, and accordingly the useful arts were cultivated in England while they were unknown in Scotland. The present

state of the arts in the latter country affords the best proof of the rapid advances that have been made since the latter part of the eighteenth century. The same people that languished under a feudal aristocracy, too haughty to be restrained by law, or under kings who weakened the nobles for the purpose of appropriating their ill-gotten power, have overcome difficulties arising from an unfavourable climate, an insulated situation, and an unproductive and mountainous surface. However much may be attributed to the impulse given by England, the Scotch could never have made such advances in the same course without free institutions; and the past indolence and present industry of the inhabitants, their past poverty and present wealth, are not more widely different than the past and present government of the country. One or two statistical results may place the foregoing conclusion in a remarkable point of view. A considerable time after the calamitous period of Scottish history, even so lately as the commencement of the eighteenth century, the population of Scotland did not exceed 1,048,000; by the present census it amounts to 2,365,807. Within the same period many parts of Scotland have been rendered more than doubly productive, while other departments of industry have increased in a much greater proportion. Thus, the revenue after the union of the two kingdoms in 1707 was not more than L.160,000; at present it is greater than L.4,000,000. It might be shown from these and similar results, that the means of subsistence are now supplied in greater plenty to the numerous inhabitants than formerly to the scanty population of Scotland. And this fact enables us to detect much exaggeration and many errors in the popular opinion concerning the present poverty and wretchedness of the lower orders.

The commercial prosperity of the country, and the consequent diffusion of wealth among the people, are the more remarkable, considering the long degraded state of parliamentary representation. It has been shown how much the population and the public revenue have increased since the union, the one being now more than double, and the other nearly a hundred times greater;^b but from the same period to the present time, the number of members has been limited to forty-five, one more than the number formerly returned by the single county of Cornwall. The electors did not exceed 3000, and of these more than a half enjoyed the privilege from rights of superiority,^c not from any property in the soil. The Scotch members representing their electors, devoting themselves to their interest, and not to that of the people, were almost proverbially distinguished by want of independence. It is unnecessary to allude further to the subject; the old system is now abolished, civil liberty is extended to Scotland, and the people return their representatives.

J. Sinclair's General Report of Scotland, 1814, vol. 1. p. 19—20.)—910 parishes; 940 clergymen; 78 presbyteries; 15 synods. (Ed. Enc. art. Scotland, 1829.)—903 parishes; 972 ministers; 55 chapels of ease; 33 chapels in the Highlands depending on the royal bounty; 7 chapels depending on the Society for propagating Christian Knowledge; 40 chapels recently granted by parliament. These chapels are all connected with the established church. (Bell's Geog. vol. I. p. 200. 1832.)—P.

^c A *superiority* was a nominal title to land, which, without any property in the soil, conferred the right of suffrage. Superiorities were abolished by the reform bill.—P.

BOOK CLVI.

EUROPE.

Europe Continued.—Scotland.—Section Second.—Civil Divisions.—Topographical Details.

SCOTLAND, like England and Wales, is civilly divided into counties, and the number is equal to thirty-three. They may perhaps be most aptly classed under the northern, central and southern divisions, at least these correspond in some degree with the distinctive features of the country. The northern are those of Orkney, Caithness, Sutherland, Ross, Cromarty, and Inverness; the central or midland are those of Argyle, Bute, Nairn, Murray or Elgin, Banff, Aberdeen, Mearns or Kincardine, Angus or Forfar, Perth, Fife, Kinross, Clackmannan, Stirling and Dumbarton; lastly, the southern division is made up of those of Linlithgow or West Lothian, Edinburgh or Mid Lothian, Haddington or East Lothian, Berwick, Roxburgh, Selkirk, Peebles, Dumfries, Lanark, Renfrew, Ayr, Wigton and Kirkcudbright. It appears from the last census^a that the mean population of each county is 71,691 inhabitants, and the relative population to the surface is 78 to the square mile. The superficial extent is considerably greater than the half of England, and the number of inhabitants is little more than a sixth part,^b but the result, if the barren and rugged surface be taken into consideration, indicates sufficiently the improved state of the country.

In the chorographical account of Scotland, it may be as well to begin at that part of it nearest the Welsh coast, the one that has been last described. The small town of Wigton, which may be seen on entering the Solway Frith, stands on the declivity of a hill at the bottom of the bay of Wigton. Although a chief town, it is not a place of any importance. It gives its name to a maritime county at the south-west extremity of Scotland, washed by the Irish Sea on the south and west,^c and contiguous to Kirkcudbright on the east, and to Ayrshire on the north. The extent of Wigtonshire is probably equal to 485 square miles, and not more than a third part of the

surface is cultivated. The heights on the north rise 1100 feet above the level of the sea;^d the rest of the land consists mostly of low, broken and undulating hills, detached rocks and extensive moors. The manufactures are few or of little value, and the trade is confined to the export of raw produce, and the import of coal, lime and other articles required for consumption. It appears, however, that the relative population is more than 75 to the square mile, consequently that it is very little below the mean term. It may be further observed that the county is of an irregular form, deeply indented by bays and inlets. It has been divided into the three districts of Wigton, Whithorn and Stranraer,^e according to the situation of its towns. The first or the eastern division is watered by the Cree and several streams that descend from the heights of Carrick. The second or the south-eastern is of a triangular form, watered by the bays of Wigton and Glenluce, and terminating towards the south in the promontory of Burrowhead.^f The district of Stranraer^g or the Rhinns of Galloway extends nine miles from north to south,^h and is almost separated from the rest of the county by the bay of Loch Ryan. The Mull of Galloway and Fairland Point are the southern and northern extremities of this detached portion. Lastly, Port-Patrick, which is concealed from the rest of the shire by the Mull of Galloway,ⁱ is the nearest point between Britain and Ireland. The harbor was formerly small and inconvenient; it now possesses a reflecting light-house, and one of the finest quays in Britain.

Wigtonshire forms the western district of the ancient province of Galloway;^k the eastern is comprehended in the stewartry of Kirkcudbright. The western district or the county is not remarkable for the altitude of its mountains, or the size of its rivers; but the heights which divide the stewartry from Ayrshire, are little inferior in elevation to any in the south of Scot-

^a Of 1831.

^b The superficial extent of England and Wales is 57,960 sq. miles (that of Wales alone, 7,425); that of Scotland, 29,871 sq. miles. (Bell's Geog.)—The population of England and Wales in 1831, was 13,894,574 (that of Wales, 805,236); that of Scotland, 2,365,807. (Stat. Tab.)—P.

^c On the west by the narrow entrance into the Irish Sea on the north, called the North Channel.—P.

^d Laig Fell, in the north-eastern corner, whence it extends north-east between Kirkcudbright and Ayrshires, rises 1758 feet.—P.

^e It is divided into three districts, viz. the Rhyns (peninsula,) west of a line drawn between Luce Bay and Loch Ryan; the Machers (flat country,) between Wigton and Luce Bays; and the Moors, which include the remainder, being more than the half of the county. (Ed. Enc.)—These districts correspond, in a reverse order, to those in the text.—P.

^f Called also Burgh Head and Borough Head.—P.

^g The town of Stranraer, the largest in the county, stands in a plain at the head of Loch Ryan.—P.

^h The Rhinns extend at least 30 miles from north to south, from Kirkcolm Point, at the entrance of Loch Ryan, to the Mull of Galloway. The isthmus between Loch Ryan and Luce Bay is about nine miles in width.—P.

ⁱ This is certainly a very strange expression. Port-Patrick is situated on the western coast of the Rhinns, south-west of Stranraer, on the shore of the North Channel, nearly opposite Donaghadee, in Ireland, to which place is a line of mail packets. It has a south-western exposure, being surrounded in other directions by a chain of low hills. In order to arrive at it by sea, from the eastern part of the county, it is necessary to sail round the Mull of Galloway.—P.

^k It is sometimes called West Galloway, or the shire of Galloway; the stewartry of Kirkcudbright being called East Galloway. Galloway, including these two counties, was an independent principality previous to the 13th century, governed by its own lords or princes.—P.

land.^a They extend along the northern boundary, and form a sort of amphitheatre, which occupies more than the half of it. Viewed from these lofty mountains, the rest of Kirkcudbrightshire appears like a plain; it must not, however, be imagined that it is destitute of hills; those on the south near the sea, although not comparable to the northern, are by no means inconsiderable. Rising in some places above the margin of the waters, they exhibit a variety of forms, and contribute to the beauty or grandeur of the scenery. It may be inferred from the nature of the country that the quantity of arable or productive land is small, and this conjecture is confirmed by the relation of the population to the surface, for the county consists of 882 square miles, and the number of inhabitants is not more than forty-six to the square mile.

Much of the mountainous tract consists of granite, and according to the agricultural survey, there are three separate districts of granite, which cover nearly a fourth part of the surface.^b Different strata of schistus are common in the lower parts, and with these are mixed layers of a soft, argillaceous stone, which yields readily to the weather, and is popularly known by the name of slate-land. Limestone is found at Kirkbean on the Nith, the only place in the county, where it is worked. Iron ore, although very common, is rendered of little value from the want of coal or fuel. Lead mines were formerly wrought in Minnigaff, and copper, which was lately discovered near Gatehouse, is now worked by an English company.

The Dee, the principal river, enters Loch Ken,^c a lake almost in the centre of the county, about eight miles in length, and in some places more than one in breadth. The river falls into the Solway Frith about six miles below the town of Kirkcudbright, and it is navigable two miles above it for vessels of 200 tons. Kirkcudbright, the county town, although by no means populous, may be mentioned on account of its pleasant situation on the Dee, and also on account of its commodious port. In ordinary spring-tides the depth of the water is 30 feet, and it is never less than 18 during the lowest tides;^d the harbour besides is safe and well sheltered, and there is good anchorage at its mouth. Societies have been formed for the purpose of supplying the members with houses.^e Each individual makes a small monthly payment into a general fund, which is employed in erecting houses, and these, as they are finished, are assigned to the contributors by lot; those who obtain them, pay, in addition to their monthly contributions, five per cent. on the

^a Larg Fell has been already mentioned (note ^d, p. 1252.) The highest summits in the county are found in the granite ridges which pervade it. Criffel forms a detached group in the south-east, on the west of the Nith, near its mouth, the highest summit of which is 2044 feet in height. The granite ridge of Cairnsmuir commences between the Fleet and the Dee, and extends north, parallel to the Ken, to the northern border of the county. It forms two groups, divided by the Dee. The southern, on the Fleet, rises to the height of 2329 feet; the northern, on the Deugh, a branch of the Ken, to that of 2597 feet.—P.

^b The mountain of Criffel forms the centre of the first of these tracts of granite; the two others occur in the ridge of Cairnsmuir, the one on the south and the other on the north of the Dee.—P.

^c The river Ken flows south into the head of the lake, and the Dee enters the lake on the western side. The river that flows from the lake is also called the Dee. That part of the lake below the entrance of the Dee, is sometimes called Loch Dee.—P.

^d Opposite the town, the depth is 8 feet at low water, and 23 at high water; the rise being 20 feet. In the road, at the mouth of the river, there is 16 feet at low water, and 40 at high water; rise 24 feet. (Stat. Acc. vol. xi. p. 11—12)—P.

money laid out in building their houses; and this arrangement continues until habitations have been provided for all the members.

The county of Dumfries, contiguous to Kirkcudbrightshire on the west, and to the Solway Frith on the south, covers an area of more than 1006 square miles. It was anciently divided into the three divisions of Annandale, Eskdale and Nithsdale,^f so called from the rivers that water it, and each of them was under a separate jurisdiction. Surrounded on the north, the east and the west by the mountainous ranges,^g that have been already indicated, the county has for the most part a southern exposure, and the climate, although moist, is mild and salubrious.

The Nith, after entering the county from Ayrshire, traverses it in a south-east direction more than forty miles, and passing the town of Dumfries, falls into the Solway Frith. The Annan or central river rises from the mountains on the north, near the confines of Lanarkshire,^h and near the sources of the Clyde and the Tweed, flows southwards through Moffat, and discharges itself into the Solway Frith below Annan. The Eskⁱ issues from the borders of Selkirkshire, and enters the same frith below Langtown,^k after a course of forty miles. Of the numerous lakes, Loch Skeen is not the least remarkable; it is situated more than 1300 feet above the level of the sea, and it supplies the waters of the *Gray Mare's Tail*, a romantic and well known cascade.

The same county is important on account of its minerals; the lead mines have been already mentioned,^l and it may be added that the miners are distinguished by their knowledge and good conduct. The workmen of Wanlockhead set apart a portion of their earnings for the purchase of books, and they are already in possession of an useful library. May the same practice now so common in Britain, be introduced into France; may the higher orders promote the diffusion of knowledge, and by so doing, guard the working classes against idleness and grovelling pleasures, elevate their character, render them more useful citizens, and contribute to their happiness and enjoyments. The other minerals are antimony, manganese, coal in small quantities, sandstone, iron, limestone, marble and slate.^m The only coal fit to be wrought is situated at the two extremities of the county, namely, at Sanquhar on the north-west, and Canobie on the south-east; the principal supply, therefore, is obtained from Lanarkshire, Ayrshire and England. Mineral springs are not uncommon in the county, but none are more frequented than the two at Moffat, of which the one

^e House Societies.

^f The sheriffdom of Nithsdale, the stewartry of Annandale, and the regality of Eskdale—all now under the jurisdiction of the sheriff-depute of Dumfries-shire. (Ed. Enc.)—P.

^g Properly, on the north-west, north and north-east, separating it from the counties of Ayr, Lanark, Peebles, Selkirk and Roxburgh. On the western border, which is partly formed by the Nith, near its mouth, there is no prominent range of mountains.—P.

^h It rises in the Hartfell mountains, near the point, where the shires of Dumfries, Lanark and Peebles meet.—P.

ⁱ Esk, a name common to several rivers in Scotland, as well as Exe (Lat. *Isca*) in England, and Usk in Wales, is doubtless the Gaelic, *uisge water*—the smaller rivers in Scotland being still called *waters*.—P.

^k Longtown, in Cumberland.—The Esk enters the head of the Solway.—P.

^l p. 1246.—Leadhills is in Lanarkshire, and Wanlockhead in Dumfries-shire; both in the ridge dividing the two counties, and separating the waters of the Clyde and Nith.—P.

is sulphureous and the other a chalybeate. The surface is very irregular, a great part of it is mountainous, and much of the land is barren or covered with heath. Of the forty-two parishes into which the whole is divided, seven are considered maritime, eighteen midland, and seventeen mountainous; the last occupy more than a half of the county. The number of churches or parishes appears more than sufficient, but the population is not so scanty as might be inferred from the nature of the country. In relation to the surface, it is equal to more than seventy-three persons to the square mile, or nearly to the mean number throughout Scotland. No branch of the arts or manufactures is conducted on a great scale, except the smelting of lead ore. The principal exports are lead, cattle, wool, grain and potatoes, and the imports are coal, iron, timber and wine.

Dumfries, the county town, is pleasantly situated on a rising ground on the east of the Nith, about nine miles from its influx into the Solway Frith. It was formerly a place of considerable importance, and it still bears unequivocal marks of antiquity. Thus, although one of its bridges is comparatively of modern construction,^a another at no great distance from it, is supposed to have been built by the mother of John Baliol, king of Scotland.^b Although the town was more than once burned by the English, and often exposed to depredations, while England and Scotland were under distinct governments, the inhabitants were so indignant against the articles of the union, that they burned them with great solemnity in the market place in 1706. The port of Dumfries extends from Southwick in the parish of Colvend in the stewartry of Kirkcudbright, along the Solway Frith to the border stream of Sark, and by this means nearly all the exports and imports of the county by sea are conveyed to the town.^c The public buildings are a town-house built in 1706, and a county jail and court house, which were lately finished. The wall of Adrian terminated near the small burgh of Annan,^d which is supposed to have been a Roman station; at all events, the remains of Roman camps, and other antiquities, have been discovered in the neighbourhood.

The county of Roxburgh, situated at the south-eastern extremity of the kingdom,^e is remarkable for the rivers and numerous streams with which it is watered, for its pastoral beauty and romantic sites. The boundaries are very irregular; it is partly separated from Berwickshire by the Tweed;^f it is contiguous to Selkirkshire and Dumfries-shire on the west and south-west, and to

Cumberland and Northumberland on the south-east and east. A small portion between Berwickshire and Selkirkshire is adjacent to Mid Lothian; it terminates almost in a point between Dumfries-shire and Cumberland; it surrounds different parts of Selkirkshire in some places, and cuts deeply into it in others. In superficial extent it is equal to 715 square miles, and the relation between the surface and population is less than sixty-five persons to the square mile, consequently the number is considerably smaller than in Dumfries-shire.

Few counties are better supplied with rivers and numerous streams. The Tweed passes from Selkirkshire into the north-western part of Roxburghshire, and leaves it below Redden on the north-east. The Teviot rises and joins the Tweed within the limits of the county; it has its source in the south-west, near the confines of Dumfries-shire, and flowing in a north-east direction, falls into the Tweed a short way above the town of Kelso. The feeders of the Teviot are the Allen,^g the Slett-^hrick, the Rule, the Jed, the Oxnam and the Kaleⁱ from the south, and the Borthwick and the Ale from the north and west. The other tributaries of the Tweed are the Etterick,^k which joins it on the south-west as it enters the county, a second Allen and the Leader,^l which flow from the north, and the Eden, which after an easterly course, enters the same river^m near its egress from Roxburghshire. Thus the Tweed receives almost all the waters of the county; the principal exceptions are the Liddel,ⁿ which gives its name to the tract of Liddesdale,^o and the Beaumont^p which rises from the Cheviots and enters Northumberland. These streams and rivers, it may be repeated, contribute greatly to the beauty of the country, heightening the charms of the romantic and pastoral districts, and adorning the luxuriant and fertile lands.

The most remarkable heights form part of the Cheviot range, and they are chiefly composed of whinstone. A sandy loam is the prevailing soil in the arable land and on many of the hills. A barren or a clayey soil occupies a considerable tract on the north-west. Moss, marsh and heath occur in the south-west and in other directions. The light soil, it may be readily inferred, is well adapted for turnips, and the field culture of that useful plant was first introduced into Scotland in 1753, by Mr. Dawson, an intelligent farmer of Roxburghshire, who had previously observed the advantages which attended it in different parts of England.^q The want of minerals has hitherto retarded the cultivation of the soil;

^a Begun 1792; completed 1795—crossing the river a little way above the old bridge.—P.

^b Dervorgilla, daughter of Allan, the last lord of Galloway.—It was built in the 13th century, for the accommodation of the Franciscan convent founded by her in Dumfries.—Within the above limits, vessels receive and discharge their cargoes only in the Nith below Dumfries and at Annan. At the latter place only a small share of business is done. (Stat. Acc. v. 125.)—P.

^c This is the extent of the revenue port, under the jurisdiction of the collector of Dumfries, but it is not necessary that all imports should be made at Dumfries.—Within the above limits, vessels receive and discharge their cargoes only in the Nith below Dumfries and at Annan. At the latter place only a small share of business is done. (Stat. Acc. v. 125.)—P.

^d The wall of Adrian terminated on the opposite side of the Solway, at Boulness in Cumberland.—P.

^e The south-eastern extremity of the kingdom, on the coast, is in Berwickshire.—P.

^f It is bounded on the north by Berwickshire, but the boundary line is very irregularly indented. The Tweed crosses the county near its northern border, nearly from west to east, and in two places, viz. near the middle and at the eastern extremity, forms the northern boundary.—P.

^g Allan.

ⁱ The Kail Water.

^m On the north, near the village of Edenham or Ednam, the birth place of Thomson.—P.

^o Liddisdale.—This tract lies on the south side of the ridge extending eastwardly from the Hartfell to the Cheviot, and separating the waters of the Teviot from those that flow south into the Solway. The Liddel rises near the Tyne, on the borders of Northumberland, flows south-west, and after receiving the Hermitage, the Kershope and many other small streams, leaves the county at its southern point, and then forms the boundary for a few miles between Dumfries-shire and Cumberland, till it meets the Esk.—P.

^p Beaumont. It first flows north, and then bending east into England, joins the Till, a branch of the Tweed.—P.

^q Mr. Craik of Arbigland, in Dumfries-shire, is said to have first cultivated drilled turnips in Scotland, about 1745. About 1755, Mr. Pringle, near Coldstream, in Berwickshire, commenced the culture of drilled turnips. Wm. Dawson Esq. of Graden, in Roxburghshire, adopted Mr. Pringle's method, in preference to that which he had observed in Norfolk, and in 1764, began the drilled turnip husbandry on a large scale. (Sir J. Sinclair's Gen. Rep. i. 553-4.)—P.

coal and lime are still imported from Northumberland,^a and the principal agricultural wealth consists not in corn or grain, but in oxen and sheep.

The county is divided, for the purposes of justice and police, into the districts of Kelso and Jedburgh on the east, and Melrose and Hawick on the west. Kelso, the chief town in the first of these districts, is pleasantly situated on the north side of the Tweed, opposite the junction of the Teviot.^b The river is crossed by a modern bridge of five arches, equal in elegance and solidity to any other work of the same sort in Scotland. In former times, Kelso was the seat of an abbey, a great part of which still remains. It was founded by David the First in 1128; much land was afterwards annexed to it, which on the forfeiture of the Earl of Bothwell, the admiral of Scotland, was made over by James the Sixth to Sir Robert Ker of Cessford, the founder of the Roxburgh family. Jedburgh, the capital of the county, is about eleven miles to the west of Kelso. It is more populous and more worthy of notice from its industry. The manufactures consist of stockings, flannels and narrow cloths, and many of the inhabitants are employed in tanning leather. Like Kelso, it possessed a large abbey, which has been partly transformed into a parish church. The celebrity of Melrose depends not on the number or industry of its inhabitants, but on one of the finest Gothic ruins in Scotland. Melrose abbey was founded in 1136 by King David, who consecrated it to the virgin, and endowed it with extensive privileges and a great revenue. It became the principal residence of the Cisterians, and the capital, if it may be so termed, of that order in Scotland. It is built in the form of a St. John's cross, and the present dimensions of the ruins are 258 feet in length, 137 in breadth, and 943 in circumference. Hawick, situated at the confluence of the Slitridge and the Teviot, is a place of greater importance; leather, worsted, carpets, stockings and inkle are the principal manufactures. Lastly, the small town of Galashiels is not more than four miles north-east from Melrose; being divided into two parts by the Tweed, it is situated partly in Selkirkshire and partly in Roxburghshire.^c It was formerly an obscure village, but has now become flourishing from the industry of its inhabitants. The only manufacture at no very distant period consisted of coarse cloth, worn by the peasantry, and known by the name of *Galashiels greys*; but within these few years, fine broad cloths have been made, and a hall, similar to those in the manufacturing towns of England, has been opened for the sale of them. It carries on besides a considerable trade in flannels and

different stuffs, and it is now the principal seat of the woollen manufactures in the south-east of Scotland. Such are the principal towns in Roxburghshire, and in the account of them, notice has been taken of different religious edifices; but it may also be remarked that many parts of the same county are adorned with the ruins of castles, towers and baronial residences, erected for the purposes of security or defence in an age when the inhabitants were exposed to frequent depredations from their vicinity to England.

The county of Selkirk is contiguous to Mid Lothian on the north, Roxburghshire on the east and south-east, Dumfriesshire on the south, and Peeblesshire or Tweeddale on the west. But all the boundaries, except the one on the south, are so irregular that it is difficult to determine the area. It is not, however, more than 269 square miles; it is divided into two entire parishes, and seven others are partly situated in Selkirkshire, and partly in the adjoining counties.^d According to the last returns, the absolute population amounts to 6833 individuals, and consequently the relative is not more than twenty-five to the square mile. The nature of the country may be inferred from the last statement; it is almost wholly a pastoral district; it resembles the more lofty and barren part of Roxburghshire, but the heights reach to a greater elevation, and the vallies are more contracted. The general declivity is, as in the last county, towards the north and north-east, where all the streams discharge themselves into the Tweed. Of these the principal are the Ettrick and the Yarrow,^e both of which water a romantic country, and both are celebrated in song. The Yarrow passes through two lakes, the Loch of the Lows and St. Mary's Loch; the latter, perhaps the finest in the south-east of Scotland, is separated from the other by a narrow neck of land. The county is destitute of coal, sandstone and limestone; shell-marle is common in the mosses and in the beds of the lakes, and it is used as a manure. It may be further observed that the cultivated land, which is by no means rich, does not exceed a twentieth part of the uncultivated.

Selkirk, the county town, is the only place that requires to be mentioned. It is situated on a rising ground below the confluence of the Yarrow and the Ettrick, near the borders of Roxburghshire, and it is more remarkable for its antiquity than its manufactures. A hundred townsmen, it is related, followed James the Fourth from Selkirk to the field of Flodden, and none of them returned.^f At a later period, in the year 1645, the Marquis of Montrose, until then victorious, was first

^a Coal has been opened on Carter Fell, a hill on the border of Northumberland, and also near the south point of Liddisdale; but nearly all the coal used in the county is imported—in the west, from Dumfriesshire and the Lothians, and in the east, from Northumberland. Limestone is found in Liddisdale and on the southern border, but from the want of coal little is burnt. (Ed. Enc.)—P.

^b Kelso extends about half a mile along the Tweed, which is joined by the Teviot opposite the west end of the town. The bridge is over the Tweed. (Ed. Enc.)—P.

^c Galashiels is situated to the west of Melrose, higher up the Tweed. The parish is divided by the Tweed into two parts; the northern in Selkirkshire; the southern in Roxburghshire. The town of Galashiels stands on the north bank of the Tweed, on both sides of the Gala Water, at its mouth, and as the Gala here forms the boundary between the counties of Roxburgh and Selkirk, the eastern part of the town is in the former (Melrose parish,) and the western or principal part in the latter county.—P.

^d Only two parishes lie entirely within its limits, while five or six lie partly in it, and partly in the neighbouring shires. (Gazetteer of

Scotland, Dundee, 1803.)—It includes the entire parishes of Etterick and Yarrow, the greater part of Selkirk and Galashiels, and minor portions of Ashkirk, Robertson and Inverleithen. The remainder of all these parishes lies in Roxburghshire, except the last (in Peeblesshire.)—P.

^e The Ettrick and the Yarrow both rise among the mountains on the south-western border of the county, and flowing north-east through two parallel valleys, meet each other a little above the town of Selkirk. The united stream retains the name of Ettrick, and about two miles below enters the Tweed. The Loch of the Lows and St. Mary's Loch are properly the source of the Yarrow, which issues from the latter, much the largest of the two. They lie in the same basin, on the confines of Peeblesshire, and are embosomed in a group of lofty rounded hills, from which several small streams flow into them; the largest of these, the Megget, runs wholly within Peeblesshire.—P.

^f Only a few survived. (Ed. Enc.)—A few returned, loaded with the spoils of the enemy. (Stat. Acc. ii. 436.)—William Brydone, the town clerk, was knighted for his valour on that occasion.—P.

defeated by General Leslie in the vicinity of the town.^a

The Tweed, the boundary between Roxburghshire and Berwickshire,^b separates the last county from England.^c The same county is contiguous to East Lothian on the north, and to Mid Lothian on the north-west, and it is washed by the German Ocean on the east. It is popularly divided into three districts, the Lammermoors, Lauderdale and the Merse;^d but the second may be included under the other two, and a greater part of it belongs to the first than to the last. It is connected with East Lothian by the Lammermoors,^e a range that commences at St. Abb's Head on the south-east of the county,^f and passes into Mid Lothian; their height varies from fifteen hundred to a thousand feet above the level of the sea,^g and the surface, covered with heath and the coarsest herbage, is more sterile and unproductive than might be inferred from its altitude. The Merse or the other great division comprehends all the lowlands of the county, and these are cultivated according to the most approved methods of modern husbandry; indeed it is doubtful if there is any other district in which the management of arable land is so skilfully combined with that of live stock and pasturage. The perseverance of the inhabitants in the improvement of their soil is the more remarkable on account of the obstacles which they have surmounted. If their land in many places resemble a garden, it might be imagined that they possessed many natural advantages, but they are situated far from any crowded or dense population, they are without coal and lime,^h and a rocky or precipitous coast limits the exports and imports by sea to one or two places at a considerable distance from the centre of the county.ⁱ The Merse is watered by the Whittadder, the Blaekadder, the Leader^k and other small streams that enlarge the Tweed. The principal towns are Dunse, Greenlaw, Lauder, Eyemouth and Coldstream. The first has been rendered the county-town, but none of them are of much importance.

Remains of past times may still be observed, and different castles exhibit the ruins of border fortresses. A deep ravine in the north-east part of the county was formerly a sort of natural barrier against the incursions of English freebooters. It is now crossed by a bridge^l 300 feet long and fifteen wide, and rising from the stream below to the great height of 124 feet. The low grounds were suffered to lie waste during the border wars; the inhabitants were then accustomed to plunder; they lived in

^a At Philiphaugh, opposite the town, Sept. 15, 1645.—P.

^b See note ^f, p. 1254.

^c Berwick upon Tweed, with a small surrounding territory, dependent on it, is situated on the north of the Tweed, at its mouth. It belongs neither to Scotland nor England. (See p. 1209).—P.

^d Formerly the county was divided into two jurisdictions: viz. that of the Merse or March (whence the Earl of March)—the Merches (Guthrie,) i. e. the borders, which also included the low country of Roxburghshire; and the bailliary of Lauderdale. Of the present divisions, that of the Merse includes the low country along the Tweed, on the south; that of Lauderdale, the valley of the Leader and the surrounding hills, in the north-west corner; and that of Lammermoor, the ridge of hills extending east along the northern border, from Lauderdale to the German Sea.—P.

^e Properly, the county is separated from East Lothian by the ridge of Lammermoor (or Lammermuir).—P.

^f St. Abb's Head is rather in the north-east of the county, where the coast turns to the west. The ridge of Lammermoor stretches from it nearly west to Mid Lothian.—P.

^g The average height of the chain is about 1000 feet; rising towards

poverty and wretchedness. The same grounds, now enclosed with hedges, and sheltered by plantations, yield abundant crops. The industry of the present inhabitants forms a remarkable contrast with the indolence of their ancestors, and their rural prosperity with the desolation consequent on predatory habits. The relative population is upwards of eighty-three to the square mile, and the total number of square miles is probably greater than 486.

Continuing our course towards the north-west along the shore, we enter East Lothian or Haddingtonshire, a county still more distinguished for its agricultural riches. The greatest length of the county from east to west is twenty-five miles, and the utmost breadth from north to south, about seventeen; but such is the irregularity of its boundaries that the area does not exceed 272 square miles. According to the last census, the number of persons to the square mile is equal to more than 133, a result the more remarkable, if it be considered that no branch of manufacturing industry is conducted on a great scale, and that the labor of the inhabitants is almost exclusively confined to the culture or improvement of the soil. Of the whole land about four fifths are in tillage, or fit for cultivation, and the remaining fifth, consisting of hills or moorish ground, is covered with heath and the coarser grasses.

The Lammermuirs,^m which traverse the county,ⁿ occupy the greater portion of the uncultivated land, and the rest of Haddingtonshire, when viewed from these heights on the south, appears like a plain sloping gradually to the Frith of Forth and the German Ocean. In reality, however, the apparent declivity consists of a number of smaller and parallel ridges, commencing near the western extremity, extending a considerable distance eastwards, and diminishing in height as they approach the sea.^o Some hills in the lower part of the county, although by no means lofty, have an imposing appearance; they rise abruptly from a flat surface, and are conspicuous in every direction. Such are North Berwick Law and Traprane Law,^p of which the former is not more than 940, and the latter only 700 feet above the level of the sea.

According to the agricultural survey, the soil is very various; the greater part of it, however, is said to consist of clay and loam, mixed in nearly equal proportions and of very different qualities. Much of it is not fruitful, the clay is shallow, and it rests on a wet bottom. The superiority of the grain may be partly attributed to the climate; little rain falls during the summer months

the west, and descending towards the east. Clint Hill, at the western extremity, is 1544 feet high.—P.

^h Coal and lime have been found at Lamerton, on the sea-coast near Berwick.—P.

ⁱ The only port in the county is at Eyemouth, on the small river Eye, to the north of Berwick. The Tweed forms the great natural outlet of the county, by Berwick.—P.

^k These streams all rise in the Lammermoor, and flow south. The two former (the Whitewater and Blackwater) unite, and soon after enter the Tweed near Berwick. The latter enters it a little below Melrose.—P.

^l Pease Bridge.

^m Generally in the singular, Lammermuir.—P.

ⁿ Rather, which stretch along the southern border of the county.—P.

^o The principal ridge in the lower part of the county is that of the Garleton Hills, which run east and west between the Tyne and the Forth, in the neighbourhood of Haddington.—P.

^p Traprene or Traprane Law—an isolated trap hill between Haddington and Dunbar.—P.

in the eastern part, and the harvests are generally about ten days earlier than in the neighbourhood of the coast, although even in that quarter, the crops are reaped three weeks or a month sooner than in the hilly district.^a

The same county abounds with the most valuable minerals, and these in common with its soil and climate, have contributed to its agricultural wealth. Coal has been worked since a very early period,^b and it is still found in great quantities, particularly in the western districts, from the borders of the Lammermuirs to the sea. No part of the same tract is more than six miles distant from limestone,^c and several extensive parishes rest on that rock. Lastly, ironstone is wrought in different parts of the county, and some of the mineral springs, although now deserted, were once held in great repute.

It was in Haddingtonshire that the spirit of agricultural improvement commenced, and it was diffused from it over the rest of Scotland. It was there that the practice of summer fallow was first introduced and extensively adopted, and the plan of encouraging tenants to make improvements by granting them long leases was begun and carried into effect by the proprietors. Many other improvements might be mentioned, but it may be sufficient to add that the threshing machine was invented and perfected by Mr. Meikle, an ingenious mechanic of the county.^d The effect of these improvements, or the continued exercise of skill and ingenuity, has increased the value and fertility of the soil; the produce in the worst seasons is much more than sufficient for the consumption, and with the exception of the districts in the vicinity of great towns, land lets for a higher rent in East Lothian, than in any other part of Scotland. Independently, however, of all these advantages, several defects are still apparent; the farm-houses are indeed excellent, but the cottages are much inferior to those in England; the corn lands in some places are open, in others they are ill-enclosed, and too much land is suffered to lie waste; thus, in the neighbourhood of Dunbar,^e a common of more than 4000 acres is still uncultivated; it is true that it belongs to the burgh.

None of the towns are important. Haddington, the capital, is situated on the Tyne, some miles from the sea, near the centre of the lower district. The products of industry, except those of distilleries, are confined to the consumption of the county; different manufactories have been at different times established, but none of them have flourished. It carries on, however, a con-

siderable trade, and more grain in bulk is sold weekly at its market, than in any other town in the kingdom. Although the same market is the principal support of the town, and one cause of the agricultural prosperity of the county, little convenience is afforded to those who attend it; carts loaded with grain, are crowded together, and many of them are not accessible to purchasers without inconvenience.

The ancient town of Dunbar, formerly an important place, and frequently mentioned in Scottish history, is situated on the east coast, at the distance of twenty-seven miles from Edinburgh. Ship-building, the making of sail-cloth and cordage, soap-works, founderies, and other branches of industry are carried on in a small scale, and its inhabitants engage occasionally in the northern whale-fisheries. North Berwick, to the north-west of the last place, is little better than a village, but it may be mentioned on account of its hill or *Law*, a noted landmark to mariners, and also on account of the ruins of Tantallon castle,^f a stronghold of the Douglasses, that was destroyed in 1639 by the covenanters.

The same county is associated with the memory of several eminent men, with that of the Fletchers, the Maitlands and the Dalrymples. The poet Dunbar was born in Saltoun,^g and Bishop Burnet, the historian, officiated as rector in the same parish. George Heriot, the founder of the noble institution that bears his name, was a native of Gladsmuir, where Robertson wrote his history of Scotland. Lastly, an old house in the suburbs of Haddington^h is still shown to strangers as the birth-place of Knox the reformer.ⁱ

Contiguous to Haddingtonshire on the east,^k the county of Mid Lothian occupies an area of 360 square miles, and the population, relatively to the surface, is equal according to the last returns, to more than 600 to the square mile. So great a number indicates that we have arrived at the county in which the capital of Scotland is situated.

The lower and richer part of Mid Lothian is of a semi-circular form resembling an amphitheatre with an inclination towards the Frith of Forth. But the Pentland chain approaches to the distance of five miles from the frith, covers about forty square miles, and thus divides the same tract into two plains.^l The Moorfoot Hills, another lofty tract, are situated on the south-east, where the county terminates almost in a point between the shires of Roxburgh and Selkirk; they are more than fifteen miles distant from the sea; the highest rises to

^a In the east part of the county [i. e. on the coast of the German Sea], where little rain falls, the harvest in mild seasons is generally ten days earlier than upon the coast lands in the north [i. e. on the Firth of Forth]; and these again are about three or four weeks earlier than the hilly districts.—P.

^b It was dug at Prestongrange, by the monks of Newbottle, as early as A. D. 1200. (Ed. Enc.)—P.

^c Scarcely any part of the county is above six miles distant from lime rock. (Ed. Enc.)—P.

^d The threshing machine, now in general use in Great Britain, was invented by Mr. Andrew Meikle, near Haddington, in 1785—6. Several ineffectual attempts had been previously made; the first by Mr. Michael Menzies of East Lothian; the second, by Mr. Michael Stirling of Dunblane, about 1758—the last of these still used, particularly for threshing oats. James Meikle, the father of the above, first introduced the fanners (fanning mill) into Scotland from Holland, in 1710, under the patronage of the celebrated Andrew Fletcher of Saltoun. This is now one of the appendages of the threshing machine, and moved by the same power. (Ed. Enc. art. Agric. Sir J. Sinclair's Gen. Rep. i. 226—33.)—P.

^f Tantallon Castle—about two miles east of North Berwick, on a rock overhanging the sea, which surrounds it on three sides. (Stat. Acc. v. 443.)—P.

^g Saltoun—a parish on the Tyne, west of Haddington. It was the seat of the Fletchers of Saltoun.—P.

^h In the suburb of Gifford-gate.—P.

ⁱ Blair, the author of the *Grave and Home*, the author of *Douglas*, were successively ministers of Athelstaneford. Dr. Witherspoon, President of Princeton College, and Dr. Nisbet, President of Carlisle College, were both natives of Yester.—P.

^k Mid Lothian or Edinburghshire is bounded on the east by Haddingtonshire and a part of Berwickshire; on the south and south-west by the counties of Selkirk, Peebles and Lanark; on the west by Linlithgowshire; and on the north by the Firth of Forth, which separates it from Fifeshire.—P.

^l The Pentland Hills rise in the parish of Liberton, about four miles south-west of Edinburgh, and extend south-west about twelve miles, to the borders of Lanarkshire. This range, together with most of the heights in the lower part of the county, is of the trap formation.—P.

upwards of 1800 feet, and they extend over fifty square miles. The rest of Edinburghshire may be considered a low, but not a flat or level county; it is varied by an undulating surface, and by detached hills of moderate height, among which may be mentioned Arthur's Seat on the east, and Corstorphine Hill on the west of the capital.

The county is destitute of rivers, and the streams are too insignificant to require notice; they have, however, been rendered subservient to the abridgment of labour; thus, the course of the Water of Leith is not more than sixteen miles, but, in a distance of ten miles, it turns seventy mills.^a

The minerals are very valuable; a continuous bed of coal extends across the county from the confines of Peebles-shire in a direction from south-west to north-east.^b Limestone is not only found in the same tract, but still further to the east and south-east, in places where coal has not been discovered; sandstone, or freestone, as it is popularly called, is another important mineral, and several quarries of it are worked at no great distance from the city. Ironstone abounds in the coal district, and along the shore to the west of Leith.^c A substance similar in its properties to the petunse of the Chinese, and used in the manufacture of porcelain, is obtained on the Pentland Hills,^d and clay, which is converted into crucibles, is wrought in the parish of Duddingstone.

The ports of Dunbar and North Berwick have been already mentioned; no other place of any consequence is situated between them and Leith,^e which forms one of the suburbs of the capital. Edinburgh is no longer the residence of kings, nor is it longer the centre of government, but it is still the seat of the highest tribunals, and still the metropolis of the country. The courts of justice are even at present the principal source of its opulence, and many lawyers, attorneys and clerks attend them. In past times the town was distinguished by the turbulence of its inhabitants, and by constant feuds; it is now still more distinguished by the peacefulness of its citizens, by the progress of industry and the useful arts, by the cultivation of knowledge, and by its ennobling results. All have it in their power to obtain an elementary education, and to all on whom nature has conferred more than ordinary talent, the road to distinction is open. From the effects of this system in Edinburgh and other parts of Scotland, many advantages have ensued; the limits of knowledge have been extended; the true principles of political economy were first developed and demonstrated by a Scotchman; additional wealth and additional comforts have been diffused from the same country to every region where British commerce extends, for by the genius of Watt, the steam-engine has been rendered the most powerful agent of productive industry. Within the last hundred years,

the sciences have been illustrated by Maclaurin, Simson, Ferguson and Black. Hume, Robertson, Smith and Stewart are equally eminent in philosophy and literature. The greater number of these celebrated men devoted their time and their talents to public instruction in the university of Edinburgh,^f and contributed to the prosperity of the town, inasmuch as they attracted students from every part of the united kingdom, and from foreign countries. The patrons have not shewn themselves of late years so careful of the interests of the city, eminent men have not been appointed to the vacant chairs, and if the same system be continued, or if other recommendations are more cogent than that of merit, the prosperity of the university cannot be long maintained.^g The town derives a considerable income from the seat-rents of the churches, and the magistrates have increased it by appointing popular preachers, as vacancies occur in the capital. It might be well if they were to take more extensive views, and by increasing the reputation of the city as a seat of learning, render it a place of greater resort to young men for the purposes of education.

The city is built on three hills that run parallel to each other. The old town occupies the central hill, which is the highest; the new town stands on the northern or lowest hill, and the third eminence is covered with additions made to the old town. Of the two vallies which separate the three hills, the one on the north is deeper and wider than the other on the south, and it formed at no very remote period the basin of a lake,^h of which the stagnant waters were injurious to the health of the inhabitants. The lake or marsh, however, has been drained, and its bed is now converted into gardens and public walks. It is not much more than half a century since the old town made up the whole of Edinburgh,ⁱ and it then consisted of dark and dirty houses, built without regularity, without taste, and so much confined as to render them unhealthy. The principal street in the same quarter,^k extends along the ridge of the central hill, and is intersected by an immense number of narrow and crooked lanes; the houses consist of six or seven stories in front, and nine, ten or eleven on the side of the valley. The Castle, an irregular and Gothic edifice, separated from the town by an esplanade, rises on a rugged rock at the western extremity of the same hill. The building and the fortifications occupy an area of seven English acres; in past times it was considered a place of great strength, but as there are points within the range of artillery, which command it, it might now be easily reduced. It is now used as a station for soldiers, and it may contain about 3000; the apartments in which James the Sixth was born,^l are converted into barracks for officers, and a new range of barracks for soldiers has been erected on a very injudicious plan, and by no means according

^a The Almond, which forms the north-western boundary, and the North and South Esks, which unite below Dalkeith, and enter the Forth at Musselburgh, are the largest streams in the county.—P.

^b The coal-field of Mid Lothian is 15 miles in length and 8 in breadth. (Ed. Enc.)—P.

ⁱ The New Town was begun to be built in 1767. (Gaz. Scot.)—P.

^k The High Street—extending from the Castle to Holyrood-house.—P.

^l On the east of the castle buildings were formerly royal apartments. James VI. was born in a small square apartment in the south-east part of the castle. (Gaz. Scot. Ed. Enc.)—P.

with the rest of the fortress. The Parliament Square,^a at no great distance from the Castle, possesses little to attract attention, except the spacious hall, in which the Scottish Parliament held its sessions.^b The church of St. Giles forms one side of the square; four different places of worship were formerly contained in it, but the number has since been reduced. A square tower rises from the centre of the structure; it is surmounted by slender arches of good workmanship, supporting a steeple, the whole representing in the air the figure of an imperial crown. Beneath the vault of this venerable building rest the ashes of Lord Napier, the immortal inventor of logarithms. The mint in the neighbourhood of the last place, may be mentioned on account of its antiquity and preservation. Although no money is coined, all the officers are still appointed, agreeably to the act of union, and the bell is regularly rung at the hours in which the workmen left off their work in the sixteenth century. The palace is situated at the eastern or opposite extremity of the old town, in a valley with Arthur's Seat and Salisbury Crags on the one side, and the Calton Hill on the other. It was originally a monastery,^c and it is still called Holyrood-house or the house of the holy cross. It is of mixed architecture, and the Grecian style is blended with castellated turrets, which destroy the regularity without adding to the imposing effect of the building. Such are the most remarkable of the ancient monuments, but many modern works have been erected even in the old town. The courts of justice, the County Hall, the Bank of Scotland, the Advocates' Library, and the library of the writers to the signet, are grouped round the cathedral,^d and all of them have been built within a comparatively recent period. Other improvements are at present in progress; a new bridge and a new line of communication are forming between the old and new town, and another bridge now almost completed, and a road cut along the south side of the Castle-hill are to connect the two towns on the west.

The ground on which the new town stands was added to the royalty in 1767, and it was afterwards laid out in conformity to a plan designed by Mr. Craig. Some notion may be formed of the immense additions made within the period already specified, from the fact that the new town comprehends by far the greater portion of Edinburgh. The houses are large and well built; the streets are no less regular than spacious; and the squares present admirable sites for the monuments with which they are adorned. The whole affords a grand and imposing spectacle, one to which it might be difficult to find a parallel in the finest capitals of Europe. Every part is not entitled to unqualified praise, and a critic might condemn some of the edifices; still the combination of the whole is in a style of great simplicity, and the effects of architecture are conspicuous in the judicious arrangement and well-chosen site of most of the public buildings. Thus, the line from east to west is not marked by superstition or prejudice for the nave of the church; and

wherever a church can be placed at the extremity of a spacious street, the front rises in the direction of the street, to which it forms a majestic termination. The register office in which the records of the kingdom are deposited, was built by the late Mr. Adam, after the style of Palladio, and it is perhaps the best work of that celebrated architect. It commands a view of the finest street in the old town,^e a street continued across two vallies from north to south, by two bridges corresponding with it in width. The north bridge consists of five arches, three of which are seventy-six feet and a half wide, and the two others nearly twenty. The road-way is elevated fifty-four feet above the bottom of the valley, which is also crossed by a mound about 698 feet in length, and 210 wide at the summit. The materials of which this vast work is formed, were supplied from the foundations of the buildings in the new town. A third bridge,^f situated near the register office, serves as a communication between the new town and the Calton-hill, on which many buildings have of late been erected. The most remarkable are the High-school, the admired work of Mr. Hamilton, the Observatory, and the monuments of Playfair and of Stewart, both of whom distinguished themselves in the Edinburgh University. The first illustrated the theory of Hutton, and the second is known as one of the ablest and most eloquent mental philosophers of his age.^g The spectator may observe from these monuments a circular tower in the Grecian style; it is the tomb of Hume, the most philosophical of the British historians. The view from the public walk along the same hill commands the Frith of Forth, with the adjacent country on both its banks, and requires only the sky of Italy or Greece to vie with the shores of the bay of Naples, or the coast of the Bosphorus in the neighbourhood of Constantinople.

The university was begun about forty years ago^h after the plan of Mr. Robert Adam, but it was conceived on too great a scale for the wealth of the town. It was found necessary to deviate from the original plan; and to complete it according to its reduced form, a grant of money was obtained from parliament. The site is inconvenient, and as a work of art, it is not unexceptionable; it is probable indeed that the sums expended in finishing what was begun by Mr. Adam, might have sufficed for the erection of a finer building in a more eligible or less confined situation.

Edinburgh is celebrated for the number and grandeur of its monuments, and the elegance and regularity of its streets; but its celebrity in this respect dates only from a recent period, and houses which were formerly inhabited by nobles, are now too mean for the middling classes. If towns, of which the importance or existence depends solely on commerce and industry, be excepted, it would be difficult to find a place, of which the extension has been so great, or the improvements so manifold and various. The increase in the population must bear some relation to the enlargement of the town, and ac-

^a The Parliament Square or Close is an open space in front of the Parliament-house, in the middle of which is an equestrian statue of Charles II. (Gaz. Scot.)—P.

^b It is 122 feet in length by 49 in width, and 40 feet high, with an elegant carved roof. It is called the Outer House, and is now occupied by the courts of the Lords Ordinary. The inner courts, or Inner House, meet in two adjoining chambers.—P.

^c The ruins of the Abbey church still remain.—P.

^d Church of St. Giles.

^e It stands at the north end of the North Bridge, fronting it, and receding 40 feet from the north line of Prince's Street in the New Town.—P.

^f Regent Bridge.
^g The life of Reid has been written by Mr. Stewart, who was his pupil, and the ablest defender of the system which is called in France the Scotch system of philosophy.

^h The foundation was laid, Nov. 16th, 1739.—P.

cordingly it has been very great. In 1687 the number of inhabitants amounted to 20,000, in 1830 it was equal to 162,156, so that it is now more than eight times greater than it was a hundred and fifty years ago. Various branches of industry have sprung up and become flourishing within a later period; we may mention the numerous paper-mills in the vicinity, the casting of iron, the distillation of spirituous liquors on a great scale, the printing of calico and cloth, and the weaving of kerseymeres and shawls; but the most remarkable example of any is to be found in an art that is as much connected with the diffusion of knowledge as the enterprise of commerce: about fifty or sixty years since few books were printed in Edinburgh; it has now become second to London in the number of its printing presses, and consequently of the products that issue from them. Admirable communications extend in every direction from the same town, and most of them are of recent formation. Railways pass from Musselburgh and Dalkeith or the neighbourhood of the coal mines, and their produce is thus sent to the capital. The Union Canal joins that of the Forth and Clyde, and facilitates the conveyance of the manufactures of Glasgow. A new work is now in contemplation; the example set by the inhabitants of Liverpool and Manchester is likely to be imitated in Scotland, and steam carriages may ere long run between Glasgow and Edinburgh.

It has already been remarked that Leith is almost a suburb of Edinburgh; streets extend between them, and unite two towns that were formerly separated. It is situated on both sides of the Water of Leith, at its confluence with the Frith of Forth, and is thus divided into two districts, the southern and northern.^a The northern part is modern; the southern is ancient. The one is laid out according to a plan; the other is built without regularity, and consists mostly of dirty houses, and narrow or crooked lanes.^b The two districts communicate with each other by two draw-bridges across the harbour. In the year 1777, the harbour was considerably improved, and it has since been enlarged. The pier, which forms the eastern boundary of the confluence of the stream, has been carried farther into the sea; quays, basins and docks have been constructed on the opposite side, and these successive additions were rendered necessary by an increase in the trade.

In a military point of view, Leith is of great importance to the defence of Edinburgh, and, accordingly, in past times, the French and the English landed there fre-

quently to succour or oppress Scotland. A fort was built in the same place by Cromwell,^c and probably for that very reason was destroyed by Charles the Second. The harbour is protected by a battery on the eminence that rises on the west of the docks, and extends beyond Newhaven.^d The works are surrounded by an entrenchment and defended by bastions at the gorge.

If Edinburgh and Leith be excepted, no other town of consequence can be mentioned in Mid Lothian.^e The Almond, a small river, or rather stream, separates it from Linlithgowshire or West Lothian, a county contiguous to the last on the east and south-east, to the Frith of Forth on the north, to Lanarkshire on the south-west, and to Stirlingshire on the west. In figure it resembles a triangle, and the area is not greater than 112 square miles, and each square mile contains on an average, 209 inhabitants. A large portion of the surface is either level or gently undulating, and only a fifth part of it is supposed to be unfit for cultivation. It must not, however, be inferred that it is destitute of hills; a ridge extends across it, of which Cairnpapple or the highest point is more than fifteen hundred feet above the level of the sea.^f The richest carse lands and some of the best loams, as well as a great portion of gravel and sandy land, are situated in different parts of the county, but the prevalent soil consists of clay, and it varies from the best to the worst sorts.

The same county is distinguished by the number and value of its mineral products. Silver and lead were once obtained on the hills of Bathgate in the parish of Linlithgow, and it is not many years since a small vein of silver ore was found in a limestone quarry in the neighbourhood.^g It may be also remarked that there is an inexhaustible supply of limestone, while iron ore is wrought in Borrowstonness and Carriden on the Forth; but coal is perhaps the most abundant of the mineral products; it is wrought in different parts of the coast,^h in Uphall and Whitburn on the east and south, in the central parish of Bathgate, and at Cultmuir on the south-western border; and as the Union Canal passes through the country, the produce of the mines is easily conveyed to the capital.

Queensferryⁱ is situated about nine miles from Edinburgh, on the principal road to Perth, where the frith is rather less than two miles in breadth. The superintendance of the ferry is committed to a lieutenant in the navy, and the use of steam vessels is likely to supersede that of the numerous passage boats. The small port of Borrowstonness^k on the same coast, reckons 140 vessels, measuring nearly 1000 tons.^l

^a Called South Leith and North Leith, and forming two distinct parishes.—P.

^b By far the greater part of the town is situated on the south side of the river; but both in North and South Leith, the streets of the old part are narrow and irregular. The parts of the town which have been erected during the last twenty or thirty years are not surpassed by the finest parts of Edinburgh. (Ed. Enc. 1819.)—P.

^c In North Leith—called the Citadel.—P.

^d A village, with a harbour, about one mile north-west of Leith.—P.

^e See note ^c, p. 1258.

^f A range of hills extends across the middle of the county, obliquely from north-west to south-east. The highest of these are Cairnpapple, in the centre, about 1498 feet above the level of the sea, and Cocklerue in the west, about 500 feet. (Ed. Enc.)—The first of these is properly Cairn-papple, and lies south-west of Linlithgow.—P.

^g Silver and lead mines were formerly wrought in the neighbourhood of Linlithgow [in the hills at the southern extremity of the parish,] and a vein of silver was discovered in a limestone rock in Bathgate parish, but too inconsiderable to pay the expense of working it. (Ed. Enc.)—The Bathgate hills, in the north-eastern part of Bathgate parish, are a continuation of the range, already mentioned, including Cockle-

rue and Cairn-naple, and extending along the southern border of Linlithgow parish.—P.

^h Particularly at Borrowstonness and Carriden, at the former of which it has been wrought for more than 500 years.—P.

ⁱ Called also South Queensferry. North Queensferry is a small village, where the passage boats land, on the opposite shore of the Frith, in Fife.—P.

^k Properly Borrowstonness (borough, town, and ness)—from its situation on a promontory on the Forth, near the borough of Linlithgow. Also called Boroughstonness, Borrowstonness and popularly Boness. It is situated in the north-western corner of the county, on the coast north of Linlithgow. Its trade was more considerable before the opening of the Forth and Clyde canal, which has transferred much of it to Grangemouth. Its extensive coal works, with the manufactures of iron, salt and pottery, depending on them, render it still a place of importance.—P.

^l There must be some error in this statement. According to it, the average tonnage of its vessels would be but about 7 tons. In 1796, the shipping belonging to the town was about 25 sail, and the tonnage of the revenue port, nearly 10,000 tons, about one fourth of which belonged in Boness. (Stat. Acc. xviii. 433.)—P.

Linlithgow, the county town, is more remarkable for its antiquity than its trade or industry. It consists of a single street, nearly three quarters of a mile in length. The royal palace occupies the site of an ancient castle;^a in the north-west corner is the room in which Queen Mary was born in 1542, and the spacious hall on the east side of the building was set apart for the Parliament. These memorials of a past age are falling fast into decay, and the palace is now roofless. The church almost contiguous to it, a noble specimen of Gothic architecture, has lately been repaired in a style suitable to the grandeur of the fabric. The length is equal to 180 feet, the breadth to 100, the height to 90, and a lofty spire adorned with an imperial crown rises from the western extremity. The same town was often the residence of the court, and it has been the scene of events that are recorded in history. It was there that the Regent Murray was shot by Hamilton of Bothwellhaugh in 1569;^b and at a later period, in 1662, the solemn league and covenant was burnt with great solemnity in the market place.

The traveller passes from Edinburgh through Linlithgowshire, or West Lothian, on his road to Lanarkshire or Clydesdale, the most important as well as the most populous of the Scottish counties.^c Situated in the centre of the country between the German and Atlantic oceans, it is divided into three wards, the upper, the middle, and the lower;^d Lanark is the chief town in the first, Hamilton in the second, and Glasgow in the third. The last town is the largest of any, and the others are comparatively insignificant. The upper ward, which occupies nearly two thirds of the county, is for the most part mountainous or sterile, and from the unevenness of the surface, and the quality of the soil, it is not likely to be rendered fruitful by industry or labour. The others are more productive, and they abound in many places with valuable minerals, such as freestone, limestone, coal and granite.^e From the lower extremity of the county to a considerable distance upwards, freestone is the most common rock, and it is interspersed with different ridges of whin.^f Limestone is found in the same tract, but only in elevated positions, and generally near the surface. More than 300 labourers are employed in the lime quarries within the county, and the value of the produce varies from L.12,000 to L.15,000. The coal lies beneath the freestone; it is supposed to stretch in a solid mass over an extent of 110 square miles, and the average thickness, it is certain, is not less than five yards. The quantity of coal annually obtained from this vast area is

nearly equal to 800,000 tons, and no part of it has been so much worked as the field in the neighbourhood of Glasgow, which yields seven different sorts, and which, by facilitating the means of production, has mainly contributed to the rise and prosperity of the town. Ironstone occurs in regular strata above the limestone and coal: it is also found in contact with the sandstone; in some places, in the form of balls, which are arranged in beds, and are of so rich a quality as to yield fifty per cent. of ore. The lead mines, which have been already mentioned, and which have been now worked about two hundred years, are situated in the southern extremity of the county.^g The Clyde and the numerous streams that water Lanarkshire, are more or less subservient to the purposes of commerce; they facilitate the transportation of goods, or machinery is erected on their banks.^h

A line of defence was erected in the third centuryⁱ by the Romans against the incursions of the Caledonians, and the same line was fixed upon in the eighteenth, as the site of the Forth and Clyde canal.^k The purpose for which the two works were intended, was very different; if the fate of the falling empire cannot be said to have been retarded by the one, intercourse, industry and civilization have been extended by the other. The canal was begun in 1768, and not completed before 1790. It cost L.500,000, and some notion of the navigation performed on it may be inferred from its progressive returns. In 1800, it yielded a dividend of ten per cent., of twenty in 1815, and nearly 30 in 1820. The produce of the extensive coal-fields in Old and New Monkland is conveyed to Glasgow by the Monkland canal,^l and although the Ardrossan canal is not yet completed, it serves as a communication from the same town to Paisley.^m

Lanarkshire, according to the last returns, contains 316,820 inhabitants; it is therefore the most populous of the Scottish counties. The superficial extent is not less than 870 square miles; consequently the mean number of persons to the square mile amounts to 365.

If the rank of a city be estimated by its commerce, wealth and population, Glasgow must be considered the capital of Scotland. Like other great towns, its origin is involved in fable, and the foundation of it is attributed to St. Mungo, or St. Kentigern,ⁿ a person whose celebrity depends on his miracles. William the Lion erected it into a barony,^o and in 1450, it was raised into a regality by James the Second, but in its new character, it continued subject to its bishop. The dignity was at last vested in the dukes of Lennox by James the Sixth, who

^a It was built on the site of a Roman station. (Gaz. Scot.)—It stands on a rising ground running into a small lake on the north side of the burgh, on the site of a fort or castle, erected by Edward I. (Leighton's Scenes in Scotland.)—P.

^b Jan. 23, 1570. (Chambers' Picture of Scotland, ii. 40. Hume. Smollet.)—Jan. 23, 1571. (Watkins' Edit. of Buchanan's Hist. Scot. p. 485.)—P.

^c It contains the greatest absolute population, but is inferior to Mid Lothian and Renfrewshire in relative population.—P.

^d Each of these wards is governed by a sheriff-substitute, appointed by the sheriff-depute of the county. (Chambers.)—Lanarkshire was anciently divided into three wards or jurisdictions, viz. Clydesdale, Douglasdale and Avendale; but it is now divided into two, viz. the Shire of Lanark, of which Lanark is the chief town, and the Barony of Glasgow, of which that city is the seat of the courts. (Gaz. Scot. 1803.)—P.

^e Is not this last statement a mistake? The two lower wards of Lanarkshire are almost entirely within the coal formation; the upper ward is chiefly within the transition formation of the south of Scotland.—P.

^f Trap or greenstone.—P.

^g The village of Leadhills is situated in Lanarkshire.—P.

^h All the streams of any size, in Lanarkshire, are tributaries of the Clyde. The principal of these are the Douglas, the Nethan and the Kelvin, on the west, and the North and South Calder and the Kelvin, on the east.—P.

ⁱ In the second century—A. D. 140. (See p. 1116.)—P.

^k The lines of Graham's Dyke and the Forth and Clyde canal do not coincide, but intersect each other; the former terminating on the east, at Carriden in West Lothian; the latter at Grangemouth in Stirlingshire. The canal on the west crosses the dyke and approaches nearer Glasgow, before it terminates in the Clyde. Both the lines, however, are conducted along a remarkable valley, which here crosses the island from the Forth to the Clyde, between the trap range of the Campsie Fells on the north, and the hills of the coal formation on the south, and including the northern outcrop of the coal.—P.

^l This canal is connected at its western extremity with the Forth and Clyde canal.—P.

^m The Ardrossan canal is completed to the village of Johnstone three miles beyond Paisley. (Ed. Enc.)—P.

ⁿ A. D. 570.—P.

^o A. D. 1172. (Stat. Acc.)—P.

granted the town an advantageous charter, and made it a royal burgh.^a The inhabitants engaged at an early period in the salmon and herring fishery, but their foreign trade previously to the union, was almost confined to Holland, and carried on by doubling the north of Scotland, a circuitous and dangerous navigation. In 1707, when the two kingdoms were united, Glasgow took the lead in opposing the act; the citizens revolted, and to restore obedience, it was found necessary to have recourse to the rigours of martial law.^b It might not be easy to account for the notions that prevailed, but the inhabitants, it is certain, believed the prosperity of their city at an end, and their own ruin inevitable, in consequence of an act, from which many advantages have resulted to Scotland, and to no place more than to Glasgow. In 1707, the population amounted to 14,000, in 1807, to 114,000, and in 1821, to 147,000.^c The accession gained within the last ten years is still more extraordinary; it is nearly equal to 56,000, for Glasgow contains at present 202,426 inhabitants. This progression, so great and so rapid, can only be attributed to the power of industry, and to the advantages of a favourable position. Abundant mines of coal are wrought in the vicinity, and their produce is conveyed at a low rate along the Monkland canal. The Forth, the Clyde, and the canal which unites them, afford the most direct access to the old and the new world, and Glasgow receives in exchange for her manufactures the products of both hemispheres.

But it may be necessary to show how much the prosperity of the town was increased in consequence of a measure, which the inhabitants opposed with equal violence and folly. The act of union was no sooner passed than Glasgow obtained a free navigation for its ships to all the British colonial ports, and possessing that advantage, it became the principal station from which the tobacco of Maryland and Virginia was transported to France.^d Not long afterwards, manufactories of cloth, lawn and cambric were erected in the town, and before the introduction of its muslins, these articles formed its most valuable exports.^e The long contest, which terminated in the independence of America, proved very detrimental to the commerce and industry of the town, and the intercourse, which the war had destroyed or interrupted, was established on a new basis, in other words, products different from those which were formerly admitted, were exported to America after the peace.^f Not long afterwards the new process of spinning cotton by machinery, the invention of the celebrated Arkwright, was generally adopted in Glasgow, and new branches of industry were successively introduced. Iron founderies were erected, flax, hemp and woollen manufactories were

established, and the inhabitants, in place of confining their manufactures to the supply of the colonies, sent their goods to London and the principal markets in England. But the mills in which the different articles were manufactured, and in which cotton was spun according to the process of Arkwright, might have been still confined to the banks of the streams that set them in motion, had it not been for the genius of Watt.^g The history of modern art might be examined in vain for the purpose of showing any other invention from which so much advantage has resulted, one from which so great and so uniform a power has been obtained in so small a compass and at so small an expense. The application of steam to navigation, the consequence of the same invention, is now common, but it was not before 1812 that the first steam vessel sailed on the Clyde. In like manner, the process of spinning and of weaving by steam, although of modern date, is now carried on to a great extent, and the city of Glasgow possesses more than 210 steam engines, which communicate their power to as many mills or manufactories.^h There are at present in the same town fifty-four large spinning factories, in which nearly 600,000 spindles are turned, and the capital invested in these works is upwards of L.1,000,000.ⁱ Eighteen mills for weaving cotton move by mechanical power 2,800 looms and 32,000 hand looms.^k In the calenders that are moved by steam, 110,000 yards of calico may be calendered in a day, the same number can be dressed, and 30,000 glazed.^m The other products of industry are of less importance; they consist of glass, delft ware and different substances that are used in the arts.

Some of the useful institutions may be briefly enumerated. The college occupies an area of more than two acres, and in an elegant building designed by Mr. Stark, is contained the Hunterian museum, a very valuable collection of natural history, anatomical preparations and medals. The number of students that attend the university is upwards of 1400. In 1795, Mr. Anderson, a professor in the university of Glasgow, founded and endowed the Andersonian Institution. Young men, who do not receive an university education, are instructed in this seminary in mathematics, natural philosophy, pharmacy, chemistry, and the application of chemistry to the arts. The numerous schools for the instruction of the poor are creditable to the benevolence of the upper classes; by their means 6516 children of both sexes are gratuitously educated, while in the other schools, the total number of pupils does not exceed 10,283. The advantages of education are put within the reach of every individual.

The same town is adorned with many public buildings, and its ancient cathedralⁿ is considered the most

ⁿ The High Kirk (church)—dedicated to St. Mungo.—P.

perfect specimen of Gothic architecture in Scotland, almost all the other churches of equal antiquity having been injured or demolished by the blind zeal of the reformers. The length of the interior from east to west is equal to 319 feet, but as it is now divided into several distinct churches, the symmetry of the whole is lost.^a The building was preserved from the fury of Knox and his Vandals, by the firmness of the municipal authorities.^b The college, a neat and commodious building, extends more than a hundred yards along the high street; the interior is divided into two courts, of which the larger is 103 feet in length, and 80 in width. The town-house is a modern edifice,^c and it has been admired on account of the magnificence of its front, which is supported on rusticated pillars, and adorned with Ionic pilasters; the space between the columns and the building affording a convenient piazza to the merchants and men of business that frequent it. The Tontine is the name of a spacious hall in which the English, Scotch and French newspapers are read; the expenses are defrayed by fifteen hundred subscribers, but free access is allowed to strangers and the inhabitants. Independently of the purposes for which the institution is intended, it may easily be imagined that it is favourable to commerce, and the liberality by which it is supported, is worthy of a commercial city.

The town of Hamilton rises on the banks of the Clyde about ten miles and a half above Glasgow,^d and fourteen miles further is the village of New Lanark, celebrated on account of the cotton factories, that have been established by their philanthropic proprietor.^{e,f} The lead hills are situated at some distance above the last place, and not far from the Clyde; their name denotes the substance for which they are famous, and which is found there in greater abundance than in any other part of Scotland.^g

A large meadow adorned with trees and situated on the right bank of the Clyde, serves as a public walk to the inhabitants of Glasgow,^h and is intersected by the road that leads to Peebles, the capital of a county, although it does not contain 3000 inhabitants; still different branches of industry are carried on in a small scale, such as the manufacture of stockings, carpets and flannels, and there are besides one or two large breweries. The county itself is inferior to many others both in size and in the number of inhabitants; for it is not

^a It is now divided into two places of worship, the Outer and Inner; the former occupying the western part of the choir; the latter, the nave—with a common vestibule between them. The cemetery underneath the eastern part of the church, formerly served as a place of worship for the Barony or Landward (country) parish, and was called the Laigh Kirk (Low Church,) but is now restored to its original use.—P.

^b In 1579, at the instigation of the protestant clergy, the magistrates engaged to demolish the edifice, and assembled a body of workmen for the purpose; but the craftsmen or members of trade corporations flew to arms, took possession of the building, and threatened to kill the first man who should lay hands on it. The magistrates were thus forced to desist from their purpose, and the building was preserved. It was then converted into three protestant places of worship (see note ^a), after having been cleared of the statues of saints and other Catholic appendages. (Chambers. Ed. Enc.)—P.

^c The town-house (town-hall) was built in 1636. (Ed. Enc. Pict. of Glasgow.)—P.

^d On the west bank of the Clyde near the mouth of the Avon.—P.

^e Mr. Owen.

^f The village of New Lanark and the cotton factories were founded by David Dale, father-in-law of Robert Owen. It stands in a valley on the banks of the Clyde, between the falls of Corra Linn and Stone-

more than 365 square miles in superficial extent, and the mean population is less than twenty-nine individuals to the square mile. The boundaries of Peebles-shire are the counties of Lanark on the west, Dumfries on the south, Selkirk on the east, and Mid Lothian on the north. The surface, which is in many parts hilly, becomes mountainous towards the south, and the heights that separate it from Annandale in Dumfries-shire, vary from 2500 to 3000 feet above the level of the sea. The general elevation of the pasture lands is about 1200 feet, and the hills with few exceptions are covered with herbage, heath being almost exclusively confined to the highest summits. The dale or valley of the Tweed, which forms a great part of the county, and from which it derives its popular name of Tweeddale, communicates with many narrow vallies, that branch from it in different directions. Thus, the scenery consists of hills, dales, and numerous streams, but the spectator looks in vain for lofty trees or indeed for trees of any kind, and the effect of the natural beauties is apt to be associated with the idea of bleakness or sterility.

The soil of the cultivated land, lying chiefly on the sides of the lower hills, and the banks of the rivers, is for the most part a light loam; clay, moss and moor are more common on the high grounds. As to the minerals, coal and limestone are wrought in the northern part of the county, or in the parishes of Linton and Newlands; ironstone too is obtained in the last of these parishes, and slate is exported to the adjacent counties from the parish of Stobo on the Tweed.ⁱ Peebles-shire, however, is not distinguished by its mineral riches, and as it is by no means a manufacturing county, it has little to offer except sheep and wool in exchange for the articles that are consumed.

The next county, although smaller than the last, is more important from the number and industry of its inhabitants. In the year 1754, Renfrewshire contained only 26,654 inhabitants; in 1831, the population amounted to 133,433. The extent of surface is not more than 241 square miles, and it is bounded by the Frith of Clyde on the north and west, by Lanarkshire on the east, and by Ayrshire on the south. Nearly two thirds of the surface are hilly, but the highest hill or Misty-law is not more than 1240 feet in height. The greater portion of this district is ill adapted for tillage, and it is generally kept in pasture. The cultivated land

byres, and west of the town of Lanark. The Clyde is precipitated over three large falls in this vicinity, viz. Bonnington Linn, Corra Linn and the Fall of Stonebyres. The town of Lanark, a royal burgh, and the county town, stands on elevated ground, to the east of the Clyde, but is not a place of much importance.—P.

^g The range of the Lead Hills is that part of the great transition chain in the south of Scotland, which divides the waters of the Clyde from those of the Nith. The village of Leadhills is situated at a great height on this range, and near the sources of the Clyde. It is entirely inhabited by miners, who, like those in the neighbouring mining village of Wanlockhead in Dumfries-shire, have long devoted a part of their earnings to the establishment of a library.—P.

^h The public park, or green, on the banks of the river, adjoining the south-east side of the town, contains upwards of 108 acres of grass, and more than 3 miles, 6 furlongs, of gravel walks. (Ed. Enc.)—P.

ⁱ At least two thirds of the county on the south and east consists of greywacke and argillite, forming part of the great transition range of the south of Scotland. The remainder of the county on the north-west consists of sandstone, with coal and limestone. The dividing line enters the county at Kingside, and passes through the parish of Newlands and along the northern border of Stobo into Lanarkshire.—P.

is almost exclusively confined to the north and north-east districts, and to the centre of the county. The rivers and streams are the Clyde, the White Cart, the Black Cart, and the Gryfe, from which last the county is often styled Strathgryfe.^a The Clyde, the only large river, flows along the confines; the White Cart has been rendered navigable from Paisley to the Clyde. The Black Cart flows from the south-west, and the Gryfe from the west, and both meet at Walkinshaw about two miles above their confluence with the White Cart. These streams are chiefly worthy of notice on account of the many cotton and other mills which they set in motion. Smaller streams are applied to the same purpose, and a constant supply of water is secured by means of reservoirs, several of which from their size and appearance might be mistaken for lakes.

The minerals are of primary importance, and they constitute the main source of the commerce and manufactures. Coal is worked in part of the hilly district, and both coal and lime in the flat district near Renfrew. But it is in the central district that coal is obtained in the greatest quantities. More than twelve different works are established, and of these the most extensive is the one at Quarrelton on the Black Cart.^b The coal at that place consists of five contiguous strata, and the thickness of the whole, measured at right angles to their surface, is upwards of fifty feet, but as in some places the seam forms a considerable angle with the horizon, the thickness of the strata, measured vertically, is there upwards of ninety feet. The coal in consequence of so great a depth is wrought in floors or stories. Limestone abounds in different directions, and twelve or fourteen quarries are at present worked.^c Ironstone, which is scattered throughout the middle district, is found in strata and in the form of balls. Considerable quantities of pyrites, obtained from the coal stratum at Hurlet and Househill, are manufactured into sulphate of iron, or green vitriol.^d Lastly, excellent freestone, lying near the surface, is wrought in the neighbourhood of Paisley, and in other parts of the county.

Renfrew, the nominal capital of Renfrewshire, is an ancient and small burgh too insignificant to require notice.^e But Paisley, from its size and importance, may be considered the third city in Scotland. It is situated on the White Cart, between two and three miles south of the

^a From the river Gryfe the county derived its most ancient name of Strathgryfe. (Stat. Acc.)—P.

^b Coal, limestone and freestone abound in various parts of the county. There are no fewer than twelve coal works in actual operation. The most extensive are those at Quarrelton, near the centre of the county, at Polmadie, on its north-east boundary, and at Hurlet and Househill, to the south-east of Paisley. (Ed. Enc.)—All the works, above specified, except Polmadie, are in the Abbey parish of Paisley. That of Quarrelton is near the manufacturing village of Johnstone (on the Black Cart,) begun in 1782, and now one of the most flourishing places in the county. The whole eastern part of the county is included within the coal formation. The limestone is properly an appendage of that formation, very little being found beyond its limits.—P.

^c Limestone is wrought at about eight different quarries. One of the most singular masses of it occurs at the entrance of the romantic glen of Gleniffer, three miles south of Paisley. It appears in the face of a high rock, under a superincumbent mass of greenstone, and forms a bed about ten feet thick, dipping towards a centre, where several mines meet, forming a subterranean labyrinth. (Ed. Enc. 1825. Stat. Acc. vii.)—P.

^d The coal mines of Hurlet afford materials for a manufactory of sulphate of iron, and the most extensive alum manufactory in Great Britain is carried on at the same place. (Ed. Enc.)—The materials are obtained from a stratum of shale, placed above the coal, and abounding in iron pyrites, which having been exposed to the atmosphere for more than 200 years, and at the same time kept dry, the natural forma-

Clyde, and nearly seven west from Glasgow. The old town stands on a rising ground on the western, and the new in a valley on the eastern bank of the river, and they communicate with each other by three bridges. The most remarkable of its public buildings is an ancient abbey, part of which has been converted into a parish church, while the rest is in ruins.^f A monument, however, is still preserved;§ it was raised in honour of Margery Bruce, the daughter of king Robert Bruce, and wife of Walter, the great steward of Scotland, from whom the Stuarts descended.

It was after the union that Paisley began to flourish as a manufacturing town. The various branches of the linen manufacture were established after the same period; in 1760, the manufacture of silk gauze was introduced, and became in a few years so successful as to afford employment to nearly 5000 workmen. But the cotton manufacture or the one by which the others have been in some degree superseded, was commenced about the year 1780. In 1810, the cotton yarn which was sold, amounted in value to L.63,000, and the capital laid out in the buildings and machinery of the mills, was estimated at L.630,000. Seven thousand looms were then employed in the weaving of muslins, five hundred were wrought by steam, and they produced coarse cottons to the value of L.125,000 yearly. These, however, are not the only branches of industry, that are carried on; soap-making, tanneries, distilleries, breweries and founderies, together with numerous bleach-fields and print-fields, furnish employment to many of the inhabitants. Of the rapid rise of Paisley some notion may be inferred from the fact that the population of the town and abbey-parish amounted to less than 7000 in 1755, and to more than 50,000 in 1831.

Port-Glasgow and Greenock are situated in the same county and on the banks of the Clyde, the former about twenty, and the latter about twenty-three miles below Glasgow. The former contains between ten and eleven thousand inhabitants; it is built around a basin, excavated so as to serve as a dock for the vessels which are prevented by the weight of their cargoes from proceeding to Glasgow. It reckons about one hundred and twenty vessels measuring nearly 20,000 tons. Greenock was only an obscure village at the period of the union,^h and

tion of alum and sulphate of iron has been continued by the decomposition of the pyrites, so that the rock has become impregnated with these substances, which are extracted from it by lixiviation. (Nicholson's Journal, xvi.)—P.

^e Renfrew is the county town—situated near the junction of the Clyde and Cart, north of Paisley.—P.

^f The nave of the Abbey Church is now occupied as a place of worship for the Abbey Parish, an extensive country parish in the heart of which the town (burgh) of Paisley is situated, and of which the New Town is considered a part. The west end of the church is open, and forms a fine Gothic ruin. (Ed. Enc.)—Originally Paisley formed but one parish, dependent on the Abbey. In 1488, the town (now Old Town) of Paisley was erected into a burgh of barony by James IV. and formed into a separate parish inclosed by the Abbey or country parish. The suburbs, including the New Town, are of course within the limits of the Abbey Parish—the Abbey itself being situated in the new town on the east of the Cart. In the burgh, in 1821, there were three parishes, viz. the High, the Middle, and the Low Church, besides numerous places of worship for dissenters. Paisley was not represented before the passage of the Reform Bill.—P.

^g In a building called the Abercorn Chapel, still entire, on the east side of the cloisters, and south of the church.—P.

^h Greenock consisted of only a few fishermen's huts about 1697. The directors of the Scotch India and African Company having then determined to establish salt works on the shores of the Firth, Sir John Shaw, the superior, was led to improve its maritime advantages

afterwards in 1740, the gross receipt of the customs amounted to L.15,000; in 1828, they were equal to L.455,596.^a It now possesses three hundred and fifty vessels, measuring more than 50,000 tons. It is at Greenock and Port-Glasgow that the foreign and coasting trade of the county, and the principal foreign trade of Scotland, are carried on. They have an extensive trade with America and the West Indies, Ireland and the west of England, and by the means of the Forth and Clyde canal, with every part of Scotland. The herring and whale fisheries^b were once more important than at present, but the former is still flourishing, and the merchants of Greenock are extensively engaged in the Newfoundland and Nova Scotia fisheries.^c

The maritime county of Ayr is contiguous to Renfrewshire on the north, to Lanark and Dumfries-shires on the east, and to Galloway^d on the south, and it is washed in an extent of nearly seventy miles on the west by the Irish Sea and the Frith of Clyde. It is important as an agricultural county, and as a manufacturing one, it is only inferior to Lanarkshire and Renfrewshire. The area is not less than 1039 square miles, and the relative population is nearly equal to one hundred and forty individuals to the square mile. It is divided into the three bailiwicks of Cunningham, Kyle^e and Carrick. The first or the most northern is separated from the second or central division by the river Irvine; and the Doon, which is familiar to the readers of Burns, forms the boundary between the second and Carrick or the southern district. Cunningham is level and fruitful, Kyle is varied by heights, and the greater portion of Carrick is hilly or mountainous. Most of the rivers rise in the county, and fall into the frith or the sea, which washes it on the west; the principal are the Stinchar, the Girvan, the Doon, the Irvine, the Garnock and the Ayr, from which last, valuable whetstones are exported to England and different parts of Scotland. But Ayrshire possesses other advantages besides numerous rivers, an extensive coast and several commodious harbours—it abounds in coal and lime; to the one may be traced the origin and rise of its manufactures, and to the other its general improvements and increased fertility. The old

rotation of three consecutive crops of corn, followed by six years hay and pasture, has been generally abandoned, and, after the example of the eastern counties, has given place to an alternation of white and green crops. The dairy, however, is the great object of attention, the cows are not surpassed by any in Scotland, and the cheese is exported to most parts of Britain. An immense number of horses are bred in the same county; indeed it has been called the *patria* of the Lanarkshire or Clydesdale horse, which, for purposes of draught, may bear a comparison with any in the island. It must not be inferred that the agricultural improvements are yet complete; on the contrary, most of the lands are not sufficiently manured, and imperfectly drained, defects which must be partly attributed to the small size of the farms, affording little or no opportunity for the employment of capital, or the division of labour.

The products of industry are the various articles of the woollen manufacture, and in addition to the extensive works in which the different branches are carried on, private families in almost every parish are employed in making blankets and coarse cloth, which are sold in the markets and fairs of the county. Beith has long been noted for its thread manufacture,^g and the cotton works at Catrine are probably the most extensive of any in Scotland, at all events, it is not many years since they furnished occupation to more than nine hundred persons, who consumed 10,000 lbs. of cotton wool, and made 35,000 yards of cloth every week.^h Pig and bar iron are wrought on a great scale, and founderies are erected at Muirkirk, Glenbuck, and other places. The other manufactures are leather, saddlery, earthen ware, kelp and salt.

The seaport town of Ayr, the capital of the county, is situated on the banks of the river whose name it bears, and at no great distance from the Doon, of which the bar is impassable to ships.ⁱ The public monuments are not remarkable, and some of them date from the time of Cromwell, who built a citadel in the vicinity, and converted the principal church into an armoury.^k The harbour begins below a bridge of four arches,^l built between the town and the northern suburbs.^m Two piers of stone

(Myers' Geog. i. 178.)—Before the Union (1707), the merchants of Greenock had some trade to the Baltic for timber, in exchange for herrings, and to France, Spain and other parts of Europe. In 1714, a custom-house was established in Greenock, as a member of Port-Gla gov. About 1745, the town was formed into a separate parish, called the New Parish of Greenock, and in 1757, it was erected into a burgh of barony, by Sir John Shaw. (Stat. Acc. v.)—Greenock, like Paisley, was not represented previous to the Reform. In the town of Greenock, in 1817, there were two parishes (the new one erected in 1809.) The suburbs were included in the Old or country Parish. Besides these three established churches, there was a Gaelic chapel, and six other places of worship.—P.

^a In 1728, the gross receipt of the customs amounted to L.15,231; in 1828, they amounted to L.455,596. (Bell's Geog.)—P.

^b The Whale Fishery from the Clyde has been by no means successful. It was first attempted in 1752, but soon given up. It was again revived in 1786, but the Greenock merchants soon tired of it, and it was confined to Port-Glasgow. (Stat. Acc. x. 580. A. D. 1793.)—P.

^c This last statement is made, in the same terms, in the Statistical Account (vol. v. 580,) from which it is copied into the Gazetteer of Scotland, 1803.—P.

^d Wigtonshire and the stewartry of Kirkcudbright.—P.

^e Kyle is divided by the river Ayr into King's Kyle on the south, and Kyle Stewart on the north. Kyle or Coil has derived its name either from the Gaelic *coil*, a wood, or from Coilus, a British king ("auld King Coil,") who is said to have been killed in battle on the river Coil (Coyl) a south branch of the Ayr.—P.

^f Native country.

VOL. III.—NO. 61.

71

7 X

^g The manufacture of linen thread was introduced into the town of Beith (on the east of Kilbirnie Loch), and the surrounding country, in 1730, and in 1760, it is said to have amounted in value to L.16,000 annually. Since then it has greatly declined. (Stat. Acc. viii. 319.)—P.

^h The cotton works at Catrine (on the north side of the river Ayr, fourteen miles N. E. of the town of Ayr) were established in 1787, by Mr. Alexander of Ballochmyle, in partnership with the celebrated David Dale, founder of the New Lanark cotton works.—P.

ⁱ The construction would seem to imply that the entrance of the Doon is impeded by a bar; but the entrance of the river Ayr is impeded by a bar occasionally thrown across it, especially by north-west winds. The bed of the river is narrow, and the depth of water, at spring tides, not above twelve feet; so that vessels exceeding 140 tons cannot pass the bar. (Ed. Enc. Stat. Acc. ii.)—P.

^k Cromwell built his citadel around the old church of St. John the Baptist, which stood near the sea, and also near the site of the old castle built by William the Lion. The citadel enclosed twelve acres of ground, including the church and the site of the castle. He converted the church into an armoury, and as an indemnity, gave 1000 English merks to the citizens for building a new one. The tower of the old church still remains.—There are now two established churches in Ayr. (Ed. Enc. 1813.)—P.

^l The river is crossed by two bridges, the Auld and New Brigs of Burns—the former, which is very narrow, with several low arches, is said to have been built in the reign of Alexander III.; the latter is a recent structure, situated about a hundred yards below the old bridge (Chambers' Pict. Scot. i. 295.)—P.

^m The principal suburb on the north side of the river forms a sepa

and wood, prolonged to the distance of 550 yards on the right and left of the river, serve as moorings to vessels which take in cargoes of coal from wharfs similar to those at Sunderland and Tynemouth. The port reckons about sixty vessels, which measure 5000 tons, and they are mostly employed in exporting the coal that abounds in the surrounding country. The town and neighbourhood have been rendered classical by the muse of Burns, and the ruins of Alloway Kirk excite a deeper interest than that resulting merely from a romantic situation. A costly monument, erected in honour of the poet, rises near the humble dwelling in which he was born;^a the one contrasts well with the other, and both are emblematic of the conduct of his countrymen—they suffered him to live in poverty, they raise monuments to his memory.

Kilmarnock, the most flourishing town in the county, was at no very remote period an obscure village.^b It is situated on the Fenwick near its junction with the Irvine, about fourteen miles to the north-east of Ayr. It was formerly one of the worst built places in Scotland; it is now distinguished by modern houses and regular streets. Independently of the carpets, blankets, tartans, bonnets and woollen manufactures, of which it is the principal seat in Ayrshire, many workmen are employed in weaving cotton, muslin and silk for the manufacturers of Glasgow and Paisley. Greater extension has of late been afforded to its trade by improved communications, for which the inhabitants are indebted to the Duke of Portland. The works of that public spirited nobleman are the harbour at Troon, a promontory which stretches about a mile into the Frith of Clyde,^c and the rail road, which extends from the same harbour to the town of Kilmarnock, a distance of more than ten miles. The harbour extends more than two hundred yards into the sea, and it is proposed to prolong it to three hundred. The depth at the present extremity is about 18 feet at low water. A graving dock was finished about five years ago, and it is now much frequented for the repairing of coasting vessels. Another, which was still more lately completed, is thirty-seven feet wide at the gate, and vessels of almost any burden may enter it. Extensive warehouses are erected, and a yard is open for the building of ships. There are upwards of 3000 acres of coal fields in the country along which the railway passes from the harbour to Kilmarnock. Coal, accordingly, has hitherto been the principal article of conveyance to Troon, and the average quantity exceeds a hundred tons daily. Iron, grain, timber, and other articles, are transported to Kilmarnock.

Another instance of public spirit is exhibited in the works, which have been begun and carried on at Ardross-

rate burgh (of barony), called Newton upon Ayr. Ayr itself is a royal burgh.—P.

^a This house is situated about a mile and a half south-east of Ayr, on the right hand side of the road to Maybole, within a few hundred yards of Alloway Kirk, and but little farther from the Brig of Doon. The monument, a costly edifice of white stone, in the form of a Grecian temple, rises on a height between the kirk and the bridge.—P.

^b Kilmarnock was erected into a burgh of barony in 1591. It was not represented before the Reform Bill.—P.

^c It is about midway between the mouths of the Ayr and Irvine. Off it, at about two miles distance, is a small island, called Lady's Isle, within which is a road for ships.—P.

^d Irvine stands on the north side of the river Irvine at its mouth. Saltcoats is on the coast, about five miles north-west of Irvine, and

an by the Earl of Eglinton. The Frith of Clyde is in many respects ill adapted for the purposes of navigation; the channel is narrow—it is exposed to squalls, and rendered dangerous by shallows. Besides, it can only be navigated when the wind blows from certain directions, and that appears almost a sufficient reason for having the harbour of Glasgow in the open bay of Ardrossan, where, whatever be the direction of the wind, mariners can put to sea, which they cannot do either at Greenock or Port-Glasgow. As Ardrossan thus offered the site of a safe, commodious and accessible harbour, the works were commenced with much spirit, and a circular pier of 900 yards was completed in 1811. A wet dock was afterwards begun, which according to the plan of Mr. Telford, should contain a hundred vessels, and have a depth of water equal to sixteen feet. But the works have been given up, and they are not likely to be finished without public aid. The harbour was only part of the original plan; it was proposed, instead of the present circuitous passage by the Frith of Clyde, to open a direct communication with Glasgow, Paisley and the other flourishing towns in the vicinity. The line of a canal was therefore marked from Glasgow to Ardrossan, a distance of thirty-one and a half miles, and the expense of cutting it was estimated at L.125,000. About a third part of this work, namely, that which extends from Glasgow to Johnstone, is finished, and it cost nearly L.90,000. The other ports in the county are those of Saltcoats and Irvine,^d and their principal trade consists in the export of coal to Ireland.

Returning to the Forth and Clyde canal, we enter Stirlingshire, which is situated on the isthmus between these two friths.^e It is contiguous to the counties of Perth and Clackmannan on the north, to Linlithgowshire on the east, to Lanarkshire on the south, and to Dumbartonshire on the south-west and west. The population amounts by the last returns to 72,621 individuals, and the surface has been estimated at 625 square miles. Nearly two-thirds of the surface consist of hills, and are unfit for cultivation; they afford, however, good pasturage to sheep, for although heath appears occasionally, they are mostly covered with green herbage. The Lennox hills, the principal tract of this description, extend across the county from Dumbartonshire on the west to the town of Stirling on the north, and their elevation is not higher than 1,500 feet.^f Loftier summits are situated in other directions; Ben-Lomond on the north-west, on the banks of Loch Lomond, is 3262,^g and Benclach in the parish of Alva on the north side of the Forth is 2400 feet.^h The country is low on the north and on the east of the Lennox hills, and much of the

one and a half south of Ardrossan Point. It has a good artificial harbour.—P.

^e The Friths of Forth and Clyde.

^f Seldom exceed an elevation of 1500 feet above the sea. The height of the Campsie hills is about 1500, and that of the Kilsyth hills 1365. (Ed. Enc.)—The trap range extending from the Clyde at Dumbarton, in a north-east direction to the Forth at Stirling, where it meets the Ochils, is called by the general name of the Lennox Hills. Different portions of the range receive different local names, viz. from east to west, the rock of Stirling, the Gargunnoch and Kilsyth hills, the Campsie Fells (hills), the Kilpatrick hills, and the rock of Dumbarton.—P.

^g 3176 feet. (Bell.)—P.

^h 2420 feet. (Bell.)—Benclach or Benclough (Gaelic, *Benn-Cloich*,

land near the Forth is only a few feet higher than the surface of the water.

Almost every variety of soil, common to Scotland, may be found in Stirlingshire, but that by which it is most distinguished, is the alluvial or carse land on the Forth. It covers an extent of about 40,000 acres within the county, and twice as many in the adjoining counties of Perth, Clackmannan and Linlithgow, in all about 200 square miles. It is without doubt the most fruitful land in the kingdom; it is unmixed with stones, it consists of the finest particles of earth, and in point of friability it approaches to loam. It is in some places thirty feet deep, and nowhere so much above the level of the sea at high water. Lastly, the debris of plants and animals have been found at the depth of nineteen feet, while the upper surface consists entirely of fine earth.

The same county is well supplied with valuable minerals, and the abundance of coal in particular, has given rise to different manufactures. The northern boundary of the great coal belt, which extends in an oblique direction from Cantyre on the west, to Fifeshire on the east, runs in Stirlingshire along the southern base of the Lennox hills; the mineral abounds, as has been already seen, on the south, although it has not yet been discovered in any quantity on the north of this line. Limestone, ironstone and sandstone are common in different places, and other substances, such as copper, lead and silver, have occasionally been wrought.

Stirlingshire was at an early period exposed to frequent contests, and to defend it against the incursions of the Caledonians, who descended like torrents from its mountains, a chain of forts was built by Agricola.^a At a later period it was the boundary of four kingdoms, namely, the Cumbrian and Northumbrian on the south, and the Scottish and Pictish on the north,^b and became in consequence the battle-field of these warlike barbarians.

Stirling, the capital, was formerly called *Striveling*, the place of contention or fight, and from its ancient castle, it is said, may be seen twelve spots in which as many battles were fought. It is certain that the castle itself was long one of the most important fortresses in the kingdom, and as such, its possession was contested from the time of the Danish invasion in the year 1009^c until it was taken by General Monk in 1651. Situated

peak of the stone or rock) is the highest of the Ochils, and near their western extremity; it is situated at the point where the three counties of Clackmannan, Perth and Stirling meet, partly in each. Alva hill, or Wood hill, farther west in the same range, is 1620 feet high.—P.

^a The chain of forts (*pratentura*), built by Agricola, occupied nearly the same line as the wall of Antoninus, and of course extended along the southern border of the county. It could not therefore have been a direct defence to it against the Caledonians.—P.

^b The Cumbrian (*Cumraig*, or *Cymraig*) kingdom of Strath-Clyde continued till the 10th century. It extended over all the west of Scotland, south of the Frith of Clyde. Its inhabitants are said to have been of kindred origin with the Welsh, i. e. *Cimbri*, or *Cymry*. (Pinkerton.) The Anglo-Saxon kingdom of Bernicia or Northumberland extended over the eastern part of Scotland, south of the Forth, including the Lothians. The Pictish kingdom occupied the east of Scotland, north of the Forth. Abernethy, on the Tay, in Perthshire, was its capital. The Picts are considered by G. Chalmers as descendants of the original Celtic population of Scotland (the *Caledonii* of the Romans); by Pinkerton, as descendants indeed of the Caledonians, but originally a Gothic colony from Norway. The Scottish kingdom was founded in the 6th century by the Dalriads (Gaelic, *Dalruadhini*), an Irish colony, who settled in Argyle, and became the ancestors of the Highlanders. They occupied the north-west of Scotland.—P.

^c Stirling Castle was rebuilt by the Northumbrians, who had taken

at the western extremity of the rock on which the town is built, it commands an extensive view of the beautiful country in the neighbourhood. The Scottish kings used frequently to hold their court in Stirling castle; there James the Second was born, and there he murdered with his own hand his kinsman, the earl of Douglas. The palace^d is now converted into a house for the governor, and barracks for the soldiers, but the apartments occupied by the celebrated Buchanan, while tutor to James the Sixth, are still shown to strangers. The Forth, which waters the valley below it, pursues a very meandering course, so much so that following it to Alloa, the distance is more than twenty miles, while in a direct line it is less than seven.^e These windings are called by the common people the *links* of the Forth.^f The town itself is ancient and irregularly built; all the old streets, except the one on the summit of the hill, which is broad and spacious, are crooked and narrow. Considerable additions have been made, however, within the last thirty years, and modern houses and regular streets have been erected on the north and on the east of the town. Although not remarkable for its manufactures or any branch of industry,^g it is not without some inland and foreign trade, the latter chiefly to the Baltic. Vessels of seventy tons ascend to the quay, after a circuitous and tedious navigation from Alloa.

The village of Bannockburn is situated about two miles to the east of Stirling, and is still memorable on account of the battle in which the Scots, under the conduct of Bruce, defeated the English, and regained independence.^h The marsh into which the English soldiers incautiously rushed, still remains, and the stream that was stained with their blood, has since been made subservient to the purposes of industry. It is long since the inhabitants have been disturbed by the march of hostile armies, and the village is now flourishing; although still a place of very moderate population, it possesses extensive manufactories of carpets, tartans and leather.

Continuing our journey eastwards, we arrive at the town of Falkirk, which may be mentioned on account of its three annual *trysts* or fairs, the most important of any in Scotland for the sale of oxen and sheep. The neighbouring port of Grangemouth has become flourishing from its position on the Forth and Clyde canal;ⁱ but the vil-

possession of that part of Scotland, in the 9th century. In the 10th century, it was retaken by the Scots, and, during the Danish invasion in 1009, it was the place of rendezvous of the Scottish army. (Gaz. Scot.)—The Danes made three successive invasions of Scotland in the reign of Malcolm II. (A. D. 1003—33) viz. in Moray, Angus and Buchan.—P.

^d The palace is a large building, in the form of a quadrangle, in the south-eastern part of the castle.—P.

^e The distance, by the windings of the Forth, from the quay of Alloa to the bridge of Stirling, is 19½ miles, whereas the distance by land does not exceed seven miles; though the turnings in the road are numerous. (Stat. Acc. viii. 593.)—P.

^f The Scottish word *links* signifies, 1. the windings of a river, forming peninsulas: "the bonny *links* o' Forth;" 2. the rich carse land in those peninsulas: "Forth's *links* o' waving corr" (Macneill); 3. sandy flat ground on the sea shore, covered with bents, furze, &c., and used in playing golf: the *links* of Leith, of Montrose, &c.; 4. any tract of sandy ground, not on the sea-coast, of a similar character, as Bruntsfield Links, part of the old Borough-muir of Edinburgh.—P.

^g Cotton and woollen goods, but particularly carpets, are among its chief manufactures. (Ed. Enc.)—P.

^h July 24, 1314.

ⁱ It is situated at the junction of the canal with the Forth, and is thus an important port. It was built in 1777.—P.

lage of Carron must be considered the most remarkable place in the vicinity, for its iron works are among the most extensive of any in Britain. They were erected about the year 1760; twenty furnaces are now employed, more than two hundred tons of coal are consumed weekly, and employment is provided for upwards of 2000 persons.^a Various articles used in the arts and in war are manufactured at Carron; among the former are cylinders, steam engines, pumps, boilers, flies, wheels and pinions; among the latter are different articles of ordnance, and the carronade, a short ship gun with a chamber, which derives its name from that of the place. The transportation of these ponderous articles to different parts of Britain, and to foreign countries, is facilitated by means of the Forth and a navigable canal.^b

The Forth separates Stirlingshire from Clackmannanshire; the latter is bounded on the south-east by Fifeshire, and in every other direction by Perthshire.^c Although the smallest county in Scotland, it is more important than might be inferred from the extent of its surface; thus, the area does not exceed fifty-two square miles, but the population is not much less than three hundred persons to every square mile.^d Nearly three-fourths of the surface are under cultivation, a greater proportion, with the exception of East Lothian, than that of any other Scottish county. It is besides rich in minerals; silver, copper, lead, iron-ore, cobalt and antimony have all been discovered on the Ochil hills, between Airthrie and Dollar.^e They have never been worked on an extensive scale, and the miners have never penetrated below the level of the plain or the base of these mountains; but it is still believed that valuable metallic veins are contained in them, and that they may reward the enterprise of future capitalists. A mass of greenstone, in the neighbourhood of Stirling, is known by the name of the Abbey-Craigs;^f its external appearance is columnar, and the internal structure is crystallized. It affords, in the grinding of wheat into flour, a useful substitute for the French buhr-stones, which could not be obtained in Britain during the last war. It is not many years since the stone of the Abbey Craig was first applied to that purpose, and the discovery was made by Mr. James Brownhill, a miller at Alloa. The Clackmannanshire millstones are now considered superior, in some respects, to the French; many hundreds of them are used in different parts of England and Scotland, and the ingenious individual already mentioned, was rewarded

for his discovery by the Society for the Encouragement of the Arts. Coal has been worked during two hundred years, and the quantity obtained annually from this small county, amounts to more than 130,000 tons.^g The excess above what is required for the home consumption, is exported to Leith, Dunbar and other parts of the country. Machinery for drawing water from the mines, was constructed before the invention of the steam-engine, and the Alloa colliery is drained by an overshot water wheel, which is thirty feet in diameter, and which raises the water from the depth of three hundred. And it may be remarked, that a powerful steam-engine, belonging to the Devon coal company,^h is capable of raising 1,000,000 gallons of water in twenty-four hours, from the depth of two hundred and eighty feet.

The small town of Clackmannan, the capital of the county, is finely situated on an eminence above the banks of the Forth, and is crowned by an ancient tower or keep, all that remains of the palace of King Robert Bruce.ⁱ The port of Alloa is well situated for commerce; the quay is well built, and the dry dock can admit vessels of large burden. The custom-house comprehends within its precincts, the creeks of Stirling, Kincardine, and Clackmannan. A hundred and thirty vessels are registered, carrying nearly 10,000 tons. There are cleared outwards, on an average, from 900 to 1000 vessels, carrying 50,000 tons, and employing 2500 seamen. The distillation of spirits, it may be added, is the most important branch of industry; there are not fewer than six large distilleries in this small district, and two of them paid some time ago to government, in the form of excise duty, a greater sum than the whole land-tax of Scotland.^k

If Clackmannanshire be excepted, no other county is so small as Kinross-shire, which is bounded on the north-east, east and south by the county of Fife, and on the north and west by Perthshire. The greatest length from east to west is about twelve miles, the utmost breadth from north to south is not more than ten, and the area is probably equal to eighty-three square miles. The number of persons amounts to a hundred and ten to the square mile; it is therefore much inferior to the last county in point of population.

It is the highest level land in the peninsula formed by the Forth and the Tay; it was formerly called *Ross* or the promontory, and it comprehended in addition to the present county those of Fife and Clackmannan.^l The productive lands cover an extent of 30,000 acres, or

^a There are five blast furnaces, which produce nearly 200 tons of pig iron weekly, and above 20 air furnaces and cupolas for castings. No less than 200 tons of coal are consumed daily. Upwards of 2000 people are employed at the works. (Ed. Enc. 1813.)—P.

^b A canal leads directly from the works to the Carron Wharf, on the Forth and Clyde canal.—P.

^c The county is properly bounded on the south-west by the Firth of Forth, separating it from Stirlingshire; on the north by Perthshire; on the east, for a short distance, by Fifeshire; and on the south-east by a detached portion of Perthshire, including Culross. On the north-west, it is interlocked with detached portions of Stirlingshire.—P.

^d About 283.—P.

^e The trap range of the Ochils is a continuation of that of the Lennox Hills, which terminate at Stirling. It commences in the Abbey Craig, in the parish of Logie, on the north of the Forth, opposite Stirling, and thence extends easterly along the northern border of the parishes of Alva, Tillicoultry and Dollar. It thus skirts the county of Clackmannan on the north, and along its southern foot ranges the valley of the Doan (Devon.) The rest of the county on the south-east, of which the surface is uneven, belongs to the coal formation.—P.

^f The Abbey Craig (in Logie parish, separated by the Forth from

the rock of Stirling, with which it corresponds)—so called from its vicinity to the ruined abbey of Cambuskenneth.—P.

^g The present annual output of coals may be taken at 130,000 tons. (Ed. Enc. 1815.)—P.

^h At the Sauchy mine, in Clackmannan parish. (Ed. Enc.)—P.

ⁱ The old tower is said to have been built by King Robert Bruce, and was long the seat of the chief of the Bruces, the hereditary sheriff of the county. (Stat. Acc. Ed. Enc.)—P.

^k There are no less than six large distilleries in this small district [the county of Clackmannan]; Kilbagie, in the parish of Clackmannan, is the most extensive. (Ed. Enc.)—The two great distilleries of Kilbagie and Kennetpans, in Clackmannan parish, paid to government an excise duty considerably greater than the whole land tax of Scotland, previous to 1788, when the license duty was doubled, and an increased duty levied on all Scotch spirits imported into England. From that time, the business declined, but in 1795 the duty paid by those two distilleries was L.8000 yearly. (Stat. Acc. xiv. 623—6.)—P.

^l This is erroneous. The subject is stated more correctly in the Edin. Encyc. "The county of Fife at a former period included the county of Kinross, and part of Clackmannan. The whole district was

about three-fifths of the whole; the remaining portion consists either of a light and scanty soil, or of moorish and barren land. Coal is worked in the southern districts, and the prevailing rocks are whinstone,^a sandstone and limestone. Several lakes are scattered in different directions, and Loch Leven, the largest, may bear a comparison with any other in the lowlands of Scotland. It is situated in the middle and near the capital of the county; it covers an extent of about six square miles, is adorned with several islands, and abounds with different kinds of fish. The largest of the islands is upwards of two acres,^b and it is crowned by the ruins of the castle in which the unfortunate queen Mary was confined. The lake is fed by several rivulets, but only one stream of any size issues from it at the eastern extremity, passes through a considerable part of Fife, and enters the sea at the town of Leven.^c

Kinross rises in a plain at the west end of the lake, on the great road from Edinburgh to Perth; it is styled the capital, and the only town in the county;^d in reality, however, it is little better than a village. A few weavers are employed by the manufacturers of Glasgow, but no branch of industry is conducted on a great scale.^e

The county of Fife is contiguous to the last, and to Perthshire and Clackmannanshire, on the west; the river Tay forms the boundary on the north; it is bathed by the German Ocean on the east, and by the Frith of Forth on the south.^f The mean length of the county from east to west is about thirty-six, and the mean breadth from north to south about fourteen miles,^g so that the surface is equal to five hundred and four square miles. The relative population is upwards of two hundred and fifty-five persons to the square mile.

It is varied in every direction by hill and dale, but the surface in general is by no means lofty, and it has been calculated that about four-fifths of it are fit for cultivation; the remaining portion consists of hills and moors. It is divided into two portions by a high tract, of which the western part is formed by the Lomond hills, and which stretching almost in a direct line eastwards approaches within a few miles of the shore. West Lo-

mond, the highest of these hills, is seventeen hundred and twenty-one feet above the level of the sea; Largo Law on the east is nine hundred and fifty-two, and Kelly Law is eight hundred and ten. The same county is naturally divided into three parts by the Eden and the Leven; the northern extends between the former of these rivers and the Tay, the central lies between the Eden and the Leven, and the southern between the Leven and the Frith of Forth. In the southern part the soil is very fruitful, and consists of a deep rich loam which covers a tract about three miles in breadth. In the central division a cold and sterile clay, resting mostly on sandstone, stretches to the heights on the south of the Eden. But along both the banks of the same river is situated the *How of Fife*, or the rich valley of Stratheden. A continuation of the Ochils separates this valley from the Tay, but the soil is in many places fertile, and often deeper on the acclivities than at their base. It thus appears that the most fruitful lands are situated on the confines, while the bleak or barren parts, the moors and mosses, are chiefly confined to the central districts. It was formerly said by James the Sixth, that Fife resembled a *gray cloth mantle with a golden fringe*, and the simile is not inapplicable to it at the present day.^h

The southern division of Fifeshire from the Forth almost to the Eden, abounds in coal, and every kind common to Scotland is found in that part of the country. The strata incline to the east and south-east, and do not extend more than two or three miles from the shore.ⁱ Thus, coal occurs in this district and along the coast line from west to east in the parishes of Torryburn, Abbots-hall, Kirkaldy, Dysart, Wemyss, Scoonie, Largo and Pittenweem. The works in Dysart are very extensive, and one of the beds, eighteen feet thick, is said to have been worked more than three hundred years ago.^k On the north of this tract, the coal and the strata that accompany it, incline commonly to the north or north-east, and the largest collieries are situated in the parishes of Dunfermline, Dalgety, Auchterderran and Leslie. Lastly, from the vale of Eden northwards to the Tay, there is no appearance of coal or the concomitant

known by the name of Ross, or the peninsula, and hence Culross [in the detached portion of Perthshire on the Forth] signified the lower [back] part of the peninsula [Gaelic, *cul*, backside,] Kinross the head of the peninsula [Gaelic, *ceann*, head,] and Muckross, now Fifeness, the snout of the peninsula, or the latter may have been so called from the number of wild boars [Gaelic, *muc*, a boar] that infested it." (Art. Fifeshire.)—Kinross-shire was not separated from Fifeshire until 1426. (Ed. Enc.)—The whole peninsula between the Forth and the Tay formerly went under the general name of Ross. (Stat. Acc.)—This Gaelic name, *Ross*, is frequently applied to peninsulas in Scotland. Thus, the county of Ross, so called from the two peninsulas on its eastern coast, on the north and south of the Firth of Cromarty; Montrose, the fenny peninsula (Gaelic, *Moinross*, from *moin*, a fen or morass, and *ross*): Roseneath, a peninsula on the Clyde in Dumbar-tonshire—Gaelic, *Rossnachoch* (*Ross-na-h-oighe*,) peninsula of the virgin (*oighe*).—P.

^a Greenstone or trap.—This forms the summit rock on the hills, both of the Ochils on the north, and of those of the coal formation on the south. Sandstone is the underlying rock of the whole county. The limestone accompanies the coal.—P.

^b The largest island (St. Serf's Isle, or the Inch) is generally said to contain 45 acres (23.44 acres. Ed. Enc.) Castle Island contains about two acres.—P.

^c It would be singular if more than one stream of any size issued from it. Its outlet is the river Leven.—P.

^d Kinross is the county town, and the seat of the sheriff courts and other public meetings.—P.

^e Population in 1811, 2214. It was formerly celebrated for its manufacture of cutlery, and in the latter part of the last century was ex-

tensively engaged in the manufacture of coarse linens, called Silesias; the quantity stamped averaging annually, from 1780 to 1790 inclusive, 118,434 yards, at the value of L.4441. (Stat. Acc. vi. 169.)—P.

^f Following the western boundary from the Tay on the north, Fifeshire is first bounded in that direction by Perthshire (W.); then by Kinross-shire (S. W., W., N. W. and N.); then by Fos-away parish, in Perthshire (N.); then for a short distance by Clackmannanshire (W. and S. W.); and lastly, by Culross, in the detached portion of Perthshire (W.) The Firth of Forth is generally considered as extending along its south and south-eastern coast to Fifeness, whence the coast extends north-west by St. Andrews to the mouth of the Eden, and then north to the mouth of the Tay.—P.

^g Its greatest breadth is about 19 miles from north to south, and its greatest length about 48 miles, from Fifeness on the east, to the borders of Clackmannanshire on the west. (Ed. Enc.)—P.

^h This remark was made in allusion to the close line of boroughs along the southern coast, compared with the moors in the interior of the county.—P.

ⁱ This must refer to the strata on the coast, particularly in the neighbourhood of Dysart.—P.

^k There are 14 beds of coal on the Sinclair estate, in Dysart parish. Three of the thickest, which are contiguous, are now working. The upper is 5 feet thick, separated from the second, by a stratum of 18 inches thick (thin coal and till or slate); the second, 8 feet thick, and underneath it, a stratum of stone 2 feet 3 inches thick; the lower, 5 feet thick; so that the whole thickness of workable coal is 18 feet. The coal is now worked at the depth of 60 fathoms. Dysart coal was among the first wrought in Scotland, having been begun 300 years ago. (Stat. Acc. xii. A. D. 1794.)—P.

minerals. Limestone abounds in the same part of Fifeshire that is so rich in coal,^a and it may be sufficient to remark that the lime works at Charlestown on the Forth^b are the most extensive of any in Scotland. More than a hundred thousand tons are annually raised from them; they are partly sold as they are taken from the quarry, and 12,000 tons of coal are consumed every year in calcining the remainder.^c Such are the most important mineral substances; some of the others are ironstone, lead, and clay well adapted for fire bricks.

The civil divisions of Fifeshire are the districts of St. Andrews, Cupar, Kirkaldy and Dunfermline. Cupar is entitled the capital, but it is by no means the most populous or the most industrious town in the county. It is situated at the junction of the St. Mary, a small stream, with the Eden; it consists of three or four streets, several detached houses and many lanes. The manufacture of linen is the most important branch of industry, and more than 500,000 yards have been stamped in a year.^d The other articles made in the same place are soap, candles, leather, cordage, bricks and tiles. Although remarkable for its antiquity, few ancient monuments remain, and no part of the castle in which the thanes of Fife held their courts can be discovered.^e The hill on which it stood, is still styled the Play-field of Cupar, and the satire of the Three Estates, one of the oldest Scottish dramas, was acted on it in 1535.^f

At no great distance from the mouth of the Tay, and about twelve miles to the east of Cupar, is situated the ancient city of St. Andrews. It was erected into the capital of a diocese at the intercession of James the Third by Pope Sixtus the Fourth in the year 1441,^g and it possessed, during a long period, the distinction of being the metropolitan see of the kingdom. The cathedral, once its great ornament, is now in ruins; to build it was the labour of a century and a half; it was destroyed in a single day by the zeal of the reformers.^h The remains

^a In the range of the Ochils, limestone is found only at one place, near Newburgh. (Ed. Enc.)—P.

^b In Dunfermline parish.—P.

^c The following statements are contained in Sir J. Sinclair's Stat. Acc. vol. xiii. p. 468. "From 80,000 to 90,000 tons of limestone are quarried annually. It is partly manufactured into lime at the works, and partly sold in the unburnt stone. About 12,000 tons of coal are annually consumed in burning the lime." This was in 1793—4. Has there been no increase since then?—P.

^d About 500,000 yards of linen are annually stamped at Cupar. (Stat. Acc. 1796.)—P.

^e It was long the residence of the Earls of Fife, and afterwards became a national fortress. (Stat. Acc.)—The Thanes of Fife, from the earliest times of which any account has been transmitted to us, held their courts of justice at Cupar. (Gaz. Scot.)—P.

^f The place, where, during the middle ages, the theatrical representations, called *mysterics* and *moralities*, were presented, was styled the *Playfield*. Arnot, in his Hist. of Edinburgh, says, "that of Cupar in Fife was on the Castle-hill." (Stat. Acc. xvii.)—In 1555, the esplanade in front of the castle was appropriated for the performance *sub dio* of Sir David Lindsay's Satire of the Three Estates, a witty drama, principally levelled at the clergy, and supposed to have had great influence in bringing about the religious revolution, which soon after ensued. (Chambers' Pict. of Scot. ii. 178.)—The same date (1555) is given in the Stat. Acc., in which the Proclamation is inserted. The first outbreak of the Reformation at Perth was in 1559. Sir D. Lindsay is said to have written the Three Estates before 1536. (Gorton.) His estate, called the Mount, was in the neighbourhood of Cupar.—P.

^g St. Andrews was the see of a bishop in the time of the Picts, at least in the 9th century. It was erected into an archbishopric by Sixtus IV. at the request of James III. during the incumbency of Patrick Graham. This could not have been in 1441. James III was born in 1452. Patrick Graham finished the monastery of the Observantines in 1478. Sixtus IV. became pope in 1471.—P.

^h It was begun in 1159, and finished in 1318, and was thus 159 years

are part of the south side, of the east and west ends, and the chapel of St. Regulus, of which the body and great tower are still standing.ⁱ The ancient castle, like the cathedral, has now fallen into decay, but it is remembered as the scene of many a struggle and many an act of injustice. It may be sufficient to add that Cardinal Beaton beheld from one of its windows the execution of the reformer Wishart, whom he had unjustly condemned to death, and before the same window the body of the cardinal himself was exposed immediately after his assassination. The principal church, which is sufficiently large to hold between two and three thousand people, contains the monument of Archbishop Sharpe, who was murdered near the town by the covenanters,^k an event which is still recorded by rude sculptures on the walls.^l The university of St. Andrews, the oldest in Scotland, consisted originally of three colleges, St. Salvator's, St. Leonard's, and St. Mary's; but the second has been dissolved, and the first is set apart for the students of divinity.^m The number of students seldom exceeds three hundred, and the university has been long known abroad on account of the facility with which it confers degrees. The same town carried on formerly a considerable trade, and it possessed in the time of Charles the First from thirty to forty vessels. It is now nowise remarkable for commerce or industry.

Kirkaldy,ⁿ like St. Andrews, is the chief town of a district; it is situated on the Frith of Forth about thirteen miles to the north-east of Edinburgh. It consisted formerly of several lanes, communicating with a very long, narrow and irregular street, but of late years improvements have been made, and new streets and modern houses have been erected.^o The town, once a place of much more consequence than at present, was a port of some importance so early as the fourteenth century, when it was made over as a burgh of regality to the abbot of Dunfermline by David the Second.^p It was afterwards raised to the rank of a royal

in building. It was destroyed in a single afternoon (June 1559) by a mob, after having been excited by a sermon of John Knox against idolatry.—P.

ⁱ The only remains of the cathedral are part of the east and west ends, and of the south side. (Ed. Enc.)—Both towers at the east end are still standing. One only of the western towers now remains, and a part of the west end of the outermost south wall. (Stat. Acc.)—The chapel of St. Regulus (St. Rule's chapel,) though near the cathedral, was not a part of that edifice. It is said to have been erected by Hergust, king of the Picts, for St. Regulus, a Greek monk, who landed at St. Andrews, A. D. 370. The walls of the chapel, and its square tower, still remain. The latter is in fine preservation. Its low semicircular arches, and general style of architecture, indicate a great antiquity.—P.

^k On Magus moor, three miles west of St. Andrews, 1679.—P.

^l The monument is 30 feet high, and contains besides a Latin epitaph, a statue of the archbishop kneeling, and a bass-relief, on an oblong marble slab, representing his murder. (Chambers' Pict. Scot.)—P.

^m St. Mary's was appropriated to the study of theology in 1579, by James VI.; the university having been then remodelled by the celebrated Buchanan. It is therefore called the Divinity or New College. In 1747, on a petition from the masters of St. Salvator's and St. Leonard's, these two colleges were united by parliament into one society, called the United College of St. Salvator's and St. Leonard's. (Stat. Acc.)—P.

ⁿ Kirkaldy, i. e. Kirk-Keldei, church of the Culdees.—P.

^o Kirkaldy, including Pathhead on the east, in Dysart parish, and Linktown on the west, in Abbotshall parish, all of which form one continuous street, is about three miles in length.* The extremities of this street are narrow, tortuous and ill-built, but in the middle it expands to a noble breadth, and is almost perfectly straight, with tall and elegant houses. (Chambers.)—P.

* From this circumstance, it is familiarly called "the Lang Toun o' Kirkaldy."

P. A. D. 1334.—P.

burgh,^a and important privileges and immunities were conferred on it. About a hundred vessels belonged to Kirkaldy during the reign of Charles the First, and evidence is not wanting to shew that it was then more populous than at present. The period of the civil war was the commencement of its decline, and the inhabitants suffered so much in consequence of their exertions in behalf of the Parliament, that it was deemed necessary in 1682 to present a petition for relief to the convention of royal burghs. Its commerce, however, has revived since the middle of the last century, and it now possesses about eighty vessels, the burden of which amounts to 7000 tons. Its spinning-mills, linen manufactories and tanneries, a foundery, and a large distillery, afford employment to the poorer inhabitants. It may be added that the town was the birth-place of Adam Smith, the author of the *Wealth of Nations*, and the first person who raised political economy to the rank of a science.

Dunfermline, the only other place that requires to be mentioned, and the most important manufacturing town in the county, is situated about fourteen miles to the west of Kirkaldy, and more than four to the north of the Frith of Forth.^b The principal manufacture, and the one in which nearly 1800 looms are employed, consists of diaper and damask table linen; the cotton manufacture, which is now increasing, was introduced at a later period, in consequence of the demand for such articles by the manufacturers of Glasgow and Paisley. The same place is memorable on account of its remains of royal and ecclesiastical magnificence; the sites of two palaces have been discovered by antiquaries,^c and the ancient monastery is now in ruins. The last building founded by Malcolm the Third, was much injured by Edward the First, who quartered his troops in it during winter,^d and was finally desecrated at the Reformation.^e The part occupied by the chancel and transepts was lately transformed into a Gothic church,^f which accords ill with the Saxon character still visible in the ruins.^g While the workmen were occupied in building the church, the tomb and the remains of King Robert Bruce were discovered.

“*Oppidulis præcingitur*”^h are the terms used by Buchanan in reference to the numerous small towns on the northern shore of the Frith of Forth. These places are now fallen into decay, but they derived their former importance from the advantages of commerce, to which the inhabitants had devoted themselves at a time when it was almost unknown in most parts of Scotland.

^a In 1450, the commendator of the abbey, and the convent, disposed of the burgh and harbour, with all their rights and privileges, to the bailies and community of Kirkaldy, soon after which it was erected into a royal burgh. (Stat. Acc.)—P.

^b About 3 miles north of the Frith of Forth at Queensferry. (Ed. Enc.)—This is the general statement.—P.

^c The tower or castle of Malcolm III. (Canmore,) and a little S. E. of it, a palace of later construction, in which James VI. resided. Only a few fragments of these buildings remain.—P.

^d A. D. 1303.—P.

^e The Abbey of Dunfermline was founded for the Benedictines in the 11th century, by Malcolm Canmore (Gaelic, *ceann-mor*, great head.) Edward I. destroyed all but the church and a few cells for the monks. At the reformation, these cells, and the choir and transepts of the church, were demolished, leaving only the nave, which was used as the parish church till 1818, when the choir and transepts were restored, and the edifice thus completed. The nave, however, is of heavy Saxon architecture, while the new structure appended to it, is of light Gothic. (Chambers.)—P.

^f In 1818.—P.

The county of Forfar or Angusⁱ is separated from Fife by the Frith of Tay; its boundaries are Aberdeenshire and Kincardineshire on the north, the German Ocean on the east, the Frith of Tay on the south, and Perthshire on the west. The superficial extent, according to the lowest computation, is upwards of 840 miles, and the population by the last census amounts to 139,606 individuals.

It may here be remarked that what is popularly termed the east coast of Scotland comprehends that part of the country between the friths of Tay and Moray; it forms a sort of large plain, which descends from the Grampians to the sea, and includes the counties of Forfar, Kincardine and Aberdeen. The northern division, or more than a third part of Forfarshire, is covered by the Grampians; but the heights are not bold or precipitous, their summits are generally rounded, and Catlaw, the loftiest in the county, is not more than 2264 feet above the level of the sea.^k The same hills are covered with a thin stratum of moorish soil bearing heath and coarse herbage. They are intersected by small vallies, watered by rivulets that are enlarged in their course towards the south-east by streams or torrents from the heights.^l The Sidlaw hills, a parallel and a lower range, situated on the south of the Grampians, attain in some places an elevation of fourteen hundred feet.

Strathmore, or the Great Valley, as its name signifies in Gaelic,^m is situated between these two divisions, reaching in length a distance of thirty-three miles,ⁿ with a breadth varying from four to six. This part of it is commonly called the How of Angus, but the whole of Strathmore stretches from Stonehaven to Perth, and is prolonged by the vale or strath of the Earn, a distance of about 112 miles.^o If lime for manure, and coal for fuel were more abundant in this tract, it might become equally important as an agricultural and manufacturing district. The How of Angus, the most fruitful division of the county, is diversified by corn fields, plantations and villages, and no part of it is much higher than 200 feet above the level of the sea. It has been at different times proposed to carry a canal through the district, and to prolong it to Dumbarton, and thus to unite the three great rivers of Scotland, the Forth, the Tay and the Clyde. This enterprise, too vast for the means of the proprietors, is not likely to be realized without the assistance of government. The fourth and the last division extends from the Sidlaw hills to the German Ocean on the east, and the Frith of Tay on the south

^g In the nave.—P.

^h It is girt by a belt of little towns.

ⁱ Forfarshire or Angus-shire.

^k The Braes of Angus [Grampians] in some places possess an elevation of nearly 3000 feet. (Ed. Enc.)—Catlaw is on the northern border of the parish of Kingoldrum, and near the southern skirt of the Grampians.—P.

^l The principal rivers of the county rise in the Grampians, viz. the North and South Esk, which flow south-east into the German Sea, and the Isla, which flows west into the Tay. In their descent from the mountains, they receive numerous branches.—P.

^m The Gaelic term *Strath* is applied to a wide, open valley, and that of *Glen* to a deep and narrow one.—P.

ⁿ This only includes that part of the valley within the county.—P.

^o The distance from Stonehaven to Perth, by the post-road through the strath, is 67 miles; from Perth to Stirling, 38 miles. (Gaz. Scot. Roads.)—The distance from Stonehaven to Stirling is thus 105 miles. The writer probably intends to include in this distance of 112 miles the whole length of the valley from Dumbarton to Stonehaven.—P.

The principal towns are situated in this part of Forfarshire, which occupies nearly a fourth part of the county, and is on the whole fruitful and well cultivated.

Granite, micaceous schistus and porphyry are the most common minerals in the Grampian district. The Sidlaw hills are chiefly composed of sandstone of different colours, and in some places, susceptible of a high polish. Shell marl, which is much used, abounds in different parts, particularly in the lochs near the base of the Grampians, on the Sidlaw hills, in the parish of Kirriemuir, and in the neighbourhood of Forfar.^a The most important lime-works are in the maritime division, at Hedderwick near Montrose,^b and in the parish of Craig on the sea-shore.^c

None of the streams can be dignified with the name of rivers. The North Esk issues from Lochlee, flows eastwards, and then bends towards the south-east, when it forms the boundary between the county and Kincardineshire, and falls into the sea about three miles to the north-east of Montrose. The South Esk rises from the Grampians in the north-western part of the county, waters Brechin, and discharges itself into the basin of Montrose, about five miles from the mouth of the North Esk.^d

The five royal burghs of Forfar, Dundee, Arbroath, Montrose and Brechin are situated in the county of Forfar. Dundee, the most important of any, occupies the site of the ancient *Alectum*, and according to tradition, it was called *Donum-Dei* in 1189, by the Earl of Huntingdon, in gratitude for his miraculous escape from shipwreck on his return from the third crusade. The town is situated on the northern bank of the Tay, about twelve miles from its mouth. It contained a population of 30,575 souls in 1820,^e and the number amounts at present to nearly 40,000. Public buildings, warehouses, and whole streets, consisting of new houses, are the proofs of its modern prosperity. It possessed upwards of 170 vessels in 1820, measuring nearly 18,000 tons; they are employed in the foreign and coasting trade, and in the Greenland fisheries. The docks are left dry at low water, and the port is not free from inconvenience. The mouth of the frith is comparatively narrow, and the tide at its entrance rushes with considerable force, and carries along with it a great quantity of sand. But as the channel becomes broader, the velocity of the

^a Shell marl is found in great abundance in the bottoms of lochs and mosses, in that part of Strathmore, extending west from Aberlemno. It is found in Balrie moss in Airley parish, and in the Loch of Kinnordy and the moss of Logie in Kirriemuir parish, all of which are near the base of the Grampians; also in the moss of Meigle along the south of the Dean, but most abundantly in a chain of small lakes near Forfar, viz. the Loch of Forfar, which flows into the Dean, and the Lochs of Restenet, Rescobie and Balcavies, which flow into the Lunan. The Dean flows west into the Isla, a branch of the Tay, and the Lunan into the sea south of Montrose, thus showing the great uniformity of level in Strathmore. The two first of these lochs had been drained (1791,) and the marl was obtained from the others by dragging. (Stat. Acc.)—P.

^b In the parish of Montrose. This lime-work is not mentioned in the Stat. Acc.—In 1793, there were extensive lime-works in the parish of Pert, on the North Esk, near its mouth. (Stat. Acc.)—P.

^c At Boddan, on a small point on the north side of the bay of Lunan.—P.

^d The South Esk, about two miles from its mouth, expands into the basin of Montrose, and contracting opposite the town of Montrose, enters the sea about three miles from the mouth of the North Esk.—P.

^e In 1801, 26,084; in 1811, 29,616.—P.

^f C. Dupin, Force Commerciale, vol. ii.

^g The principal channel of the Tay is on the south side, near the

current is diminished, and sand, which was held in suspension, is deposited, and forms large banks or shallows in the neighbourhood of the town. When the tide ebbs, the waters take necessarily a contrary direction, and carry along with them much mud from the upper part of the river. A ballast machine, worked by a steam-engine, is used for clearing the harbour, which otherwise might be obstructed with alternate deposits of sand and mud at every flux and reflux of the tide.^g Two light-houses, built at the expense of the town, have been erected on the sands of Barry; the one consists of stone, and the other of wood; the one is about sixty, and the other about forty feet in height. The light in the latter is shifted so as to correspond with the changes that often occur in the sands, and the mariners, who enter the frith, make it a rule to keep both lights in a line.^h The principal manufactures are osnaburghs or coarse linen, thread, gloves, canvas and cordage.ⁱ As the demand for sail-cloth has been less since the peace, many manufacturers have adopted the expedient of spinning finer thread, which is made into cloth for domestic purposes.

Arbroath or Aberbrothwick^k is, after Dundee, the most commercial town in Angus. It is situated about eighteen miles to the north-east of Dundee, and the inhabitants are engaged in the same sort of industry; they are employed in making sail-cloth and coarse linen; indeed there are upwards of one hundred factories in Forfarshire for spinning and weaving the thread for that purpose. The harbour is built in the form of a rectangle, and is defended from the sea by a wall of hewn stone on the north, and a pier on the south. In this part of the town are the house inhabited by the keepers of the celebrated light-house on the Bell Rock, and the signal tower by which the keepers on shore correspond with those on duty. The Inch Cape or Bell Rock is situated about twelve miles to the south-east of Arbroath, and about thirty to the north-east of St. Abb's Head in Berwickshire. It may be seen from the charts of the coast that it lies in the direct track of the shipping on the Frith of Tay, and of the greater proportion on the Frith of Forth, embracing not only the extensive local trade of many populous counties, but forming the principal inlet on the eastern coast of Britain, in which the shipping on the German Ocean and the North Sea take

shore of Fife. The sand banks, which are numerous between Dundee and Errol on the west, in which distance the river is from two to three miles wide, are on the north side. The shore on that side, along the Carse of Gowrie, consists of light earth, subject to continual encroachment from the river, which thus adds to the obstructions. The harbour was formerly cleared by a basin, left open at low water, and afterwards by opening arched passages in the piers, by which rapid currents were produced, which carried off the sand and mud deposited. (Stat. Acc. viii.)—P.

^h The channel at the entrance of the Tay is about a mile broad, between two sand banks running out from the shores on the north and south. These sands are frequently shifting, from nearly the same causes that vary the bed of the river. The two light houses are erected on the flood mark on the sandy downs or links, at the mouth of the river, in the parish of Barrie. The larger, or stationary light, is a circular stone building erected on piles; the smaller is a moveable wooden building, raised on rollers. This is shifted, when necessary, so that the two lights may be always in the same line with the entrance of the river, and so that when they appear as one, the mariner may be sure of his safety. The expense of the lights is defrayed by a small tonnage duty on all vessels entering the Tay. (Stat. Acc. viii. Malham's Nav. Gaz. ii.)—P.

ⁱ Cotton bagging is extensively manufactured.—P.

^k Aberbrothock, mouth of the Brothock, so called from its situation at the mouth of a small river of that name.—P.

refuge from easterly storms. During the quadratures when the sea does not fall so low at the reflux, the rocks can hardly be distinguished, but in spring tides when the ebbs are greatest, the part visible at low water is 142 yards in length, 70 in breadth, and about 1 feet in height. A chain of rocks still lower and almost contiguous to the last extends to the distance of nearly two miles.^a According to a tradition, which does not appear very probable, a large bell was erected in the fourteenth century by the monks of Arbroath, on the principal rock in this vast reef. Mariners were thus warned of their danger, and the name of the Bell Rock serves still to commemorate the benevolent labour of the monks. The light-house that has lately been erected on the Bell Rock, is an extraordinary monument of its kind, more so in some respects than the celebrated Pharos of Alexandria, the tower of Cordouan^b at the entrance of the Garonne, or the far-famed Eddystone light-house; for independently of its distance from the land, the obstacle arising from the depth of water at which the operations were commenced, was greater than in any other work of the same sort. It was begun in 1807, and finished in 1811.^c The light from it, when the sky is serene, may be distinctly seen at the distance of eight leagues. As the only mode of warning mariners of their danger in dark and cloudy weather, when neither the building nor the lamps can be distinguished, two large bells, each weighing 1324 pounds, are tolled day and night by means of the machinery that sets the reflectors in motion.

Montrose, about twelve miles from Arbroath, is the first port on the north of it. It is situated on a flat and sandy peninsula, formed by the German Ocean, the South Esk, and a large expanse of water, called the Basin. A handsome wooden bridge has lately been erected across the river to the island of Inchbrayrayock, which, together with the stone bridge from the island to the shore, opens a communication on the south. The quay commences beyond the wooden bridge on the side fronting the sea,^d and vessels of three or four hundred tons can reach it at high water. The harbour of Montrose reckons 150 vessels, measuring nearly 13,000 tons; they are chiefly employed in the coasting and Baltic trade, and in the whale fishery. Their number, it may be added, is rapidly increasing, and Montrose is rising in importance. The population amounts to 10,000 inhabitants, and the products of industry are the same as those of Dundee.^e

Brechin and Forfar, the only other towns in the county, are of minor importance; the first claims the

rank of capital, but the sheriff courts are held in the second.^f Brechin is situated about eight miles to the west of Montrose, on the side of a hill, the base of which is washed by the South Esk.^g It is remarkable for its antiquity; it was formerly walled, and some relics of its fortifications may be still discovered.^h It was twice destroyed by fire, once by the Danes in 1012, and a second time by the Marquis of Montrose in 1645. It was erected into an episcopal see by David the First in 1150, and the present parish church occupies the west end of the ancient cathedral.ⁱ

Kincardineshire, or, as it is frequently called, the Mearns, is contiguous to the German Ocean on the east, to the river Dee and Aberdeenshire on the north, and to the county of Forfar on the west and south. It is of a triangular form, and contains 380 square miles, exclusively of three square miles of lakes. According to the last returns, the population amounted to 31,431 individuals; so that the average number to every square mile is upwards of 82, a greater proportion than might have been anticipated from the scarcity of minerals, and the nature of the soil.

More than half the surface is made up of hills and heaths of little value; little more than a fourth part of it is cultivated. A third of the area is covered with the Grampians, which, crossing the whole breadth of the county from east to west, are sterile, rugged, and very thinly inhabited. Hills of five or six hundred feet may be observed within three miles of the coast in this mountainous tract; and at the western extremity of the county, about twenty miles from the sea, Mount Battock, the loftiest in Kincardineshire, rises to the height of 3500 feet.

Lime is by no means abundant, and there is no coal in the county. Native iron has been found in detached pieces in the parish of Fettercairn, where no indications of iron have been discovered. Granite, basalt, puddingstone, and sandstone are the prevailing rocks. The Grampians are mostly composed of the first, which is scattered over the surface, and much of the soil in that part of the county is formed from the decomposition of granite. A very fruitful soil, consisting of decomposed basalt or *rotten rock*, as it is popularly called, extends along the coast on the south of Stonehaven. Puddingstone abounds in the same quarter, and is formed into millstones. Sandstone prevails in the tract along the coast, and also in the How of the Mearns, which is covered with loam of various qualities, none of which are unfruitful.

^a The rock extends from north-east to south-west, in the direction of the sandstone strata, and consists of an upper and lower level. The former measures, at low water of spring tides, 427 feet in length, and 230 in breadth. The lower, on the south-west, which appears only at the ebb of spring tides, and then is not entirely bare, extends 1700 feet in length, making the whole length of the rock, visible at that time, 2127 feet. During spring tides, the higher level is about four feet above water at ebb, and the lower level just visible; while at flood, the higher level is about twelve feet under water. During neap tides, which are six or seven feet less than the spring tides, the higher level is two or three feet under water at ebb. On the south-west, a reef extends under water, so that at the distance of a mile, there is only 4 or 5 fathoms. In other directions, particularly on the south-east, in the direction of the dip of the strata, the depth increases more rapidly, so as to be 3 fathoms at 100 yards, and 18 to 22 fathoms at a mile's distance. (Ed. Enc. Malham's Nav. Gaz.)—P.

^b Tour de Cordouan.—P.

^c The work was begun by Mr. Stevenson, the architect, Aug. 17, 1807, and the light was first exhibited, Feb. 1, 1811.—P.

^d On the side towards the sea. The South Esk enters the sea about two miles below the bridge.—P.

VOL. III.—NO. 60.

^e The principal manufactures are sail-cloth, sheeting and linen. (Ed. Enc.)—P.

^f Brechin was formerly the county town, and the see of a bishopric. Forfar is at present the county town, where the courts and other public meetings of the county are held. The sheriff courts have been held in Forfar for more than 200 years. (Stat. Acc.)—P.

^g On the north bank of the South Esk, over which there is a stone bridge.—P.

^h It was formerly walled about, and some relics of the ancient gates still remain. (Gaz. Scot.)—Brechin in former times had ports or gates at the different entries of the city. Some vestiges of them are extant, and the names of North, South and West Port still remain. (Stat. Acc. xxi. App.)—P.

ⁱ The chancel (east end) of the cathedral was destroyed at the Reformation, as being defiled by the idolatries of the mass; the nave (west end) was converted into the parish church, and has lately been repaired. At one of its corners rises the steeple, an elegant square tower, 120 feet high. The round tower of Brechin, called the little steeple, stands near the church, and is a remarkable specimen of antiquity; there being only one other structure of the kind in Scotland, a smaller one at Abernethy in Perthshire. The tower of Brechin is 80 feet high, with an octagonal spire of 23 feet—in all 103 feet.—P.

Although the county is watered by numerous streams, the only rivers of any consequence are the North Esk and the Dee;^a the first, it has been remarked, forms the boundary between the county and Angus-shire, and the second, which flows about eight miles through the northern part of Kincardineshire, separates it from Aberdeenshire.^b The Loch of Drum, and the Loch of Leys, are situated on Dee side or in the northern district;^c the latter is remarkable on account of an artificial island, founded on piles of oak, and crowned with the ruins of an edifice concerning which tradition is silent.

The towns and villages are small, and their manufactures are inconsiderable. Stonehaven, Stonehive or Rockharbour is situated on the coast about fourteen miles from Aberdeen. It contains about two thousand inhabitants, who are partly employed in rope-making, and in the manufacture of canvass and osnaburghs. The harbour is well sheltered, and formed by a natural gap between the rocks; but it has not sufficient depth of water. The commerce of the county, besides its trade in sheep and cattle, consists in the import of timber, coal and lime, and the export of grain and fish. The ports by which the trade is carried on are Stonehaven, Johnshaven, and Gourdon. Lastly, the village of Laurencekirk, in the centre of the county, is noted for its wooden snuff-boxes.

The German Ocean washes Aberdeenshire on the north and east; it is contiguous to the counties of Kincardine, Forfar and Perth on the south, and to those of Inverness, Moray and Banff on the west. The greatest length is about eighty-five miles, and the greatest breadth nearly forty; the boundary line is upwards of 280 miles, and of these sixty extend along the coast. The area of the county is not less than 1960 square miles, or nearly a sixteenth part of Scotland. The total population, by the last returns, amounts to 177,651 individuals.

It is made up of five divisions.^d Marr comprehends the district between the Dee and the Don, and a considerable tract on the south of the Dee. It is the loftiest part of Aberdeenshire; few of the bounding lines are lower than 3000, and some of them are higher than 4000 feet above the level of the sea. Formartin, or the second division, includes in a distance of ten miles all the lands between the Don and the Ythan, and extends beyond the last river to the banks of the Deveron.^e The land on the coast is low and fruitful; but beyond it, and at no great distance from the sea, hills and mosses are spread over the country. Buchan, after Marr, the largest division in Aberdeenshire, extends along the eastern coast, and a considerable portion of it has been

improved and rendered productive by labour. Several fruitful vallies are scattered over Garioch, or the district surrounded by Marr, Formartin and Strathbogie. Strathbogie, or the last division, about 150 square miles in extent, derives its name from that of the river which waters it, and consists mostly of hills, mosses and moors. Although the eastern coast is flat, Aberdeenshire, it has been seen, is a high country, and in the south-western or largest division, some of the heights are little inferior to any in Scotland.

Of the numerous straths or vallies in different parts of the county, several are comparatively large and fruitful; but although Aberdeenshire has participated in the improvements of modern husbandry, and although the best rotations are now followed, the wealth of the farmer consists in his cattle, not in his corn. The number of oxen is supposed to be about 120,000, and the sales in England and the south of Scotland, amounting to more than 12,000, are estimated to bring L.150,000 annually.

The fishings on the coasts and rivers, together with the Greenland whale fishery, which has been lately much extended, form an important branch of trade, of which the revenue is not less than L.80,000 or L.100,000.

The minerals are not the most valuable; no coal has been discovered, and limestone is not obtained in sufficient quantities. The mountains of Braemar are famed for their precious stones or *cairngorums*,^f which are sought by the country-people in the summer season, and sold to the London jewellers. Manganese is found near Aberdeen, and black-lead in the neighbourhood of Huntly. Granite, however, is the most valuable as well as the most abundant mineral; and in preparing the land for tillage, granite stones, amounting in value to L.40 or L.50, are sometimes collected from an acre, and shipped to London, where they are used in paving the streets. The total quantity exported from the county yields a yearly revenue of more than L.40,000, and seventy vessels of 7000 tons, and manned by 4000 sailors, are employed in transporting it to England.

The Dee and the Don, the principal rivers, receive the waters of a great many tributary streams, and empty themselves into the sea at no great distance from each other. Old Aberdeen is situated on the Don; the modern town, or New Aberdeen, on the Dee; they are little more than a mile distant from each other, and their united population is upwards of 50,000 souls. The churches, some of which were almost destroyed by the reformers, and King's college, which was formerly under the direction of the celebrated Boetius,^g are situated in

^a The only other river of importance is the Bervie Water. It rises in the Grampians in the northern part of Glenbervie, then flows south across the How, and passing through the trap range along the coast, by a pleasant valley, enters the sea at the town of Inverbervie.—P.

^b The Dee rises at the head of Braemar, and after flowing east in Aberdeenshire, about 53 miles, crosses a projection of Kincardineshire on the north for eight miles, and then forms the boundary between the two counties for fourteen miles, till it enters the sea below Aberdeen. Its course is nearly due east for 75 miles. (Ed. Enc.)—P.

^c These two lochs are each about three miles in circumference, and are situated on the north side of the Dee, with which they communicate, in a tract of low grounds and mosses, running parallel to the river, at one or two miles distance, and in the parish of Banchoory Tarnan, which includes that part of the county, north of the Dec.—P.

^d The divisions, here mentioned, are ancient.—Aberdeenshire is at present divided into eight civil divisions viz. the districts of Kincar-

dine O'Neil (in the south-west,) Garioch, Alford (on the upper part of the Don,) Strathbogie, Turrell (in the north-west,) Deer (in the north-east,) Ellon (in the east,) and Aberdeen (in the south-east.) (Gaz. Scot.)—That part of the county, in the neighbourhood of the town of Aberdeen, is sometimes called Aberdeen Proper; but Aberdeen was properly in Mar.—P.

^e Formartin lies on the east coast, between the rivers Don and Ythan, and stretches across the whole county, from S. E. to N. W., at an average breadth of about ten miles, till it reaches the Deveron. (Sinclair's Gen. Rep.)—P.

^f *Cairngorm* stones, so called from the mountain of Cairngorm (blue mountain.) They are properly rock crystals, (brown and yellow,) topazes (blue, white and brown) and beryls; the latter rare, the others abundant. The yellow rock crystals have been called topazes; other specimens, emeralds and amethysts.—P.

^g Hector Boece or Boies (Boethius,) a native of Dundee—first principal of King's College.—P.

Old Aberdeen.^a The town was erected into a bishopric or city in the year 1153 by the translation of the episcopal see of Mortlach in Banffshire, and the college was endowed more than three hundred years afterwards by Bishop Elphinstone.^b The library, which contains about 15,000 volumes, is entitled to a copy of every work entered in stationers' hall. Marischal college, which is situated in the new town, was founded in 1593 by George, Earl Marischal of Scotland. The buildings, which occupy a considerable area, are very irregular, in consequence of having been erected at different periods. The observatory, which was lately built, commands an extensive view of the horizon; and the cabinet of natural philosophy belonging to the college, is considered one of the finest in Scotland. It must be observed, however, that the number of young men attending the two colleges, is much less than might have been expected from the eminence or zeal of the professors, the system of tuition and the advantages afforded to the students.

New Aberdeen is in a far more flourishing condition than the old town. It is spacious and well built, and the stranger observes everywhere the signs of extension and improvement.^c The principal streets are adorned with fountains; and the bridges, edifices and houses are mostly built of granite.^d The cause of so much prosperity must be attributed to the commerce and industry of the inhabitants.^e The entrance into the Don, below Old Aberdeen, is almost closed by a bank, which affords only a passage for small boats. This obstruction has occasioned the gradual migration of the citizens from the old to the new town on the banks of the Dee; and even there the harbour was long rendered difficult of access by the sand and alluvial deposits of the river,^f an inconvenience which is now removed. A mole on the left bank of the river, extending in the direction of N. N. E., and originally built by Mr. Smeaton, has been lengthened nearly 300 yards; its breadth, at the summit, is six yards, and its total length 492. A light-house on the mole, shows the entrance into the harbour; and a break-water has been constructed on the opposite bank of the river. But notwithstanding these works, vessels, when the winds are contrary, are often liable to run

^a The construction requires it to be understood, that the churches, or at least those, some of which were almost destroyed by the reformers, are situated in Old Aberdeen. In Old Aberdeen, before the Reformation, was a large cathedral, dedicated to St. Machar, of which there remains only the aisle (converted into the parish church of Old Machar, the parish including the burgh of Old Aberdeen.) In New Aberdeen, there were at the same period, besides the ancient parish church of St. Nicholas (rebuilt about 1750,) four chapels, two of which were occupied in 1797, as places of worship, and five monasteries. (Stat. Acc.) In 1830, there were twenty-six places of worship, of all denominations, in Aberdeen (nearly all in New Aberdeen.) (Chambers.)—P.

^b The college was founded by Bishop Elphinstone in 1505. The bull of institution was issued by Pope Alexander VI. in 1494. The charter was granted by James IV. in 1497.—P.

^c The expenses attending the various public improvements have been such as to create a deficiency in the burgh funds, of not less than L.4000 per annum, and eventually to place its whole property in the hands of trustees. (Bell's Geog. iii. 213.)—P.

^d Immense quantities of granite and sienite are quarried in the neighbourhood of Aberdeen.—In 1821, there were exported 41,000 tons of stone, the value of which was upwards of L.40,000. (Bell. Idem.)—P.

^e New Aberdeen is extensively engaged in manufactures. These consist chiefly of linen, woollen and cotton—also hosiery and carpeting; coarse yarn spun by machinery, partly exported, and partly worked into canvass and sheeting—also iron founderies, and several large breweries. (Bell. Idem.)—The manufacture of knit woollen stockings was formerly the most important in Aberdeen. The wool was chiefly imported by the Aberdeen merchants from England, and after having

ashore, so much is the neighbouring coast exposed to the waves of the North Sea, and to the current of the Dee, which runs to the south. An extensive quay has been erected above the mole, and it is partly lined with large buildings for the preparation of train oil; beyond the same quay are situated the downs, which command the beach between the two Aberdeens.

Aberdeen holds a high rank among the industrious towns in Scotland; its principal manufactures consist of cotton, linen and woollen goods; one of the largest flax manufactories in the country has been established on the Don, and the manufacture of cotton affords employment to more than a thousand inhabitants. Three hundred and fifty vessels, of 400,000 tons, belong to the port, and they are employed in the different fisheries, and in the foreign and coasting trade. Lastly, a navigable canal, eighteen miles in length, passes from Aberdeen to Inverury,^g and the products of the country in the neighbourhood are thus conveyed to the town.

No towns of any importance are situated in the interior of the county.^h If we continue our journey northwards from Aberdeen, along the coast, we pass the village of Newburgh, at the mouth of the Ythan, a river formerly celebrated on account of its pearl fisheries.ⁱ Peterhead, the most easterly point of Scotland, is situated to the north-north-east of the last place. The town contains nearly 7000 inhabitants, and is built on the edge of an extensive bay, which affords good anchorage to ships of all sizes. Besides the old harbour on the south, a new one has been erected on the north, so that, whatever be the direction of the wind, vessels can now enter Peterhead. The governors of the Merchant Maiden Hospital in Edinburgh, are the trustees of the harbour, and they have expended L.15,000 on these works. The commissioners of public roads in the Highlands, have applied a like sum for the same purpose, from the funds placed at their disposal by parliament. Cape Kinnaird^k is situated to the north-west of Peterhead, and the harbour of Fraserburgh has been built at its base. The townsmen subscribed L.5620 for the repairs of the harbour, and an equal sum was granted by the road commissioners. The jetty has in con-

been prepared, was distributed by agents, throughout the north-eastern counties, particularly Aberdeenshire and the adjoining part of the Mearns. The stockings were knit by hand, by the women, children and aged persons, and were returned by the same agents to Aberdeen, where the trade centred. In 1797, not less than 30,000 persons were occasionally employed in spinning and knitting, and the amount annually exported was estimated at L.103,000. (Stat. Acc.) L.183,000. (Gaz. Scot. 1803.)—P.

^f By a bar of sand, which was perpetually shifting its situation. (Ed. Enc.)—P.

^g The canal commences in the harbour of Aberdeen, and crossing to the valley of the Don, proceeds up that river to Inverury, an ancient royal burgh, at the confluence of the Don and the Ury. The rise is 169 feet by 17 locks, 15 of which are near Aberdeen. It might be extended 12 miles farther on a level. (Ed. Enc.)—It was originally proposed to continue it up the Don to Monymusk, with a branch up the Ury, through Garioch, to Inch. (Stat. Acc.)—P.

^h The only other royal burghs in the county, besides Aberdeen, are situated near each other, on the Don, viz. Kintore, on the south bank of the river, and Inverury, a little above, on a point of land at the confluence of the Don and Ury. They are decayed places, of little importance.—P.

ⁱ The Ythan is chiefly noted for the large pearls, which its muscles produce, some of which have been sold as high as L.3 sterling. (Gaz. Scot.)—P.

^k Kinnaird's Head—an elevated promontory, at the north-eastern point of Aberdeenshire. A light-house is erected on it. Fraserburgh is situated on the south side.—P.

sequence been prolonged to the distance of 146 yards from low water mark; and so much advantage has resulted from this improvement, that additional subscriptions have been levied among the inhabitants, to complete the harbour, which is now one of the safest and the best on the eastern coast.

Almost all the country through which we have travelled, and which extends from the Solway Frith to the Grampians, has been denominated the Lowlands of Scotland. The remaining portion, or the Highlands, is widely different. The inhabitants wear a different dress; they speak a different language; they are of a different origin. The government of petty chiefs, and the evils of the feudal system, a system long established and abolished at a comparatively recent period, have had their influence on the character of the people, and the Highlander is not perhaps less distinguished by cunning and servility, than he confessedly is by courage. The latter is the virtue of a military vassal, and the former arose necessarily in a small community, of which the different members held small portions of land at the will of a barbarous chief, who exercised almost despotic authority over their property and their lives. Commerce, and every sort of industry, except that of raising a scanty subsistence from the ground, or from rearing cattle, were almost unknown in the period of which we speak, and if bleakness and sterility are not less characteristic of the Highlands than "the mountain and the flood," it is not wonderful that the inferior condition of the people is evinced in their miserable cottages, or rather hovels, in their wretched clothing, and still more wretched food, and in the absence of comforts, in which the lower classes throughout other parts of Scotland participate. All the causes by which civilization has been retarded, no longer exist, but the effects of those causes are still apparent, and there is reason to believe that the best means have not hitherto been employed for so desirable an end as the moral and intellectual improvement of the inhabitants. The subject may be afterwards more fully examined, but it may be remarked that a hundred years have not yet elapsed since the tyranny of petty chiefs was at its height, or since the great bulwarks of English liberty afforded no protection in the Highlands against "the speedy course of feudal justice." Many traces of the state of society under such a system^a are still conspicuous, and a long period may pass away ere they are wholly effaced. It was the object of every proprietor to divide his lands into as many small farms as possible, a custom by which the number of his retainers was increased, and which was rendered necessary by the manner of life, the habits and inclinations of the people. The farms were thus

^a Previous to 1745, or before the abolition of heritable jurisdictions.—P.

^b A tenure formerly prevailed very generally in Scotland, called in the Lowlands, *run-rig*, or *rig and reunit*, by which a large farm or town was held in common by a number of tenants, who divided the arable land into narrow ridges or small portions, which were so allotted that their individual possessions were intermingled, and these, too, were alternated from year to year. This tenure was particularly prevalent in those parts of the country exposed to military or predatory incursions, as on the English and Highland borders. This practice even continued in some parts, till the close of the last century. (Stat. Acc.)—P.

^c Gaelic (Scotch and Irish) *baile* (plu. *baillte*), a town or city—also a manor or township. (Manks, *balley*, plu. *baljyn*.) This word is the

possessed by joint tenants,^b of which the number was regulated by the quantity of food that could be raised from the land. The larger farms occupied a portion of a valley to which many miles of mountain pasture were annexed; they formed so many hamlets or petty townships, which the inhabitants called *baillé*,^c and which are known in the low country dialect by the name of *touns*. The rate at which the lands were let was very moderate, and the wealth of a chief was not estimated by the rental, but by the number of his tenants; they were his soldiers in war; he associated with them, or lived in indolence, during peace.

There were besides other tenants, who were denominated tacksmen, and they formed an intermediate class between the chief and the ordinary tenantry. They were little different from the ordinary landowners; they were the officers, who, under the chief, commanded the soldiers in war, and they traced their origin to some ancient or celebrated warrior, who had made over a portion of his land as a provision to the younger branch of his family. Part of their farm was sufficient to supply their wants, and the rest was divided among a number of subtenants or cotters, who were bound to perform a certain quantity of labour, as rent for their land. Cotters were likewise settled as labourers on the farms of the small tenants, and they had generally a share in the stock of cattle, which formed a joint property. A few individuals exercised the most common trades; there were some blacksmiths, weavers, tailors and shoemakers, and a portion of land was assigned to them by one or other of the tenants. Thus, every man in the Highlands had a certain quantity of ground; there was no such person as an independent labourer or artisan,^d for whatever his calling might be, that of a husbandman was united, and his subsistence with that of his family was derived from the soil. The produce of the land was consumed on the spot; there was no separation of employment, much less any thing like a division of labour. While the vast and complicated system of commerce and production was pervading other parts of the island, it was cut off from the Highlands by the same mountains that served as barriers against law and justice.

Many advantages, however, resulted from the unsuccessful rebellion in 1745; and the measures which were afterwards adopted, while they were necessary for the subjugation, were not less so for the civilization, of the Highlands. The country was disarmed, a force sufficient to command it was stationed at the principal passes, it was intersected for the first time by roads, it became subject to the same laws as the rest of Scotland, and all the benefits of regular government were gradually obtained. But it seldom happens that a sudden change takes place from imperfect civil

prefix to the many names of places in Scotland and Ireland, beginning with *bal* (Scotland) and *balli* or *bally* (Ireland.) Dublin was called by the native Irish, *Bally-lean-cleath*, the town of the harbour of hurdles.—*Baile* is not written with an accent in Gaelic, but is pronounced as two syllables.—The *baile* of the Gaels corresponds with the *tre* or *treo* of the Welsh (*Cymry*)—hence *Cantrev* (*cant* and *treo*), a hundred, i. e. a hundred hamlets or townships. Although *baile* (*balley*) is common to all the present Gaelic languages, and is used by them all equally in the sense of town, yet in the sense of city, it is used only by the Scotch Gaels; the Irish using in that sense, *callair* (the Welsh *caer* or *caer*, properly, a fortress.) and the Manks, *ard-ralley*, high town (Gaelic, *aird-bhaile*.) The Welsh now use for city, *dinas*.—P.

^d Qu. one who was simply a labourer or artisan.—P.

institutions of long standing to others of a better description without producing much inconvenience and many temporary evils. The business of plunder was at an end, and the glory of the chieftains was gone. Regardless of the tenantry that had been their pride in feudal times, they followed the example of the proprietors in the south, and let their lands to the highest bidder. Persons of capital were thus induced to settle in the Highlands, and many small farms were united into one. Of the numerous Highlanders, thus thrown out of employment, some removed to the Lowlands, and engaged in different branches of industry, others migrated to America, and many entered the British army, of which they have been the flower since the latter part of the eighteenth century. The country, too, has been improved; many roads have been made, canals have been cut,^a and inland navigation has been extended by means of these canals and numerous lakes. The fisheries have become an object of national importance, and although it might have been at first necessary to excite the indolent Highlander by the lure of a government bounty, it may be doubted if its continuance be accordant with sound policy. The rearing of sheep, the department of rural economy best adapted for the soil and climate of the Highlands, is every year becoming more general; extensive woollen manufactures may in time be established, other branches of industry may be introduced, and the country, instead of containing a scanty and indolent population, may be peopled by active and industrious men. Much good has already been effected by the Highland Society, the improvement of the Highlands and Islands being one of the objects of that institution. Another object is to contribute to the preservation of the language, poetry and music of the Highlands. It may be remarked that the limits within which the Gaelic is used, are gradually contracting; in other words, it is unknown in places where it was spoken fifty years ago.^b Such indeed is the natural consequence of the measures adopted after the rebellion, and of every successive attempt to improve the country, or to enable the inhabitants to participate in the industry and civilization of the Lowlands. It is not necessary to inquire whether the two objects of the Society are incompatible with each other; it is certain that the first, or the improvement of the Highlands, is retarded by the second, or the preservation of the Gaelic language.^c The introduction and diffusion of useful knowledge are thus in some degree prevented, or at all events rendered more difficult, and prejudices which ought to be eradicated are thus perpetuated. The improvement so much desired cannot be complete, so long as these prejudices exist, and so long as the language and habits of the Highlanders are different from those of the other inhabitants of Scotland.

The superior condition of the lower orders forms a characteristic difference between the past and present state

of the Lowlands; the houses of the peasantry are better built, the inmates pay greater attention to cleanliness, and from the facility with which the various products of industry are multiplied, the people are in possession of many articles of household furniture and dress, which, among the peasantry at least, might have been sought in vain fifty years ago. But a corresponding improvement has not yet taken place among the lower orders in the Highlands; their costume is still the same, and their houses are only remarkable for their rudeness. They are built of round stones, cemented with clay or mud, and the roof is formed by a covering of turf or heath. The interior consists generally of a single chamber, but in those of the best description it is divided by a wicker partition. The smaller division is reserved for the poultry, pigs or cattle, if there are any, and the other serves as the kitchen, dining-room and bedroom of the whole family. The fire is placed in the middle of the chamber, and a hook suspended from a chain, supports a single pot, all that is used for dressing the victuals. An aperture is made in the roof for the passage of smoke; the opening is not placed in a direct line above the fire, lest it might be extinguished by the rain, and the greater part of the smoke is thus diffused through the apartment, or escapes only by the door. The beds of the family are so many blankets laid over ferns or heath, and their food, as simple as their habits, consists of oat-meal, milk, and vegetables. The grain that is raised in the country, suffices for their subsistence, and for the distillation of whisky,^d their favourite liquor.

It will be afterwards seen that the industry of the inhabitants is now directed to objects that are likely to reward them, to the rearing of cattle and sheep, to the mines, forests and fisheries, which form the wealth of the Highlands. The country may now be examined. Buteshire, a county on the west coast of Scotland, in the Frith of Clyde, consists entirely of islands, and comprehends those of Bute and Arran, the two Cumbraes, Inchmarnoch, and a few islets. The first of these islands, one of the most important of the Hebrides, and the one that gives its name to the county, is separated by a narrow channel from the district of Cowal in Argyleshire. It is about fifteen miles in length, and nowhere so much as five in breadth, but in some places it is so much indented by the sea, that the heads of opposite bays are not more than a mile from each other. The superficial extent is nearly equal to 30,000 acres.

It is as remarkable for the mildness as for the moisture of its climate; in the former respect it has been compared to the southern counties of England, and it has been ascertained that the annual fall of rain is at least equal to twice the average quantity on the eastern coast.^e The surface is varied by low hills, of which the highest is not more than

^a The Highland canals are the Caledonian Canal, through the *G'en-mort-na-Albin*, in Inverness-shire, and the Crinan Canal, across the isthmus of Cantyre, in Argyleshire. (Ed. Enc. Bell.)—P.

^b The Gaelic, Erse or Highland Scotch (called by the Highlanders, *Gaelic Albanach*, Albanian or Caledonian Gaelic) is a dialect of the Gaelic-Celtic family, so closely allied to the Irish language (Irish Gaelic,) that the two are to a large extent mutually intelligible. The term Gaelic properly characterizes the whole family; the Irish calling their language Gaelic, as well as the Highlanders theirs. The Manks (native language of the Isle of Man) is radically a Gaelic dialect, but more widely separated from the original stock (particularly by foreign admixture—Norse, English) than either the Scotch or Irish Gaelic.—P.

^c The design of the society is not so much to preserve the Gaelic as a living language, as to collect and preserve its literary monuments. For this purpose, they have critically investigated the authen-

ticity of the Ossianic poems, and have published a highly valuable Report on the subject. They have made large collections of Gaelic literature, especially poetry, and have promoted the philological study of the language. Similar efforts have been made by the Highland Society of London.—P.

^d Whisky is a corruption of the Gaelic *uisge*, water, and *usquebaugh*, of *uisge beatha* (pron. *beaha*.) water of life. The river of the water of life (Rev. xxii. 1) is rendered, *amhainn do uisge na beatha* (pron. *arain do uisge na beaha*.) river of water of the life. There is the same distinction in French, *eau de vie* and *eau de la vie*.—P.

^e At Mount-Stuart, in Bute, the annual quantity of rain, on an average of seven years, was 46.6 inches; at Duddingstone, on the Forth, near Edinburgh, on an average of eight years, 25.7 inches.—There is said to be less rain in Bute, than in the adjoining districts, owing to the attraction of the clouds by the mountains of Arran and Cowal. (Ed. Enc.)—P.

720 feet above the level of the sea. Slate and lime are found in different places, and extensive beds of sea-shells are scattered on the western side of the island. Agriculture has of late years been extended, all the crops in the lowlands of Scotland are raised, and nearly three-fourths of the surface are fit for cultivation. Fifty thousand barrels of herrings were often exported from the island in the course of a year. The manufacture of cotton is one of the branches of industry, which has been introduced within a comparatively recent period, and the extensive spinning mills in the neighbourhood of Rothesay afford employment to many of the inhabitants.^a

Rothesay,^b the only town, is situated on the north-western side of the island, opposite a spacious bay, in which there is a safe anchorage.^c The pier is commodious, and the number of vessels belonging to the port measure upwards of 5000 tons.^d Packets sail regularly from the town to Greenock,^e and there is a daily mail boat to Largs in Ayrshire.^f The ruins of the ancient castle of Rothesay are the principal ornament of the place; it was long a residence of the Stuarts, and the bed-rooms and banqueting room of Robert the Second and Third, the last monarchs by whom it was inhabited, are still shown to strangers.

Arran, about twelve miles to the south of Bute, is more than twenty miles in length, and from seven to eleven miles in breadth. The surface is equal to 165 square miles, but it is rugged and mountainous, and not more than a seventh part is fit for cultivation. The loftiest summits, the deepest and most romantic vallies, are situated in the northern part of the island. Goatfell^g towers above the rest, and according to the trigonometrical survey, it is 2865 feet above the level of the sea. Limestone, marl and slate are by no means uncommon, and indications of coal have been at different times discovered. The herring fishery is the most productive branch of industry, and convenient harbours are situated at the two towns, or rather villages of Lamlash and Loch-Ranza, the one on the eastern, and the other on the northern side of the island. It is divided into the two parishes of Kilbride and Kilmory, and in both of them the Gaelic was formerly the only language of the inhabitants, but it is now little known, and there are at present twelve English schools in Arran.

The Cumbraes are two small islands on the coast of Ayrshire; the largest is about four square miles in extent, and nearly a half of it is cultivated. A light-house is erected on the small one, which is inhabited by five or six families.

^a A large cotton mill was established in 1778, by an English Company—the first in Scotland. This establishment has been recently enlarged, and greatly improved by Mr. Thom, who has superseded the use of steam-engines by water power. (Ed. Enc.)—P.

^b Rothesay, or Rothsay—the first the more usual form. Some have supposed the name of Danish origin; others have derived it from the Gaelic, *Riogh (Righ) Suidhe*, the King's Seat, from the Castle of Rothesay, once a royal residence. Rothesay is a royal burgh, and the county town.—P.

^c It is situated at the bottom of an extensive bay, on the N. W. side of the island, in which there is safe anchorage. (Gaz. Scot.)—This is a mistake; Rothesay is on the N. E. coast of the island.—Rothesay is situated on a bay of the same name, on the north-east side of Bute. (Ed. Enc.)—P.

^d In 1790, the shipping amounted to 4246 tons, of which 3104 were employed in the herring-fishery. (Gaz. Scot.)—P.

^e By means of steam-boats on the Clyde, it communicates with Glasgow commonly many times in a day. (Bell.)—P.

^f It lies on the west side of the Firth of Clyde, nearly opposite Largs.—P.

^g Goatfield. Fell and field are here the Dan. *field*, Swed. *fjäll*, mountain.—P.

^h Inchmarnoch (island of Marnoch) is about a mile long. On the west side are vast strata of shells. The ruins of a chapel, dedicated to St. Marnoch, are still visible. (Gaz. Scot.)—P.

The islet of Inchmarnoch, on the south-west of Bute, derives its name from a chapel dedicated to St. Marnoch. The area is less than a square mile, and the greater part of it is fruitful.^h A light-house has been built on the islet of Pladda on the south of Arran,ⁱ for the guidance of vessels into the Frith of Clyde.^k

If we ascend the same frith, and turn to the right, we may arrive at the town of Dumbarton, which is situated near the confluence of the Clyde and the Leven,^l and almost insulated by the last river at high water. More than two thousand tons of shipping belong to the harbour, and the rise of water is equal to eleven feet at spring tides. The principal manufacture, or that of crown glass, affords employment to many of the inhabitants, and of the extent to which it is carried, some notion may be formed from the government duties, of which the annual amount has not been less, on an average of several years, than L. 100,000.^m The fairs that are held in the town attract many persons from different parts of the country, and the one that takes place in the month of June, is considered the principal mart for Highland cattle in the west of Scotland.

The ancient castle of Dumbarton crowns a lofty rock that rises abruptly from a plain at the confluence of the two rivers, which wash both sides of its base,ⁿ and surround it during high tides. Although the fort was considered impregnable in the days of the venerable Bede, it was reduced by famine in 706;^o and at a later period, while held by the adherents of Queen Mary, it was taken by escalade.^p It has since stood several sieges, and before the rebellion of 1745, it was not inaccurately designated the key of the West Highlands.

When the merchants of Glasgow found it necessary, in consequence of the increase of their trade, and the distance of their town from the sea, to have a port and a depot for their exports and imports towards the mouth of the Clyde, they made choice of Dumbarton. The proposition was communicated to and rejected by the municipal authorities and burgesses. Numerous shipping, it was urged, always raised the price of provisions, seaports were necessarily dirty, the townsmen hated the bustle of trade, and other absurdities had their weight in influencing their opinion. The proposal was rejected, and it is perhaps impossible to mention another instance in which Scotchmen acted so contrary to their interest.^q

The county of which Dumbarton is the capital,^r is divid-

ⁱ Pladda is about a mile distant from the south-east point of Arran.—P.

^k This light-house is furnished with two lights, to distinguish it from the others in the Frith.—P.

^l On the eastern bank of the Leven, a little to the north-west of the castle.—P.

^m A manufactory of glass is carried on to such an extent, as to pay nearly L.4000 of duty annually. (Ed. Enc. 1817.)—Average duties L.3800 per ann. (Stat. Acc. 1792.)—P.

ⁿ The Clyde on the south, and the Leven on the west.—P.

^o The venerable Bede informs us, that it was the strongest fortification in the kingdom in his time, and deemed almost impregnable; it was reduced by famine in the year 756, by Egbert, king of Northumberland. (Gaz. Scot.)—In 726, this city was attacked by Egbert, king of Northumberland, and Oangus (Ungus,) king of the Picts, and the Britons were compelled to submit. (Leighton's Scenes in Scotland, 100.)—Ungus reigned from 730 to 761. (Ed. Enc.)—Dumbarton (the *Alcluth* of Bede, the *Balclutha* (town of the Clyde) of Ossian, and the *Dunbritton* (fort of the Britons) of the Gael) was the capital of the Strathclyde Britons (*Cymry*).—P.

^p A. D. 1571. It was the last place in Scotland, that held out for Mary.—P.

^r Dumbartonshire.

ed into two parts that are some miles distant from each other ;^a the larger or the western is bounded by Perthshire on the north, by Argyshire on the west, from which it is separated by Loch Long, an arm of the sea, by Lanarkshire and the Clyde on the south, and by Stirlingshire on the east. The eastern portion is enclosed by the last county and by Lanarkshire. The area is equal to 230 square miles, and the relative population is not less than 144 persons to every square mile.

The soil on the low grounds, consists of schistose clay, and in some places, particularly on the banks of the Clyde, of a rich black loam. But about two thirds of the county are occupied by lofty hills, some of which are 3000 feet in height,^b and all of them form part of the ridge which traverses the island from Forfarshire to the Frith of Clyde.^c Coal, iron-ore and limestone are the most valuable minerals. But the first is only worked on the south-east border, where little more than 11,000 tons are annually raised. As to the second, it is computed that 3000 tons of ironstone are sent every year to the Carron foundry from the parishes of Kirkintilloch^d and Cumbernauld. Although limestone abounds, it is only worked in two or three places on account of the scarcity of fuel.

The Leven, the outlet of Loch Lomond, is the principal river ; it flows five or six miles through a fruitful plain, and joins the Clyde at Dumbarton Castle. The extent of coast formed by Loch Long and Gareloch^e affords the advantage of water carriage to a large part of the county, and in the remaining portion the conveyance of goods is equally facilitated by the Forth and Clyde canal.^f Loch Lomond is about twenty-five miles in length, and more than six at its greatest breadth. A small part of it is situated in Stirlingshire, the rest in Dumbartonshire. It is not inferior to any of the British lakes in the beauty and variety of its scenery, which depend on its numerous and well wooded islands, and the striking contrast of its verdant and shaded banks with the rugged mountains that rise above them. The northern part is comparatively narrow, the southern or broadest is bounded by a fruitful plain, and between the two extremities extend the heights, which are crowned by Benlomond.^g

As a manufacturing county, Dumbartonshire is not without importance, and the printing and bleaching of cottons

form a great branch of industry. There are besides three extensive cotton mills, several paper mills, and an iron-work for edge tools and other articles.^h The glass works of Dumbarton have been already mentioned ; there are several tanneries in the same place, a manufactory of alkali at Burnfoot, and another of pyrolignous acid at Millburn. Many printfields are situated on the banks of the Leven,ⁱ and the small stream of Dunlocher turns in its short course sixteen water-wheels.

The maritime county of Argyle, made up partly of the mainland, and partly of islands, which shall be afterwards described, is bounded by Perthshire and Dumbartonshire on the east, by Inverness-shire on the north, by the Irish Sea and the Frith of Clyde on the south, and by the Atlantic Ocean on the west. The greatest length of the continental portion from the Mull of Kintyre on the south to Ardnanurchan Point on the north, is about 115 miles, and its breadth is more than sixty-eight. The surface has been computed at 3800 square miles, of which 1065 are insular, and the remainder, or more than a thirteenth of the whole of Scotland, is situated on the mainland. The coast in the last portion consists of many long promontories, and deep bays or inlets, and the length of line thus formed is upwards of 600 miles. Several fresh water lakes are situated in the interior, and their superficial extent, it has been supposed, is equal to sixty square miles. Like the rest of the Highlands, Argyshire presents the dreary prospect of hills, rocks and barren mountains. The lofty Ben-Cruachan is 3390 feet above the level of the sea, and some of the heights are not much inferior in the neighbourhood of Benlomond.^k The inlets cut deep into the land, and the district of Cowal is peninsulated by Loch Long on one side, and Loch Fine on the other. Some barley is raised for the supply of the distilleries, the other crops are oats, potatoes and turnips, but the arable land bears a very small proportion to the uncultivated ; indeed there are not more than 125,000 acres of the former out of 1,408,000.^l The rearing of cattle was long the principal branch of rural economy, and the breed of oxen is still considered superior in many respects to most in Britain. But about the middle of the last century the coarse woolled heath sheep were introduced, and it was soon discovered that they were much better adapted than oxen for the lofty and barren districts,

^a The eastern portion is a long narrow tract, composed of the parishes of Cumbernauld and Kirkintilloch, separated from the rest of the county by a part of the parish of Calder (Cadder) in Lanarkshire. It is bounded by Stirlingshire on the north and east, and by Lanarkshire on the south and west. The Great Canal passes through it longitudinally. The main body of the county is of a very irregular figure. It consists of two arms, one extending north, and the other east from Dumbarton. The Clyde forms the southern and south-western boundary, separating it from Renfrewshire ; Lanarkshire bounds it on the south-east for a short distance ; Stirlingshire on the north-east to the mouth of the Endrick in Loch Lomond, and then on the east to the northern boundary, Loch Lomond separating the two counties for the greater part of the distance ; Perthshire on the north ; Argyshire on the west, Loch Long forming the boundary for the greater part of the distance, toward the south.—P.

^b In the parish of Arroquhar at the northern extremity. (Ed. Enc.)—P.

^c That part of the west division of the county, which lies east of the river Leven, is intersected by a continuation of the lofty ridge, which crosses the island from Forfarshire to the Frith of Clyde. (Ed. Enc.)—This portion of the ridge forms part of the chain of the Lennox Hills. The highest hills in the county, viz. those on the west of Loch Lomond, have no connexion with this ridge, but form part of the Grampians.—P.

^d Kirkintilloch. (See note a.)—P.

^e Gareloch, or Loch Gair—an arm of the Firth of Clyde to the west of the Leven, extending about twelve miles north into Dumbarton-

shire, and with Loch Long on the west, forming the peninsula of Roseneath.—P.

^f The Forth and Clyde canal traverses the eastern division of the county, and just crosses the south-eastern corner of the western division.—P.

^g Loch Lomond is nearly surrounded by ranges of mountains or hills. On the south-east are the Kilpatrick Hills (trap range,) leaving between them and the lake, a tract of low land, extending along the Leven. On the west are the mountains of Luss and Arroquhar, separating it from Loch Long. On the east is Ben Lomond, the highest summit, with the chain that extends north and connects it with the Grampians. At the upper extremity, a narrow valley extends in the direction of the lake, called Glenfalloch.—P.

^h At Dalnotter iron-work (in Old Kilpatrick,) nails, edge-tools and all sorts of wrought iron goods are manufactured on an extensive scale. (Ed. Enc.)—P.

ⁱ The banks of the Leven are covered with numerous bleachfields, printfields and cotton-works. (Gaz. Scot.)—Bleaching flourishes to a greater extent on the Leven, than in any other part of Scotland, on account of the limpid purity of its water. (Chambers.)—P.

^k Ben Lomond is in Stirlingshire, separated from Argyshire by Loch Lomond and Dumbartonshire. Does the writer refer to the summits on the borders of Dumbartonshire ? Beinn Ima, or the Cobler of Arroquhar, in that direction, is 2389 feet above the sea.—P.

^l Number of acres on the mainland, 1,415,898 ; in the whole county, 1,918,714. (Bell.)—Number of acres cultivated on the mainland, 126,130. (Sinclair's Gen. Rep.)—P.

yielding both a much greater quantity of food for man, and the raw material of an important manufacture. There are not probably fewer than 350,000 of these valuable animals throughout the continental part of Argyleshire, and although they have increased so rapidly since the time of their introduction, it must not be inferred that the number of oxen is diminished; on the contrary, there is reason to suppose it greater at present than at any former period, a circumstance that must be attributed to the improved state of the arable and pasture lands.

The products of the fisheries are not less important than those of agriculture; they afford perhaps a greater quantity of food; they furnish employment to a greater number of hands. The form of the county is admirably adapted for this branch of industry; it is penetrated almost in every direction by arms of the sea, it is traversed by extensive lakes, and some idea of its importance may be derived from the fact that the herrings caught during two seasons in Loch Fine, were computed to be worth more than L.80,000.^a

If the spirit of improvement, which was introduced several years ago, be continued, Argyleshire is likely to become important as a manufacturing and commercial county. The old roads have been extended, and new ones have been made almost in every direction. The Crinan canal, which has been cut across the peninsula of Kintyre, at an expense of L.140,000, shortened the voyage from the ports in the West Highlands and the Hebrides by a distance of nearly two hundred miles. Lastly, the county has been made to communicate with the German Ocean by means of the Caledonian canal, of which Loch Linnhe forms the entrance into the Atlantic; and from the completion of this vast work, Argyleshire has derived the advantages of increased navigation and frequent intercourse.

A portion of Argyleshire, it has already been observed, is insular, and the islands form part of the Hebrides. The Western Isles or Hebrides lie between 55° 30' and 58° 28' north latitude, and 4° 52' and 7° 40' west longitude from Greenwich. They are about 200 in number, but not more than eighty-seven are inhabited. Their superficial contents are probably greater than 2800 square miles, and their total population is nearly equal to eighty thousand inhabitants. The Norwegians and the Danes contended for the possession of them in ancient times, but in the present day the inhabitants appear to differ little from the Highlanders; they speak the same language, wear the same dress, and observe the same customs. Bute, Arran and two or three small islands, it has been already seen, make up a distinct county. The other Hebrides form part of the counties of Argyle, Inverness and Ross. The superficies of those belonging to the first county is equal to 992 square miles; 1150 are attached to the second or Inverness-shire, and 560 to Ross-shire.

They are sometimes divided into the Outer and Inner Hebrides, and as the latter lie nearer the shore, they are much better known. The former, separated from them by a channel varying in breadth from fifteen to forty miles, exhibit a great variety of forms; some of them are conical, others are flat; some are several miles in diameter, others are only a few yards. The eastern sides of the islands are low or marshy, and they afford excellent anchorages; the

western sides, on the other hand, are rugged or precipitous, and almost destitute of safe harbours.^b The same islands are remarkable for the number of their dark and sombre lakes. Peat is the most prevalent soil on the low grounds, but on the heights it appears only in patches. The vegetation on the peat land consists chiefly of heath, mosses and lichens, and these plants are most abundant on the eastern sides of the islands; the western are more fruitful, and the vegetation is comparatively rich and verdant. In winter, the islands are exposed to violent storms; the Atlantic, after a continued gale of westerly wind, rolls its impetuous billows, and dashes them against the headlands on the western coasts, presenting sometimes the terrific spectacle of breakers, extending in ranges for miles.^c The most important islands and the principal ports shall be afterwards enumerated, although few of the latter are remarkable for their buildings or public works.

Inverary, the capital of the county, is the only town of any consequence in Argyleshire. It is situated at the mouth of the Aray, on a small bay about eight miles from the head of the Loch Fyne.^d The houses are well built, and they form a handsome street in front of the lake. Repeated attempts have been at different times made to introduce manufactures, but none of them appear to have succeeded. The principal support of the place is derived from the herring fisheries, which have flourished during a long period, and there is reason to believe that French merchants were formerly in the habit of repairing to Inverary for the purpose of bartering their wine for herrings. It is long, however, since the inhabitants have been engaged in any commerce with foreigners; their trade consists in the export of wool, timber, bark and fish to Glasgow and Liverpool, and in the import of different articles that are consumed in the town and neighbourhood. The counties of Bute, Dumbarton and Argyle make up what is commonly called the West Highlands.

Perthshire is contiguous to the last county and Dumbarton on the west, to Stirling and Clackmannan on the south, to Fife, Kinross and Forfar on the east, and to Aberdeen and Inverness on the north. The superficial extent is not less than 2638 square miles, but of these more than fifty are occupied by lakes. The greatest length from east to west is about 77 miles, and the utmost breadth from north to south is equal to 68. The extent of Perthshire indicates its importance; in that respect it is only inferior to Inverness-shire, but the relation between the surface and the population, amounting to little more than fifty-four persons to the square mile, is considerably below the mean term throughout Scotland. It is partly lowland and partly highland; the last portion, however, occupies a much larger space than the first, and more than two-thirds of the whole are unfit for cultivation. The arable land is mostly confined to the southern and eastern extremities, and to the plain of Strathmore, bounded in Perthshire by the Grampians on the north-west, and on the east by the Ochils and Sidlaw hills.

Benlawers, the highest mountain, on the side of Loch Tay, is upwards of 4000 feet above the level of the sea; the next in point of elevation are Benmore on the south-west, and Schiehallion on the north-east; and it is supposed that

^a Smith's Survey of Argyleshire.

^b The contrary is the fact, particularly in the islands of North and South Uist—the eastern coast being steep and rocky, with many inlets forming harbours; the western coast sloping down to the sea, and bordered by a sandy beach, but without harbours. The cultivated lands are generally along the west coast.—P.

^c Bell's Geography, vol. iii.

^d Loch Fine—Gaelic, *Loch-fhin* or *fhionn*, fair lake or estuary. Loch Long is also Gaelic (*Loch-luing*, lake of ships—from *loch*, lake and *long* (plu. *luing*.) ship).—P.

there are at least seven in the county, which are more than 3000 feet in height. But the different mountains through almost the whole breadth of the county, are intersected by straths or vallies, some of them comparatively large, and all of them watered by streams, or varied by lakes, of which the banks are adorned with natural woods. The lakes have been described by many tourists; it is therefore only necessary to mention the situation and extent of the most remarkable. Loch Tay almost in the centre of the Highland district, is about twelve miles in length, one in breadth, and in some places a hundred fathoms in depth. Loch Erich on the north-west, although not so broad, is longer than the former, and extends into Inverness-shire. Loch Earn is situated on the south of Loch Tay, and Loch Rannoch on the south-east of Loch Erich. Lastly, Lochs Vennachar, Achray and Katrine on the south-west, are famed for their romantic scenery.

The principal rivers, the Tay and the Forth, have been already mentioned. The Earn rises from the lake of the same name, flows in an easterly direction, and bending towards the south,^a waters Strathearn, a fruitful district, and joins the Tay after a course of twenty-five miles. At no great distance from their confluence, it passes by the village of Pitcaithly, a celebrated place on account of its mineral waters.

If all the soils common to Scotland have not been observed, the number may be readily supposed to be considerable in so extensive a county, and it is certain that some of the best and worst sorts are contained in it. The alluvial soils or carse lands are the most productive; and the Carse of Gowrie on the west and north-west of the Frith of Tay,^b a tract of about 18,000 acres, is one of the most fertile in Scotland. The lands at the base of the Ochils^c are only inferior to the last district in point of productiveness, and some of the straths in the Highlands are by no means unfruitful. A great part of the county was in former times covered with forests, which were successively destroyed as agriculture extended, or population increased. The defect, however, has been supplied within the last fifty or sixty years; the larch, which has been transported from the Tyrol, flourishes on the heaths and barren districts, and plantations of different forest trees, which are profitable to the proprietors, and ornamental to their estates, may be seen in most parts of the county.

Perthshire, it is said, was the boundary between two divisions of Scotland, which were distinguished in former times by their woods or forests; firs abounded in the one, and deciduous trees were common in the other. It may be said too to divide the granite and the freestone districts in the same country, the latter being comparatively rare on the north, and the former on the south of Perthshire. There is, however, a scarcity of valuable minerals; coal has only been found in the neighbourhood of Culross, a detached portion of the county on the south-east of the rest, and on the shores of the Forth. Although limestone is not uncommon, it is rendered of comparatively little value from the want of fuel to calcine it. Slates abound in the Highland district, and indications of copper, lead and iron have been

observed in different places; a copper mine was at one time wrought in the parish of Logie, and two lead mines, the one near Tyndrum, and the other in Glenlyen, although formerly considered productive, have been both abandoned.

Perth, the capital, is a place of great antiquity; it was formerly the seat of parliaments, and the frequent residence of Scottish kings, who were crowned in the vicinity.^d To enumerate the many memorable events in the history of Scotland, of which the same place was the scene, might occupy several pages. It may be doubted, however, if it ever was more flourishing than at present; at all events, different branches of industry are now cultivated, which were formerly unknown. It is the commercial capital of the South Highlands, and their improvement has been accompanied with a corresponding extension of its trade; and until industry is diffused over that part of Scotland, until the work of improvement is complete, Perth is likely to rise in importance. A steam-boat descends daily from it to Dundee, and another arrives from the same place. Seven different roads diverge to the defiles or straths in the Highlands, and the excellence of these roads, and the difficulties that have been overcome in making them, are equally worthy of admiration. The Tay runs south, and takes a bend towards the east about a mile below the town, which is situated on an extensive plain, partly surrounded by hills on the south and west of the river. The part on which the town stands, is divided into two meadows, the North and South Inches, each about a mile and a half in circumference, and each forming an agreeable walk.^e The town is regularly built, and consists of several streets extending from east to west, which are intersected by others at right angles from north to south. It contained formerly many churches and religious houses, most of which were destroyed by the blind zeal of the reformers. It is not without importance as a place of instruction; the grammar school has long enjoyed a high and merited reputation, and there is an academy in which drawing, mathematics and the different branches of natural philosophy are taught.

The principal manufactures of the county are carried on in the same place; they consist of linen, cotton, leather, paper and other articles. The vessels belonging to the port, measure about 3000 tons, and the exports are corn, salmon and different manufactures. The imports are the raw materials of the manufactures, and various articles of consumption. Although other towns and villages are situated in the county, none of them are of sufficient importance to require notice.

Inverness-shire is contiguous to Perthshire on the south, and is the largest county of any in Scotland. The outline, however, is very irregular; a narrow tract extends between Nairnshire and the Moray Frith, and another portion detached from the rest is enclosed by the counties of Banff and Moray; Argyleshire penetrates into it from the south-west; it is indented on the west by several lochs or arms of the sea, and it has already been remarked, that several of the Hebrides are politically attached to it.^f

It is obvious from these remarks that the surface cannot

^a The Earn bends south-east, not far from its outlet, and then flows nearly east through Strathearn.—P.

^b It is situated on the north of the Tay, between that river and the foot of the Sidla Hills, and between Perth and Dundee.—P.

^c Strathearn extends along the foot of the Ochils on the north.—P.

^d At Scone, on the opposite side of the Tay.—P.

^e The town divides a spacious plain into what are called the North and

South Inches. (Gaz. Scot.)—The Inches are level fields or meadows on the north and south of the town, used for public walks and pastures. The South Inch is planted with rows of trees.—P.

^f Its general boundaries are Nairn, Moray and Aberdeen on the east, Perth and Argyle on the south, the Atlantic on the west, and Ross and a part of Moray Frith on the north.—P.

be easily calculated; it has not, however, been computed at less than 3036 square miles, and of these 132 are occupied by lakes.^a If the calculation be correct, the extent of land is equal to 2904 square miles, and, in each of them, the average number of inhabitants is little more than twenty-eight individuals.

The appearance of the country is varied by lofty mountains, deep and narrow vallies, and numerous rivers and lakes. Glenmore, or the Great Glen, which is bounded on either side by precipitous heights, is for the most part about a mile in breadth; it extends from north-east to south-west, and divides the county into two nearly equal parts. The Ness discharges itself into the Murray Frith at the northern extremity of Glenmore, and the southern is formed by an inlet of the sea, that communicates with the Atlantic. The intermediate country is watered by several lakes that shall be afterwards mentioned.

Eight subordinate vallies join the great glen of Caledonia, which, it has been already seen, extends from sea to sea. The mountains, too, stretch across the island, confining and running parallel to the vallies, and forming lofty boundaries on both sides of them. The deep glens between these masses are the natural recipients of the waters that fall from the high grounds, and which for want of an outlet are formed into lakes; and as the vallies are long and narrow, so are the lakes; their average breadth is less than a mile; their average length is probably more than nine. Loch-Ness, the largest, is twenty-two miles long and from one to two broad.

The length of the rivers is modified by the direction of their course, and those that flow westwards into the Atlantic are in general shorter than those that fall into the German Ocean. The Spey, the largest of any, rises from a loch on the east of Glenmore,^b flows a distance of about ninety-six miles in a north-east direction, and receives the waters of 1300 square miles. The Ness issues from the lake of the same name, waters the town of Inverness, and discharges itself into the Murray Frith. The Lochy flows westwards,^c and enters Loch Eil after a course of ten miles. The Beaully has its source in the north-west, and carries the waters of several feeders into the frith that bears its name.^d

Mention has been made in a former chapter of the chain of mountains that traverses the county; it has been seen that Ben-Nevis, in the district of Lochaber, rises to a greater height than any in Britain, and that some of the others in the neighbourhood are not much lower.

The western side of the county, between Glenmore and the Atlantic, from Argyleshire on the south, to Ross-shire on the north, is the most desolate tract in Inverness-shire. The extensive district of Badenoch, which lies on the east side of the valley, terminates in Lochaber on the south, and in the Aird, the most fruitful part of the county, on the north.^e

The nature of the country may be inferred from the fact that two thirds of it are covered with heath, that the arable land does not exceed a fortieth part, and that the woodlands, green pastures, and cultivated fields, do not

make up more than eight acres out of a hundred. The productive land lies chiefly on the sea-coast, and along the banks of the lakes or rivers where the soil is alluvial and fruitful.

The most common minerals are granite, limestone, slate and marble. A great part of Ben-Nevis is composed of beautiful porphyry; lead has been discovered in the same mountain, and plumbago in Glengarry.^f The want of coal is severely felt by the inhabitants, and limestone, the most useful of their minerals, is thus rendered of little value.

The public works by which the same county is distinguished, have been completed within a comparatively recent period. The memorable rebellions in 1715 and 1745 contributed to the security of the inhabitants of the south, and to the subjugation of the Highlands. To accomplish so desirable an end, the three military stations of Fort George, Fort Augustus and Fort William were erected in the valley of Glenmore. The first was raised to guard the entrance of the Moray Frith on the east, the second to repel attacks from the centre, and the third to prevent any rising in the west.

The military roads which were made for a similar purpose by the soldiers under General Wade, attract, even at the present day, the attention of strangers, both on account of the patient labor requisite for the completion of such works, and also on account of the skill with which they are executed. It may be sufficient to add that mountains and marshes, formerly impassable, are now intersected by roads, which were made at a time when the country was barbarous, and which have mainly contributed to its civilization. In later times, other roads have been extended in many directions; and an easy communication is now afforded to most parts of the county. The public spirit of the proprietors has been encouraged by government, for of the sums expended on the roads, only one half is defrayed by the county; the other is granted by parliament.

It has already been remarked that a series of lakes extends in a direct line from north-east to south-west along the great valley of Caledonia. These lakes are Lochs Ness, Oich, Lochy, Eil and Linnhe.^g It is highly probable from the geological appearance of the country, that in a period now unknown, the lakes were continuous or the whole valley was submerged. If this supposition be correct, the waters must have broken the barriers, which confined them on the east and west, and made a passage for themselves to the German and Atlantic Oceans. The natural effect of such a change must have been to uncover the higher parts of Glenmore, or to form the necks of land that separate the salt and fresh water lakes. This opinion is further strengthened by the excavations which have been made in the valley, and which, with few exceptions, consist of sand, gravel and water-worn stones. The work of art, or the communication between the two seas, was thus rendered comparatively easy, and the advantages of a canal in such a situation, were pointed out by the celebrated Watt at so early a period as 1773.^h A considerable time, how-

^a This is the extent of the mainland, as given by Sinclair (Gen. Rep.)—That of the islands (Sky, Harris, Uist, Barra), by the same, 1209 square miles.—P.

^b The Spey rises in Badenoch, and a few miles from its source, forms an expansion called Loch Spey. (Bell.)—P.

^c The Lochy issues from Loch Lochy, and flows south-west through Glenmore.—P.

^d The Frith of Beaully, or Loch Beaully, forms the western extremity of Moray Frith, between the counties of Inverness and Ross.—P.

^e The Aird extends along the south side of the Frith of Beaully, between Beaully and Inverness. (Sinclair's Gen. Rep.)—P.

^f Glengarry.

^g Lochs Eil and Linnhe are sea lochs, or rather different parts of the same inlet. Loch Linnhe commences at the strait of Ardgower, about nine miles below Fort William, and extends to the sea.—P.

^h Mr. Watt was employed in making a survey of the valley, for that purpose, in 1773.—P.

ever, elapsed before its commencement, and one of the motives, which induced government to undertake the work, was to afford relief to the Highlanders. The system of sheep farming, a very great improvement, was perhaps too rapidly extended, and it cannot be denied that it had for a time the effect of throwing many out of employment. The formation of roads and canals, and the multiplication of fishing stations, were considered by government the best means of alleviating the distress resulting from a too sudden change. The Caledonian Canal was therefore begun in 1804,^a and completed in 1822, at an expense of more than L.800,000. It is not too much to say that the benevolent purposes, which it was intended to promote, were in a great degree realized during the long period that elapsed from its commencement to its completion. The summit level of the navigation, in a distance of about sixty miles from sea to sea, is only ninety-four feet above the ocean, and that circumstance renders Glenmore one of the most remarkable vallies in the kingdom. The length of the excavations of the canal is twenty-one miles and a half, and that of the intermediate lakes thirty-seven and a quarter, which gives a total length of fifty-eight miles and three quarters. It is 20 feet deep, 50 wide at the bottom, and 110 at the top. It is thus rendered navigable for frigates of 32 guns, and merchant ships of a like size. The differences of the level are compensated by 25 locks, of which the depth is 20 feet, the length 170, and the breadth 40. The canal rises 94 feet from the east sea to Loch Oich by 13 locks, and it descends 90 from the same loch to the opposite sea by 12 locks. Eight of these twelve, to which mariners have given the appropriate name of Neptune's Stairs, are situated near the western extremity of the canal, towards the bay that terminates in the Atlantic^b. The greatness of the dimensions renders the canal accessible to the largest class of merchant vessels in the trade of the North Sea; and although a short period has elapsed since its completion, many advantages have resulted from it. Others may be reasonably expected; commerce is likely to be further extended, and industry more widely diffused. The forts, which have been already mentioned, and which were raised to keep the Highlanders in awe, are now wholly useless for that purpose, and the time may come when the strong built barracks and spacious magazines shall be converted into store-houses and manufactories, affording employment to an increasing population, and spreading wealth over the surrounding country.

No part of the county has been more benefited by the canal than the capital, which, after the rebellion of 1745, was little better than a mass of ruinous houses. It is situated on both sides of the Ness, at its entrance into the Murray Frith. Part of the town and the old fort were built by a military colony sent by Cromwell to keep the Highlanders in subjection. It now possesses an academy, a library and a collection of philosophical instruments. It is besides the seat of different manufactures, and the centre of a mercantile intercourse, which extends to every part of the county.

No other towns of any consequence are situated in

^a Mr. Telford was employed by government, in 1802, in making a new survey.—P.

^b At Banavie, one mile from the western termination in Loch Eil.—P.

^c Banff or Bamff.

^d Cairngorm, 4060 feet high, is at the southern extremity of the county.—P.

Inverness-shire; but it has been remarked that several of the Hebrides are politically attached to it. Of these, the largest or the Isle of Sky contains nearly 10,000 inhabitants. It is very long and much indented by deep bays, and many smaller isles are situated in the vicinity. Roads made by government pass from one extremity to the other, and they are connected with others that lead to the small ports of Trotternish, Snizort, Dunvegan and Sconser.

The northern ramifications of the Grampians bound the valley of the Deveron, which flows into the North Sea, and waters the small town of Banff,^c the capital of a county, and one of the best built towns in the north of Scotland. The river is crossed by a handsome bridge of seven arches, but the harbour is rendered inconvenient by the shifting of sand banks. The boundaries of Banffshire are the counties of Inverness and Moray on the west, the Murray Frith on the north, and Aberdeenshire on the east and south. The surface is not less than 627 square miles. The soil along the coast consists chiefly of sand and loam, and is in many places well cultivated. But although there are several fertile vallies, and valuable pastures, sheltered with natural wood on the banks of rivers, Banffshire is in general a hilly, and, on the south, a mountainous district. Numerous streams are tributary to the Spey and the Deveron, the former of which forms its western, and the latter its eastern boundary, and both of them yield a considerable revenue from their salmon fishings.

Marble, limestone and marl abound, but from the want of coal, most of the lime is imported from Sunderland. The other minerals are freestone, granite, slate, brick-clay, and the rock crystals that are found on the elevated range that forms the southern and western limits of the county.^d

A vegetable substance, the cupbear or cupmoss,^e grows only on rocky and high situations, and its use as a purple dye, is said to have been discovered in 1755, by a native of the county. The quantity that is annually exported from Banffshire to Glasgow, amounts in value to more than L.700.

No manufactures are established on a great scale. The wealth of the farmer consists in his cattle; the climate and the soil are on the whole unfavourable to the raising of corn, and not more than a fifth part of the county is considered fit for tillage. The relation, however, between the surface and the population, is greater than in most parts of the Highlands; it is nearly as seventy-five to the square mile.

Elginshire or the county of Moray is washed by the frith of the same name on the north, and bounded by the last county or Banffshire on the east, by Inverness-shire on the south, and by Nairnshire on the west. The area is not more than 480 square miles, but in former times it was much larger, and the province of Moray,^f as it was then called, comprehended a considerable portion of the adjoining counties.^g Not more than a third part of the land is productive, and the relative number of inhabitants is upwards of seventy-one to the square mile. The county is naturally divided into two parts, the northern and the

^e *Cudbear* (so called from Dr. *Cuthbert* Gordon, who first manufactured it on a large scale) is a red or brownish red dye-stuff, prepared from lichens, particularly the *Lecanora tartarea*. The cup-moss is the *Cenomyce pyxidata*. The first manufactory of cudbear in Glasgow, was established in 1777.—P.

^f It formerly comprehended the shires of Nairn and Elgin, and a great part of the shire of Banff. (Gaz. Scot.)—P.

southern, and these are widely different from each other. The first comprehends the low grounds which stretch from the coast to the distance in some places of twelve, and in others of only five miles. The second division includes the heights or mountains in the interior. In the former, the climate may bear a comparison with that of most parts in Scotland, and the prevailing soil is a sandy loam, which yields plentiful harvests; in the latter, the winters are long and severe, the quantity of rain is greater than on the coast, and it sometimes happens that the ground is covered with snow, before the crops are collected. Limestone, sandstone, marl and slate abound in different parishes, and about a century ago iron ore was wrought in the county.

The numerous mountain streams serve to enlarge the principal rivers, the Spey, the Lossie, and the Findhorn. Of these, the first or largest forms the eastern boundary of Morayshire, which it enters at Aviemore, a place more than thirty miles from its source. It then flows in a deep bed with a considerable declivity, and reaches the sea at Speymouth.^a It affords the means of transporting the products of the woods on its banks, but it is ill adapted for the purposes of navigation; indeed it is only navigable near its mouth, and that merely for small vessels.

Many of the inhabitants are employed in agricultural, few in manufacturing industry; in the former of these occupations, particularly in the branch that relates to the rearing of cattle, considerable advances have been made. The native cattle have been crossed and improved by the Argyleshire race, and the Shetland sheep, once the only sort in the county, is now superseded by a better breed.

Elgin, the county town, is situated on the banks of the Lossie, about three miles from its mouth. It was formerly a place of more importance than at present, having been once the seat of a diocese,^b possessing the largest revenue of any in Scotland. Little of the ancient cathedral now remains, but the ruins are still imposing. The modern town consists principally of a single street more than a mile in length, and near the middle of it are the court-house, the parish church, the town-house, and the county gaol. The harbour in the neighbourhood,^c admits vessels of eighty tons at spring tides, and a considerable quantity of grain is exported to Grangemouth and Leith. Lastly, the burgh of Forres near the bay of Findhorn,^d and about twelve miles west of Elgin, contains nearly 4000 inhabitants.

The small county of Nairn was formerly contained in the ancient province of Moray. It is contiguous to the modern shire on the east and south, to Inverness-shire on the west, and to the Moray Frith on the north. The extent of surface is equal to 198 square miles, and the total population according to the last returns, to 9354 individuals. The northern or maritime part of Nairnshire, like the northern part of Morayshire, is fruitful; the prevailing soils consist of loam and clay, and both of them are considered equally productive. But the portion of arable land in the south, or at the distance of a few miles from the shore, is

very inconsiderable, and mostly confined to a sandy loam or gravel. Sandstone and marl are the only minerals of any importance, and the latter is not only abundant, but of an excellent quality.

The Findhorn and the Nairn, the only streams of any consequence, pass into the county from Inverness-shire, and it has been seen that the former also waters Morayshire, where it discharges itself into the sea, but the town of Nairn, the capital of the county, is situated at the confluence of the latter with the Moray Frith. It is a place of great antiquity, and it was formerly defended by a castle, of which the ruins cannot easily be discovered. It is now, however, without commerce or industry, and the population amounts to little more than two thousand individuals.

The small shire of Cromarty consists for the most part of different districts that are surrounded by Ross-shire.^e The boundaries of both counties are the sea on the east and west, Sutherland on the north, and Inverness on the south. The friths of Dornoch, Cromarty and Moray cut into the land on the eastern side, and the western is more deeply indented by numerous smaller inlets or lochs, which run into the interior, and of which the most remarkable are lochs Gareloch and Carron.^f The superficial extent of the two counties, exclusively of the islands that depend on Ross-shire, is not supposed to be less than 2474 square miles. But the population is so thinly scattered, that even according to the last returns, the ratio between the inhabitants and the surface is little more than 30 to the square mile.

If a narrow tract on the eastern coast be excepted, where the soil and climate are not unfavourable to vegetation, the general aspect of the country is rugged, mountainous and barren. A few patches of natural wood, and some plantations near the seats of the principal proprietors, relieve the prospect of this bleak and desolate region, subject to frequent rains in summer, and to much snow in winter. The western districts exhibit many broken summits, rocky mountains, and snowy glaciers in their deep and shaded recesses. But the numerous lakes^g in the same quarter are well adapted for fishing stations, and they are regularly visited by shoals of herrings. The principal rivers are the Conon and the Orrin, the Beaully which separates the county from Inverness-shire, and the Oickel^h which divides it from Sutherland.

Many of the farmers hold only a few acres of land with grazing ground, which is commonly contiguous, but in some instances, at a distance from their farm. They raise oats, barley for the distillation of spirits, and potatoes. It is customary for them to keep a great many cattle and horses, but for want of food, all of them are stunted in their growth, and from the same cause together with the severity of the climate, many of them perish in winter. It cannot, however, be denied that the state of the country has been improved of late years. Thus the repeal of the tax on salt has led to a more successful prosecution of the fisheries,

Cromarty. But in 1685 and 1698, George Earl of Cromarty procured by acts of parliament, the annexation of all his estates in Ross-shire to this county, giving it an extent far greater than before. The largest division, thus annexed, lies near the western coast, between Ross and Sutherland. Thirteen smaller districts are scattered through Ross-shire, even including islands on the western coast. In matters of police, this county is united with Ross, and it is placed under the jurisdiction of the sheriff of Ross.—P.

^e The shire of Cromarty originally consisted of a narrow tract, ten miles in length, extending along the coast of Murray Frith, south from the entrance of Cromarty Frith, in which was included the town of

and within the same recent period, many small farms have been united and let to persons of capital from different parts of Scotland; and although much opposition has been experienced, it may now be said that the system of sheep-farming, the one best adapted for the Highlands, is established in Ross-shire.

The minerals are freestone and limestone, and the latter approaches in many places to the qualities of marble. Ironstone is abundant, and according to a highland tradition, it was smelted many hundred years ago on the banks of Loch Eu. Repeated but hitherto unsuccessful attempts have been made for the discovery of coal.^a

The towns are Dingwall, Fortrose and Tain, all of them royal burghs, and all of them inconsiderable in point of population or industry. The first is situated on a plain at the west end of the Cromarty Frith, and small vessels can ascend to the town. Although the streets are paved, and many of the houses are well built, it is an ancient place, and there is reason to believe that it was formerly larger than at present. No branch of industry worthy of notice is carried on by the inhabitants, and their number does not amount to 2200. Fortrose, on the northern side of the Moray Frith, is still less populous, but it is the station from which ferry boats ply to Fort George on the opposite coast. The two forts were built after the rebellion of 1745 by George the Second, and their cross fire defends the entrance of the bay.^b Tain, on the southern coast of the Dornoch Frith, is considered the capital of Ross-shire;^c it possesses nearly 3000 inhabitants, and the only branches of industry in which they are engaged, are the spinning of flax, and the dressing of leather. The village of Ullapool, on the banks of Loch Broom, is the most important place on the western side of the county, and it was built at an expense of more than L.20,000 by the British Society for the improvement of the fisheries.

The port of Cromarty, a place of greater consequence than any in Ross-shire, is situated on the bay that bears the name of the small county and the town.^d The bay or frith, as it is commonly called, receives the waters of several lakes and mountain streams; it is deep, spacious, and sheltered on all sides. Cromarty is thus rendered one of the safest and most capacious harbours of any in the kingdom; and it is likely from its situation to become a depot of trade in the northern part of Scotland, and a place of resort to the royal navy in the northern and eastern seas. The principal manufacture, that of hempen bagging, has been estimated at L.27,000, and there are besides extensive breweries and different branches of the woollen manufacture.

The island of Lewis,^e the largest of the Hebrides that are attached to Ross-shire, may be mentioned on account of Stornoway, the principal port, which contains nearly

5000 inhabitants, most of whom find employment in the white and herring fisheries. The harbour is well frequented, and the seat of a custom-house; a packet sails regularly from it every week with the mail and passengers to the mainland.

The county of Sutherland is washed by the sea on the west, the north and the south-east; Caithness and Ross-shire are the boundaries on the north-east and south. It extends from 35 to 50 miles from north to south, and from 45 to 50 from east to west. The area, although not accurately determined, is not less than 1840 square miles, and the population relatively to the surface is not so great as fourteen persons to the square mile.

The coast, like that of the other Highland counties, is formed by a number of inlets, bold promontories, rocks and islets. The principal arms of the sea are Lochs Assynt,^f Laxford and Inchard on the west; Durness Bay, Loch Eriboll, the Kyle of Tongue,^g and the bays of Torrisdale and Strathy, on the north; and Loch Fleet in the Dornoch Frith on the south-east. The most remarkable promontories are Ru-Stoir^h on the south side of Loch Assynt, Cape Wrath on the north-west extremity of the county, Farout Head on the north, and Strathy Head on the north-east.

The interior consists of mountains, mosses or heaths, lakes and streams, and although it exhibits considerable variety of surface, the different parts resemble each other in sterility, ruggedness and the appearance of desolation. But the western side is perhaps more remarkable in this respect than any other portion of the county; no valley of any extent can be observed, and seldom a tree or shrub to vary the gloomy scene. It appears from the agricultural report, that the cultivated land, green pastures and woods do not exceed 60,000 acres, or a thirtieth part of the whole, and that the cultivated land alone is little more than one acre in a hundred.

The principal streams are the Fleet, the Brora and Helmsdale, which rise from the central part of the county, and fall into the Dornoch Frith on the south-east.ⁱ The extent of surface occupied by lakes is about 47 square miles, or 30,000 acres.

The sea has formed several large cavities in the limestone rock on the northern coast; one of them at Snow^k on the east of Durness, is about 32 yards in width and 20 in height, and another in Fraisgill is 50 feet high and 20 broad at its mouth, but it contracts gradually to its termination, a distance of more than half a mile. It has already been remarked, that with one or two exceptions the Highlands are destitute of coal; but that useful and valuable substance is included among the minerals of Sutherland, and it is worked not without profit near the banks of the Brora, where a railway has been constructed from the mines to the

^a A seam of coal, four inches thick, has been discovered on the eastern coast, near Cromarty. (Ed. Enc.)—P.

^b Fort George stands on a long narrow neck of land, called Ardersier Point, on the south side of Moray Frith, east of the Ness. It was begun in 1747 (after the suppression of the rebellion of 1745,) and finished in twenty years. Chanonry Ness projects into the Frith on the north side, nearly opposite Fort George, leaving comparatively a narrow passage into the upper part of the Frith. This last point extends from the town of Fortrose, and forms what are called the Links of Fortrose. The ferry is at the extremity of the point. I can find no mention of a fort on Chanonry Ness. Fort Augustus and Fort William were built at the same time with Fort George.—P.

^c It is the seat of the courts and the county jail.—P.

^d Cromarty, in Cromartyshire, is situated on the south side of the entrance of Cromarty Frith.—P.

^e Lewis and Harris form two parts of one island, connected by a narrow isthmus. Lewis is in Ross-shire, and Harris, in Inverness-shire.—P.

^f By Loch Assynt is doubtless meant the arm of the sea between Assint and Edrachilis, called Kilis (*Caolis*) or Kiliscuig (the Kyle or the Narrow Kyle.) Loch Assint is a fresh water lake in the interior of Assint.—P.

^g The Bay of Tongue. Kyle (Gaelic, *Kilis*) signifies a separation by water, an inlet or estuary.—P.

^h Great Point—also written, Row-Store. It forms the western point of Assint.—P.

ⁱ The Dornoch Frith is here made to include the whole arm of the sea between Tarbat Ness and the Ord of Caithness, and consequently the whole eastern coast of the county.—P.

^k Snow.—Smo or Smoah. (Gaz. Scot.)—P.

harbour at the mouth of the river. The other minerals are limestone, marble and sandstone. The first abounds on the coast,^a and is common in some parts of the interior. Two sorts of marble have been observed in the district of Assynt; the first, white, pure as alabaster, and of an excellent quality, has been wrought during several years at Lead-more and Lead-begg; the second sort, which is black with yellow veins, is found in Edderachylis.^b

Many boats are employed in the fisheries on the west and north coast for cod, ling, haddock and herring; and many of the small tenants, who were removed from their habitations in consequence of the introduction of sheep farming, have become fishermen on the eastern coast.^c

Dornoch, a royal burgh, situated on the south-eastern extremity of the Dornoch Frith,^d is the only town in the county, and it does not contain 700 inhabitants. Golspie, Helmsdale and Brora are the principal villages.

Caithness is the most northern county on the mainland of Great Britain. If the island of Stroma in the Pentland Frith, which is politically attached to it, be included, the surface is not less than 620 square miles,^e and the population relatively to the surface is at present more than fifty-five persons to the square mile. A fourth part of the surface is mountainous, more than a half consists of moss or heath, and not more than the eighth part is cultivated.^f It may be added that it formed part of Sutherland until the year 1807, when it was made a separate county under the jurisdiction of a sheriff.^g The boundaries are the Pentland Frith on the north, the Moray Frith and the German Ocean on the east, and the Ord of Caithness on the south.^h The last promontory or its southern limit separates it from Sutherland,ⁱ to which Caithness is contiguous on the south-west and west. On account of the northern situation of the county, the phenomenon of constant twilight may be observed about the summer solstice; but the climate is by no means insalubrious. Westerly winds prevail nearly three quarters of the year, and the annual quantity of rain is very considerable. According to the celebrated Pennant, the whole county was formerly a morass,^k but it is certain that even in the present day many trunks of trees are dug from the mosses. The surface, it has been already seen, is uneven, and the highest summits or the Paps of Caithness are more than 1900 feet above the level of the sea. The coasts are broken by numerous bays and promontories, and penetrated in several places by extensive caverns, which are frequented by seals. It is supposed that about 10,000 acres are covered by lakes or water, but none of the lakes occupy so great a surface as two miles in length by one in breadth. The principal river, or the Thurso, which rises from the confines of Sutherland, has a course of about thirty miles, and is navigable a short distance for small vessels. The

others, or the waters of Wick, Forss and Wester, are not navigable.

Although copper and lead have been discovered, the minerals on the whole are of little value. The same may be said of the manufactures, for although repeated attempts have been made to introduce them, none appear to have succeeded. Fishing and agriculture are the chief occupations of the inhabitants. The annual revenue derived from the herring, cod, lobster and salmon fisheries amounts to L.45,000, and of that sum, more than L.40,000 are obtained from the herring fishery alone. Many boats are likewise employed in the creeks and bays in fishing for haddock, ling and other fish that are consumed in the county, and several smacks sail every year from Gravesend to the cod fisheries on the northern coast.

Different agricultural improvements have been introduced within a comparatively recent period, and perhaps the most important is the successful introduction of the Cheviot sheep by Sir John Sinclair. But other improvements may yet be effected; the implements of husbandry are still extremely rude; the harrows consist entirely of wood, and there is only a thin plate of iron on the plough to prevent it from wearing by the friction of the soil. There are no granaries or barns, and the thrashing mill is almost unknown. The crops are barley and oats alternately on the old tillage lands, and four or five successive crops of grey oats on the outfield or inferior land. Wheat has been tried in a few places, but it appears to be ill adapted to the climate. An act of parliament was passed about thirty years ago for commuting the statute labour, under which L.550 have been annually expended on the repair of roads, and within a still later period, the proprietors have availed themselves of the aid granted to the northern counties, by which one half of the estimated expense of the great lines of road is defrayed by government. Thus, a communication has been formed from the Ord of Caithness to Wick, and from Wick to Thurso.

Wick and Thurso are the only towns. The former is situated at the mouth of the river of the same name, on the German Ocean. It contains about 1200 inhabitants. The harbour, which was formerly very inconvenient, has been much improved; piers, quays and dry docks have been constructed at an expense of L.12,000, and in consequence of these works, Wick has become an important fishing station. Thurso, a place of nearly 2000 inhabitants, is situated on the north-west coast of Caithness, at the head of a spacious bay, the estuary of the Thurso. The town consists of two parts; the houses and streets on the east of the river are old and irregularly built, but several modern buildings have been erected on the western bank.^l The same place is a port of the custom house, and it reckons about

^a The west coast is in a great measure formed of limestone. (Ed. Enc.)—P.

^b Assynt (Assint) and Edderachylis are two districts on the west coast of Sutherland; the former on the south, the latter on the north of *Kiliscuig*. Leadmore (Great Plain) and Leadbeg (Little Plain) are in Assynt.—P.

^g Is there not a mistake in the date? Let the reader compare the following statements. "Caithness was formerly part of Sutherland, but is now a separate shire." (Britannia Fortior, 1709.) "The Earl of Breadalbane is hereditary sheriff of Caithness. Wick is the residence of the sheriff, or his officer (substitute.) The Earls of Sutherland are hereditary sheriffs of Sutherland. By the act of Union (1707)

Bute and Caithness were joined in sending representatives to Parliament." (Chamberlayne's Mag. Brit. Notit. 1737.) "James IV. (1489—1514) appointed the sheriffs of Caithness to reside at Dornoch, or else at Wick, as occasion should require." (Camden's Britannia, Gibson's Edit.)—P.

^h The North Sea and the Pentland Frith on the north; the German Ocean on the east and south-east; Sutherland on the west and south-west; and on the south, terminating in a point at the Ord of Caithness.—P.

ⁱ The Ord is merely a point of land, on which the line between Sutherland and Caithness meets the German Ocean.—P.

^k "Caithness may be termed an immense morass, interspersed with some fruitful spots, but poorly cultivated." (Pennant's First Tour.)—P.

^l The town of Thurso is irregularly built, but very elegant houses have been erected to the south of the old town. (Ed. Enc.)—The town of Thurso stood on the west bank of the river in 1798, and was

thirty-six decked vessels, of which more than twelve belong to the town.^a

Two groups, the Orkney and Shetland or Zetland Islands, form the most northern county of Great Britain. The former are separated from Caithness by the Pentland Frith, a strait which varies in breadth from six to twelve miles.

Fair Isle and Foula are situated between Orkney and Shetland; the former is about twenty-four miles to the south, and the latter, which has been supposed to be the Thule of Tacitus, about twenty miles to the west of the Shetland group. Both of them are included in the same group, from which they may be distinctly seen in clear weather, and from which Fair Isle is more than thirty miles distant.^b

The Orkneys, it has been computed, contain 384,000 acres, a calculation which is probably above the truth, and it is also said that 300,000 acres are waste lands or covered with water. The Shetland Islands are perhaps twice as large, but in the whole of them not more than 22,000 acres are cultivated. As no correct survey has been taken of these islands, as their forms are very irregular, and as they are indented almost in every direction by arms of the sea, it is impossible to estimate their superficies with any thing like accuracy.

The Orcades or Orkneys, exclusively of insulated rocks, which bear little or no herbage, make up a group of sixty-seven islands, but of these not more than thirty are inhabited; the others, or holms^c as they are called, afford only scanty pastures for cattle. South Ronaldshay, the most southern of the inhabited islands, is about twenty-four square miles in extent, and contains nearly 1700 inhabitants, most of whom are employed in agriculture or in the manufacture of kelp. Hoy, on the north-west of it, is probably twice as large, but it does not contain a third part of the inhabitants; the ground indeed is not nearly so fruitful, the greater part of it being lofty,^d or covered with heath. Burray, on the north of South Ronaldshay, from which it is separated by a channel about a mile in breadth, produces grain, green crops and good pastures, but it is only three square miles in extent.^e Mainland or Pomona, the largest of the Orkneys, is situated on the north of the last; it contains more than two hundred square miles; it extends 30 miles from east to west, and in the same island are situated the towns of Kirkwall and Stromness. Shapinsay and Rousay, each about ten or twelve square miles, consist partly of arable, and partly of pasture lands. Still further north are Stronsay and Eday, the former about sixteen square miles in extent, the latter about twelve, and both of them containing a considerable proportion of productive

very irregularly built, but Sir J. Sinclair then proposed to feu a tract for building, on the south side of the town. Thurso Castle stood on the east bank of the river, nearly opposite the town. (Sir J. Sinclair. Stat. Acc.)—P.

^a Twenty decked vessels belong to the town. (Ed. Enc. 1831.)—P.

^b If, as the construction seems to require, the writer means to say that both these islands are included in the Shetland group, he has contradicted himself; for in the first sentence, he says, Fair Isle is 24 miles south of that group, and in the second, 30 miles distant from it. The following statements will explain the matter. "Fair-Isle is situated about 24 miles to the south of the Mainland in Shetland, and Foula about 20 miles to the west." (Ed. Enc.)—"The Fair Isle (*Fara*) is 30 miles distant from the most northerly of the Orkney Islands." (Stat. Acc. xiv.)—*Fara* or the Fair Isle, and Foula (Fowla.) *Fula* (Fule) or the Foul Isle, are isolated islands, not included in the Shetland group, but politically dependent on it; *Fara* being included in Dunrossness parish, and Foula, in Walls and Sandness parish, both on the Mainland of Shetland. The terminations *a, e, ay, ey*, in the Scottish

land. The former possesses two good harbours, and the manufacture of kelp in the latter affords employment to many of the inhabitants. Sanday lies on the north-east, and Westray on the north-west of the two last.^f The first, although only nineteen square miles in extent, has a population of nearly 1900 persons, being naturally productive, and yielding about a fifth part of all the kelp made in Orkney. North Ronaldshay, the most northern of the Orkneys, lies about three miles to the north of Sanday, and on a surface of nearly six square miles, contains about 550 inhabitants. As the superficial extent of the Orkneys must still be considered unknown, the relation between the population and the surface cannot be determined, but it is not probably less than fifty persons to the square mile.

The ancients were not wholly ignorant of these islands, which appear to have been the subject of many errors and fables. Pliny makes their number amount to forty, and Solinus affirms them to be uninhabitable, and covered with reeds. According to Ossian, they formed a powerful kingdom, and those who believe not only in his poems, but can determine the period in which the bard flourished, may from that fact form some notion of the other *powerful kingdoms* then established in Scotland. It is probable that the Picts possessed them until the subversion of their kingdom in the year 838.^g From that period until the end of the eleventh century, when they were made over to Norway, they were under the dominion of the kings of Scotland. They were exposed to frequent aggressions from the Scots, the Norwegians and the Danes, until the marriage of James the Third with Margaret of Norway, who obtained them as her dowry. The Orcadians speak English with a Scottish accent; the upper classes are polished and hospitable; the lower orders, although much addicted to superstition, are bold and adventurous, patient of fatigue and inured to hardships. The exports are oxen, sheep and kelp; the imports are different articles of consumption, and of these, the most important are coal and iron.

Kirkwall in the island of Pomona, the capital of the county, is small, dirty and ill built. It is said to have been founded in 1138 by Ronwald, count of Norway,^h and among its antiquities are the ruins of an ancient fortress and palace.ⁱ The cathedral, which is still entire, and used as a parish church, is a fine Gothic edifice. The harbour lies opposite a spacious and safe roadstead, and is defended by a fort that was built by Cromwell. An excellent port is all that is worthy of notice in the small town of Stromness on the southern side of the same island.

The inhabitants of the Shetland Islands are robust, well made, and of a sun-burnt or swarthy complexion. Not less

Islands, are the Danish, *ae*, island. *Fara* (Dan. *Faaræe*) is Sheep Island, and *Fula* (Dan. *Fuglæe*), Bird Island.—P.

^c *Holm* is a Danish word, signifying islet.—P.

^d Hoy (Dan. *høi-øe*, high-island) contains a mountain group of three summits; the highest, 1600 feet high. These mountains consist of sandstone, a formation which includes the whole of the Orkneys, except a small tract of granite, of little elevation, at Stromness, in the south-west corner of the Mainland.—P.

^e It is four miles long, and from one to two broad. (Gen. Rep.)—P.

^f Rather of Eday.—P.

^g The Pictish kingdom was subverted by Kenneth II. in 843.—P.

^h The cathedral was founded by Rognvald (Ronald,) Count (Earl—Dan. *Jarl*) of Orkney, in 1138. (Stat. Acc. vii. Ed. Enc.)—Rognvald was a Norwegian, the father of Rolf (Rollo), conqueror of Normandy, and the first Earl (jarl) of Orkney.—P.

ⁱ The Castle of Kirkwall (founded by Henry St. Clair, the first Earl of the Sinclair family, near the close of the 14th century,) the Earl's Palace and the Bishop's Palace.—P.

hospitable than their neighbours the Orcadians, they are equally bold and regardless of danger. It is customary for them to marry early, and nothing is more rare than celibacy. A small hut, one or two blankets, a single cow, a pot to boil provisions, and a spade to labour the ground, make up the most valuable property of many who enter into the married state. The language,^a laws, dress, manners and customs of the inhabitants, are the same as in the north of Scotland. The number of islands is 86, but more than a half of them are not inhabited. The most important are the Mainland, Yell, Unst, Whalsay, Bressay, Bur-

ray, House,^b Fetlar, Mickle and Little Roe, Skerries^c and Noss.

Lerwick and Scalloway, the only towns, are both of them situated in Mainland. The first is a place of rendezvous for the vessels engaged in the whale-fishery, and the second is provided with a commodious harbour. The origin of these islanders has given rise to different conjectures; it appears, however, that they are sprung from a Norwegian colony. Their small archipelago and the Orkneys were annexed at the same period to the Scottish crown.

^a The language of the Shetland and Orkney Islands and of Caithness was originally Norse. It is now English, with provincial peculiarities, which in Shetland particularly, are said to have little resemblance to the Scotch dialect. The names of places are mostly of Norse origin.—P.

^b Burray and House are parallel to each other, and are connected by a bridge.—P.

^c The Out Skerries—a cluster of islets and rocks, at some distance to the east of the Mainland. They are the easternmost of the group, as Unst is the most northern (and the most northern part of the British Home Dominions—60° 52' N.)—P

BOOK CLVII.

EUROPE.

Europe Continued.—Description of Ireland.—Boundaries.—Nature of the Country.—Harbours.—Rivers.—Islands, &c.

THE undeviating progress of civilization towards the west has gradually brought Ireland into historical notoriety. Scarcely known but by name to the writers of classic antiquity, seldom noticed in the earliest ages of Christianity except as a place of refuge from persecution, and, even at a later period, cited chiefly in the annals of ecclesiastical literature, its central position in one of the main circuits of commercial activity, and its connexion with the greatest maritime power in the world, have latterly invested it with a character of importance sufficient to entitle it to an enlarged share of attention. The many peculiarities of its physical and political constitution will amply repay the inquirer for the time and labour of investigation.

The island of Ireland, the second in magnitude of those considered as belonging to Europe, is situated to the north-west of that continent, and due west of the larger island of Great Britain, between the latitudes of $51^{\circ} 26'$ and $55^{\circ} 20'$ north, and the longitudes of $5^{\circ} 28'$ and $10^{\circ} 27'$ west. The Atlantic Ocean surrounds it on all sides but the eastern, on which it is separated from the island just mentioned by a confined arm of the sea, of which the southern extremity is known by the name of St. George's Channel, the centre expands into the Irish Sea, and the northern part is again contracted into the narrow strait of the Northern passage.^a Its geographical position gives it great commercial advantages. An uninterrupted expanse of sea admits an easy communication with the northern regions of Europe,^b the north-west of Africa, and the entire line of the eastern shore of the transatlantic continent as far south as the empire of Brazil, including the whole of the West Indian archipelago; the numerous and spacious gulfs and harbours by which its western and southern coasts are indented, afford a safe refuge from all those quarters to the vessels which the prevalence of westerly winds, and the influence of the great gulf stream, necessarily impel upon its coasts in their progress to any of the northern parts of Europe, while its proximity to all the great continental emporiums of commerce, presents an equally commodious vent for its natural productions, or its imported commodities. These great advantages will be

still more clearly perceptible from an enlarged description of the principal features of the country; and, as from its insulated situation, those connected with its maritime position must be considered as the most important, the investigation will best be commenced by an examination of the local peculiarities of its several bays, harbours, and other naval stations, as they would present themselves to an inquirer in a circumnavigation of the island made for this special object.

Commencing with Dublin, as well because this city is the metropolis of the island, as because, in consequence of the progress of steam navigation, it has become a great focus of communication with the manufacturing districts of Great Britain—Dublin Bay is formed by the mouth of the Liffey, a river of little importance beyond what it derives from the city seated upon its banks: the bay, open to the east, is confined on its northern side by the hilly peninsula of Howth, while to the south it is bounded by a low and undulating shore extending to the Killiney hills that form its southern extremity. Its extent across the mouth is eight miles, and its inland depth about nine. The passage of large vessels to the quays of Dublin is prevented by a bar at the river's mouth, over which the depth of water at high spring tides is but sixteen feet. To remedy this defect of nature, recourse has been unavailingly had to art. A wall has been built on each side of the river so as to confine its waters, by preventing them from spreading over the adjacent low lands, in the hope of thus diminishing the bar by the increased impulse of an accumulated body of water. The wall on the northern side is of small extent; that to the south projects in the form of a broad carriage road upwards of a mile into the sea, where its termination is marked by a fort used as a depot for heavy guns and other military stores. A massive pier of solid masonry is carried out from this spot nearly two miles further, where it is terminated by a light-house.^c

Experience having at length led to a conviction of the impossibility of removing the natural impediments in the mouth of the river that preclude the hope of rendering it a place of resort for vessels of heavy burden, the formation of a safety harbour in the vicinity suggested itself. A position on the north of the promontory of Howth was selected;^d but, after the expenditure of nearly a million sterling, the harbour has been found to be ill

^a North Channel.—P.

^b Rather the western, particularly France, Spain and Portugal, on the south.—P.

^d Howth harbour.

adapted for its intended object, and is now used solely as a station for the packets which ply between Dublin and Holyhead, and as an occasional shelter for the neighbouring fishing craft. Another situation was then chosen. A safety harbour has been nearly completed on the southern shore, to the west of the Killiney hills, at Dunleary, now called Kingstown, as being the place whence the late king embarked on leaving Ireland. The harbour is formed by two piers extending into the sea and gradually approaching at their outer extremities: it has depth of water sufficient for vessels of large size, and is already the place to which ships of this description steer, when either their commercial engagements or stress of weather direct them to Dublin.

Upon quitting Kingstown harbour and proceeding southwards from Dublin Bay along the eastern coast of Leinster, the small and uninhabited island of Dalkey^a presents itself, remarkable for little more than the recollections of times long past, when it formed the outer side of a port at which the chief governors of the country frequently landed and embarked, and where merchants deposited their cargoes intended for the Dublin market. The traces of its former importance are still discernible on the adjoining mainland in the ruins of several castles, which served as places of storage for securing the property deposited in them from the incursions of the neighbouring tribes of native Irish who inhabited the Wicklow mountains. The only harbours between those of Dublin and Wexford are at Wicklow and Arklow, suited merely for small craft. That of Wexford, though spacious and deep, is obstructed by a bar at its entrance, on which there is at times not more than seven feet water: it is also rendered unsafe by several shifting sand-banks. The navigation through the whole of this part of the channel is peculiarly hazardous to strangers on account of the shoals which lie along the coast, although due precaution has been taken to warn them of the danger by floating lights placed at each extremity; the northern is called the Kish,^b the southern the Star light. The port of Wicklow is also marked by two light-houses.

On turning southward by Carnsore Point, which also is marked by a light-house far out at sea on the Tuscar rock, the Saltees become visible, two uninhabited islands, near which some concealed rocks and shoals are also indicated by a floating light. Beyond these a few small islets present themselves, fit only for fishing stations. Among them the estuary of the river Bannow may be noticed as being the spot where the little band of Cambrian English,^c by their successful invasion, laid the foundation of a total change of the political destinies of the country.

The first harbour of importance on the southern coast is that of Waterford, being in fact an estuary formed by the three great rivers, Suir, Nore and Barrow; it is of

sufficient depth to admit large vessels to discharge their cargoes at the quay of Waterford city.^d Within this estuary is also the harbour of Dunmore, formed artificially at considerable expense for the purpose of facilitating the commercial intercourse between this part of Ireland and Bristol, which is regularly maintained by means of steam-vessels: it is likewise the station for the post-office packets that ply to Milford-Haven. The pier extends 700 yards from the cliff in four fathoms at low water, enclosing an area of six acres. Vessels of fifteen feet draft may lie afloat here at all times.

Tramore Bay, further west, though sufficiently capacious for a large fleet, is cautiously avoided by sailors. The similarity of its entrance to that of Waterford often deludes the inexperienced mariner, who, when too late, finds himself locked up in a situation whence egress is nearly impossible, and safety as nearly hopeless from the total want of places of shelter for large ships.

Dungarvan Bay,^e though extensive, is too shallow for large vessels; it is therefore little more than a fishing station. The same may be said of Youghal,^f the next in succession, the entrance of which is likewise impeded by a bar, having on it only five feet water at low, and but thirteen at high water neaps. Ballycotton Bay is wholly unsheltered, and is distinguished by two small uninhabited islands at its entrance.

Next in succession westward, and among the most important in size and value, is Cork harbour, whose narrow entrance, guarded on each side by heavy batteries, expands into a magnificent and deep basin in which a numerous fleet may set at defiance the fury of the elements in their most tempestuous mood. The entrance is further marked by a brilliant light on Roche's tower at the eastern side.^g Within the harbour are three islands. On Great Island, the largest of them, constituting a parish in itself, and containing a population of 9400 souls, is built the town of Cove,^h the great mercantile emporium of Cork; for, while ships of every size can discharge here, none drawing more than ten or eleven feet water can proceed as far as the city of Cork, which lies several miles inland on the river Lee.ⁱ Spike Island and Hawlbowlng,^k the two others, are used as naval depositories, for which purpose they have been fortified at a very great expense.^l

The next harbour of note is that of Kinsale.^m Vessels of every size may lie in safety within it, although there is a bar at the entrance with but twelve feet water at low spring-tides. This harbour is marked by a large light at the entrance, while a smaller in the interior indicates the place of anchorage for large vessels within.ⁿ Cloghnakilty^o and Castlehaven harbours are fit for small vessels only; the former contains Inchidony island, having a population of 2090 souls. The harbour of Baltimore affords protection for ships of every size, and is

^a Dalkey Island lies off Dalkey Point, the southern limit of Dublin Bay, and is separated from the mainland by a narrow channel, called Dalkey Sound, in which there is good anchorage. (Malham's Nav. Gaz.)—P.

easy of access to vessels bound either eastward or westward, as there are from twelve to nineteen fathoms water at the entrance. The island of Cape Clear or Clare Island contributes much to ensure the safety of vessels which take advantage of this port. The island was once considered to be a cape on the mainland, and as such was marked as being the most southern point of Ireland;^a but incorrectly, for it is separated from the mainland by the sound or channel of Gaskenane, which is about seven miles across. Cape Clear Island measures five miles from north-east to south-west: it is a parish within itself, maintaining a population of 886 souls. Several singular peculiarities connected with it are worthy of notice. It rises high above the surrounding ocean, encompassed with inaccessible cliffs, excepting only where two small inlets serving for harbours, nearly intersect it from north to south. Nature has been peculiarly bountiful to its inhabitants, by providing them with a small but perennial fresh-water lake, endowed with the peculiar quality of purifying in a few days any thing thrown into it: casks which had contained train oil, after lying in it a short time, have been rendered fit to hold milk. The natives were remarkable for size and strength. The thigh-bone of one of the O'Driscoll family, which long claimed the superiority here, is still preserved, and has been pronounced to belong to a man at least seven feet high. Fishing is the sole occupation of the people. The men go out to sea in open boats on Tuesdays to the distance of from twenty to thirty leagues, guiding their venturous course by the stars; returning on Friday or Saturday, they transfer the whole of their cargoes to the women, on whom devolve not only the subsequent labours of curing and disposing of the fish, but all the processes of agricultural industry. Formerly, and even within the last half century, the islanders elected a king from among themselves, to whose decisions, regulated by a code of laws handed down by tradition, unqualified obedience was conceded. But the late era of political revolutions, amongst other changes, has swept away the dynasty of the monarchs of Clear Island. The regal title is no longer known; the regal authority no longer recognised; and of the whole code of laws concocted by the collected wisdom of the islanders, nothing now remains but a few isolated customs. By one of these, strangers are prohibited from settling in the island; by another, offences of a deep dye are punished by exportation from it. Between Clear Island and the mainland is Sherkin Island,^b close to the shore.

The coast between Baltimore and Dunmanus Bay is marked by a number of islands, most of which, though small, are inhabited, but, from their vicinity to the mainland, and the consequent frequency of intercourse with strangers, their residents are not noted for those peculiarities of character or manners that mark the hardy islanders of Cape Clear. Within this space is Crookhaven, a fine harbour, though narrow, with water sufficiently deep for large ships, and always tranquil except during eastern gales.

^a Cape Clear is on an island of the same name, and forms the most southern point of Ireland. (Ed. Enc.)—Geographers, in calling it the most southern point of Ireland, do not consider it a part of the mainland, but the most southern point of land dependent on Ireland. Fastnet Rock is, however, about two leagues W. by S. of it.—P.

^b Inisherkin (Malham)—on the north-east, near Baltimore Point.—*Inis* (Welsh, *Ynys*) is a Gaelic word signifying island. Prefixed to names in Scotland and Ireland, it is spelt variously, viz. Inis, Innis, Inish, Inch, Enis, Ennis. *Ynys* is still used in the Welsh; but in present use, the Gaelic dialects have adopted the English word *island* (Ir. *oilean*, Sc. *eilean*, M. *ellan*).—P.

^c Mizzen Head is the south-west point of the mainland of Ireland.—P.

Passing by Brow Head, the most southern point of Ireland, and Mizzen Head,^c supposed to be the *Notium promontorium* of Ptolemy,^d Dunmanus Bay presents itself, having deep water and good anchorage, yet but little frequented, except by small vessels, as being exposed to the western gales, which here are very prevalent. To the north of this is Bantry Bay, large, safe and commodious for every kind of shipping; the stream of tide is scarcely felt in it; the water is deep almost close to the shore on both sides, nor are there any rocks from which danger can be apprehended. At its north-eastern extremity is Whiddy Island; in its western part are Glengariff, a small port, and Berehaven, a fine and safe harbour, well sheltered by Bere Island, which lies contiguous to it.^e Both these islands^f are inhabited; the former containing a population of 590, the latter of 2110 souls. This bay is celebrated in the most ancient period of Irish history, as the place where the Milesian colony landed, and in modern times not less so, as the point to which the French fleet directed its course, for the purpose of invasion, in the winter of 1796.^g

At Dursley Island the coast assumes a more decidedly northern direction. On passing it, are the bays of Ballydonaghan and Quolagh, both with deep water, yet little frequented on account of their numerous rocks. In Kenmare River, a large estuary, with abundance of water and sure anchorage, are the harbours of Ardgrome and Kilmickalogue, each suited to the reception of large ships.

Ballinskellig Bay^h has the Skelig Islands at its northern extremity.ⁱ These are merely barren uninhabited rocks, the largest marked by a light-house; yet they are of historic, or rather of romantic notoriety. The ancient traditions of the country record the death of one of the sons of Milesius, by drowning, near them. They are much frequented by gannets. It is even said that they are the only places on the Irish coast on which these birds light to lay their eggs. The fact, if true, may serve to explain an old tradition recorded by Keating, the Irish historian, concerning them, which states that a certain attractive quality in the soil draws down the birds that attempt to fly over them.

The sound between Valentia Island and the mainland of Kerry forms a deep and safe harbour, which has plenty of water, and is well sheltered. The island itself is about nine miles long, and has a population of 2130 souls, the greatest proportion of whom exist in a state of extreme poverty.

In Dingle Bay, which includes the harbours of Castlemain, Ventry and Dingle, a vessel may anchor in any part within a mile of the shore, which is steep on every side. To the north of this bay are the Blasquet or Ferriter Islands, twelve in number; most of them are merely barren rocks. A vessel of the Spanish armada of 1000 tons burden foundered here, and but two of the crew were saved.^k

^d Some have supposed Cape Clear to be the *Notium* of Ptolemy.—P.

ⁱ The Skelligs, Skelligs or Shellocks are three large rocks, west of the entrance of Ballynaskellig Bay, and S. W. of Valentia Island, about twelve miles from the mainland. (Ed. Enc.)—P.

^k Dunmore Head is the west point of the peninsula of Dingle, as well as of Europe; off it lie the Blasquet Islands. (Ed. Enc.)—P.

Smerwick Bay,^a although open to the north and north-west, affords good shelter for large vessels. The Spaniards built a fort here during the wars in Elizabeth's reign; it was ultimately taken by the English, and all the Spaniards in the garrison, except the officers, were slaughtered in cold blood. Tralee Bay also admits vessels of large tonnage.

The estuary of the Shannon, eight miles wide at its mouth, and extending many miles inland, lies between Kerry Head and Loop Head, on the latter of which there is a light-house. Vessels of large tonnage can proceed up it as far as Limerick. Besides this principal port there are numerous inlets on each side, affording shelter for smaller vessels, and commercial advantages to the adjoining districts. Among the many islets with which this estuary abounds, that of Inniscattery is peculiarly celebrated in monastic records, on account of being the chosen residence of St. Senanus, and for the exclusion of women from its hallowed precincts.

The shores between Loop Head and Galway Bay are chiefly comprehended within Malbay, justly so named, for a vessel driven into it by stress of weather, has but little chance of escaping shipwreck.

The entrance of the magnificent bay of Galway is sheltered by the islands of Arran,^b on both sides of which ample scope is afforded for the admission of vessels of every description, but the prevalence of western winds rendered egress at times extremely difficult, until this check to its nautical utility was removed by the application of steam power. Like the estuary of the Shannon, it has many havens or inlets in its interior adequate to the accommodation of smaller vessels. The islands of Arran are three: Arranmore, Inismain and Inishere. The ruins of ancient structures still existing on them, particularly on the largest, afford reasonable confirmation of the traditional opinion that these islands were the chosen seats of superstitious ceremonies before the introduction of Christianity. During the invasions of the Danes, they suffered much from the piratical assaults of these marauders, and even so lately as the period of the civil wars that desolated Ireland in 1641,^c they were deemed of sufficient importance to be the subject of a special capitulation by which they were surrendered to the parliamentary forces. The population of the islands is as follows: Arranmore 2276, Inismain 386, and Inishere 417. The inhabitants are chiefly employed in fishing, but there are in them several landholders in easy circumstances.

Cashin Bay, Kilkeeran Bay,^d Birterbuy Bay,^e and Roundstone Bay, which succeed each other closely on the west of Galway Bay, are each capable of sheltering the largest ships, and are the only good harbours for such vessels along the north-western coast from the Shannon to Lough Swilly. Roundstone Bay would contain and shelter the whole navy of England.

The line of coast hence to Clew Bay consists of indentations suited to accommodate ships of moderate burden. The principal are named Ardbean, Clifden, Kingstown, Cleggan, Ballynakill, and Killery. Along the coast are the islands of Inishark, Innisbofin and Innisturk, containing respectively 130, 1050, and 456 souls.

Clew Bay is from fifteen to seventeen miles long and about seven broad; its entrance is protected for about one third of its breadth by Clare Island; its interior is occupied by a collection of small islets more than 100 in number, among which, and in the adjoining creeks and islets of the mainland, is a variety of safe roadsteads and harbours. Verbal description, without the aid of a chart, would be wholly inadequate to convey a satisfactory idea of those valuable harbours. The average depth of water throughout the bay is fifteen fathoms. The chief ports in the interior are Newport and Westport, both places of late formation and of rapidly increasing wealth. The islands and channels near the latter are screened from the violence of the sea by a very singular natural breakwater of shingle and boulder-stones, which, with little interruption, extends nearly to Newport. In this line of beach are six openings, the most important of which, as forming the main channel, is marked by a light-house built and maintained wholly at the expense of the proprietor of the surrounding lands.

The island of Achil, or Eagle Island, so named from the great resort of eagles to it, divides Clew Bay from Blacksod Bay, and is the largest on the Irish coast. It contains an area of 22,000 acres, and is inhabited by a population of 3880 souls, who procure a wretched and precarious subsistence from the herring fishery. The land is hilly, with little arable ground, but peculiarly adapted for the fattening of sheep. It is separated from the mainland by a narrow gut so shallow at one part as to be easily crossed on foot at low water.

Blacksod Bay has water sufficient, and tolerable shelter for any ship. North of it are the small islands of Enniskea,^f and still further, that of Eagle Island, whence the coast, taking a new direction, trends due east by Broadhaven and Killala Bay to Sligo harbour. Broadhaven has depth of water but not scope sufficient for any number of large vessels; Killala Bay is barred by a bank covered by not more than four feet water at low spring tides. A small body of French landed here without opposition in the autumn of 1798.^g Sligo Bay is about five miles across at its mouth, and as much inland; it branches into three inlets, of which the only one of importance is that leading to Sligo, where a vessel will float in ten feet at high water.

Donegal Bay is of great extent, containing within it several harbours, the principal of which are Ballyshannon on the south, the entrance to which is dangerous, and Donegal, Inver and Killibegs on the northern side; of these the last named only is fit for large vessels. Although the coast of Donegal, hence to Lough Swilly, forms a succession of creeks, none of them are of sufficient importance to invite particular notice. Off the coast are many islands, the most remarkable of which are North Arranmore,^h on which is a light-house, Inismadun or Rutland, Croit Island and Tory Island. This last named island is ten miles off the coast. It is not more than three miles long by one broad, and maintains 300 inhabitants, who live in the most simple state. They choose their own chief judge, and yield implicit obedience to his mandate, issued from a seat of turf. So little intercourse have the natives with the mainland, that of a boat's crew of seven or eight men, who were driven on the

shore by stress of weather, not one had been in Ireland before. The appearance of the trees astonished them, and they collected small branches and leaves to exhibit to their friends on their return.

After passing Horn Head, which takes its name from two sharp projections on the summit of the cliff, Sheep Bay^a presents itself. It is much exposed to the north and north-western blasts, but the largest ships may ride in Dunfanaghy Bay in it. Mulroy Bay, the next in succession, also admits vessels of every description, but the difficulty of entrance deters many from trying the experiment.

Lough Swilly and Lough Foyle, which succeed one another on the Donegal coast, are the finest harbours on the northern shores of Ireland. It may here be mentioned, that in Ireland the name of *lough*, as in Scotland that of *loch*,^b is not confined to inland sheets of water wholly detached from the main ocean, but is applied, as in the present instance, to such indentations of the sea as have narrow mouths, and trench deeply into the land. Such is peculiarly the case with Lough Swilly. It penetrates twenty-five miles into the interior, branching out into several lesser bays. In its centre is the large island of Inch, containing 1094 inhabitants.

The form of Lough Foyle, which lies between the counties of Donegal and Derry,^c is somewhat similar to that of Lough Swilly. The city of Londonderry is situated at its southern extremity, at the mouth of the river Foyle. Off Malin Head is the island of Ennistrahul,^d distinguished by a light-house.

Passing by some smaller bays, and a group of islands near the coast, called the Skerries, and also the precipitous shores in the vicinity of the Giant's Causeway, the next port of consequence is that of Ballycastle, between Bengore Head and Fair Head, at the mouth of the Glensesk river. Its importance is derived, not so much from the magnitude or convenience of the harbour, as from the efforts made to render it a place of export for the coal raised in the neighbourhood. A pier quay was erected for this purpose. But the efforts of ingenuity against the gigantic powers of nature were unavailing. The pier has been washed away by the influx of the great Deucealedonian Ocean,^e and the colliery is now nearly abandoned. The port, however, is in some degree protected from the fury of the ocean by the island of Rathlin or Ragherly, the *Ricnea* of Pliny, and the *Ricina* of Ptolemy, extending in the form of a crescent, with its tips towards the mainland, from which it is separated by a strait six miles wide. It is five miles in length, and half as many broad, affording subsistence to a hardy and industrious population of 1100 inhabitants. Such is their attachment to the place of their nativity, that one of their worst wishes to a neighbour who has injured them is, that he may end his days in Ireland. Kelp is made here in considerable quan-

ties, and the soil, where cultivated, produces good barley. In it are several curious arrangements of basaltic pillars, like those of the Giant's Causeway. This island formerly belonged to the Danes or Norwegians. It afforded shelter for some time to Robert Bruce during the period of his adversity. The ruins of the castle in which he defended himself so gallantly against his rival Baliol,^f are still in existence.

From Fair Head and Tor Point the coast turns southwards, and the northern channel^g commences, the breadth of which, measured from the latter of those promontories to the Mull of Cantyre, is but twelve miles.^h

The subsequent ports or havens along the Antrim shore, conspicuous as they may be in the tablets of the tourist, are but of little note in the consideration of the navigator. Larne presents an excellent harbour, known also by the name of Olderfleet,ⁱ but only for smaller vessels; the next which admits those of the higher classes, is Belfast Lough, called also Carrickfergus Bay. This bay, as valuable for its nautical advantages, as admirable for the scenic beauties of its shores, separates the counties of Antrim and Down, and is terminated by the neat and busy town of Belfast, at the mouth of the Lagan. Large ships can lie no nearer to that town than in mid-channel off Carrickfergus.^k At the southern entrance of the bay lie the Copeland Islands,^l three in number, with a light-house on the largest.

Donaghadee is the station for the post-office packets between Ireland and Scotland: the distance across the channel to Port-Patrick is twenty-two miles. The harbour has been lately considerably improved by the formation of two large piers built on ledges of rock, and enclosing a space of about 200 yards each way outside the former harbour. The piers extend into sixteen feet water at low tide, and a great part of the interior has been excavated to the same depth.

Strangford Lough or Lough Cone affords a safe harbour of depth sufficient for ships of the greatest draught, and of much more easy access than is generally supposed; but, owing to the rapidity of the current of tide which will carry vessels against the wind, and to the risk occasioned by several rocks near its entrance, against which the sea beats violently, strangers enter it with great reluctance. Its interior expands into a noble basin, lying north and south, studded with numerous islands, some richly wooded, others browsed on by sheep. It terminates at Newtown Ardes, nine miles inland.^m

Carlingford Loughⁿ is a spacious inlet about eight miles long, and one and a half broad at Warren Point, with deep water and sure anchorage; but from its situation among lofty mountains subject to sudden flaws and gusts of wind. It forms the passage to the town of Newry. A light-house at Hawlbowl Island^o marks the entrance.

^a Sheep-Haven. (Bell).—P.

^b The Gaelic orthography is the same in Ireland and Scotland, viz. *loch* (the Scotch and Irish Gaelic dialects not differing in this word.) The Manks word is *logh*. All are pronounced alike, *loh*.—P.

ⁱ Old Fleet or Learn. (Malham.) Oldfield (Ed. Enc.)—P.

^k Large vessels lie at Carmoil Pool, three miles from Belfast. (Ed. Enc.)—P.

^l Nouthead forms the south point of the entrance, off which lie the Copeland Islands. (Ed. Enc.)—P.

^m Strangford Lough is a basin, fifteen miles long and five broad, and is the largest salt water lough in Ireland. It runs directly north to Newton, and sends a small branch to the west, on which stands Downpatrick. Strangford Bay is an inlet, five miles and a half long, and a mile broad, opening into the Lough of Strangford. (Ed. Enc.)—Thus the whole length from the sea to Newtown Ardes, will be 20½ miles. The writer probably means that from Newtown Ardes it is nine miles in a direct line overland to the coast on the east.—P.

ⁿ Lough Carlingford, or Carlingford Bay. (Ed. Enc.)—P.

^o Haul Bowling Island—the passage is on the east side. (Malham.)—P.

Dundalk Bay is about seven miles across, and the same distance inland. A ledge of rocks across the mouth forms a bar over which there is seven fathom water: the general depth within is from four to six fathoms. Large vessels require spring-tides to float them to Dundalk quay. The tide rises on the bar nearly twenty feet at high springs.

The mouth of the Boyne forms the port of Drogheda. At the town, vessels of ten feet draught may lie afloat in the channel. A considerable export trade, chiefly in grain, is carried on here, but the harbour is not suited to large vessels. Proceeding thence southwards by Balbriggan, Skerries and Rush, the two latter of which are merely fishing stations, passing the small and uninhabited islands of Skerries, Lambay and Ireland's Eye, and doubling the promontory of Howth, the bay of Dublin again presents itself.

In a few words, Ireland is in possession of upwards of seventy harbours well suited for the purposes of commerce; of these fourteen are capable of accommodating fleets of war, besides which the number of fishing stations is too great to be specified in detail. Near the shores are 138 islands inhabited by a hardy, active, and industrious population of 43,000 souls. Several of the larger bays extend far into the country, proportionally enlarging the range of commercial utility; some of these are formed by the mouths of navigable rivers, thus facilitating the export of native produce, and the introduction of foreign merchandize. Another illustration of the great capabilities for traffic enjoyed by the island may be deduced from the fact, that the distance across the island from Galway Bay to Dublin, whence there is an immediate and expeditious transportation of goods to all the western ports of Great Britain, is but 110 miles, and that no point in the whole island is more than sixty-four miles from the sea.

The general appearance of the coast is bold, often precipitous, particularly in the northern districts. It presents either a succession of headlands projecting into the sea, comprehending in their intervals sweeping lines of depressed shore often of singular beauty, or a range of beetling cliffs, lowering over the subject ocean, and forbidding all access to the land, impressing upon it the character styled, in the energetic language of seaman-ship, an iron-bound coast. The peninsula of Island Magee, lying between Larne harbour and the northern channel, is a striking example of this latter characteristic feature, where the land terminates at once in a perpendicular precipice called the Gobbins, upwards of 200 feet high, at the foot of which the largest vessel in the British navy may float.

To proceed to the interior, the island, of which the outline has thus been sketched, is of a rhomboidal form, measuring 306 miles in its longer diameter from Mizen Head to Fair Head, and 216 in its shorter, from Carnsore Point to Urris Head in Mayo. Its breadth in a line drawn due west from Howth Head to Sline Head in Mayo^a is 170 miles. The superficial contents have been variously stated; but, from the calculations of writers most estimated for accuracy and intelligence, they may be laid down as being 20,400,000 acres, or 31,875

square miles.^b Of this number it is supposed that 1,000,000 acres are lakes, rivers, roads, and land utterly irreclaimable; 3,500,000 waste, but reclaimable; 1,500,000 unproductive, from injudicious or negligent treatment; leaving a remainder of 14,400,000, available towards supplying the wants of the population.

Ireland is in general a hilly country, though not without extensive plains in several parts; yet even these exhibit occasional undulations of surface which prevent the monotony of a continuous level so wearisome to the traveller in alluvial districts. The land seldom rises to an elevation that precludes culture; even on the loftiest eminences the snow does not remain for any length of time. The mountains are distributed rather in groups or masses than in chains. The west and north is generally mountainous. Wicklow county is an immense collection of mountain land, with no intervention of plains. The Mourne mountains occupy a large portion of the south of Down county. Kerry, in the south-west, presents a number of ridges, between which deep and productive valleys are the basins that conduct rivers of various dimensions to the sea. In Cork the mountain ridges lie nearly east and west. The Slieve Bloom^c and Devils Bit mountains form a central range between the King's and Queen's counties; Kilkenny also contains a considerable extent of rugged hilly land. The south of Carlow county rises into the lofty ridges of Mount Leinster and the Blackstairs.

The highest mountains are situated near the coast; their respective heights above the level of the sea are as follows:—

	Feet
Gurran Tual, the highest part of Macgillicuddy's Reeks,	
Kerry county,	3430
Lugnaquilla, Wicklow county,	3070
Slieve Donard, Down county,	2809
Muilrea, Mayo county,	2737
Mangerton, Kerry county,	2693
Nepin, Mayo county,	2540
Croagh Patrick, Mayo county,	2532
Benbana, the highest of the Twelve Pins, Galway county,	2406
Keeper, in Slieve Bloom, King's county,	2200

A catalogue of all the rivers that discharge themselves directly into the sea, exclusively of their numerous branches, contains the names of ninety-four. Many of these, however, are little more than rivulets, serving for the irrigation of very limited districts. The following are among the most important rivers.

Indisputably, first in rank is the Shannon. Issuing from an insignificant source in the mountainous district that separates Fermanagh from Leitrim, it takes a southern course between the provinces of Leinster and Connaught; then changing to a south-western direction, it flows between the counties of Clare and Limerick, until it discharges itself into the Atlantic through the estuary already described among the western bays. Its course is more than 230 miles in length,^d during which it expands into several lakes, the chief of which are Lough Allen in Leitrim county, Lough Reagh^e between Ros common and Longford, and Lough Deargh^f between

^a Sline Head is in the county of Galway.—P.
^b Mr. Wakefield estimates the superficial contents at 32,201 Eng. sq. miles, and 20,437,974 Eng. acres. (Ed. Enc.)—P.
^c *Slieve*, prefixed to the names of so many mountains in Ireland, as *Ben* is in Scotland, is a Gaelic word (*sliabh*, pron. *sleece*) signifying mountain. *Ben* (Gaelic, *beinn*) also signifies mountain, or rather peak.

These words are both found in Scotland and Ireland; but *slieve* is almost peculiar to the latter, as *ben* is to the former.—P.
^d The whole course of the Shannon is about 170 miles. (Ed. Enc.)—P.
^e Lough Ree.
^f Lough Derg.

Galway and Tipperary. It is navigable for shipping as far as Limerick, above which the river, though obstructed by a ledge of rocks, has been rendered navigable for small craft by a short line of canal.^a

The three rivers, Barrow, Nore and Suir, proceed from different parts of the Slieve Bloom mountains. The Barrow rises in their northern extremity, and takes a course at first east, but afterwards due south. Meeting the Nore near New Ross, the united stream assumes the name of the Ross river, and after forming an island called Great Island,^b it meets the Suir east of Waterford, where the three conjointly form the fine estuary of Waterford.^c The Suir rises from the southern extremity of the same range; flows first south and then east, affording the means of water conveyance for goods to several populous towns, and at Waterford expands into a deep and spacious channel. The Nore takes a direction between both. Each is navigable for large boats to a considerable distance up the country.

The Southern Blackwater^d rises on the confines of the counties of Cork and Kerry. Its direction is eastward during the greatest part of its course, but it ultimately turns southwards, forming the line of division between Cork and Waterford counties, and falling into the sea at Youghal.

The streams that feed Lake Allua in the west of the county of Cork, are the origin of the Lee, whence it takes a direction parallel to the Blackwater, from whose basin it is separated by the long and barren ridge of the Derrynasagart and Bogra mountains. On approaching the sea, it passes through the city of Cork, and falls into the harbour of the same name. The Bandon, still more southerly, and of comparatively inconsiderable length, takes a similar direction to the sea at Kinsale harbour.

The Slaney rises on the borders of Wicklow and Carlow counties.^e Its course is nearly due south to Wexford. The Liffey obtains admission into the catalogue of principal rivers, chiefly from the metropolis being seated on its banks; perhaps also its scenic beauties add something to its claim. Its source is in the mountainous district in the western part of Wicklow county, whence, after forming the fine waterfall of Poulaphuca, it pursues a tranquil course through the level county of Kildare, until on quitting it for that of Dublin, it precipitates itself over a ledge of rocks at the romantic falls of the Salmon-leap, near Leixlip, when again resuming its tranquil character, it glides silently into Dublin Bay. Its navigation extends no farther than the western extremity of Dublin city, and even thus far is available for boats only.

The central elevation over which the Bog of Allen is spread gives rise to the Boyne. This river taking a north-eastern direction, and having its stream increased by the Blackwater, proceeds to the Irish Sea at Drogh-

^c Waterford Haven.

^d There are two considerable rivers, called Blackwater, in the north of Ireland; one of which is a branch of the Boyne, and the other flows into the south-west corner of Lough Neagh.—P.

^e The Slaney rises in the south-western corner of Wicklow county. (Ed. Enc.)—P.

^f To its junction with the Blackwater.—P.

^g The principal source of the Foyle is the Mourne, which rises in the south of Tyrone; after receiving the Poe and the Derg from the west,

eda. With the aid of some artificial channels, it has been made navigable for boats to its junction near Navan.^f Old Bridge, a village on its banks, about three miles west of Drogheda, is a place of much historical notoriety, as being the spot where the armies of William and James decided the claims of these kings to the sovereignty of the British dominions.

The Mourne mountains give rise to the Bann, which flows northward, passes through Lough Neagh, and still preserving the same direction, forms the boundary between the counties of Antrim and Londonderry, till it gives vent to its waters in the Atlantic Ocean, a few miles north of Coleraine. A ledge of rocks across its channel to the north of Lough Neagh, presents a barrier hitherto insuperable to the free navigation of this fine river.

The junction of the Poe, the Finn, the Derg, and other smaller streams, forms the Foyle;^g it flows northwards, and discharges itself into the lough of the same name at Londonderry. Ballyshannon, or Belleek river,^h though containing a large body of water, is of very short extent, merely passing through the isthmus that separates Lough Erne from Ballyshannon Bay.

The lakes in Ireland are numerous. Lough Neagh, in Ulster, is by much the largest, being spread, according to the calculations of Beaufort, over a surface of 94,274 acres, or 147 square miles.ⁱ In shape it is oblong, somewhat approximating to a square; it is further distinguished from the other lakes by the tameness of its surrounding scenery and its want of islands; Ram Island in its southern part is the only one of importance.^k A brisk trade between the five counties that form the boundary of the lake, is carried on by means of it. The level of its surface is considerably raised in winter, and plans have been suggested, though never yet attempted to be carried into execution, by clearing the obstructions at the egress of the Bann from it, so far to lower the level of its waters, as to add considerably to the quantity of arable land in the surrounding districts. This lake has long been celebrated for its petrifying qualities. Numerous fragments of trees, in part, or wholly converted into a silicious substance, have been found near its shores, but the process by which this extraordinary change was effected, has never been observed in actual operation. A peculiar species of trout, called by the people Dolochan, is found in its waters.

Two lakes in the south-west of Ulster, connected by a narrow channel, on the banks of which the town of Enniskillen is built, assume the common name of Lough Erne. Both are long and narrow; the more inland measures about twelve miles in length; that nearer the sea, twenty-five. Many islands are interspersed through each, several of them well wooded, which, with the varied outline of the surrounding shores, gives the whole much scenic beauty.

and the Moyle from the east, it unites with the Finn, and assumes the name of the Foyle.—P.

^h Also called the river Erne. It is simply the outlet of Lough Erne.—P.

ⁱ Lough Erne is the most extensive fresh-water lake in Ireland. Lough Neagh was formerly believed to cover 100,000 acres of land, but by a recent accurate survey, its area is reduced to 58,200 acres. (Ed. Enc.)—P.

^k The tameness of its surface is broken only in two parts, by Blackwater Island, in the south-western angle of the lough, at the mouth of the river of the same name, and by Ram Island, on its eastern borders, near the coast of Antrim. (Ed. Enc.)—P.

In the west of Connaught, is Lough Corrib, thirty miles long,^a and nine or ten broad in some places. At its southern extremity it approaches the bay of Galway, into which it discharges its waters by a short river. Though the level of this lake is but thirteen and a half feet above that of the sea, no attempt has yet been made to connect them by a navigable canal carried across the insignificant isthmus by which they are now separated. On the north it is separated from Lough Mask, a lake of somewhat smaller dimensions, by a neck of land not more than three miles across. The still smaller lake of Lough Garra communicates with the latter of those by a short strait or river. Still further north, but wholly unconnected with those now mentioned, is Lough Conn, fourteen miles long.

To recapitulate the names or local peculiarities of all the smaller lakes in Ireland would be tedious and unprofitable. They are most numerous in the central tract, occupied by the counties of Cavan, Longford and West Meath. Two however, Lough Lane and Lough Derg, are not to be passed over in silence. The former, situated in the west of Munster, and better known by the name of the Lakes of Killarney, as consisting, in strictness of fact, of three sheets of water connected by narrow channels,^b is annually visited by strangers from every part, on account of its singularly romantic scenery. The latter, situated in the north-west of Ulster,^c is equally, if not still more famous, as a place of resort for pilgrims who collect thither for the performance of certain religious rites; and, though the observance of these has been frequently forbidden by the heads of the Roman catholic church in Ireland, the practices are still continued, and the island in it, called St. Patrick's Purgatory,^d which is the main object of attraction, is still annually visited by multitudes confiding in the efficacy of the pilgrimage.

Ireland was once so thickly covered with trees, as to have acquired, among its other numerous appellations, that of the Isle of Woods. It is now lamentably the reverse; insomuch, that an Anglo-American, when coasting along its north-western shores, on perceiving the total want of standing timber, which presents such a contrast to the general appearance of his native soil, where agricultural improvements are chiefly impeded by the exuberance of the forests, has been heard to exclaim in a tone of admiration, "what a well-cleared country!" Many tracts of land, where not a vestige of plantations can now be discovered, still retain the name of woods. The number and density of the forests was one great check to the military progress of the English invaders: the noble hall of Westminster is roofed with oak from the woods of Shillelagh in Wicklow. The disturbed state of the country during many centuries, together with the uncertain tenure of the new proprietors to whom the greater part of the land was transferred on the close of the civil wars of 1641, are amply sufficient to account for the change. Attempts have since been made to supply a want now so severely felt. Spirited landholders have planted, and the Irish legislature, in aid of their exertions, has secured to the occupying tenant, on the

close of his tenure, a right to the benefits of the trees which he had raised. The effects of this salutary law are but partial; much still remains to be done. The country continues to labour under a defect equally detrimental to its agricultural prosperity and to its scenic beauty. This is the more to be lamented, because all kinds of valuable timber trees grow freely in a soil, whose variety accommodates itself to the healthy sustenance of every species. The oak attains its most majestic expansion on the rich plains; the more elevated hills, too chilly for tillage, and in many parts affording but a scanty pasturage for sheep, would give the intelligent planter an ample return for the outlay of capital in hardy timber trees congenial to the situation. Besides the oak, already noticed, the larch, which though of comparatively modern introduction thrives rapidly, the various species of fir, the ash, beech, lime and other large trees, together with several of the more elegant and delicate species, grow freely. The arbutus is found in abundance in the vales of Kerry;^e the myrtle thrives in the open air on the sandy soils of Cork, Waterford, and even so far north as Wicklow, seldom checked by the occasional frosts of a short and generally mild winter.

But among the most singular natural features of the country, and most retarding the progress of agricultural improvement, are the bogs. These are not to be considered as low and marshy tracts incapable of drainage; on the contrary, they are found universally in elevated situations, and in every case admit of water communication by some river to the sea. The entire extent of bog-land exceeds 2,830,000 acres, or nearly one-seventh of the whole superficies. The bogs are principally situated in the elevated district in the midland counties. If two diverging lines be drawn across the island from east to west, the one from Howth Head to Sligo, the other from Wicklow to Galway, the included space, resembling in form a broad belt drawn across the centre of the island, with its narrowest end nearest the capital, and gradually enlarging as it approaches the Atlantic, will comprise by much the greater portion of the bogs in the island,^f exclusive of mere mountain bogs and those of less extent than 500 acres each.

This great division of the island is traversed by the Shannon from north to south, and is thus divided into two parts; the quantity of bog contained in the more western of these divisions is double of that in the eastern; so that if the whole of the bogs of Ireland, exclusively of those in mountains and in small detached portions, were to be divided into twenty parts, seventeen of these would be comprised within the great central band, twelve parts lying westward and five eastward of the Shannon; and of the three remaining parts, two are to the south and one to the north of the same band. Although the mountainous and detached bogs do not enter into the preceding calculation, their importance as an aggregate may be inferred from the fact that in the county of Cavan alone, there are more than ninety tracts of bog, no one of which exceeds 800 acres,^g but

^a Twenty miles long. (Ed. Enc. Myers. Bell.)—P.

^b The lower lake (3000 acres) to the north; the middle or Mucross Lake (640 acres); and the upper lake (720 acres) to the south. (Ed. Enc.)—P.

^c In the south-western part of Donegal.—P.

^d In the centre of the lake, and about a mile from the shore, is an island containing not more than an Irish acre. There is a cavern there called the Cave of St. Patrick, or St. Patrick's Purgatory. (Ed. Enc.)—P.

^e The romantic scenery of Killarney, in the county of Kerry, is the most northern habitat of the *Arbutus Unedo*. (Ed. Enc.) In 1776, there was a very large arbutus tree at Mount Kennedy, near Wicklow, one branch of which, parting from the body near the ground, was six feet two inches in circumference. (Young's Tour in Ireland.)—P.

^f Six sevenths. (Ed. Enc.)—P.

^g 500 acres (Ed. Enc.)—P.

which collectively contain about 17,600 acres, besides many smaller plots, varying from five to twenty acres. It may be deemed almost superfluous to remark, that as the only use to which bog is applied is for fuel, its value, as a marketable commodity, is generally in the inverse proportion to its extent of surface, particularly in those districts where mineral coal is of difficult attainment. A shrewd landed proprietor remarked that he considered the bog to be the most profitable part of his estate.

The total amount of the bogs is thus estimated by the parliamentary commissioners appointed to investigate the subject in 1810.^a

	Acres.
Flat red bog, convertible to the general purposes of agriculture	1,576,000
Mountain bog, a large proportion of which might be converted into pasture or plantation	1,255,000
Total	2,831,000

There are two species of bog, the red or fibrous, and the black or compact. The former predominates; the chief part of the most extensive bog districts being composed of it. It is formed chiefly of the fibres of the *Sphagnum palustre* or bog moss, but the following species of plants also aid in its formation, namely, *Hypnum* or feather moss, *Polytrichum* or hair moss, *Bryum*, *Lichen rangiferinus*^b or rein-deer moss, *Scirpus cæspitosus* or dwarf club rush, *Anthericum ossifragum*, *Juncus bufonius* or toad rush^c—the three last named plants are found in large quantities in soft wet bogs; the first of them, called by the peasants keeve-grass, flourishes most in the wettest parts, where its long and slender roots may be traced to the depth of two feet:—*Erica vulgaris* or common heath, *Equisetum limosum* and *arvense*,^d *Lemna* or duck-weed, *Conferva*,^e *Schænus Mariscus* or bog-rush, *Mentha sylvestris*,^f *Hypericum pulchrum*,^g *Vaccinium Oxycoccus* or cranberry, *Empetrum nigrum* or crowberry, *Myrica Gale*,^h *Arundo Phragmites* or common reed grass, *Eriophorum angustifolium* or narrow-leaved cotton grass, *Holcus lanatus* or meadow soft grass, *Melica cærulea* or purple melic grass, and *Agrostis stolonifera* or florin grass: the two last named plants are very general, and found growing together. The external appearance of this kind of bog is usually reddish brown; when dry it is darker, approaching to an olive; in this state its surface is usually covered with the *Erica vulgaris* or common heath, which gives it at a distance an olive, or, if in blossom, a pinkish hue.

Those parts of the red bogs that are so wet and soft as to render their interior nearly inaccessible are distinguished by the name of fluid peat or quagmire. They frequently occupy the most elevated situations, and diverge by winding courses to the edges; the bog is usually shallow where they occur, seldom exceeding fourteen feet in depth. The red peat, from its tough and fibrous texture, is cut with difficulty by the spade;

whence, and from its porous nature, it is not used as fuel except in cases of necessity.

The compact or black bog varies in colour from deep reddish brown to jet black, in which latter case, the mass is perfectly close-grained, strongly resembling pitch or pitch-coal, the fracture being conchoidal in every direction and the lustre glistening. This kind of bog very rarely contains any vegetable remains; when any such occur, they consist of some of the varieties of rushes common in stagnant waters.

Compact or black bog is frequently met with, unaccompanied with fibrous bog, but in such cases it seldom forms large tracts; while in all bogs where the upper part is fibrous, the lower consists of the black. Where turf cuttings have been made, black bog is universally found, but as the turf-cutters are frequently prevented, by the want of sufficient drainage, from cutting to a sufficient depth, they necessarily leave untouched the larger and by far the more valuable part, as it is invariably found, that the compactness of the bog increases with its depth, and the more dense and solid the turf, the hotter and more durable the fire.

An accurate perpendicular section of a portion of red bog gave the following results: 1, To the depth of two feet, being the surface of the bog decomposed by the atmosphere, was a dark reddish brown mass, rarely exhibiting any vegetable remains. 2, Three feet further down, a light reddish brown mass, in which the moss was still so perfect as to be distinguishable into its various species. 3, Five feet thickness, deep reddish brown, fibres visible, but the component parts less distinguishable; this portion may be used for fuel, but it burns badly from the openness of its texture, and its containing no empyreumatic oil. 4, Eight feet and a half thick, deep reddish brown, the fibres discernible, though compact; it burns tolerably well as fuel. 5, Three feet thick, of a blackish brown, the fibrous texture scarcely discernible, numerous twigs and small branches of birch, alder and fir interspersed through the mass; these are always found to be hollow, the woody part having wholly disappeared, leaving the bark in a tubular form: this is the commencement of the compact or black-bog formation. 6, Three feet thick; a blackish brown mass, compact, without any trace of fibrous texture; as fuel it burns swiftly with a bright flame, and is vulgarly named greasy turf from its inflaming quickly like grease. 7, Ten feet thick; a blackish brown mass, very compact, without any vegetable remains, containing much empyreumatic oil, and burning slowly with an unpleasant smell. 8, Four feet thick; a black mass, very compact, bearing a strong resemblance to pitch or coal, fracture conchoidal in every direction, lustre shining, susceptible of a high polish, but, from its offensive smell when ignited, it is seldom used as fuel. Here the bog formation terminates at a depth of 38½ feet. 9, Three feet thick, yellowish white marl not adhering to the tongue, and containing 64 per cent. of carbonate of lime. 10, Four

^a In Sept. 1809, a warrant was issued, by which commissioners were appointed to inquire into the nature and extent of the bogs in Ireland, and the practicability of draining and cultivating them. Four reports were presented by them, the last of which, laid before Parliament, in the session of 1813—14, contains the numerical statements in the text. (Ed. Enc.)—P.

feet thick, blue clay, adhering strongly to the tongue, and containing 72 per cent. of alumine, 22 of silex coloured by oxide of iron, and the remainder of carbonate of lime. 11, Depth unknown, clay mixed with limestone gravel. However much the internal structure of the different bogs may vary from that now described, it appears certain that all without exception rest on a basis of marl or of limestone gravel either pure or combined with clay.

Viewing the bogs externally, they present surfaces by no means level, but with planes of inclination amply sufficient for their drainage. The highest level of the Bog of Allen, in the eastern division of the central band, is 298 feet above the level of the sea, while the lowest is but 84 feet less, being 214 feet above the same level. There is no part of them, therefore, from which the water may not be discharged into rivers in their immediate vicinity, and with a fall adequate to their complete drainage. It has been clearly ascertained, that, though in their present state they exhibit little more than an unproductive waste, a judicious system of reclamation would render them highly productive, without diminishing in any degree their capability of being converted into fuel at any future period, should the wants of the country require it.

One very remarkable feature in the landscape of Ireland cannot fail to strike the observer. In traversing most parts of the island, isolated ranges or groups of bold mountainous or hilly tracts are to be seen, the intervals between them being occupied by a surface which, when viewed on the great scale, appears level, but on a nearer approach, presents a gently undulating plain. A considerable expansion of this level occupies the central counties between Dublin and Galway Bays. Such a surface, it may be affirmed, almost without exception, covers a sub-soil of flötz limestone,^a to the abundance of which mineral, next to the mild temperature and general moisture of the atmosphere, the soil is chiefly indebted for its superior fertility. This great sheet of limestone comes in contact with, and sweeps round every mountain tract, filling up all the intervals and hollows between them. There is, in fact, no county except Wicklow in which limestone rock either of secondary or primary origin is not to be found. The latter of these,^b however, is chiefly confined to the counties of Sligo and Galway, in the west, and to Donegal, Derry, Tyrone and Antrim, in the north.

The north-eastern region of Ireland is peculiarly remarkable by being chiefly composed of three mountainous groups marked by singular diversities of geological character. The Mourne mountains, a well defined group in the south of the county of Down, of which the towering Slieve Donard is the summit, may be considered as the first of these. Granite is the constituent not only of the main group, but also of the subordinate ranges that branch from it in several directions under the names of the Fathom Hills, Slieve Gullion or the Newry mountains, and the Ravensdale and Carlingford mountains, northward of the Mourne mountains. Slieve Croob, composed of sienite, and Slieve Anisky, of

hornblende rock, form an elevated tract dependant upon, though at some distance from, the main group. Hornblende rock and primitive greenstone are abundant on the skirts of this granitic district. Mica slate has been noticed only in one instance. Exterior chains of transition rock advance far to the west and north of this primitive tract, extending in the former direction into Cavan, and in the latter to the southern cape of Belfast Lough and the peninsula of the Ardes.^c The primitive nucleus bears but a very small proportion in superficial extent to these exterior chains, which are principally formed of grauwacke and grauwacke slate.

The coast of Scotland opposite to the Ardes, where the grauwacke terminates abruptly on the western side of the northern channel, presents a resumption of the same formation in the neighbourhood of Portpatrick, proceeding thence through the Mull of Galloway^d and the mountain chain which, under the name of Leadhills and other local appellations, traverses Scotland towards the south. The composition of this chain agrees with that of the corresponding mountainous tract in Ireland; the transition rocks forming its predominating constituent, enveloped by which several small districts of granite occur, while mica slate is either totally absent, or of very rare occurrence.

The second of the north-eastern groups is formed by the mountainous tract, partly in Derry and partly in Tyrone, between the rivers Roe and Mourne. The whole of this tract is primitive. Mica slate predominates, comprehending nine-tenths of the country; it is accompanied by primitive limestone in the lower parts. On the eastern side of the Roe, this system is succeeded by a range of secondary heights, covered by an enormous platform of basalt. Those secondary masses repose upon and conceal the mica slate in the eastern part of Derry, but it again emerges from beneath this covering in the north-eastern part of Antrim, and swells into mountains which break down suddenly between Tor Point and Cushenden Bay.

The correspondence of structure between Ireland and Scotland here again becomes visible. The Mull of Cantyre, which faces Tor Point, resumes the chain of mica slate which was broken off on the Irish coast. The Cantyre hills are connected with the Grampians, a chain strikingly similar, in all the circumstances of its composition, to that now described. Further, the mica slate in Ireland is succeeded on the south, where the Antrim coast exhibits it in section, by a conglomerate, perfectly resembling that which skirts the Grampian hills on their southern border.

The third group is divided into two chains by the valley of the Bann from Lough Neagh to the Atlantic. The eastern of these, lying between that river and the northern channel, presents an abrupt declivity towards the east, with a gentle slope in the contrary direction, in which the beds composing its mass dip. The western chain, between the Roe and the Bann, is the exact counterpart of the preceding; but the strata dip towards the north-east, the fall of the hills being gradual in this direction, while they front the west and south with abrupt and precipitous escarpments. The eastern system is wholly secondary, and uniformly covered with enormous stratified masses of basalt. The average depth of this superstratum, which acquires its greatest

thickness in the north, where it measures more than 900 feet, may be estimated at 545 feet, and its superficial extent at 800 square miles, a solid mass of extraordinary and imposing dimensions.

In the strata underlying the basalt are to be found many of the most important of those formations which, reposing on the coal measures, occupy such an extensive tract in the southern and eastern counties of England, but which in Ireland never extend beyond the circumference of the great basaltic mass. They occur in the following order: 1. Chalk. No two formations can be more identical in external characters and fossil organic remains than those Irish beds, frequently called white limestone, and the English chalk in the Isles of Wight and Purbeck. In both, the lower beds are destitute of flints, which the upper contain in abundance. 2. Mulattoe, an arenaceous stone, with a calcareous cement of a mottled appearance, whence it derives its name.^a The numerous beds of oolites which in England, almost without exception, succeed the green sandstone, are entirely wanting in Ireland, where the mulattoe reposes immediately on the lias limestone. 3. Lias limestone, disposed in thin beds alternating with slate clay, and distinguished by ammonites and gryphites, and the remains of the pentacrinus^b with which it abounds: its thickness has not been ascertained. 4. The lias reposes, as in England, on beds of red and variegated marle, containing gypsum, and further distinguished by numerous salt springs. The marle is underlaid by a thick deposit of red and variegated sandstone,^c containing clay-galls.

The four formations here specified vary considerably in thickness in different places. The mulattoe and lias are often wanting, but the chalk and the sandstone are remarkably constant. The whole series appears to the greatest advantage in the neighbourhood of Belfast.

The dykes, or whyn-dykes, form a feature peculiar to the northern part of Ireland, as none have yet been discovered in the southern or midland counties. Of those noticed, nearly one half are situated on the shore, and the remotest of the others is within fifteen miles of it. The highest observed is near the summit of Arragh, the loftiest mountain in Donegal; being 2220 feet above the sea.

Dykes seldom occur singly; they are generally found in groups, several within a short distance of each other. Their parallelism or uniformity of direction is another striking circumstance. Of 31, whose direction has been accurately noted, the greatest variety of range is from 17° to 53° north of west. The bearing of all the dykes is from south-east to north-west, and all cut the planes of the strata through which they pass at a very considerable angle.

In their relative width they vary considerably, some being but a few inches, others several hundred feet broad, but those of the latter description are very rare. Their height above the intersected strata is often very considerable; that on Arragh rises perpendicularly forty feet like a partition wall. At Scrabo hill, near Newtown Ardes, a dyke appears like a standing pillar at the entrance of one of the freestone quarries.^d Their depth is unknown; nor does it appear,

^a Qu. Green-sand—a sandstone with a calcareous cement, coloured green by hydrated silicate of iron. The green grains are often so few in number, that the rock has a grey or buff colour, in particular portions. Sometimes it is deeply coloured by brown oxide (hydrate) of iron. The chalk in Ireland reposes on green sand. (Conybeare and Phillips.)—The only other sandstone deposit between the chalk and lias, is the iron-sand—entirely silicious.—P.

^b Pentacrinites.—P.

^c New red sandstone.—P.

from observations on those lying along the coast in cliffs from 50 to 500 feet in height, that their sides converge, or that they branch off, like the metallic veins, into slender strings, or, except in very rare cases, swell into what the miners call bellies.

Their position is in all cases nearly vertical, the mean angle of deviation from the perpendicular, deduced from ten cases, being 13°, and from seven others, 7°; but no general conclusion has yet been formed as to the direction of this deviation. Neither is there that variety in their substance which might be inferred from their number, their relative distance, or the variety of their substrata. They are formed either of a number of diminutive pillars aggregated together, or of rhomboidal pieces, piled one on another like blocks of masonry, and formed of the following rocks, named in the order of their most frequent occurrence, namely trap and greenstone, with their associates, Lydian stone, flinty slate, graustone^e and wacke. One dyke of clay porphyry^f has been discovered at Farland Point in Donegal.

No general connexion has been discovered between the substance of the dyke and the rock through which it passes. Neither, in general, does any foreign matter intervene, except a slight rusty appearance on the surface of the divided stratum. The contact between the dyke and rock is close, but they may be always disjoined by the blow of a hammer. The mean specific gravity of the substances of the dykes is 2.86. The minerals found imbedded in them are augite in angular fragments, olivine in disseminated grains, crystallized glassy felspar, compact felspar, radiated zeolite, green soft steatite, iron pyrites, calcareous spar, carbonate of lime mixed with the trap, glassy quartz, sulphate of barytes, and plates of mica.

To the south of Dublin a great granite region extends in a continuous mass, without interruption, to the Blackstairs mountain, occupying generally the highest portion of the range throughout, though it is found also in the lowest position, as in the northern part of the Dublin mountains.^g It also forms an extensive flat on the western side of the range, to Castledermot and the Shillelagh hills. This constitutes the broadest part of the granite soil, being about fifteen miles across from east to west, whence it gradually narrows to a point; its breadth, in its northern extremity, is about seven miles.

Such is the extent of the continuous tract of fundamental granite on which all the succeeding rocks repose. Granite, however, reappears in other quarters, not only protruding and breaking forth in isolated denuded portions of the great base, but occurring as a later production, interstratified with rocks which unequivocally rest on the fundamental granite.

The mica slate, wherever it occurs in this district, is in direct contact with the granite on both sides of the great granitic range; but, in its widest part, it nowhere exceeds three or four miles, as it soon graduates into clay slate, by which it is bounded for the greatest part of its course. In it have been incidentally found hornblende, andalusite, hollow spar,^h garnet and sphene.ⁱ

ⁱ Silico-calcareous oxide of Titanium.—P.

The clay-slate formation is spread over considerable tracts of the granitic chain, extending on the western side in a narrow border, to Castledermot, and on the eastern, from Bray southwards along the coast, where, gradually expanding, it spreads itself over nearly the whole of the county of Wexford. The total absence of metallic veins on the western side of the granitic region, while they exist in abundance on the eastern, presents a singular feature of this district.

The flötz sandstone^a is found resting upon granite, clay-slate, grauwacke, grauwacke slate, and transition rocks;^b it occurs sometimes in isolated portions, sometimes in extensive mountain ranges. The Slieve Bloom mountains consist of a nucleus of clay-slate surrounded by sandstone. The Bilboa and Keeper mountains are surrounded by a mantle of sandstone, except in a small portion on the north side, where the clay-slate nucleus comes immediately in contact with and supports the flötz limestone. This nucleus has yielded lead, silver and copper. The Slievenamara group consists of a nucleus of clay-slate surrounded and surmounted by sandstone, which is connected with the sand-hills that extend towards Thomastown on the north, and have the clay-slate for their foundation.

The tract adjacent to the lower part of Lough Dearg on the Shannon consists partly of mica slate,^c and partly of sandstone: the slate raised from the quarries of Killaloe is equal in quality to that of Wales.

The noble range of the Galtees and its subordinate ridge of Slievenamuck, consists of sandstone. The north-western face of the Galtees is in many parts extremely precipitous, and even inaccessible; while that on the south-east is of a more subdued character. The mountainous tract between the Suir and Blackwater may be considered as table land of clay-slate, partly bordered by sandstone, and sustaining isolated caps, or more widely extended ridges of the same rock. This tract is surrounded by flötz limestone on all sides, except the eastern, which consists almost entirely of clay-slate.

The component rock of the mountains lying still more westerly in Kerry is a clay-slate, the argillite of Werner, penetrated, especially towards the north, and in the central mountains, by veins of quartz. The clay-slate is frequently raised for roofing, but the inconvenience of export has admitted quarries to be opened only at Cahir Begnish and Valentia. The northern part of this district is chiefly formed of secondary limestone, with marine remains and calcareous spar, usually of a light blue, or smoke-grey colour. From the mouth of the Cashin river to the Kerry Head, stretches a bank of upland, composed of beds of argillaceous sandstone, in the partings of which the well-known quartz crystals, called Kerry-stones, are found; steel-grained lead^d is also found traversing this formation.

In the interior of the great limestone plain, already noticed, as spreading itself over the whole of the level region of Ireland, three isolated protuberant masses of sandstone arise from beneath the limestone at Moatgrenogue, Ballymahon and Slievegoldry. To the west of the clay-slate country in Longford, this rock occupies a considerable space, crossing the Shannon, and extending into the counties of Roscommon and Leitrim.

The extensive region still further westward, as far as

Galway, is chiefly calcareous. A line drawn from that town to Oughterard, marks the limit of the formation. All to the north, over Lough Corrib into Mayo and Roscommon, except the neighbourhood of Dumnore, is limestone; that to the south and west, as far as Sline Head, with the exception of two masses of primitive limestone, which occur between Oughterard and Clifden, is granite, or rather sienite.

The mountains in the northern part of this region are composed of quartz; round the bases they are gneiss and mica slate, with bands of hornblende and primitive limestone. Along the northern side of Lough Corrib, and to Ballynakill, the mica slate and hornblende rise into mountains, and the limestone disappears. From Lough Mask to Killery Bay, is a transition country of greenstone and grauwacke slate, covered with red sandstone, which also forms the hill of Muilrea, the highest point of Mayo. The upper beds of this and of the greenstone are frequently porphyritic. Greenstone and clay-slate prevail to the north of Mayo, and to the mountain of Croagh Patrick, the summit and western side of which are quartz, the eastern side slate and serpentine, but without any limestone, none of which is found in this direction beyond the great secondary limestone field. The component part of the mountain of Benebola or Twelve Pins, the highest in Connamara, is quartz, in general distinctly stratified, or at least schistose.

The great limestone field, though affording indications of several metals, more particularly lead and copper, is singularly ill adapted for mining operations, as it occupies the lowest and richest parts of the country, and frequently supports a considerable depth of alluvial matter and soil. Hence mines cannot be freed from water without machinery; the value of fuel and the drainage of lands become likewise important elements in the estimate of expenses. The marly tracts covering the limestone are distinguished in several places by the relics occasionally preserved in them of that extraordinary animal, the Irish elk or moose deer. A head and branches of one measuring ten feet ten inches between the tips of the horns, is described by Molyneux. But the valuable remains of this stately animal preserved in the museum of Trinity College, Dublin, contain a greater variety and number of bones than are to be seen in any other collection. A complete skeleton has not yet been discovered.

Though indications of metallic ores are to be met with in most parts of Ireland, few mines have as yet been found capable of being worked to advantage. The principal of those now wrought are in the granitic region of the county of Wicklow. A vein of gold, which has been discovered at Croghan-Kinselagh, by the particles of that metal observed in the bed of a neighbouring rivulet, was worked for some time for the benefit of the crown as a special royalty; but the profits were not found sufficient to justify the continuance of the expenditure, and the workings have been relinquished.

Rich veins of copper have been wrought at Cronebane and Ballymurtagh in the same county. Copper of excellent quality, and in large quantities, is also raised at Knockmahon and Bonmahon, in the county of Waterford. A mine at Allihies, in the county of Cork, is accounted one of the richest in Ireland; another at Cappagh, though yield-

^c Qu. clay slate. The slate from these quarries must be clay slate Killaloe is at the foot of Lough Derg.—P.

^d Granular sulphuret of lead.—P.

ing metal of fine quality, has been lately relinquished as not being sufficiently productive, as have also others at Kenmare and Ross Island, in the county of Kerry, and at Bouldar in Galway.

Lead is raised at the Ballycorus, Luganure, Hero and Carrigeenduff mines in Wicklow, and at Came in the neighbouring county of Wexford; mines of the same metal are also wrought at Clea in Armagh, and at Kildrum in Donegal. Those of Castlemaine and Kenmare in Kerry, and that of Sheffry in Mayo, have been relinquished after the loss of a considerable outlay in ascertaining their probable produce.

At Arigna, near the western shore of Lough Allen, is a rich and copious vein of iron, which, after having been formerly wrought to much advantage as long as the surrounding country supplied timber for fuel, remained for many years neglected. The workings have been resumed by one of the lately formed companies, with every prospect of a favourable result, as coal is now raised in the neighbourhood in sufficient quantity to justify the expectation of an adequate supply for many years. Antimony is found at Castleshane.

Coal has been discovered in greater or smaller quantities in seventeen counties, which may be classed in four districts, one in each of the provinces. Those of Leinster and Munster contain carbonaceous or stone coal, the slaty glantz coal of Werner;^a the two other provinces, bituminous or blazing coal.

The Leinster coal district is situated in the counties of Kilkenny, Queen's county and Carlow, extending also a short distance into Tipperary. It is divided into three detached parts, separated from each other by a secondary limestone country which not only envelopes, but in continuation passes under the whole of the coal district:^b the neighbouring country is abundantly supplied from this source.

The Munster coal district occupies a considerable portion of the counties of Limerick, Kerry, and Cork. Though by much the most extensive of the four, it is only now attracting to it that degree of scientific and manufacturing attention which, from its importance as an object of peculiar national interest, has long been called for. Coal and culm have been raised, for nearly a century, in the neighbourhood of Kanturk in Cork. At Dromagh, particularly, the works have been carried on with much effect, and the annual supply from them would have materially contributed to the agricultural improvement of a great extent of the maritime and commercial counties of Cork and Limerick, had the improvements on the surface for facilitating the land carriage, by means of judiciously planned and well formed roads, kept pace with the exertions of the individuals engaged in the production of the coal.

Next in order of value and importance is the Connaught coal district in the county of Leitrim, where workings are now carrying on with much energy at Aughabehy and other collieries in the vicinity of the Arigna iron-works. That the great natural facilities for distributing the produce of these collieries, arising from the neighbouring lake^c and

its communication through the Shannon, or by means of roads, have not been adequately seconded by the hand of art, will appear from the following quotation, which forms the first sentence of a late report of the directors of the Arigna mining company. "The roads in the Connaught coal district remain nearly in as bad a state as they were in prior to the interference of government in 1823, consequently the company is deprived of land sale at the colliery, while the sale in the lower Shannon district, upon which the board relied, has been interrupted for some months by the progress of certain repairs at the lock of the Lanesborough canal."^d

The coal district of Ulster is of trifling importance, when compared with any of the foregoing. The principal collieries are at Coal Island and Dungannon in Tyrone. Indications of coal have been observed at Drumquin in the same county, and at Pettigoe to the north of Lough Erne. Possibly the formation may extend westward from the first mentioned coal field to that part of the lake. Coal has also been found at Belturbet in Cavan, and at Ballycastle in Antrim. This latter vein, though long wrought, is by no means extensive. It had been worked at a very early period, for, in the year 1770, the miners, when pushing forward an adit level at a newly explored part of the cliff, unexpectedly discovered a passage cut through the rock. This passage was very narrow owing to incrustations on its sides. On examination it was found to be a regular gallery leading to thirty-six chambers; in short, the explorers found themselves at once in the heart of an extensive mine which had been wrought by workmen at least as expert as those of the present generation. Some remains of the tools, baskets, &c., were found, but in such a decayed state as to crumble into dust when touched; several of the tools appeared to have been made of wood thinly shod with iron.

Numerous mineral springs have been discovered in various counties in Ireland; few, however, have rendered their vicinity a place of general resort for invalids. The most remarkable are that at Mallow in Cork, which strongly resembles the hot wells of Bristol; those of Lucan and Golden-bridge near Dublin, the former sulphureous, the latter sulphureous and chalybeate; and that of Ballynahinch,^e also sulphureous and chalybeate, which attracts many visitors from the neighbouring counties. Swanlingbar in Cavan is sulphureous, and Castleconnel near Limerick, chalybeate. The first mentioned of these is the most noted.

To proceed from the physical to the political circumstances of the country. It is now generally admitted that Ireland owes its first colonization to a tribe of the Celtæ. The language is a Celtic dialect, and the names of many of its mountains, districts, lakes, rivers and towns are deducible from the same source. Still, however, the derivation of its best known appellation, Erin, has been much disputed. "Iri," says Ledwich, an antiquarian more distinguished for learning than sagacity, "or as now written Eri, is, in Irish, the great isle.^f In Teutonic, Er-aii, contracted into Eri, is the farther isle."^g Camden derives it from *Hiere*, an Irish word signifying west, or the westward.^h

^c Lough Allen.

^d The Upper Shannon navigation, commencing above Lough Ree, at Lanesborough, and extending 33 miles along the river, to near Leitrim. (Ed. Enc.)—P.

^e In Down county.—P.

^f *Er*, great; *I*, island. A more frequent Gaelic word for island is *Inis*; whence Innis, Ennis and Inch, in names of islands in Scotland and Ireland. The modern Gaelic word is *Oilean* (*Uilean, Eilean*).—P.

^g *Qu. fer* (*verre*.) far, or *eer*, ante, and *æ* or *ey*, insula—or *ur-ey*, primitive or parent island.—P.

^h *Siar* is the Gaelic for west; *Leath-shiar* (pron. *Léah-hiár*.) westward, literally, half of west. So also, *soir*, east; *taobh-shoir* (pron. *tav-hör*.) eastward, literally, side of east.—P.

The name of Scotia first occurs in writers of the fourth century; yet, however prevalent among various authors of different countries, it never entirely superseded its former designation. Usher says that the promiscuous application of this name, both to Ireland and Scotland, arose from the coalition between the Scots and Picts in the eleventh century;^a and even then all accurate writers distinguished the former by the name of *vetus, major* or *ulterior* Scotia, the latter being styled in contradistinction *nova, minor* or *citerior*. The word "Scotland" is by some authors derived from Scythia, supposed to have been the mother country. Whitaker and Chalmers, with more probability, attribute the name to their love of roving; the term *Scéite*, in Irish, signifying dispersed or scattered.

The Celtic descent of the aborigines may also be traced by the existing remains, though few, of their antiquities. Several of the rocking stones, similar to those found in various parts of England, are still to be seen. One in the neighbourhood of Dublin was but lately displaced from its equilibrium by the wantonness of a party of soldiery. Another in full perfection, is in Island Magee. The swords, axes and arrow-heads of a mixed copper metal are also adduced as proofs of their origin. But among the most singular traces of antiquity, should be reckoned the round towers of Ireland, of which upwards of fifty are still to be seen, dispersed in various parts of the country. Their origin and use, though made the subjects of many elaborate treatises, are still involved in obscurity. Their juxtaposition to monastic ruins has led to the conjecture that they were erected in the earlier ages of Christianity; but arguments equally probable have been adduced to prove their existence prior to the erection of these structures. Attempts have been made to trace the descent of the Irish colony to other countries by the existence of similar buildings in the latter, but as yet the evidence of such existence has not been conclusive. Erected generally in situations not peculiarly elevated, their uses as signal-towers would be very limited; the confined extent of their tubular cavity would not afford scope for the ringing of a bell; they therefore still remain, and to all appearance will long continue, an enigma for the exercise of antiquarian ingenuity.

Few traces of the history of the tribe thus settled are to be found in ancient authors. The island is, indeed, supposed to be noticed by the writer of the Argonautic Expedition,^b under the name of *Iernis*: Aristotle notices it by that of *Ierne*;^c by Cæsar and other Roman writers, it is called *Hibernia*; Marcianus Heracleotes names it *Jouernia*,^d as also does Ptolemy, a writer particularly exact in the appellation of places according to their native names. The last named writer proceeds further, laying down the position of several remarkable points, and the names and situation of the principal tribes and towns.

For an account of the acts of the inhabitants from their first settlement to the period of the English invasion, recourse must be had to the native chronicles. In the Psalter of Cashel and other Irish annals, it is recorded, that

soon after the flood, a number of Fowmarries, or pirates from Africa, attempted a settlement, from which they were soon dispossessed by an Asiatic colony headed by a chief named Partholan, a descendant in the eighth generation from Noah. These were in turn dispossessed, after a lapse of more than two centuries, by another colony from the same region named Firbolgs, whom some antiquarians suppose to have been a tribe of the Belgæ. Their dominion was terminated by the invasion of a fourth colony which came from Spain, under the command of the eight sons of Milesius; five of these perished through the casualties incident on landing, leaving the honour of the conquest, and the establishment of the family to the three survivors, Heber, Heremon, and Ir. The last named died shortly after the subjugation of the country, Heber was killed by his brother, and Heremon thus became sole monarch. The history of his successors for many generations presents little to arrest attention. One of them, surnamed Ollamb-Fodlah, or the learned doctor, is celebrated as the founder of several sage institutions; he is said to have ordained a triennial meeting of the elders or legislators at Tarah, and to have founded a college for the investigation and preservation of the national records. Two other princes of the same line are said to have fixed the first territorial division of the island, by a line from Dublin through Clonmacnois to Galway, marked by a deep trench strengthened by a rampart and a series of forts. The portion of the island to the north of this line was named Leah Quin or Conn's share, that to the south, Leah Mowa or Mowa's share, from the names of the princes by whom it was partitioned.^e But a still more remarkable division, yet partially existing, was subsequently made into the five provinces of Ullah or Ulster, Layean or Leinster, Mumha or Munster, Connaught, and Ciuge-na-Mee,^f or Meath,^g which last, comprehending the central counties of Meath, West Meath, and some surrounding districts, was afterwards absorbed into the neighbouring provinces of Leinster and Ulster, especially the former.

The reigns of the Milesian monarchs were almost incessantly disturbed by intestine commotions, suspended only by the temporary combinations of the rival chieftains for the purpose of repelling the predatory incursions made from the neighbouring shores of Great Britain, or by expeditions fitted out by themselves in retaliation. In one of these, it is said that St. Patrick was brought captive to the north of Ireland, where, during a servitude of several years, he acquired a knowledge of the native language and manners which considerably forwarded his subsequent apostolic labours.

Much as the country may have been indebted to this celebrated missionary, it is generally thought that Christianity had been introduced into it some time before by Declan, St. Kieran and others, who had succeeded in converting many of the lower classes, while St. Patrick, who returned to Ireland in 432, armed with credentials from Pope Celestine, gave it stability and influence by persuading the

princes and nobility to embrace its doctrines, by building churches and religious houses, and by appointing regular orders of priests and instructors. In noticing this celebrated character, it should not perhaps be wholly omitted that Ledwich denies his existence, and that a later writer, whose opinion is entitled to still less weight, endeavours to prove him a Roman of patrician origin.

The introduction of the new faith does not appear to have had much influence on the conduct of the native princes. The succeeding part of the history contains accounts of war, turbulence and assassination, similar to those with which the era of paganism had been stained. The calamities of the country were further augmented by the invasions of the northern freebooters, known in the Irish annals by the name of the Black and White Scandinavian pirates,^a and in English history by that of Ostmen or Danes. Seizing first on the principal seaports, and afterwards availing themselves of the still continued broils of the native chieftains, they at length obtained the sovereignty of the whole island about the year 860. But they did not maintain tranquil possession of this rich prize. Turgesius, their sovereign, was killed by treachery, and the Danes were driven from the interior; but they still retained possession of the ports through which they were enabled again to strengthen themselves by fresh supplies from their native regions.

In the year 1014, Brian Boru,^b who stands recorded in the annals of Ireland as a model of royal virtues, a valiant hero, and a consummate statesman, after raising himself to the sovereignty of the whole island—for at this period each province had its petty king, one of whom, on acquiring a superiority over his fellows, was recognised as supreme ruler—defeated the Danes at Clontarf, near Dublin, so completely, as to afford his countrymen a breathing time to recover from the exhausting desolation of civil war and foreign invasion.

This period of tranquillity was marked by an important ecclesiastical event. A national synod was held at Kells in Meath, in the year 1152, at which Cardinal Paparon, the pope's legate, presided. At this meeting tithes were introduced, the Irish clergy having previously maintained themselves wholly from the produce of their mensal lands. Four pallis were also given as badges of archiepiscopal jurisdiction under the papal see; one to the archbishop of Armagh as primate, the other three to those of Dublin, Cashel, and Tuam.

The ecclesiastical revolution thus tranquilly and speedily effected, was followed by another of a political nature, which wholly changed the destinies of the nation, and laid the foundation of the arrangements that continue to the present time. Henry II. of England had early in his reign conceived the idea of adding Ireland to his dominions. To effect this, he prevailed on Pope Adrian to issue a bull, which was published in the year 1154, granting him the sovereignty of the island, on the condition of reducing it completely under the spiritual authority of the Roman see, and of paying him a tribute of a penny for each hearth, better known by the name of Peter's pence. The title, such as it was, lay dormant for several years. Too much

engaged by domestic troubles, Henry had little time to devote to a foreign expedition of such magnitude. An unexpected circumstance at length induced him to turn his attention westwards.

Dermod M'Morrough, king of Leinster, having been driven from his dominions by Roderick, king of Ireland, in consequence of an atrocious breach of hospitality committed by him against O'Ruark, chieftain of Brefney, whose wife he had seduced and carried off, applied to Henry to replace him on his throne, offering to hold his kingdom under the English monarch as the price of his restoration. Too much occupied to pay personal attention to this tempting offer, yet unwilling to reject it altogether, Henry dismissed the Irish prince with a general assurance of protection, and a vague permission to any of his subjects to volunteer their services in the cause of his new tributary. Strengthened with this permission, Dermod, while on his journey homewards through Wales, prevailed upon Richard de Clare, Earl of Chepstow, better known by the soubriquet of Strongbow, to assist him, under an engagement of giving him his daughter Eva in marriage, and of securing to him the succession to the crown of Leinster. Dermod then returned to Ferns, his capital city, to prepare for the reception of his expected ally, who shortly after sent over, as a kind of advanced guard, a small detachment, consisting of 150 knights, 70 men-at-arms, and 600 archers, under the command of Robert Fitz-Stephen. This little band, after having made good a landing at the creek of Bag and Bun in Bannow Bay, and being joined by Dermod and his Irish forces, took the town of Wexford, and made a permanent settlement in the neighbouring districts of Bargie and Forth, where their descendants continue to the present day; Strongbow shortly followed with a larger force, and after taking Waterford by storm, followed up his success by the capture of Dublin. Roderick, king of Ireland, now seriously alarmed at the progress of the invaders, endeavoured to expel them from their new conquest, but after laying siege to the last named city, he was defeated, and his army totally dispersed.

The rapid progress of Strongbow drew upon him the jealousy of the king of England, by whom he was compelled to surrender the whole of his conquests, on condition of receiving the greater part back as a fief from the crown, resigning Dublin and the other large towns wholly to the king. Henry himself soon after crossed over into Ireland with a numerous and splendid train of noblemen and troops. No opposition was attempted. Roderick remained inactive in Connaught. The petty chieftains of Leinster did homage to Henry in Dublin, where they were received by him with all the pomp of a sovereign. A council at Cashel, held under a papal bull, acknowledged his authority; large tracts of land were portioned out among the principal English adventurers; the system of English laws and English tenures was introduced, and a commencement thus formed for establishing British dominion throughout the country.

Having terminated his pacific expedition by the appointment of Hugh de Lacy as governor of Dublin, and justiciary of Ireland, Henry returned to England. Soon

^a Called by the Irish, Duff-galls and Fin-galls, black and white for-eigners. (Ed. after his arrival there, a formal treaty was concluded between him and Roderick, whereby the latter acknowledged Henry as his liege lord, paying him an annual tribute of every tenth hide, and a specific number of hawks and hounds.

The new settlers, in the mean time, were actively employed in securing and extending their possessions, partly by the sword, and partly by treaties and family alliances with the more powerful chieftains. Placed at a distance from the centre of English rule, the bands of union hung very loosely upon them. Not content with mixing as partizan auxiliaries in the domestic feuds of the native princes, they quarrelled among themselves as to the partition of their newly acquired booty, and the country, instead of finding relief from the uniform control of a more powerful superintendance, felt its former evils of intestine division aggravated by the interference of those greedy and arrogant intruders. John Earl of Morton, Henry's favourite son, was at length sent over as lord lieutenant. But he was young and ill advised. He offended the natives by his undisguised contempt of their manners; he insulted them in the persons of their leaders. Some of the native princes, on presenting themselves, were made objects of mockery; their beards were plucked in derision by the young English courtiers. They consequently quitted the court in disgust, and spread the flame of discontent through every part of the country. John was recalled, but some years after returned as king of England, and endeavoured to restore order and tranquillity upon the basis of a fixed and uniform government. The forms of the English laws were observed in the courts of judicature; all the parts of the country in any manner recognising the control of British authority were divided into the twelve counties of Dublin, Meath, Kildare, Uriel (now Louth,) Catherlough,^a Kilkenny, Wexford, Waterford, Cork, Kerry, Limerick, and Tipperary. The remainder of Ireland, consisting of Ulster, Connaught, and some of the central districts in Leinster, still remained, with a few slight exceptions, under the dominion of the native chieftains.

John remained but six months in Ireland. After his departure, the country soon lapsed into its former state of confusion. During the subsequent reigns of the first three Edwards, the Irish earnestly and frequently applied for the extension of the benefits of the English laws throughout all parts of the island. Their petitions were favourably received, and royal mandates were issued to ascertain the propriety of granting them; but the influence of the great English settlers, who profited by the public disorders, always prevented the practical application of the remedy.

During this period the part of the island subject to English law was called the Pale; it extended in reality over little more than the province of Leinster, the remainder of the country being still subject to the native princes, who ruled according to the principles of the Brehon or old Irish law. The English themselves were split into two factions, English by blood, and English by birth; the former comprising the descendants of the original adventurers and other old settlers, who, by constant residence among the natives, and frequent inter-

marriages with them, had acquired many of their customs, habits, and prejudices; the latter consisting of the fresh supplies of settlers whom the hope of large grants of lands, or of lucrative situations under the government, had allured thither. The former of those classes gave greater annoyance to the ruling powers than even the natives, insomuch that, in the writs issued for repressing the tumults arising from this state of disorganization, while the Irish in arms against the king are called enemies, the refractory English are designated by the harsher name of rebels. Not that the epithet thus imposed upon the Irish indicated any intention of visiting their trespasses with a mitigated portion of legal vengeance. On the contrary, the mere Irish, as they were called, were so utterly excluded from the protection of the newly introduced laws, that while the murder of an Englishman was punished, as now, by death, that of an Irishman was passed over with impunity, unless the sufferer had the good fortune to belong to one of the five tribes which were admitted, by special favour, to a participation of the rights of British subjects.^b Records of pleas of murder still exist in which the defendant acknowledges the fact, but alleges that the person killed was not English, but a mere Irish, and not of the five bloods, and is accordingly dismissed with impunity.

The horrors of this state of internal anarchy were increased by a foreign invasion. Edward I. had directed all the energies of his kingdom to the subjugation of Scotland. Not content with the supplies of men, arms and provisions to be procured at home, the scanty resources of Ireland were drained to swell their magnitude. On the commencement of the feeble reign of his son, Edward II., Robert Bruce, as well for the purpose of creating a diversion, as to rid himself from the encumbrance of a turbulent auxiliary, sent his brother Edward into Ireland to assert his claim to the sovereignty of the country, and to enforce it by the sword. For some time he was singularly successful. Having been joined, after his landing at Carrickfergus, by most of the discontented chieftains of Ulster, he proceeded to Dundalk, where he was crowned. Thence moving southwards, he devastated the country with fire and sword as far as Munster. But at length the whole force of the English was collected against him, and Bruce, whose army was exhausted by the rapidity of its progress and the magnitude of its exertions, too impatient also to wait the arrival of an expected supply from home, joined battle with it near Dundalk. The contest was decisive; the Scotch were totally routed, and the body of their commander found among the heaps of slain.

The fascinating though delusive prospect of the crown of France distracted the thoughts of Edward III. from the settlement of Ireland, an achievement of less splendour, though of more solid utility. Still, however, it was not wholly overlooked. His son Lionel was sent thither as chief governor. He succeeded in some degree in repressing the spirit of insubordination among the feudal barons, and in checking the predatory incursions of the Irish. But, on the other hand, the bond of separation between the two nations was sealed during his government, by the celebrated statutes of the parliament

^a Carlow—Gaelic, *Cathair-loch* (pron. *Caer-loh*.) city or fortress of the lake.—P.

^b The five tribes or families were, the O'Neils of Ulster, the O'Me-

laghlins of Meath, the O'Conoghers of Connaught, the O'Briens of Thomond, and the M'Murroughs of Leinster.

at Kilkenny, which enacted, that none but Englishmen should be admitted to holy orders, or allowed to become members of a religious house, without a licence from the king, and that a native was not to enjoy the benefits of English law, without paying a fine for a special writ for the indulgence.

The affairs of Ireland were considered by his immediate successor, Richard II., of sufficient importance to call for his personal interference. Having landed at Waterford with a force, consisting, according to the chronicles of the time, of 30,000 infantry and 4000 men-at-arms, he proceeded without interruption or molestation to Dublin. Here he received the submission of upwards of seventy chieftains, and conferred the order of knighthood on O'Neal, O'Connor, O'Brian, M'Murchad and some others, yet not without reluctance on their part, the ceremony being considered rather as a badge of inferiority than a token of elevation. On the monarch's departure, after a pompous yet inefficient residence of nine months, the feuds of the settlers and the marauding warfare of the natives revived with aggravated violence.

In 1399, Richard again visited the country, but his expedition was now neither so tranquil nor so fortunate as before. During his march from Waterford to Dublin he found his progress impeded at Kilkenny by the assaults of Art. M'Murcha, who with a band of 3000 resolute followers, rushed suddenly from the impenetrable fastnesses of his woods and morasses, and so harassed the royal army by his rapid and reiterated assaults, that the king experienced no small difficulty in arriving at the end of his journey. The insurrection in England which terminated in setting his rival Henry of Lancaster^a on the throne, hurried him from Ireland, and the country was again left a prey to the devastating animosities of the contending factions.

So powerful were the Irish princes during this and the subsequent period of the wars of York and Lancaster, that their cumrick or protection was anxiously sought for by the English borderers of the pale, and secured by the payment of an annual tribute called Black-rent. The pale itself was contracted within the narrow limits of the counties of Dublin, Meath, Kildare, and part of Louth, and the boundary line to the south of Dublin city, beyond which the king's writ was a dead letter, was fixed as far as Tallaght by the stream of the Dodder, a rivulet within three miles of Dublin, and thence by a trench with redoubts to Newcastle on the borders of Kildare; all the district to the south of this line, except a narrow band along the sea coast to Bray, being in the undisputed possession of the Irish, two families of whom, the O'Birnes and the O'Tooles, asserted and maintained the rank of independent princes throughout the southern part of Dublin county, and the mountainous district since designated as the county of Wicklow.

Ireland was not tranquillized by the termination of the civil wars in England. Even after Edward IV. obtained the undisputed possession of the throne, his government in Ireland was reduced to such a state of imbecility, that the only means devised for protecting the pale against its surrounding enemies was the formation, by act of

parliament, of a military fraternity under the name of the Armed Brotherhood of St. George, consisting of a captain and 160 horse-archers, with an equal number of attendants on foot. The private feuds of the great leaders of the degenerate English and the Irish, of the Butlers and Fitzgeralds in the south, and of O'Neil and Tyrconnel in Ulster, alone prevented the total overthrow of the king's government.^b The authority of his lieutenant was set at defiance in the very capital. Keating, prior of Kilmainham, then a preceptory of the order of the knights of St. John of Jerusalem, though deposed for his turbulence and misconduct by his superior, not only refused to submit, but seized upon Lumley, an Englishman, who had been sent over to succeed him, and kept him prisoner till his death.

The general alienation of the public sentiment in Ireland from the English dominion was so great at the commencement of the reign of Henry VII., as to induce his enemies to select this country as the theatre for their first public exhibition of the mimic kings, through whose agency they hoped to drive him from his throne. Lambert Simnel was therefore sent thither; and so numerous and zealous were his adherents, that he was enabled to carry over a large body of Irish to support his claims by the sword in England, who were cut to pieces in the bloody battle of Stoke in Nottinghamshire. Perkin Warbeck also met with a similar reception, though on a more limited scale. To such a pitch were the minds of the native chieftains excited by the imbecile government of the English about this time, that on an agreement made by Richard Duke of York with M'Geoghegan to prevent the repetition of his incursions from the north-western counties into Meath, the latter boasted among his friends, that he had granted peace to the king's lieutenant. M'Gillypatrick also, a chieftain in Ossory, despatched an ambassador with a formal complaint to the king in England, who, stopping him on coming out of his private chapel, delivered his commission in a set Latin speech, of which the following is a literal translation;—"Stand on thy feet, my lord king: my master M'Gillypatrick has sent me to you, and ordered me to declare, that if you do not punish Red Peter, he will make war against you."

But Henry was not of a temper to be insulted or resisted with impunity. When firmly fixed on his throne, he sent over Sir Edward Poyning, an English knight, much in his confidence, as chief governor. The most remarkable act of his administration was the passing of statutes, afterwards the subject of much discussion, under the name of Poyning's laws, by one of which the lord lieutenant was prohibited from holding parliaments at his pleasure, and by another, a parliament was forbidden to be held there until all the bills proposed to be introduced into it should have been previously laid before the English privy council for the king's approval. This continued to be the law of the land till the year 1782.

The intestine wars between the great English nobles and the native Irish still raged with almost unremitting violence. During their continuance, the then Earl of Kildare was called over to England to answer in person

^a Henry IV.

^b The interchange of messages between these rival potentates is worthy of being recorded for its singularity. O'Neil claimed a tribute from Tyrconnel as his feudatory; to obtain it he sent him a message

couched in the following laconic terms; "Send me my tribute, or else ——" Tyrconnel answered him in terms equally laconic and significant—"I owe you no tribute, and if ——".

some charges of a treasonable nature ; but, contrary to the expectation of his enemies, the king was so much pleased by his manly and candid explanations, that he sent him back as chief governor. On his return, he, with the aid of the O'Neils, O'Reillys, O'Connors, M'Geoghegans, and others of the Irish, defeated the united forces of Ulick M'William Burke, chieftain of Connaught, Tirlough O'Brien, Maelrony O'Carrol, and others, four thousand of whom, according to some accounts, or nine thousand, according to others, were left dead upon the field.

The virulence of civil discord was augmented during the succeeding reign by religious controversy. Henry VIII. having succeeded in extinguishing the papal power in England, attempted to accomplish the same object in Ireland, but with different success. Though supported by the bishops of English birth, his scheme was obstinately resisted by the Irish. The native chieftains, also, from a conviction that in opposing these innovations they were maintaining the cause not only of their independence but of their religion, were stimulated to the greatest efforts. The Irish of Ulster confederated under O'Neil as the champion of the cause ; but a victory gained over them at Ballyhae by Lord Grey, the lord deputy, dissolved their union. O'Neil, De Burgo and others submitted and exchanged their ancient dignities for those of English nobility. About this time, also, Henry, from a wish to confirm his authority by the assumption of a more imposing title, had himself styled king instead of lord of Ireland, under which name the sovereign authority had been hitherto exercised.

The short reign of Philip and Mary was marked by an attempt to restore the Roman Catholic form of worship, and by the formation of the districts of Leix and Offaley into shire-ground, under the names of the King's and Queen's counties, the assize towns of which were named Philipstown and Maryborough, in honour of the sovereigns who had effected the measure.

The contest between the conflicting interests was carried to its greatest height in the reign of Elizabeth. The Irish were headed by John or Shane O'Neil, son of the first earl of Tyrone. Early in this reign he had not only tendered his submission to the lord deputy, but even proceeded to London, attended by a numerous train, to offer it in person to the queen. The appearance of his retinue there struck the beholders with astonishment. His guard of gallowglasses, or heavy armed soldiers, were arrayed in the full costume of their native country. Each carried a large battle-axe, his head was bare, his hair flowed loosely over his shoulders ; he was clad in a linen shirt of extravagant dimensions, dyed yellow, over which he wore his armour and a loose cloak. The queen received him with great favour, and dismissed him with several valuable presents, a large loan of money, and an assurance of her protection.

But these proofs of a pacific disposition were not of long continuance. Shortly after his return he broke out into open rebellion, from what cause is not clearly ascertained. After a protracted struggle against the lord deputy Sir Henry Sidney, in the course of which he took the city of Derry, he was reduced to such extremity as to have recourse to his bitter enemies the Scotch, rather than throw himself on the mercy of those he still more abhorred. His choice proved fatal to him. On his arrival at the Scotch quarters he was hospitably received by their commander, but on the same evening was assassinated in his tent at an entertainment, during a quarrel supposed to have

been intentionally excited as a pretence for this violation of the rights of hospitality. His head was afterwards transmitted to Dublin, where it was exposed on the castle gate.

During this and other similar insurrections in various parts, the English government made some progress in extending and consolidating its authority. The Annaly, a district subject to the M'Mahons, was formed into a county under the name of Longford. Connaught was partitioned into the five counties of which it consists at present, in addition to which, Clare, now part of Munster, was considered to be a sixth ; in all these districts Irish chieftainries were abolished, and the supremacy of English law acknowledged. But the south of Ireland still continued to exhibit scenes of turbulence, insurrection and desolation. The Earl of Desmond, a scion of the Geraldine or Fitzgerald family, had long exerted an almost regal authority throughout the counties of Kerry, Cork and Waterford, and now, relying on the assurances of support from foreign powers and chiefly from Spain, he at length openly set up the standard of revolt. The fate of a small body of Spaniards, who landed at Smerwick to cause a division in his favour, has been already mentioned. Desmond himself, after maintaining a desperate struggle against the queen's forces, was compelled to shelter himself among the woods and morasses, where, after undergoing extreme hardships, he was at length put to death in his place of concealment. His immense property escheated to the crown, and was parcelled out principally among the heads of the great families that had preserved their allegiance.

The spirit of insurrection was scarcely quelled in Munster, when it broke out again in the north. Hugh O'Neil, grandson of the first earl of Tyrone, taking advantage of an attempt, made with more vigour than prudence, to force the English law upon the natives in Ulster, raised the standard of revolt, and maintained a position of independence during all the latter part of Elizabeth's reign. This princess sent her favourite Essex into Ireland, at the head of a numerous and well-appointed army, to subdue him ; but the royal forces wasted away without effecting any thing of consequence, and Essex himself, returning precipitately into England, met with the fate which forms so romantic a feature in the annals of her last years. Ultimately, however, Tyrone, notwithstanding a diversion caused in his favour by the arrival of an armament from Spain, which kept possession of Kinsale for some time, was reduced to such extremities as compelled him to compound for his personal safety by a most humble submission.

Sir John Davies, who, in the commencement of the reign of James the First, published his elaborate treatise on the causes why Ireland had never been completely subdued, lays it down as a principle, that a barbarous country must first be broken by a war, before it can be made capable of benefiting by good government. Without entering into the discussion of a principle the soundness of which is upon a par with its humanity, it may be safely asserted that its practical efficacy was put fully to the test in Ireland. The country at Elizabeth's death was nearly a desert. Moryson, in his account of the war against Tyrone in Ulster, estimates the surviving population at not more than seven hundred thousand souls, and both he and Spenser describe the sufferings of the wretched peasantry in language that makes humanity shudder.

James I. during the greater part of his reign, applied him

self sedulously to what was called, in the quaint phraseology of the time, the plantation of Ulster. The six counties forfeited by Tyrone and other northern chieftains were parcelled out into estates of various dimensions; flattering inducements were held out to English and Scotch agriculturists to settle on them. Much of the land was purchased by some of the London trading companies, who still, under the name of the Irish Society, retain the proprietorship of extensive tracts in those counties. Large portions of land were also appropriated to the clergy and to the public schools.

The country during his reign was peaceable and prosperous. But the progress of improvement experienced a fatal check in that of his son and successor Charles the First, whose lieutenant, the Earl of Strafford, by his harsh and unjustifiable measures, utterly destroyed the spirit of confidence between prince and people. By calling in question the titles of the landed proprietors in Connaught, he excited a suspicion of further aggressions, and this, joined with the unsettled state of England, led to the catastrophe which nearly annihilated the British dominion in Ireland.

The conspiracy by which this object was to have been effected, and which was detected on the very day fixed on for its execution, was to have commenced its operations by the seizure of the castle of Dublin.^a Lord Maguire, one of its most active agents, was seized and executed in London. Yet its failure in the capital did not prevent its explosion elsewhere. It broke out with dreadful violence in the north, where Sir Phelim O'Neil soon found himself master of all Ulster, with the exception of a few of the larger towns. The accounts of the atrocities committed at the commencement of the insurrection have been much exaggerated by the virulence of party; some of the details of the murders said to have been committed by the insurgents are of a character to excite incredulity rather than to secure belief. But this much is certain, that the contest, which raged with various success and in many varieties of form throughout the country from 1641 to 1652, was carried on with all the bitterness that characterizes civil war aggravated by religious animosity.

Cromwell, who landed in 1649, brought the contest to a speedy termination. His first military act was the investment of Drogheda, which he took by storm and put the whole garrison to the sword, by this terrible example of military execution opening to himself an easy entrance into most of the other fortified places in Ireland. The embers of resistance which his recall to England obliged him to leave unextinguished, were finally quenched by Ireton and his other generals, and the country remained in a state of passive subjection to the Parliament of England until the Restoration.

The commencement of the reign of Charles the Second forms one of the great epochs of Irish history. During the republican government, the landed property of the country had been transferred, with a few exceptions, from the ancient owners to the soldiers of the conquering army, or to speculating adventurers who had advanced money to the Commonwealth, on the assurance of repayment with liberal interest from the confiscations that had been anticipated as the necessary consequence of unsuccessful resistance to the constituted authorities of the day. The extent of these confiscations was enormous. Of upwards of 20,000,000

acres which Ireland contains, 12,634,711 were thus transferred. A transfer of persons as well as of property took place. The Roman Catholics, who were so fortunate as to prove by satisfactory evidence that they had taken no part in the war, and who, on the establishment of such proof, were distinguished by the name of innocent papists, were compelled to remove into Connaught, where they were allowed to hold lands of inferior quality, but subject to a chief rent to the crown, which, however trifling its amount may appear at the present day, was then a heavy drawback upon the tenant's industry. They were also restricted from settling within a mile of the sea-coast, and still further, were excluded from residing within any walled town. The links of amicable communion being thus effectually rent asunder, between the two great classes of society, the proprietors and the peasantry, and the line of demarcation being still more strongly marked by the invidious distinction between Protestant and Catholic, every avenue to a mutual amalgamation of sentiment and interest was closed, and the two parties were doomed by the acts of Charles the Second, confirming the confiscations of the republican government, to exist as two distinct nations in the same country, known to each other only by a reciprocity of infliction and of sufferance.

The reign of James the Second excited a hope in the depressed party that this system was to have an end. The pusillanimity of this monarch and the vigor of his rival quickly dissipated any such expectation. The former, when driven from Great Britain, made an effort to regain his elevated position through the energies of his Irish subjects. But he was wholly unqualified to direct or to sustain those energies. After a struggle of four years, in which he was baffled personally at the Boyne, and afterwards, through his generals, at Athlone and Aghrim, the surrender of Limerick, his last hold in the country, extinguished every gleam of hope. The whole population submitted to the English government with the exception of those ardent spirits who preferred the vicissitudes of a life of exile to the monotony of domestic subjugation. These were formed into a corps in the service of France under the name of the Irish brigade, where during the succeeding wars on the continent they performed good service against the government by which they had been expatriated. The number of Irish thus driven into the ranks of the enemy may be estimated from the fact, that, according to the official statements of the French army accounts, there died in that service between the taking of Limerick in 1691 and the battle of Fontenoy in 1745, a period of little more than fifty years, no fewer than 450,000 Irish soldiers. These regiments were always led on against the English with the emphatic words, before used under similar circumstances at the battle of the Boyne by Schomberg, when encouraging his Huguenot soldiers against King James's French auxiliaries, "Gentlemen, behold your persecutors."

The attention of the victorious party in Ireland was now wholly directed to the securing of its conquest. To effect this, a new confiscation of property took place, to the amount of 1,718,320 acres, which was succeeded by the enactment of a series of laws of extreme rigour, since known by the name of the Penal Code, framed for the express purpose of utterly extirpating the Roman Catholic religion. The effect of this system, so far as it affected the security of the new proprietors, and the prostration of the proscribed mode of faith, was com

^a The day fixed for the seizure of Dublin Castle was Oct. 22, 1641. The principal leader in this rebellion was Roger Moore.—P.

plete. During the first subsequent rebellion in Great Britain in favour of the son of James II.,^a Ireland was perfectly tranquil; nor could the slightest trace of any communication between the native Irish and the adherents of the Pretender in France or Scotland be detected. But, at the same time, the country was reduced to such an extreme of internal wretchedness, that Swift gave vent to his feelings of exasperated patriotism, in the bitterest strain of sarcastic irony, published under the title of "a modest proposal for preventing the children of poor people in Ireland from being a burden to their parents and country," by making use of their flesh as an article of food. On the rumour of a second attempt in favour of the dethroned family, which was carried into effect in Scotland in 1745, the Earl of Chesterfield was sent over as lord lieutenant, and this nobleman, with equal good feeling and good policy, relaxed the rigour of the penal code so far as to overlook the breach of law committed by Roman Catholics in assembling together for the celebration of divine worship.

In the year 1759, the landing of the French under Thurot in the north of Ireland, afforded another test of the spirit of the country. Though this petty invasion was merely a feint to veil the movements of a larger armament, and proceeded no farther than the momentary possession of the almost dismantled castle of Carrickfergus, the sensation excited by it pervaded the whole island; an expression of determined resistance was universally and unequivocally displayed.

Not long after, an important change took place in the constitution of the Irish parliament. The members of the House of Commons had hitherto held their seats during the life of the reigning king. The bond between the constituent and his representatives was, therefore, little more than nominal; there was no sympathy on the one side, no control on the other. The lord lieutenants, also, instead of making the country the place of their constant residence, visited it but once in two years for the purpose of holding a parliament, leaving the details of government during the intervals in the hands of two or three of the chief residents, who, under the title of lords justices, actually possessed all the influence, and consequently all the powers of the state. In the year 1768, an act was passed, in consequence of the reiterated remonstrances of the Irish House of Commons, limiting the duration of parliament to eight years, and at the same time, the lord lieutenant was required to reside in Ireland. The secondary influence of the lords justices being thus annihilated, the lord lieutenant became the actual as well as the nominal governor, and the House of Commons felt the necessity of being, in some degree at least, the real protectors of those popular rights which they were chosen to maintain.

The breaking out of the American war in 1775, afforded ample scope for the exertion of the newly acquired powers of the popular branch of the legislature. Enlarged views of the reciprocal interests of the two great portions of the empire called for new enactments. The Irish parliament, which had hitherto acquiesced in all the arrangements transmitted from England, began to exert the right of judging and of legislating for itself. The agitation of the American question, and the unex-

pected incidents consequent on the commencement of hostilities with that country, afforded new cause of excitement to the public mind. Most of the troops had been called out of Ireland, for transatlantic service; so that, when, on the apprehension of an invasion from France, an application was made to the government for an adequate supply of troops to meet the impending emergency, the answer given by the lord lieutenant was, that Great Britain had no troops to spare, and that the nation must look to itself for the means of self-defence. The hint was taken; the people armed themselves; at first in detached and unconnected bodies, but gradually convinced of the necessity for combined exertion, they ultimately formed themselves into an organized and disciplined army, amounting to 42,000 men, at the head of which was placed, by unanimous consent, the Earl of Charlemont, a nobleman who, after having spent the bloom of his youth in the elegant enjoyments of the most polished courts in Europe, had the courage to break their fascinating bonds, and to devote himself to a constant residence at home, at that time a country of few intellectual attractions, in order to aid, by his example and influence, the introduction of the spirit of refinement which his observations, when abroad, had taught him to be necessary to elevate his native land to its proper position in the scale of civilized society.

The people having, by this determined and simultaneous act, effectually dissipated all apprehensions of danger from a foreign enemy, began to turn their thoughts towards the internal improvement of the country. They called upon their representatives for a repeal of those laws, which, framed with the expressed intention of consolidating the strength of the empire by confining each division of it within the limits of its own resources and capabilities, had, in reality, weakened it by ill-judged restrictions on the dependent portion. The volunteer association changed its character; it became a deliberative as well as a military body. A meeting of delegates from all the corps in Ulster, convened at Dungannon, adopted resolutions declaratory of the right of the Irish legislature to make laws, uncontrolled by any external interference. The spirit thus excited rapidly transferred itself into the parliament. Henry Grattan, whom Lord Charlemont, from a conviction of his great latent powers, had introduced into the House of Commons, took the lead within that house, in asserting the independence of the Irish legislature. Supported by the combined exertions of the advocates of the measure, both within and without its walls, he eventually succeeded in obtaining an explicit renunciation of the claim of legislative control on the part of Great Britain.

Another great question still remained unsettled. The independence of the parliament could avail but little if its members continued liable to the influence of ministerial corruption. The volunteers, therefore, called for a reform in the House of Commons. A second delegated meeting assembled in Dublin for the express purpose of taking the opinion of the armed population of Ireland on the subject. The parliament and the volunteers were now at issue. The metropolis presented the anomalous exhibition of two rival delegated bodies, each professing to emanate from the people, each claiming to be the exclusive organ of its sentiments, and each determined to control the other. The parliament prevailed: it passed

^a In 1715.

a vote declaratory of its own omnipotence; the volunteer assembly adjourned *sine die*, and the question of reform was lost.

From this moment the spirit of volunteering began to evaporate. The peace with America rendered their services, in a military point of view, unnecessary; the late triumph of the ministerial party in parliament proved their inefficacy towards vindicating the right of the people to an effective control over the conduct of their representatives. They gradually declined in numbers and in spirit, until they were finally put down, without the slightest semblance of resistance, by a proclamation from the government prohibiting their assemblage.

In the year 1789, a great international question arose, which served to show the practical effect of the lately acquired independence of the Irish parliament. George III. was attacked by a mental derangement that wholly precluded him from holding the reins of government. A regency became necessary. The parliaments of the two countries were at issue on the point. Both agreed that the sovereign authority should be intrusted to the heir-apparent, then in the full maturity of age. But, while the parliament of Great Britain determined to impose restraints on his exercise of the functions of royalty, that of Ireland resolved to present the regency to him unshackled by any limitations beyond those imposed by the constitution on the sovereign himself. Matters had proceeded so far that a delegation from both houses of the Irish parliament was despatched to the Prince of Wales, to offer him the unrestricted regency of Ireland. On its arrival in London, the king was declared to be so far restored to the due use of his mental faculties, as to be enabled to resume the government. The delegates returned; but from that moment the British minister determined, by an amalgamation of both parliaments, to prevent the risk of such collisions in future.

During the progress of those political movements, the Roman Catholics were gradually extricating themselves from the yoke of servitude imposed on them by the penal code. In the year 1745, as has been already noticed, the first alleviation of their degraded state was afforded them by the Earl of Chesterfield's allowing their assemblage for devotional purposes to be held without molestation from the constituted authorities, an act of toleration in its most limited sense. In 1774, parliament passed a statute allowing them to testify their allegiance. Even this was a boon, for hitherto the existence of a Roman Catholic was not recognised in the eye of the law. In 1779, they were permitted to hold lands on leases for 999 years, having previously taken the oath of allegiance.

In the year 1793, the progress of the French revolution had excited a spirit of restless innovation, which, instead of endeavouring to obtain the redress of real grievances by constitutional means, displayed itself in acts of violence against the constituted authorities. The ministry, partly with a view to conciliate the great body of the people, partly in accordance with the growing spirit of liberality that every day more strongly marked the advance of knowledge, granted to the Roman Catholics, besides several minor privileges, the right of voting for the election of members of the House of Commons, thus extending to them the enjoyment of

every privilege exercised by Protestants, except that of sitting in parliament. But the concession, made under unfavourable circumstances, was accepted as a right rather than as a favour. The spirit of discontent still prevalent was sedulously fostered by a society formed in Belfast under the name of United Irishmen, and afterwards extended to Dublin. Its professed object was the obtaining of parliamentary reform; but soon, enlarging its views with its increase of strength, it determined on obtaining a separation from England by force of arms. Such was the activity of its members, that in a few years they had organized a secret confederacy of 500,000 men. Their measures at home were ably seconded abroad by Theobald Wolfe Tone, originally the secretary of the society, who, having been forced to fly in order to avoid a criminal prosecution for high treason, succeeded in prevailing on the republican government of France to send a large armament, under their favourite general Hoche, to invade Ireland. The fleet, by a most daring manœuvre, arrived in safety on the south coast of Ireland; but the vessel of their commander-in-chief having been separated from the rest by a storm, Grouchy, the next in command, by his indecision, lost the opportunity of effecting a landing, and the fleet, after lying a few days unmolested in Bantry Bay, retraced its course, and arrived again at Brest in safety.

The possibility of the recurrence of such a visitation urged the government to use the most violent and unwarrantable means for its prevention. The Protestants were all armed under the name of yeomanry; the military were encouraged to the committal of such excesses, that General Abercrombie, then first in command in Ireland, in expressing his abhorrence of their licentious behaviour, declared in public that the soldiery were formidable to every one but their enemies. He was forthwith removed, and General Lake appointed in his stead. The country was put under military law; suspected persons were seized, tried by court-martial at the drum-head, and scourged or executed by its summary sentence. Torture was applied to force confession. At length, in the spring of 1798, the rebellion, which had been fomented by the United Irishmen, and urged forward by the barbarities of the government, burst forth in the counties of Wexford and Antrim. After a short but sanguinary struggle, it was quelled. A small force of about 1000 French landed in the autumn of the same year at Killala, and after routing the troops collected to oppose them, penetrated as far as the county of Longford, where they surrendered to the overwhelming numbers brought against them by Lord Cornwallis, then lord lieutenant.

The next two years were employed in effecting the union, a measure which, as has been already said, was never lost sight of by the government since the period of the regency question. The system of unrelenting severity which had characterised the proceedings of the ministry before and during the rebellion, was now seconded by one of unlimited, undisguised corruption. Every place, every office, spiritual as well as temporal, was for sale; parliamentary influence was the price. The question of the Union, after having been rejected in the House of Commons by a small majority in 1799, was brought forward again in the succeeding year, and carried. The first day of the year

1801 saw the union standard floating over the gate of Dublin Castle.

The history of Ireland, after this period, becomes in a great measure identified with that of Great Britain. A partial insurrection which broke out unexpectedly in 1803, disturbed for a moment the torpid tranquillity of the country. It was the act but of a single night; its leaders suffered the penalties of the law, and the aspect of public affairs immediately resumed its former appearance. The remainder of the period to the present time presents little but the repetition of efforts on the part of the Roman Catholics who composed the bulk of the population, to obtain the great privilege from which they were still debarred, the right of sitting in parliament. Their perseverance has at length been crowned with success;^a but the detail of the proceedings that led to this result is too complicated to be compressed, and too recent to require a detailed narration.

According to the civil division of the country, Ireland contains thirty-two counties, of which twelve are in Leinster, nine in Ulster, six in Munster, and five in Connaught; besides which, five cities, Dublin, Cork, Limerick, Waterford, and Kilkenny, and three towns, Galway, Drogheda, and Carrickfergus, are considered to be detached counties, having a municipal jurisdiction, extending to a certain tract round each, wholly independent of that of the county in which they are situated. It is represented in the imperial parliament by twenty-eight peers, and one hundred commoners, of which latter, two are returned from each of the thirty-two counties, two from Dublin city, two from Cork city, one from Trinity College, Dublin, and one from each of thirty-one borough towns.^b

Until the year 1829, the right of election in counties was vested in all the freeholders of forty shillings and upwards, consisting of by much the greater part of the landholders; and in cities and corporate towns, of those and of the freemen admitted according to the peculiar regulations of the corporation. But, on the passing of the relief bill, which restored to the Roman Catholics their right of sitting in parliament, the privilege of voting for members of counties was limited to landholders possessing freeholds of L.10 value or upwards; the qualifications of electors in cities and boroughs remaining unaltered. The number of electors in counties, has, in consequence, been reduced from 216,891 to 39,772, while that of the electors in cities and towns is estimated at 20,520; the whole of the constituency of Ireland, therefore, consists at present of 60,292 voters for eight millions of souls,^c being in the ratio nearly of one to every one hundred and thirty-three individuals, or to every twenty-two families.

The administration of the government is vested nominally in the lord lieutenant, removable at pleasure, though usually retaining his situation for five years, but

really in this functionary's chief secretary, who is considered as responsible to parliament for the management of the country. The lord lieutenant is assisted by a privy council invested with large powers, and consisting of the great law officers, and a few others, chiefly public servants of the crown.

The judicial power is lodged in the hands of the lord chancellor, and the four judges of each of the courts of King's Bench, Exchequer, and Common Pleas. The chancellor is assisted by the master of the rolls, who presides in a subordinate court of equity. For the general dispensation of justice, the country is divided into six circuits, each of which is visited by two of the law judges twice every year. Minor causes are tried at the quarter sessions, at which such of the county justices as choose preside. A salaried lawyer, called assistant barrister, has a place on the bench, to afford the magistrates the aid of his legal knowledge.

By a late arrangement, the superintendance of the counties is committed, as in England, to a lord lieutenant appointed by the government, who is considered as in some degree responsible for the preservation of the public peace, and, therefore, has the recommendation of nominating and removing the magistrates.

The local arrangements of the counties are regulated by the grand juries, consisting of twenty-three of the principal landed proprietors, if resident, or of their agents, if absentees. They are nominated by the high sheriff, and are seldom changed; thus forming a local aristocracy. Their power is very extensive; they have the levying and expenditure of all the money laid out on roads, bridges, and public buildings of every description; a weighty trust, checked only by an appeal to the judges of assize. This department of the local government has long been the subject of much complaint, on account of the magnitude of the sums levied, the partiality exercised in its expenditure, and the unequal pressure of the mode of taxation by which it is collected. Besides these county taxes, each parish is required to defray from its own resources the repairs and maintenance of the parish church, and the cost of rebuilding it when fallen to decay.

The protection of life and property is intrusted, by a late enactment, to a constabulary force consisting of 215 chief constables, 1328 petty constables, and 4394 subconstables, in all 5937 men, besides stipendiary or salaried magistrates in particular districts. These are maintained at an annual expenditure of somewhat more than L.250,000, being at an average of about L.41 per man.

The ecclesiastical jurisdiction is vested in four archbishops, one for each province, who take their titles from the cities of their residence, viz. Armagh, Dublin, Cashel, and Tuam; under them are thirty bishopricks consolidated by unions and incorporations under eighteen bishops.^d The following table exhibits at one view the

^a A. D. 1829.

^b By the articles of union, Ireland was represented by four lords spiritual, by rotation of sessions, by twenty-eight lords temporal, elected for life by the Peers of Ireland, and by one hundred commoners, distributed as in the text. (Ed. Enc.)—The representation of lords spiritual and temporal continues the same. By the Reform Bill (June 7, 1832) Ireland is represented in the House of Commons by 105 members, of which 64 are representatives of the 32 counties, and 41 of boroughs, cities and the University, viz. for Dublin city, Cork city, Limerick, Waterford, Galway, Belfast, and the University, two each (14,) and one each for 27 boroughs, five new members being added.—P.

^c 7,734,365. (See Stat. Tab.)—P.

^d Thirty-three dioceses, under four archbishops and eighteen bishops. (Ed. Enc.)—According to the writer's own statement in his table, there are thirty-four bishoprics and twenty-two dioceses; the four archbishops each presiding over a separate diocese, exclusive of his provincial jurisdiction. The bishopric of Glendalough is not mentioned in Ed. Enc. art. Ireland. (In the account of Dublin (Ed. Enc.) it is stated that the diocese of Glendeloch was united to that of Dublin, in 1214.) The ecclesiastical provinces do not correspond with the civil. The province of Armagh includes the dioceses of Armagh, Dromore, Down, Derry, Raphoe, Clogher, Kilmore and Meath; that of Dublin

civil and ecclesiastical divisions of the country, according to provinces, counties, and dioceses.

^c Naas is the assize town. (Ed. Enc.)—P.

The number of parishes in the country is 2450, which are consolidated into 1396 benefices. The archbishops and bishops derive their incomes chiefly from the rents of land, which are farmed out by them, on leases during their own lives, or for twenty-one years; the parochial clergy are supported, in a small degree, by their glebelands, but chiefly by the tithes. Until lately, tithe was payable only from arable land, pasture grounds being relieved from it by a vote of the House of Commons, which was afterwards legalized by an act of parliament as part of the compact between the British ministry and the landed proprietors for carrying the Union. But this system has since undergone a great modification, which, though an unjustifiable infringement on the property of those who held lands under the provisions of the last mentioned act, has been a considerable relief to the poor occupying tenant. The tithe can now be converted, through a voluntary arrangement, between the incumbent and the parishioners, into an acreable imposition on the whole of the cultivated land, whether under tillage or pasture; thus equalizing the pressure on the individuals, and diminishing the expense of its collection, though in most instances increasing the amount of the incumbent's salary, by an augmentation of the total sum levied on the parish. The act has already been carried into effect in more than one-half of the parishes, 1497 having compounded, and 963^h remaining still subject to the former usage. The amount of tithe paid by the parishes which have compounded, is L.427,594, 2s. 5d.; if the value of those which have not yet come under the operation of the act be estimated at the same rate, the total of the tithe of Ireland would amount to L.704,987, 0s. 2d. Taking, in addition to this, the value of the glebe and glebe-house, at a general average of L.50 per annum for each benefice, both together would afford a net income of L.560 per annum for each incumbent,—an income, if equally apportioned, fully adequate to the wants and services of a body of men designed to be the instructors and models of conduct to the great mass of the population, which consists of those in the middling and lower walks of life.ⁱ

The incomes of the clergy officiating in town parishes are not included in the foregoing calculation, being collected in a different manner by an assessment on houses, called ministers' money. The number of parishes so circumstanced is about fifty.

^d The assizes and elections are held at Carrickfergus; the quarter-sessions, at Antrim. (Ed. Enc.)—P.

^e Clonmell is the county town, in which the assizes are held; Cashel, an archiepiscopal city, in which the quarter sessions are held. (Ed. Enc.)—P.

^f Castlebar is the county town. (Ed. Enc.)—P.

^g Kilmaduaigh. (Ed. Enc.)—P.

^h 953?—P.

ⁱ The following is the summary of the statement made by Mr. Griffith, the boundary surveyor, in his evidence before the Committee of the House of Lords in 1832.

Ireland is divided into Archbishopricks	4
Bishops	23
Parishes	2450
Statute acres	20,400,000

Gross amount of tithe composition now paid	£427,594	2	5
Average of each compounded parish	287	15	0
Average of tithe composition to £1 Sterling of the value of the land	0	1	3½
Gross annual value of the land of Ireland, at a rent of 12s. 5½d. per acre	12,715,578	0	0
Amount of tithe of all the parishes in Ireland	704,987	0	2

The Roman Catholic religion is superintended by four archbishops, as in the established church,^a and twenty-two bishops, who derive their support partly from the profits of a parish, generally the most lucrative in the diocese, partly from the fees of licenses for marriages, and partly from the *cathedraticum*, an annual contribution from every incumbent under his control, proportionate to the value of his benefice.^b In cases of old age, infirmity, or any accidental visitation from heaven, the episcopal functions are discharged by an assistant or coadjutor, nominated by the bishop. The parish priests are appointed solely by the bishop, and derive their support from the voluntary contributions of their parishioners, collected chiefly at Easter and Christmas, at which periods they hold what are called stations, being half-yearly meetings, at some commodious house fixed on by themselves for the convenience of those residing at a distance from the chapel, where they hear their confessions, catechise their children, and deliver spiritual exhortations. Monasteries and convents are frequent in Ireland, many being in the enjoyment of considerable funds arising from charitable donations. The monks of some of them collect contributions through the country for the maintenance of their respective establishments. The funds of nunneries arise in a great degree from the money paid by ladies on their entrance into the order, the amount of which is seldom less than three or four hundred pounds. In some cases their income is increased by fees paid for the education of the daughters of persons of family and wealth.

The Presbyterian religion chiefly flourishes in the north of Ireland.^c The church is governed by a synod, consisting of ministers and lay elders, deputed by the respective congregations. The synod is governed by a moderator, annually chosen by the members. The ministers are supported partly by the voluntary contributions of their congregations, and partly by a grant of public money, called the *Regium Donum*. Other dissenters are similarly governed. The Society of Friends, or Quakers, are chiefly resident in Dublin and in the King's and Queen's counties. Jews are very few in number in Ireland.

The population of Ireland has increased uniformly and rapidly since the commencement of the period at which accurate inquiries began to be made for the solution of this great political question. At the close of Elizabeth's reign it was estimated, certainly not on very positive data, at no more than 700,000 souls. It was conjectured by Sir William Petty to have been 850,000, at

the close of the wars in 1652, and to have increased to 1,100,000, in 1672. Subsequent investigators have arrived at the following conclusions:—

1695, Capt. South,	1,034,102
1712, Thomas Dobbs, Esq.	2,099,094
1718, The same,	2,169,048
1726, The same,	2,309,106
1731, Returns of the established clergy,	2,010,221
1754, Hearth-money collectors, ^d	2,372,634
1767, The same,	2,544,276
1777, The same,	2,690,556
1785, The same,	2,845,932
1788, Gerv. Parker Bushe, Esq.	4,040,000 ^e
1791, Hearth-money collectors, ^f	4,206,612
1792, Rev. Aug. Beaufort,	4,088,226
1805, Tho. Newenham, Esq.	5,395,456
1813, Incomplete parliamentary census,	5,937,856
1821, Parliamentary census, ^g	6,801,827 ^h
1831, The same,	7,734,365

Of the aggregate number, thus ascertained by the census of 1821, it was found that 1,138,069 persons were principally engaged in agriculture, 1,170,044 in trades, manufactures and handicraft, and 528,702 were occupied in avocations not included in either of those classes, making the total of occupied persons 2,836,815.

In external appearance the peasants are well made, robust and active; generally well tempered, yet easily excited to violent emotions; affectionate to their kindred, and singularly attached to the place of their nativity. Their appearance and character are, however, considerably varied by local circumstances, arising from the various sources whence the country was peopled. In the north, particularly in the eastern parts, the dress, manners and language at once point out a Scottish origin. Connaught exhibits features equally strong of the aboriginal habits and language. In the south-west are to be discovered traces of Spanish customs; the eastern region of Leinster is more decidedly Saxon. The Irish language is still spoken in many parts, but in the greatest purity in the mountainous districts of the county of Donegal. In the west, and more particularly in the islands and peninsulas on the coast of Galway, Mayo and Donegal, where the intercourse with other parts is but small, that language is almost exclusively spoken, insomuch that interpreters are frequently made use of in the courts of justice.ⁱ

The general food is the potato, to which milk, and at times salt fish, is added during seasons of plenty. Flesh meat is a luxury seldom enjoyed but on occasions of peculiar festivity, such as weddings, christenings, &c. The clothing is chiefly of home-manufactured coarse

and examined by two neighbouring magistrates, were forwarded to the chief secretary's office in Dublin, where they were abstracted and arranged for publication. The returns made by the enumerators were also subjected to the inspection of the parochial clergy of the district, both Protestant and Catholic. The copies deposited in Dublin castle were afterwards examined by persons of respectability from various parts of the country, who from their local knowledge could vouch for the accuracy of the returns from those parts with which they were personally acquainted. The payments to the enumerators were subsequent to those investigations.

^b The official (amended and corrected) return was made to parliament in 1823. (Bell's Geog.)—P.

ⁱ The Irish language, as has been observed in note ^b p. 1277, is a Gaelic-Celtic dialect, generally considered the purest of the family, and undoubtedly the most cultivated. The Irish call their language Gaelic (*Gaoidheilg*), or Irish Gaelic (*Gaoidheilg Eirinach*). In the etymologies given in the notes, the term Gaelic is referable both to the Irish and Scotch Gaelic.—P.

^a The archbishops derive their titles from the same towns as the protestant archbishops.—P.

^b Easter offerings from the inferior clergy. (Myers' Geog.)—P.

^c They are chiefly descendants of the Scotch Presbyterians and English puritans, who settled in the north of Ireland, under the patronage of James I.—P.

^d This and the three following are derived from the returns of the number of houses, on an average of six to each house. (Ed. Enc.)—P.

^e In 1778, according to the number of houses, 3,900,000. (Ed. Enc.)—P.

^f See note ^d.

^g The census of 1821 was the only one taken on the principle of actual enumeration, subjected to effective checks. The process adopted was as follows: The persons employed in the several parishes or districts to take the enumeration were furnished with books, in which they were required to enter on the spot the name, age, occupation and relationship of every individual in every house on every town land in such district, together with a specification of the number of acres held by every householder. Copies of these entries, when verified on oath

cloth or frieze for the men; but the influx of cheap cottons has latterly caused a great change in the costume of the female peasantry from the characteristic dress of their ancestors.

The prevalent religion is the Roman Catholic, although the precise ratio of its prevalence, compared with the Anglican and Presbyterian modes of doctrine, is difficult, indeed almost impossible, to be ascertained. The inquiries lately set on foot, from sectarian or political motives, have served rather to obscure them than to develop the truth.^a Superstitious practices are much observed, particularly in the remoter districts. Some may be traced to the era of paganism: such are the lighting of fires at Baaltine or Beltine,^b and the passing of animals through the fire. Pilgrimages to places of peculiar sanctity are frequent among the Roman Catholics. Lough Derg in Donegal, and Struel wells in Down, are peculiarly celebrated. The belief in witchcraft and second-sight has not yet been eradicated from among the descendants of the Scottish settlers in Ulster. The love of learning, which peculiarly marks the Irish peasantry, is however gradually diminishing the extent of the sway of opinions and practices originating in periods of ignorance.

The means now in operation for rendering the rapidly increasing population of Ireland fitted to fulfil their duties to themselves and their country, through the irresistible influence of a well-ordered system of education, has been minutely analysed and detailed by reports of two parliamentary commissions appointed to investigate the subject. The result of the perusal of these documents leads to an inference far from consolatory, unless in prospect. Much as has been spoken and written on the subject, little has been done.

The university of Trinity College, Dublin, influences and controls the education of the higher classes. The superintendance of study is vested in teachers called junior fellows. The mode of instruction is almost exclusively catechetical. The total number of pupils on the books of the university may be estimated at 1600.^c The *curriculum*, or regular course of under-graduate studies, is completed in four years; the annual average of pupils is therefore 400. Estimating the duration of human life, after arrival at years of maturity, at thirty-three years, it will appear that the total number who enjoy the advantages of a complete liberal education in Ireland is 13,200, out of a male population of 3,500,000, being at an average of 1 for every 270.^d

Maynooth College, founded in 1795,^e exclusively for the education of the Roman Catholic priesthood, admits about 250 students annually, who are under the superintendance and instruction of 14 professors and lecturers.

The education of the lower classes has long been considered as peculiarly a national concern, and as such was made the subject of legislative enactments so early as the reign of Henry VIII. By these statutes every incumbent is bound by oath, on accepting a benefice, to keep a school in his parish for the instruction of the

natives in English, or to cause one to be kept by a competent teacher. This salutary regulation has been in too many instances disregarded or evaded. King James, in his distribution of the forfeited lands in Ulster, set apart large estates for the endowment of free grammar schools. These are now distinguished by the title of schools of royal foundation.^f Some were added to the number by Charles I., but they were too few and perhaps too richly endowed to accomplish the intentions of their royal founders. A grammar school was also required to be maintained in every diocese by the contributions of the beneficed clergy: twenty of these schools^g are in existence.

The number of free grammar schools was increased by a bequest of Erasmus Smith, one of the English adventurers, who obtained a large grant of forfeited lands during the government of the commonwealth. But these^h like the former, instead of being employed for the instruction of the poor, were converted into places of liberal education for the sons of the wealthier classes; a character which they still retain in several instances.

After the revolution in 1688, an attempt was made to promote the conversion of the Roman Catholics through the medium of education. Subscriptions were raised, and lands procured by purchase or donations, which were vested in a society incorporated for the management of the fund thus raised; hence the establishments under its control acquired the name of charter schools. The sanguine anticipations of the originators of this plan have been far from realised. Notwithstanding the additional aid of large annual grants of public money, these schools have utterly failed as an engine of proselytism on an extensive scale; wealth induced thriftless expenditure; mismanagement opened the door for abuses; the grants of public money have been withdrawn, and the trustees are left to their own private resources for the maintenance of the schools.

Within the last twenty years the efforts to disseminate elementary instruction among the great mass of the population have increased rapidly by the exertions of several new societies formed wholly or principally for this purpose. The association for discountenancing vice, consisting chiefly of the clergy of the established church, among other objects, undertook the education of the poor, according to the doctrines of the protestant faith. The society for the education of the poor, now better known by the name of the Kildare Place Society, proposed to disseminate moral instruction without any interference with the religious tenets of the pupils; but the adoption of a regulation immediately after the formation of the society, which excluded from any share in its benefits those schools in which the Bible without note or comment was not admitted as a class-book, was so strongly objected to by the heads of the Roman Catholic church, as to check considerably the extension of the benefits of the institution. The Roman Catholics shrunk from a participation of literary advantages to be purchased by the dereliction of one of the tenets of their church, in the indiscriminate

^a The Protestants have stated the Catholic population at 4,500,000; the Catholics, at 6,500,000. In 1821, the Protestant census gave 4,230,000 Catholics, and 1,963,487 Protestants. (Bell's Geog.)—P.

use of the Bible unaccompanied by the superintending advice and explanation of their pastors. Both these societies were supported by large parliamentary grants, until very lately, when the legislature was at length convinced of the impolicy, not to say the impracticability, of educating the great mass of the people according to principles in direct opposition to their modes of thinking on religious subjects. The annual grants to the two last named societies have been withdrawn, and the general education of the people placed under the superintendance of a board formed of individuals selected from among the most influential members of the leading Christian sects in Ireland.

The Irish and the London Hibernian Societies were formed with the view to disseminate religious instruction throughout those parts of Ireland in which the native language is prevalent; they are aided by several minor societies under different names: all are supported solely by voluntary contributions, and are wholly under the direction of protestants.

The schools, exclusively catholic, are supported and superintended by the society of the Christian Brotherhood, and other religious orders, by the nunneries, and by the collections and donations of the Roman Catholic inhabitants of various parishes under their respective parochial clergy.

In addition to the schools already mentioned, must be named the Sunday schools, which originated chiefly with the Methodist society, and are still mainly supported by the exertions of its members.

The total number of children receiving instruction amounted in the year 1826, to 568,964. From the return of ages in the census of 1821, it appears that the number of children of both sexes, between five and fifteen, which may be called the age of education, then amounted to 1,748,663, and therefore, making due allowance for the probable increase in five years, it may be estimated in 1826, at 2,000,000. In the latter of these periods the number receiving education in the public schools will be found to be somewhat less than one-fourth of this part of the population,^a or, in other words, between two-thirds and three-fourths of the rising generation are without the benefits of scholastic instruction, notwithstanding the extended endowments in lands, the large grants of public money, and the liberality of individual contributions towards the supplying of this national defect.^b

Agriculture, although the chief source of support for the adult population, is still in a very backward state as compared with that of Great Britain or the Netherlands. The implements of husbandry are of an inferior description, and the process of cultivation executed in a less careful manner. The prevalent mode of letting land is justly considered as one great cause of this inferiority. Farms, when out of lease, are generally let to the highest bidder, regard being seldom paid to the tenant-right. The occupier, therefore, feels but little inducement to expend his capital on his land; he hoards or lays out at a non-indifferent interest what would, under a better system, be more

profitably invested in the improvement of his farm. Absenteeism is also considered to be another cause of this evil. The tenant is neither cheered by the presence nor enriched by the expenditure of his landlord; he toils under the chilling inspection of an agent, anxious chiefly to enhance the value of his own services by the amount of his remittances, and too often a creditor on the estate he has in charge. It must, however, be acknowledged that the estates of some absentees form brilliant exceptions to this remark, and that the pressure of ill-judged avidity is often equally visible on the estates of resident proprietors. The want of internal communications by well-projected and well-executed roads is in many cases an additional cause for the backward state of agriculture.

A judicious rotation of crops is still but imperfectly practised, and the raising of green food for the winter supply of the cattle by no means sufficiently attended to. In the northern districts, oats and barley are the chief produce; the cold and dampness of the atmosphere checks the growth of wheat. In the southern counties, and in the districts around Dublin, wheat is largely raised, but it is deemed of inferior quality to that of England.

Grazing has always been a favourite mode of employing land, the humidity of the atmosphere and the genial mildness of the climate affording an almost perennial supply of pasture; the unsettled state of the country also long proved a bar to tillage. Hence the wealth of the native chieftain consisted chiefly in his numerous herds and flocks; his tribute was mostly paid in kine. During the latter period of the Irish parliament great attention was paid to the encouragement of tillage, and its progress was proportionately rapid. The chief grazing counties for black cattle are those of Limerick, Tipperary, Roscommon and Meath, where the farms are sometimes of extraordinary extent, a single occupier frequently holding more than 1000 acres. The grazing of oxen and sheep is seldom combined; that of the latter is an important object with the Irish husbandman, and more land, though of a poorer quality, is employed for this purpose than in the feeding of bullocks. The chief breeding counties for sheep are Limerick, Tipperary, Clare, Roscommon and Galway; some of the finest flocks in Ireland are to be seen in the last named county. The flocks are usually managed by the herd who attends the cattle; no regular shepherd being employed, as in England. The custom of folding is seldom adopted, and great backwardness is evinced by the neglect of using turnips for winter food.^c The cattle, when fit for market, are sent in immense numbers to the fairs at Ballynasloe,^d held twice every year. The principal fair is in October; it regulates the prices of cattle for the ensuing season, and is the great standard of the prosperity of this branch of the national wealth. Fat cattle are exported in great numbers from Meath to Liverpool, and of late years, the facilities of canal navigation, combined with those afforded across the channel by steam, bring large numbers from the western parts to Dublin for exportation.

^a The proportion of those receiving instruction, in 1826, is more than one fourth.—P.

^b The comparative number of schools and pupils maintained by each of the societies above named, as also of the private schools, whose teachers are wholly remunerated by the fees of their pupils, is given a table in the appendix.

^c Mr. Wakefield says, that in the whole course of his tour he never saw a sheepfold, and only one sheep feeding on turnips. (Ed Enc.)—P.

^d In Galway county.—P.

Hogs are kept in great numbers in every part. This animal is the inmate of the peasant's cabin, and thus acquires a degree of docility unusual in other countries; its food is potatoes. The native breed, long legged, bony, and ill-proportioned, has been of late years considerably improved by a cross of that of Leicestershire. Large and rapidly increasing quantities of pork and of live stock are exported, chiefly to Liverpool.

The dairy farms form a conspicuous feature in the rural economy of the interior, occupying a greater extent of country than those held by the feeding grazier. The farms in the Walsh mountains in Kilkenny exhibit striking peculiarities of manners. The principal of them belong to one family, the members of which constantly intermarry among one another, at such close degrees of consanguinity as frequently to require dispensations from the canonical prohibitions. The land is grazed in common; the people, though wealthy, live with the greatest economy, subsisting chiefly on potatoes and griddle bread, and indulging in no animal food but the relics of the pigs slaughtered for sale. Ireland has long been celebrated for the excellence of its butter. The best is made in Carlow; the most inferior comes from the rich soil of Limerick and Meath. It is remarkable that a country so productive of butter should utterly fail in the cognate article of cheese; yet, with the exception of a small district in Antrim, chiefly in the neighbourhood of Carrickfergus, no good cheese is made in any part; the consumption of this commodity is almost wholly supplied from England.

The culture of apples in Waterford and Cork in the south of Ireland, and in Armagh in the north, is considered as one of those regular branches of rural industry on which the farmer calculates as a sure source of pecuniary remuneration. In the two first named counties the fruit is generally converted into cider, which is the usual beverage of the middling classes of landholders; a superior quality of this liquor, when prepared with care and judgment, is highly valued, and amply repays the attention bestowed on its manufacture.

The culture of tobacco was lately introduced, but to a very limited extent. The results on small detached spots have led to very sanguine anticipations of its profit, when cultivated on a large scale; but the quantity raised in any single year is insignificant. The total number of acres planted in 1829, was but 461, of which 408 were in the county of Wexford alone. When it is considered that it is a crop of a quality peculiarly exhausting to the soil, requiring constant attention and great nicety of management in every period of its growth, that it is liable to frequent and irreparable injuries from the inconstancy of the climate, and that the plant raised is at best of an inferior quality, adequate certainly to the wants of the grower who is content with an herb of less grateful flavour, from the consideration of the greater economy in its use, but for that very reason, ill suited to cope in the general market with the produce of a foreign soil, the ultimate success of an outlay of capital to a large extent on its cultivation must be extremely problematical. The

legislature has, however, set the question at rest for the present, by prohibiting its cultivation, on the ground of its interference with the revenue arising from the importation of the foreign plant.

A recurrence to the sketch of the coasts already given, would lead to the conclusion that the people derived from the surrounding waters an inexhaustible supply of food for their own consumption, and a fund equally inexhaustible of commercial wealth from its export. Experience contradicts such an inference. With an ocean rolling round him stocked with fish of nutritious quality and varied flavour, with rivers abounding also with fish of similar description and conveying the contributions of the ocean almost to his door, the peasant is still compelled to satisfy the cravings of nature by the scanty and unvaried produce of his agricultural labours. Along the southern coast of Ireland from Cork to Wexford, at a small distance from the shore, lies the Nymph Bank, plentifully stocked with cod, hake and ling, which kinds of fish are common also on many other parts of the coast. Turbot, sole, plaice, and every other species of flat fish that frequents the northern seas, are also taken there. The sun-fish is seen at times in large numbers on the western coasts. One part of the great northern shoal of herrings annually passes through the Irish Sea, while another generally pursues its course along the coasts of Connaught.^a Salmon abounds in all the large rivers; the greatest fisheries of it are in the Northern Bann^b at Coleraine, the Boyne above Drogheda, the Southern Blackwater, the Shannon, and the river of Belleek near Ballyshannon. Great part of the fish is packed in ice, and thus conveyed fresh to the tables of the British gastronomes. Shell fish also abounds. Many species^c of the oyster are raised from various parts of the shore; some of a flavour peculiarly delicate, as those of Carlingford; others noted for size; others again, though seldom, combining both these qualities. The scallop, another maritime luxury, is often used merely as bait for larger fish. Lobsters, particularly in Kerry and Galway, are of large size, and well-flavoured; the same may be said of crabs and cray fish. The sprat of Waterford, the sand eel of Newcastle, and the smelt of Strangford, will always maintain a high estimation among the minor delicacies of the table. Pilchards were formerly caught in such abundance at Cloghnakilty, that the traffic in them rendered the town a place of considerable population; but, since the desertion of that station by the fish, the town has declined.

Yet it cannot be truly asserted that the apparent disregard to these bountiful offerings of nature is attributable to want of industry or enterprise for their attainment. Along the deep shores of the western parts, the hardy fisherman is to be seen in his wicker corach,^d coated with green hide, venturing for his precarious subsistence upon seas which even the well-prepared mariner contemplates with apprehension. The young men of the southern baronies of Wexford and Waterford, quit their homes in spring for the Newfoundland fisheries; some return with their little earnings at the close of the fishing season,

^a The herrings caught off the coast near Galway, are particularly large and fine. (Ed. Enc.)—P.

^b The Bann.—A small river of the same name forms a branch of the Slaney, in Wexford county.—P.

^c Varieties.—P.

^d The corach (Gaelic, *curach*—Welsh *cwrwg* (cooroog), or *cwrwgyl*, whence coracle) is a boat made of wicker-work, and covered with hides or pitched cloth. It is still used in Wales and the Highlands, as well as in Ireland.—P.

while others remain one, two, or more winters in that inclement region, until they have realized the means of humble independence at home.

The chief cause of the backwardness of the fisheries is to be traced to the same cause as that of agricultural improvement—the want of capital. The fisherman depends on his daily labours for his daily bread; he has not wherewithal to fit out properly a substantial boat with all its tackle, much less to save and store a cargo so as to fit it for a foreign market. In order to remedy this crying evil, a board of fisheries was some years ago formed. It has already been productive of one advantage—a knowledge of the actual state of the fisheries, their capabilities, and their defects; it has excited a spirit of exertion, and produced an increased attention on the part of the ruling powers to this branch of national industry, which, persevered in judiciously, and impartially regulated, must lead to those results that a disinterested observer would say ought long since to have been realized.

The attention of the board of fisheries, during its existence, which terminated in 1830 by the stoppage of the annual grant of public money for its support, was chiefly directed to two objects, the erection and repairs of fishing-piers, and the formation of a loan fund for building and repairing boats. The expenses incurred in the attainment of the former of these objects was defrayed partly by grants of public money, and partly by the contributions of the neighbouring proprietors, and of other individuals interested in the improvement of the country. At the commencement of the year 1830, thirty-five piers were completed, and twenty-two in progress; the results produced by those completed are stated to be, in most instances, even more gratifying than might have been anticipated, exciting a spirit of increased exertion in the fishermen, from an increasing sentiment of the security thus afforded to their frail craft, and consequently inducing them to fit out new vessels, and to render those already built more sea-worthy. The expense thus incurred up to 1830 has been L.10,746.

The results of the loan fund are not so satisfactory. The total amount of the sums lent out is L.25,204, 18s. 4d. Of this sum, L.14,262, 0s. 1d. was to be repaid, according to the conditions of issue, in the year 1830. The repayments actually made at that period, were L.9,923, 9s. 1d. leaving an arrear of L.4,338, 11s. The remainder, amounting to L.10,942, 18s. 3d. was not due at the date of the return whence this statement has been formed.

Under the encouragements thus held out, the numbers of the fishermen have increased considerably, as appears from the following return, which shows that the number under the cognizance of the board, was, in the year

1822	36,159	1827	58,044
1823	44,892	1828	59,321
1824	49,448	1829	63,421
1825	52,482	1830	64,771
1826	57,805		

Thus exhibiting a progressive increase every year, and a total increase of 28,612. These numbers include the fishermen only, and do not comprehend the other persons occupied in the ulterior process of preparing the fish for market, such as curers, coopers, salt-makers, net-makers, &c.

The number of vessels employed in the fishing trade has increased proportionally. The total of the year 1830 was:—decked boats, 345; half-decked, 769; open sail-boats, 2,483; row boats, 9,522: total, 13,119.

The structure, rigging and management of the boats, and the mode of fishing, vary in different parts, to a degree, in some cases, singularly surprising. The eastern and western suburbs of Carrickfergus are inhabited almost solely by fishermen, those in the former being Scotch, in the latter Irish. The Scotch fish with the hook for round fish, in open boats, rigged with a single square sail; the Irish trawl for flat fish, in half-decked smacks. So limited is the communication these two classes maintain with each other, though the intermediate space between their residences is not more than a few hundred yards, that the technical phrases employed for the construction and working of their boats is so different, that neither can avail themselves of the assistance of the other, and thus they live little more connected than if they inhabited the shores of separate islands.

The manufactures of Ireland were at no time so flourishing as to increase much beyond the wants of its own population. The nature of its soil and climate, which tended to encourage pastoral pursuits, the habits of the people, the unsettled state of the government, and the want of coal, have all contributed to this result. The woollen manufacture, however, is to a certain degree an exception. So early as the reign of Edward the Third, a brisk export trade in some descriptions of woollen cloths was carried on with the north of Italy. The Irish caddow, or woollen coverlet, was an article in high repute. The influx of a colony of the Palatines, in the time of James the First, tended to improve the manufacture. Their chief settlement was at Carrick on Suir, on the confines of Tipperary and Waterford, which for a long period was celebrated as a woollen mart, affording employment for a large number of the surrounding inhabitants of both sexes, and finding a ready vent for the wrought article throughout other parts of the country and in foreign markets.

Notwithstanding the desolating effects of the wars of 1641 and 1688, the woollen trade was so flourishing after the revolution as to excite the jealousy of the British manufacturers, who had influence sufficient to procure an address from both houses of parliament to William the Third, “to use his utmost diligence to hinder the exportation of wool for Ireland,^a except to England, and generally to discourage the woollen manufacture in Ireland.” The address was followed up by acts prohibiting the exportation of woollens as therein expressed, and by the imposition of duties on the importation of woollens to England, which operated as a total prohibition.

In the year 1779, the Irish parliament repealed the prohibition against exporting woollen cloths to foreign markets; the trade in consequence revived, and the manufacture again became a means for the profitable investment of capital to a large amount.

By the Act of Union, the duties on woollens imported from either country into the other, were confined to those called old and new draperies; the ratio payable for importation into Ireland was fixed at 8½d. per yard on old,

^a Qu. “of woollens from Ireland.”—P.

and 2½d. per yard on new drapery. By the same act England also relaxed her monopoly of export so far as to permit wool and woollen and worsted yarn to be sent duty free from Ireland.

In 1822, the woollen cloth imported from England amounted in quantity to one-third of the whole consumption of the country, but in value it is calculated to have been considerably more than one-half; because the import duty of 8½d. per yard, being the same on cloth of every description, was little regarded in the price of the more expensive article, while it operated nearly as a prohibitory duty on those of low price, of which the general consumption mainly consisted.

These circumstances show why the manufacture of Ireland has been confined to the coarser kinds, and account for the failure of the few attempts made to introduce that of the finer qualities. Broad cloth and blanket manufactories of any magnitude are to be found nowhere to the north of Dublin; flannels are made in Wicklow, and blankets in Kilkenny.

In 1823, the protecting duties, under which the trade had thriven for many years, and which were to have been gradually diminished, in the view of assimilating the state of the trade in the two parts of the empire, were suddenly and unexpectedly repealed. To this cause in part, but much more to the great influx of cloth of newer fashion sent over from England at very reduced prices, during the subsequent depression of the woollen trade in that country, is to be attributed the almost total ruin of the manufacture and the utter destitution of those depending on it. In 1822, there existed eighty-three woollen factories in full work; they are now reduced to about twenty, which are but partially employed. In the years 1826 and 1829, the workmen were dependent on charitable contributions: numbers have crossed over to Great Britain in quest of work, and many families have been afforded the means of conveying themselves and their implements of industry to the United States of America, where a promising field of exertion is presented to them, in lieu of the gloomy prospect of idleness and destitution at home.

The few manufactories of broad cloths at present at work, and which are mostly in the vicinity of Dublin, employ 1560 hands, giving support to 10,040 persons, and producing goods to the value of L.200,000.

In Wicklow, flannels, although fallen off to about one-fourth of their former quantity, may amount to L.10,000 in value; the manufacture gives occupation to about 100 families. Blankets are still manufactured in Kilkenny, so as to employ 500 or 600 families.

Fine wool is grown principally in Wicklow; the next in quality is reared in Galway and in other parts of Connaught. The wool shorn in Ireland amounts to about 6000 bags, of 50 stone each. Besides the cloth produced in large factories, the manufacture of friezes and cloths of the coarsest quality for domestic use is prevalent throughout many parts of the country, but chiefly in Galway, Meath, Louth, Wicklow, and Kilkenny.

Although it appears from what has been just stated, that the linen manufacture was raised upon the ruins of the woollen, it was not unknown in Ireland previously to the reign of William the Third. In early times, the Irish of the higher ranks were profuse in the quantity

of linen used in their inner garments: the shirt of a man of rank contained from twenty to thirty yards; insomuch that the limitation of this article of dress within reasonable bounds was a prominent feature in the sumptuary laws of those days. The unfortunate Earl of Strafford, when lord lieutenant, made great exertions to improve the linen manufacture, sending to Holland for flax-seed, inviting competent workmen from the Netherlands and France, and embarking funds to the amount of upwards of L.30,000 from his personal fortune in the speculation. His example was followed by the Duke of Ormond, who exerted himself greatly to extend the manufacture; but the legislative measures of the English parliament after the revolution, which were echoed by enactments of a similar character in Ireland, gave it a stimulus that carried it forward for many years to a high degree of perfection.

In order further to excite exertion in this branch of industry, a board, appointed to superintend its progress, under the name of the Trustees for the Linen Manufacture, was charged with the disposal of a large annual grant of public money to be employed in premiums for its extension and encouragement. This board was also invested with powers to check frauds, so as thus to prevent the injury to be apprehended from sending goods of inferior quality to market under a false character. Still further to promote this favourite object, a linen hall was erected in Dublin for facilitating the transactions of the linen factors; similar buildings, on a smaller scale, were also erected in Belfast and Newry. Among other expedients for nursing this adopted bantling in its infancy, the use of linen scarfs and hatbands at funerals was introduced, a custom which maintains its ground to the present day, but with an important alteration as to its primary intention, by the substitution of cotton for linen cloth.

The importation of flax seed was another object of the trustees' superintendance; for the material, forming the basis or rudiment of what the legislature at the Revolution established as the staple to compensate the country for the deprivation of its natural manufacture, cannot be raised in it in sufficient quantity or of superior quality. Notwithstanding all the exertions made from that period to the present time, the seed raised in Ireland, particularly for the finer fabrics, is inadequate to the demand, and the small proportion that is raised is considered to be of inferior quality. The seed is imported from America, Prussia, Holland, and England. The proportions supplied by each of these countries may be estimated from the returns made of the quantities imported in 1821:

	Hhds.
American	36,176
Prussian	8,424
Dutch	7,308
British	5,934
Total	57,842

The quantity of flax seed imported, on an average of four years ending 1821, was 47,000 hogsheads, with which 83,000 acres of land were sown.

The silk trade in Ireland may be said to owe its origin to the revocation of the edict of Nantes, by which cruel and impolitic measure Louis XIV. transferred to the rival kingdom of Great Britain a large portion of the industry and ingenuity of his Protestant subjects. Many of the

refugees settled in Dublin, where they introduced the silk manufacture, which throve for a succession of years to a considerable extent. Besides articles of entire silk, Ireland has been celebrated for a manufacture of mixed silk and worsted, known in the country by the name of tabinet, and in Great Britain by that of Irish poplin. For a long period this fabric was much sought after both at home and in the foreign market; but the fluctuation of female fashion has latterly considerably diminished the demand for it. The silk trade, which had been on the decline since the period of the union, is now almost extinct, the number of looms at work being wholly insignificant, and chiefly employed in completing orders from England. The families who depended on it have emigrated in quest of employment, partly to Great Britain, and partly to the United States of America, carrying with them the knowledge of a manufacture of much ingenuity and singular elegance, which hitherto had been a source of wealth to their native country, and of competence and comfort to themselves. The total quantity of silk imported into Ireland in the six years immediately following the Union, was 445,713 lbs.; in the six years ending in January 1822, the amount was 387,290 lbs.

Dublin has always been the favourite seat of this manufacture. Factories were established in other places, but without success. In 1825 an attempt was made, under the auspices of the Earl of Liverpool, then prime minister, to secure to Ireland the whole of the profits of this manufacture, from the rearing of the worm to the finishing of the cloth. A large number of mulberry trees were imported into the south of Ireland, and planted there; silk-worms were also introduced. The mulberry tree, though not unproductive, declined. The insects, which even in the warm latitude of Italy require protection from the variations of the atmosphere, sunk beneath the chilly moisture of the Irish climate, and all hope has already been relinquished of producing the desired effect upon a scale commensurate with the establishment of a national manufacture.

The cotton manufacture has risen on the ruins of the linen. The first cotton factory in Ireland was erected in 1784, in the neighbourhood of Belfast. The trade was fostered in its infancy by the Irish legislature, not only by a high protecting duty, but by the distribution of public money in the form of bounties. This state of things continued till the Union. A new arrangement was then made. The duties on muslins and calicoes were to remain unaltered for eight years, after which they were successively lowered by eight equal annual reductions, so that, after the year 1816, they remained at 10 per cent. *ad valorem*.

The statements of historians and the inquiries of writers on the resources of the country show that the manufacture of iron was once flourishing; but, in consequence of the diminution of fuel by the destruction of the woods, it declined, so as to be at present almost extinct. It appears in evidence before the House of Commons, that this manufacture had scarcely made any progress from 1801 to 1821. The few founderies which existed at the latter of these periods were principally employed in executing orders for manufactories in the neighbourhood, which necessarily required the article to be made according to pattern and on the spot. The manufacture continues in the same state to the present time. The manufactures of brass, copper, tin, and hardware, are

struggling under circumstances nearly similar to that of iron, being confined to the making articles which cannot be readily procured according to pattern from Great Britain.

The manufacture of ardent spirits from malt has long been carried on to a great extent, forming one of the main sources of revenue; but the pecuniary benefit derived from it has been purchased by a frightful amount of crime and misery, the results of illicit distillation. For the suppression of this practice the legislature enacted various regulations, some exceedingly severe; but the profits accruing from it were too great to be thus counteracted, and the distillers carried on their illegal traffic with such indefatigable ingenuity, and in many instances with such a determined spirit of opposition, as to place the greater part of the population of extensive districts in direct collision, not only with the civil authorities, but with the military force of the government. The following facts prove the utter inefficacy of the system of legislative severity. In the ten years ending with 1818, there were, according to official documents, 16,244 unlicensed distilleries destroyed, in which 36,965 gallons of spirits, and 47,843 barrels of malt, besides singlings and pot ale, were seized or destroyed. In the subsequent ten years the number of distilleries destroyed had increased to 41,645, and the quantities of spirits and malt to 47,843 gallons of the one, and 156,636 barrels of the other. A subsequent change of the law, by which a reduced scale of duties has been, to a certain degree, substituted for the former practice of fine and imprisonment, has tended considerably to diminish the prevalence of this baneful practice.

For many years Ireland was chiefly supplied with beer and ale from Great Britain; latterly, however, by directing attention to the internal resources of the country for the production of a species of manufacture, the principal material of which is to be had in such plenty within itself, a sufficient quantity of both kinds of liquor is produced for domestic consumption, and for export, on a scale as yet limited, to other countries, and even to Great Britain. The averages of the quantities imported from Great Britain, at different periods, will serve to confirm this statement.

From 1721 to 1760	} the annual average of	beer and ale import-	ed from Great Britain	9,307 gallons.
1760 to 1801				56,223
1801 to 1811				37,703
1811 to 1821				5,123

The changes in the circulating medium, through which the products of agricultural and manufacturing industry are made available to the increase of the national wealth, were frequent and considerable, to an extent seriously affecting the political arrangements of the country. The first mint noticed in history was established by the Danes, but the coins issued from it circulated only among themselves, traffic being carried on among the natives, both during that period and for some centuries later, by barter, in which cattle was the standard of value. Instances of this are on record even in the reign of Elizabeth, when the tribute of several chieftains was paid in beeves.

After the arrival of the English, a mint was established by John, who, in 1210, caused pennies, halfpennies and farthings to be coined of the same weight as those in

England. His successors, Henry III. and Edward I. also issued coinages of small money; the latter of these was the first sovereign who added to his title of *REX ANGLIE* on the coins that of *DOMINUS HIBERNIE*. In the reign of Edward III. the ounce of silver, which had hitherto been cut into 20 deniers or pennies sterling, was divided into 26. Henry VI. appointed mints in Dublin, Trim and Drogheda, in which brass as well as silver was coined. In his reign the value of this latter metal was raised from 3s. 4d. to 6s. 8d. per ounce. The consequence was a sudden rise of price in provisions and all other necessaries of life. The remedy applied to this evil by a subsequent parliament, was the issue of a new coinage of five kinds of silver coins, the gross, the demi-gross, the denier, the demi-denier, and the quadrant or farthing; eleven groats were to weigh an ounce troy; the groat, if not clipped, to pass for fourpence.

By another act, in 1479, the price of silver was again raised; the weight of the groat being reduced to 32 grains, so that the difference in value between the English and Irish groat was, at the time, nearly fifty per cent. In the reign of Henry VII. the difference between English and Irish money was one-third, and in the beginning of the succeeding reign of Henry VIII. the current coin was so clipped and defaced, and had become so scarce, that the lord lieutenant petitioned to be recalled in consequence of the want of money to carry on the wars. Elizabeth caused the ounce of silver to be cut into sixty pennies; the value of a shilling, better known by the name of a harp, during her reign and that of her successor, was 9d. English.

Charles I. caused the name of Irish money to be abolished, and directed all payments into the treasury to be made in sterling English money. During the Commonwealth, money was coined for the special service of Ireland; yet, after the revolution, small money was so scarce, that several towns, and even private individuals, were obliged to coin copper tokens. On the arrival of James II. in Ireland after his abdication, the values of gold and silver coins were raised, the English guinea being fixed at L.1, 4s., and the English shilling at 1s. 1d. But he soon after attempted a still greater change in the currency of the country, by the issue of base copper money, which was ordered by proclamation to pass at a rate so extravagant, that copper of the intrinsic value of L.6,495 was made to pass current for L.1,596,799. This base money was cried down by King William immediately after the battle of the Boyne.

No money was coined during the reign of Anne. In 1725, the new gold coins of Portugal were allowed to pass current in Ireland at a stated value. Nor did any further changes in the circulating medium take place, till the assimilation of the currencies of Great Britain and Ireland in 1826, when the British shilling, which, since the time of James II., had passed for thirteen pence, was directed in future to pass for twelve, as in the other portions of the British dominions.

The deficiency of a metallic circulating medium in Ireland, co-extensive with the demands of an increasing trade and commerce, was for many years supplied only by private banking-houses, which issued notes on their own responsibility. But as the quantity of paper thus thrown into general circulation was at times far beyond the amount of the capital it purported to represent, and

even exceeded in a great degree the demands of the country, the return of the notes to their respective issuers caused sudden failures which shook public credit to its basis.

To remedy this evil, the bank of Ireland was formed in 1783, with privileges resembling that of England. Its capital was at first L.600,000; but on various renewals of its charter, it was gradually increased to L.2,850,000. At the last renewal, which took place in 1821 and extends to 1838, the amount of capital was augmented to L.3,000,000. To prevent the evil consequences of an excessive issue of private bankers' notes, every partner in such establishments was made responsible for its engagements to the whole amount of his property, but, by a singular contradiction, the number of partners in each was limited to six, thus limiting also the amount of property that could be made available for the liquidation of its engagements, in cases of insolvency, to the aggregate of the property of six individuals.

This absurd and pernicious limitation has been lately removed. Banks, consisting of an unlimited number of partners, may now be formed, yet still with a restriction in favour of the bank of Ireland, that such joint stock banking houses must be more than fifty miles from Dublin; thus continuing to this city and the surrounding counties the disadvantages under which the whole island had laboured in consequence of the impolitic monopoly caused by the limitation. The provincial bank of Ireland and the northern bank in Belfast have been formed according to this new regulation: the former has branch banks in twenty of the principal towns in Ireland. The bank of Ireland, following the example of this new rival, has established agencies in several places, thus affording increased facilities to trading and commercial transactions.

Roads and canals are the channels of internal traffic. The roads in Ireland have long been justly celebrated for the excellence of their construction. The principle of the method now styled macadamizing, was practised there for many years before it was introduced into general use in England, by the spirited exertions of the engineer from whom it derives its name. Arthur Young, in his tour in 1777, expresses his surprise at the striking superiority of the Irish roads over those of England. "For a country," says he, "so far behind us as Ireland, to have suddenly got so far the start of us in the article of roads, is a spectacle which cannot fail to strike the English traveller exceedingly. I could trace a route upon paper as wild as fancy could dictate, and every where find beautiful roads without break or hindrance, to enable me to realize my design." Since the introduction of mail-coaches in 1784, the roads have been progressively increasing in number, and improving in construction. An inexhaustible supply of limestone, the substratum of the greater part of the country, is easily procured, which, broken into small fragments, affords an even and durable surface, capable of being repaired at a small expense. In some few places, the old-fashioned paved roads are still to be met with. Yet much remains to be done. Notice has already been taken of the want of roads in the mining districts. The western part of Connaught suffers much from a similar want. In many parts goods are carried several miles on horses; in some the peasant himself is the hearer. The mountainous dis-

tricts of Cork and Kerry labour under the same defect ; a circumstance the more to be deplored, because experience has proved that wherever a well planned line of road has been carried through a range of country previously impassable for carriages, the vent of agricultural produce, and the consequent increased consumption of exciseable articles, have repaid the outlay with ample interest.

With respect to inland navigation, Ireland is far behind the sister island. While the latter boasts of 2400 miles of still-water navigation, and 2000 miles of navigable rivers, the former has but 282 miles of canals, and 380 of river navigation ; the total of water communication in the one case being 4400 miles, in the latter 660. The principal lines of inland navigation are the Grand and Royal Canals. Both commence at Dublin, and proceeding westward in lines somewhat diverging, terminate at the Shannon. The former, which is the more southern, was commenced in 1775, and has united the metropolis with the Barrow at Athy, and with the Shannon at Banagher. The canal is now extended beyond the Shannon through Roscommon as far as Ballynasloe, with a view of carrying it on to the town of Galway. The ascent to the summit level is 278 feet above the sea at the mouth of the Liffey : the fall thence to the Barrow is 97 feet, and to the Shannon 162. The cargoes conveyed on it consist chiefly of turf, in large quantities, for the supply of Dublin, corn, bricks and flag-stones. The traffic is far from producing a return adequate to the expenditure incurred ; the affairs of the company are therefore in a state by no means prosperous. The total expenditure to the Shannon, including the branch cuts to Athy, Milltown and elsewhere, amounts to L.1,861,008, being at the rate of L.18,610 per mile on 100 miles of still-water navigation, which, though yielding a net profit of at least L.300 per mile per annum, would amount to no more than 15s. 8d. per cent., per annum, on the capital expended.

The Royal canal company was incorporated in 1789. The canal, proceeding from the north of Dublin, passes through the counties of West Meath and Longford until it meets the Shannon at Tarmonbarry. Its line was most unhappily projected : at 35 miles distance from Dublin it is but eight miles distant from the Grand Canal, and at several intermediate places not more than four, so that these two great navigations, for half the length of each westward from the metropolis, are performing little more than the work of one. The expense incurred was L.1,421,954, or L.19,749 per mile, exclusive of interest for many years upon stock, loan, and grants of public money. The company having become insolvent in 1812, when not more than 53 miles of its line were executed, the undertaking was put into the hands of a public board, and completed in 1817 by parliamentary grants. One of the principal objects contemplated by its projectors was the trade arising from the collieries and iron works near Lough Allen. These sources have not yet been productive, and the only articles conveyed on it are similar to those carried along the other canal.

The Newry Canal is the oldest in the country, being commenced so early as the year 1739. It extends from the sea below Newry to Lough Neagh, a distance of twenty-four miles, nine of which are in the

bed of the river Bann ; a short cut, connecting the collieries at Coal Island with the Lough, may be considered as part of the navigation. The trade on this canal is seriously impeded by the obstacles necessarily consequent upon an attempt at making rivers navigable, arising from the delays caused by want of water in dry seasons, and from damages by floods in wet weather.

The Lagan navigation between Belfast and Lough Neagh, a distance of twenty-two miles, partakes largely of the inconvenience just stated to arise from river navigation. The same may also be said of the Boyne and Limerick navigations. The former of these extends from the tide water at Drogheda to Navan, a distance of fifteen and a half miles, and is carried chiefly through the river ; the produce of the tolls is totally inadequate to its effective maintenance. The Limerick navigation from Limerick city to Killaloe, designed to render the Shannon navigable to Lough Dearg, is twelve miles long, partly in the river. If, in the absence of more satisfactory means of ascertaining its rate of profit, an estimate be formed from the imperfect state of the navigation itself, the uncertainty of the passage through Lough Dearg, navigable only by sail and oar, and the delays from floods and foul weather, no remunerating rate of profit can reasonably be expected.

The geographical position of Ireland has been already pointed out as affording great facilities for commercial interchanges with some of the most wealthy and enterprising nations on the globe. Notwithstanding the checks imposed by England upon this branch of national industry, the commerce of Ireland increased with rapidity after the nation had, in any degree, recovered from the severe shock of the civil war in 1688. But in 1799, its commerce assumed a new character, in consequence of the right of the country to a free trade being recognized by the British parliament. By the act then passed, the laws prohibiting the exportation of woollens and glass were repealed, and the country was allowed to trade with all parts of America, the West India Islands, and Africa, subject only to regulations framed by its own parliament. The articles of the Union confirmed this equality of commercial privileges, by enacting, that the two islands should be on the same footing as to encouragements and bounties on the like articles, the produce of each country respectively, and generally also as to trade and navigation in all parts and places in the United Kingdom.

A considerable foreign trade is now carried on with America, chiefly by the merchants of Dublin, Belfast and Londonderry. The articles principally imported thence, are tobacco, cotton, wool, rice, timber, and flax seed ; linen is chiefly exported in exchange. A trade for wine is carried on with Portugal and Spain, and large quantities of butter are sent to the former of these countries, together with linen, beef, pork, salt fish, and some woollens. In addition to wines, Ireland receives in return fruit, principally oranges and lemons, salt, oil, potash, and cork. Provisions are sent to France in exchange for the wines of that country ; as also to the Netherlands, whence Geneva spirit and linseed oil are brought in exchange. To the Baltic are sent linen and butter ; the returns are made in iron, deals, hemp, potash, and herrings.

But the chief market for the surplus produce of the country is England. Besides grain and flour to a large

amount, black cattle and swine have long been a staple article of export to Great Britain: their numbers have been latterly increased to a considerable degree by steam navigation. Previously to this invention, Portpatrick, in Scotland, had been the chief landing-place for Irish cattle, on account of the shortness of the cross passage; but now Liverpool absorbs nearly the whole trade. To Scotland, also, are sent linen and linen-yarn, beef, pork, tallow, untanned hides, butter, barley, oats, and oatmeal. The returns from Great Britain are made in coal, dried fish, manufactured goods of every description, both for necessity and luxury, tea, coffee, rum, and tobacco.

Though the general population of the country is distributed through the provinces, nearly in proportion to their acreable contents, Connaught excepted, which is by much the most thinly peopled, a considerable diversity exists between them as to the mode of its location in each. That of Munster is mostly congregated into large towns, while in Connaught the population is chiefly rural. Of the cities and towns containing 4000 inhabitants, or upwards, each—nine are in Leinster, ten in Ulster, and but seven in Connaught, while Munster can reckon twenty-four, ten of which are within the single county of Cork. Or, to view the position from another point,—the population of all the towns containing 4000 or more inhabitants, amounts, in Leinster, to 309,338 souls; in Ulster, to 91,026; in Connaught, to no more than 69,173; while in Munster it increases to 332,921.^a If from the population of Leinster be deducted that of Dublin city, which, as being the metropolis of the country, is swelled into a disproportionate extent by supplies from every part of the interior, and even, in some degree, from Great Britain, the excess here pointed out will appear more striking.^b

Dublin, the metropolis of the island, and the chief city in the province of Leinster, is situated on the eastern coast, at the mouth of the Liffey. Its origin is wholly unknown. Ptolemy notices it by the name of *Eblana*; it is also mentioned by Irish writers previously to the invasion of the Danes, but not as a place of first rate importance.^c It appears to have been at first plundered, and afterwards rebuilt and fortified, by these freebooters in the ninth century,^d who retained it, with several other maritime positions, till they were expelled by the English.^e So little claim had the city to the title of metropolis at this latter period, that Henry II., on his arrival there, found it necessary to erect a temporary palace to receive the homage of the Irish chieftains. But its position, as a point of communication with the rest of that monarch's dominions, soon secured to it a preference for the seat of the local government. From that period the city increased considerably in population and importance. King John, who resided in it for some time, improved

and extended it; he erected a castle on a commanding eminence, established courts of justice, and appointed a municipal magistracy.^f Yet the city was still confined within very narrow limits, being built solely on the southern bank of the Liffey. Its walls, a small part of the ruins of which are still visible, included merely the summit of the hill on which the castle was built, and part of its northern and southern declivities. Thenceforward, its increase was uniformly progressive, though not rapid. In Elizabeth's reign, Trinity College, now nearly in its centre, was designated as being "near Dublin."^g During the succeeding civil war, temporary works thrown up to secure the south-eastern suburbs, which lay without the walls, were constructed between the castle and the college.

At present the city extends over an area of about 1300 acres,^h of which 900 lie to the south, and 500 to the north of the Liffey, giving a circumference of nearly seven miles.ⁱ Its extreme bounds are marked with tolerable precision on all sides, except the west, by the two canals. The interior exhibits a striking contrast of magnificence and wretchedness. The progress of architectural improvement has proceeded in an eastern direction towards the mouth of the river, in which portion of the city most of the public buildings, and the residences of the principal inhabitants, erected within the two last centuries, are to be found, while the western part, the site of the ancient city, is falling into decay and ruin.

The most remarkable edifices are the Bank of Ireland, formerly the Parliament House; the royal exchange, a building of peculiar elegance; the custom-house, the courts of justice, the post-office, and the extensive and massive structure of Trinity College. The castle is a pile of mean and unornamental buildings. Few of the places of public worship can be cited as examples of architectural beauty. Some of the streets are spacious and elegant. There are five squares, the largest of which, though by no means the most splendid, is St. Stephen's Green. The river, which traverses the city from west to east, is crossed by nine bridges, three of them consisting of a single arch each; two of these are formed of iron. Noble quays on each side, faced with cut stone, and extending through the heart of the city, from end to end, afford great facilities of communication, and present an appearance of airiness and salubrity peculiarly pleasing to the eye of taste.

The government of the city is vested in the Lord Mayor, chosen annually, who, on public occasions, is distinguished by a collar of gold, and has a mace of office, and a sword of state, borne before him. He is assisted in the performance of his duty by twenty-four aldermen, out of which body he is elected, and by a common council, consisting of members chosen every

^a By the Statist. Tab. (Ireland, No. vii.), there are of the cities and towns containing 4000 inhabitants, or upwards, each—nineteen in Leinster (nine between 4000 and 6000,) twelve in Ulster (seven between 4000 and 6000,) eight in Connaught (four between 4000 and 6000,) and twenty-five in Munster (only seven between 4000 and 6000.) By the same Table, the population of all such towns in Leinster, is 348,296; in Ulster, 131,961; in Connaught, 80,074; and in Munster, 366,614. The statements in the text are perhaps from the census of 1821.—P.

^b The population of such towns in Leinster, exclusive of Dublin (203,752,) is, by Stat. Tab. No. vii., 144,544.—P.

^c It was called by the native Irish, *Ath Cliath* (ford of hurdles,) and *Bally (Baile) Leam Cliath* (town of the haven of hurdles,) from the shallowness of the river rendering it fordable at low water, and the depth of the mud rendering a pathway of hurdles necessary; also

Dubh-leana (Black-haven,) whence the modern name. (Ed. Enc.)—It was called by the Irish, *Balacloy* [*Baile-cliaith* (town of hurdles,) pron. *Bàlacléah.*] (Martiniere, Dict. Geog.)—P.

third year by the twenty-five guilds, or corporations of trade. A court of justice for the trial of offences committed within the precincts of the city is held, at which the recorder, aided by some of the aldermen, who are the chartered magistrates, presides. Though this court has power of life and death, it confines its jurisdiction to minor offences, referring cases involving the penalty of death to a superior tribunal. The peace of the city is preserved by two sheriffs, annually chosen from among the common-council, under whom is a body of about 800 police, directed by twelve stipendiary magistrates: their powers extend to all places within eight miles distance. By their exertions the city and its vicinity are as secure as any other large and well ordered town in Europe. Crimes of great atrocity seldom call for punishment.

Dublin can boast of numerous charitable institutions, some largely supported by grants of public money, others entirely dependant on voluntary contributions. Among the former are, the foundling hospital for deserted children, the Hibernian and marine schools for the children of soldiers and sailors, the royal hospital for disabled soldiers, the house of recovery for fever patients, the general hospital in Brunswick street, the lying-in hospital, and the female orphan-house; among the latter, the mendicity association for the suppression of street begging, the society for the relief of sick and indigent room-keepers, the strangers' friend society, Stevens' hospital for accidents, Simpson's hospital for blind and gouty men, besides many others of minor note. Every parish has both a Protestant and Roman Catholic school for the instruction and, in several instances, for the maintenance of the children of the poor. Other sects also support similar institutions.

The literary institutions are not such, either in number or qualifications, as might be expected from the appearance of the metropolis, or the population of the country. Public libraries, properly so called, there are none. The use of that of Trinity College, the first as to the number and selection of its books, is confined to such graduates of that university as choose to take the oath of admission, an essential preliminary to the opening of a volume in it. The King's Inns' library is confined to the members and students of that society. Each of these libraries enjoys the privilege of copies of all books published in the British dominions. Marsh's, or St. Patrick's library, is more liberal as to the qualification for admission, but consists of a limited number of books, few of modern date. The Dublin library, and the Dublin institution, are private establishments supported wholly by the subscriptions of the members, and therefore open, with some exceptions, solely to them. The library of the Dublin Society, which receives a large annual grant for the dissemination of useful knowledge, and the improvement of the arts, is confined to the members, who pay a sum of L.30 for admission. This society maintains professors in chemistry, botany, experimental philosophy, and geology, who annually deliver public courses of lectures. It also maintains a school of drawing, architecture, and modelling.

The Royal Irish Academy was formed for the encouragement of literature, antiquities, and the higher branches of science. It publishes volumes of its transactions

from time to time, consisting of essays on some of the various subjects comprehended within the scope of its investigations.

The school of physic in Dublin is rising rapidly in estimation, partly owing to the talents of several of the professors, partly to the facilities of procuring subjects for dissection. The college of physicians is connected with Trinity College: the college of surgeons is detached from it. There are also several respectable private schools of medicine.

The King's Inns, intended as a place of legal instruction, has but two public halls, namely, one for the dining-room, the other for the reception of the library; attendance at the former of these, for a certain period, is essential towards admission as a pleader in the courts of justice; the presence of the student in the latter is regulated solely by his own inclination. Lectures, or other modes of communicating instruction to the young aspirant for legal honours, are unknown here.

The environs of Dublin, particularly on the southern side, present numerous situations of great picturesque beauty, which are, therefore, frequently visited by strangers.

The second city in Leinster, in population and celebrity, is Kilkenny, beautifully situated on the banks of the Nore. Like Dublin, its origin is involved in the shades of antiquity. Some writers suppose it to be the *Iernis*^a of Ptolemy, and the *Ibernia* of Richard of Cirencester; the etymology of its present name leads to the supposition of an ecclesiastical origin, Kill-kenny signifying the church or cell of Kenny, or St. Canice.^b The English effected a settlement here shortly after their landing; a charter of incorporation was granted to it by one of Strongbow's immediate successors. Thus favoured, it soon became one of the most distinguished inland cities in the country. At the close of the fourteenth century its castle fell into the hands of the Butler family, by whom it has ever since been retained. One of the descendants of this house, the Earl of Ormond, entertained Richard II. in it for fourteen days, with royal splendour, during that monarch's progress to Dublin. In the civil wars it became the seat of government of the confederate Catholics, who held their meetings there in the form of a parliament. It made a gallant defence against Cromwell, who was glad to accept its surrender upon terms highly honourable to the garrison.

The city consists of two parts, Kilkenny properly so called, and the borough of St. Canice or Irishtown, a separate jurisdiction. On the two most elevated parts of the united town are placed the structures which constitute its principal ornaments, the castle and the cathedral. The former contains a good collection of paintings, and commands a rich and extensive prospect of the fine and varied country around; the latter is the largest ecclesiastical structure in Ireland, except those in Dublin. Several ruins of monastic buildings still evince the former grandeur of the religious foundations here. As a central depot for manufacturing industry, it does not reap all the advantages that might accrue from its situation on a large river, in the midst of a fertile and populous district; the woollen manufacture, particularly that of blankets, and the tanning of leather being the only processes carried on extensively. Near the city are quarries,

^a *Iouevris—Iuernis* (Edit. Lat. Mercat.)—P.

^b *Cill-canice—Lat. Cella Canici.*—P

whence a marble of high polish is raised; when first wrought it is almost black, but after exposure to the atmosphere it gradually exhibits numerous white marks throughout its surface, which an attentive examination proves to be produced by the sections of various kinds of fossil shells. The annual export of it from the city averages fifty tons. This city is a separate jurisdiction from the cognominal county with which it is surrounded, being governed by magistrates elected under a special charter.

Thirty miles^a northwards of Dublin is Drogheda, formerly called Tredagh, a town of great antiquity and much historical notoriety, situate on the Boyne, about five miles from its mouth. Though seldom named in the early native annals, its importance in the reign of Edward II. entitled it to the privilege of being the place of a royal mint. In the succeeding reign it was made one of the staple towns, a clear proof of its commercial importance at that period. Parliaments were also held in it, particularly that celebrated one in the reign of Henry VII. at which Poynings' laws were enacted. It obtained a right by an act of Edward IV. to have an university with the same privileges as that of Oxford, but the right has never been exercised. During the civil wars of 1641, after having baffled the attempts of the northern Irish under O'Neil, and of the parliamentary forces under Jones, it was invested by Cromwell in person, who, having taken it by storm, caused the whole of the inhabitants, without distinction of age or sex, to be put to the sword, notwithstanding a previous assurance of quarter. Thirty persons only escaped from the massacre, and they were transported as slaves to the West Indies. After the battle of the Boyne the town surrendered without a struggle to the victorious army of William.

The portions of the town on each side of the Boyne were formerly separate jurisdictions, distinguished by the names of Drogheda on the side of Meath, and Drogheda on the side of Uriel.^b The dissensions arising from this division frequently terminated in bloodshed, until at length assuaged by the exertions of Peter Bennet, a Dominican friar, who, having invited the leaders of both parties to a sermon which was succeeded by a banquet, discoursed with such effect on the evil consequences of the division, that they joined in a petition to king Henry V. to remove the cause of those sanguinary tumults, by combining both parts under one common government. It is now under the control of a mayor and aldermen. The archbishop of Armagh long made this town his place of residence, the portion of his province in which the city of Armagh is situated being without the pale, and therefore deemed an unsafe residence for a prelate recognising the sovereignty of the king of England. The Roman Catholic archbishop of the province still resides in Drogheda.

The next town in Leinster as to population and importance is Dundalk, the county town of Louth. Before the reign of Elizabeth it was considered to be a frontier town of the pale, and underwent many of the changes

and sufferings incident to such a position. Edward Bruce was crowned in this town, and fell in battle near it. The first army sent by king William into Ireland under Schomberg was forced to stop here, in its progress southwards, in consequence of the ravages of disease and famine. It is now noted only as one of the chief places for the export of grain.

Wexford, the next in rank, was the first town of which the English took possession, after their landing, in the time of Henry II. Their descendants still inhabit the neighbouring districts, where they retain, to the present day, in their manners, appearance and dialect, indisputable indications of their original stock. The town is now little more than a fishing station, and a place of residence for families of limited incomes, who enjoy here, from the cheapness of all the necessaries and many of the comforts of existence, a degree of opulence not to be obtained elsewhere. During the rebellion of 1798 it remained for some time in the possession of the insurgents, and the long wooden bridge by which the Slaney is crossed near its mouth was the place of execution for their prisoners. After its recovery by the king's troops, the town became the scene of retaliation by the victorious party equally sanguinary.

Carlow on the Barrow, once a place of strength, and at times the seat of the king's exchequer, is now of little note. It is built in the midst of a rich agricultural district; and its inhabitants depend more on the limited traffic carried on by means of the river Barrow which passes by the town, than on any of the main sources of manufacturing industry. New Ross on the Slaney,^c once a port that vied in commerce with Waterford, is now little more than a village. Portarlington on the Barrow, in consequence of a settlement of French refugees there, was until lately a favourite place of elementary education for children of the higher classes.

Belfast, the largest, the most opulent, and the most public-spirited town in Ulster, owes its pre-eminence neither to its antiquity or its political constitution, but solely to the energetic well directed exertions of its inhabitants.^d It was a place of but little note so lately as the time of William III.; since that period it has risen to a great height in commercial importance, maintaining an extensive traffic with the United States and the West Indies. The following table will serve to exhibit the increase of its shipping. The number and tonnage of the vessels belonging to it were as follows, at the dates here specified.

	No. of vessels.	Tonnage.		No. of vessels.	Tonnage.
1765	55	10,040	1819	104	10,489
1792	58	9,765	1820	106	10,281
1814	78	9,866	1829	184	21,557

The principal building is the Academical Institution, a college erected solely by voluntary contributions for general instruction in the most essential departments of literature and useful knowledge; its funds have latterly been augmented by grants of public money. Belfast has also two churches, and a dissenting meeting-house of

^a 23 miles. (Myers.)—P.

^b Louth.

^c New Ross stands on the Barrow, a little below its junction with the Nore.—P.

^d Belfast is more ancient than is generally supposed; the parish is a

vicarage, called *Shankil* [Gaelic, *sean-cill*, old cell,] or the old church. The castle was taken by the Earl of Kildare, in 1503 and 1512. The town was made a borough in 1613. The custom-house was removed from Carrickfergus to Belfast, in 1638. However, in 1726, it was a small place of little consequence. (Ed. Enc.)—P.

some architectural elegance.^a The town is connected with the adjoining county of Down, by a long narrow bridge over the Lagan. It was one of the great marts for the sale of linen, before the manufacture was superseded by that of cotton, which is now carried on here to a greater extent than in any other part of Ireland.^b There are eight large cotton factories in the town, or in its immediate vicinity, besides seven others in the adjoining district.

The manufacture of damask, for table linen, is carried on with much spirit at Lisburn, a neighbouring borough town, which is indebted for the knowledge of the fabric to the settlement of some French and Flemish refugees. Large orders are executed here for crowned heads and foreigners of distinction.

Midway between Belfast and Drogheda, is the town of Newry, formerly noted as a military pass into Ulster, and now as a place of trade, though in this respect considerably inferior to the first-named of these towns. An extensive inland traffic is maintained by means of its canal, navigable for vessels of sixty tons: it also partakes of the advantages of the cross-channel trade with Great Britain. The lordship of Newry, comprehending the town, and a small surrounding district, is an exempt jurisdiction, being free from the spiritual control of any bishop. The proprietor of the lordship grants marriage-licences, probates of wills, and letters of administration, and exercises other episcopal powers.

The city of Londonderry, at the mouth of the Foyle, is a regular, well-built town, consisting of four main streets, issuing from a central square, named the Diamond, and terminating at the gates.^c The harbour affords accommodation sufficient for an extensive intercourse with Great Britain, America, and the West Indies. But Londonderry is best known for its successful defence against the forces of James II. The statue of the Rev. George Walker, who acted as governor at that crisis, is one of the ornaments of the town. The fortifications are still kept in good repair, and the ramparts, which are planted, form a fine walk round the city.

The honour of being the seat of the primatial see of Ireland,^d is the chief claim which the city of Armagh has to notice, to which circumstance it also owes most of the public institutions that now adorn it. In the early ages of Christianity, a college flourished here, said to have given instruction to several thousand students. The foundation of its cathedral, which is built on an eminence, called *Druimsailich*, or the Hill of Willows, is attributed to St. Patrick. The bodies of Brian Boru, and of his son, both of whom fell at the battle of Clontarf, were interred in it. During the incursions of the

Danes, the city suffered severely from their ravages, in some of which all their books and records were destroyed. Since the revolution, it has been enriched by Lord Rokeby, otherwise called Primate Robinson,^e with a library, an observatory, and an extensive grammar school-house. He projected the foundation of an University, but unfortunately for the interests of science, intrusted the execution of his design to his executors. Armagh was one of the great staples of the linen manufacture.

Coleraine, at the mouth of the Bann, and the place of one of the most extensive salmon-fishings in Ireland—Carrickfergus, once the capital of the north of Ireland, but now a military depot, and a fishing town—Downpatrick, the county town of Down county, celebrated in monastic records as the burial place of the saints Patrick, Bridget and Columbkil^f—and Enniskillen, situated on the strait or river that connects the two basins of Lough Erne, have little to entitle them to a rank among the chief towns of Ireland, beyond the right of returning members to the Imperial Parliament.

The city of Cork, which stands foremost among the numerous towns of Munster, was for many years after the invasion of the English, a place of inferior note, situated in a salt-water marsh subject to occasional inundations, called in the native tongue, "*Corcagh*,"^g whence the city derives its name, and yielding the precedence in population and trade to Limerick and Waterford. In Elizabeth's reign it consisted of one street, terminated by a bridge over the Lee; several smaller streams, which are now arched over, flowed through the city. Its increase of inhabitants, and its present celebrity, are attributable wholly to its trade, chiefly in provisions. During the late war, the average number of black cattle annually slaughtered in it amounted to 18,000, and not less than 160,000 cwt. of butter had been exported in some one of those years.^h Large quantities of spirits, and some malt liquor, manufactured here, are also sent to Great Britain, and to foreign markets. Its public buildings are few and plain, with the exception of the Roman Catholic Chapel, which would do honour to any city, particularly in its internal structure. A literary institution, for the promotion of useful knowledge, was founded here in 1807, and endowed with an annual grant of public money, which was expended in the formation of a library, and in maintaining lectureships in several branches of science.ⁱ The grant has been lately withdrawn.

A favourable commercial station on the Shannon, gave rise to the city of Limerick. It was the first fordable place to be met with on that river from its mouth; and, therefore, attracted a concourse of settlers. Soon after

^a The houses of public worship are ten; an established church; six dissenting meeting-houses, four of which are presbyterian; a quaker meeting-house; a methodist meeting-house; and a Roman Catholic chapel. (Ed. Enc. 1813.)—There are two episcopal churches. (Myers.)—P.

^b Belfast was the first seat of the cotton manufacture in Ireland.—P.

^c Londonderry has four main streets, crossing at right angles, within the walls, and a mall, with a public terrace, or diamond, in the centre. (Ed. Enc.)—P.

^d The archbishop of Armagh is styled lord primate and metropolitan of all Ireland; that of Dublin, lord primate of Ireland.—P.

^e Richard Robinson, a native of Yorkshire, made archbishop of Armagh in 1765, and a peer of Ireland, by the title of Baron Rokeby, in 1777.—P.

^f This should read Columba (Gaelic, *Colum*.) Columbkil (Gaelic,

Choluim-cill) is Columba's cell or church. The celebrated island off the south-western extremity of Mull, is Icolumbkill (Gaelic, *I-choluim-chill*, island of Columba's church,) or Iona (Gaelic, *I-thonn* (pron. *Ihon*.) island of waves.)—P.

^g Gaelic, *corcach*, a moor or marsh. The rich alluvial flats (meadows) on the Shannon are called *corcach*, corrupted in English into *corcass* or *caucas*. They resemble the Scotch *carsc* lands on the Forth and Tay. *Carsc* itself may be derived from the Gaelic, though it seems more immediately connected with the Welsh *cors*, a bog or fen; *corsaug*, fenny. The Curragh, an extensive grassy plain in the county of Kildare, derives its name from the Gaelic *currach*, a bog or fen, a plain.—P.

^h In 1806. (Ed. Enc.)—P.

ⁱ An "Institution for applying Science to the Common Purposes of Life," has been established, and is in a flourishing state. (Ed. Enc.)—P.

the arrival of the English under Strongbow, it was seized by them, but was immediately after evacuated, in consequence of his death, and burned by the native princes, to prevent it from falling again into the hands of their enemy. Cromwell invested it during his campaign in Ireland, but was forced to raise the siege.^a It underwent two sieges in the subsequent war of 1688. In the former, the efforts of William, who opened the trenches in person, were baffled by a daring manœuvre of General Sarsfield.^b The latter terminated by the memorable surrender, which put an end to the bloody contest that had too long desolated the country.^c

The city is composed of two parts, the English and the Irish town. In some instances, the streets are narrow and gloomy; and though, in the ranges of buildings lately erected, great attention has been paid to external appearance, hovels, exhibiting a picture of squalid wretchedness, are to be seen in the contiguity of splendid mansions. As an emporium of commerce, it once disputed the title to precedence with Galway, formerly a first-rate port. Both have latterly been outstripped in the career of mercantile competition by other places.

Waterford occupies a commanding position, near the mouth of the Suir.^d Its streets, as is usual in towns which had been fortified, are narrow; its public buildings, in general, well designed and elegant. The quays, which extend nearly a mile along the river, are much admired; a well constructed bridge affords free communication with the adjoining county of Kilkenny. The city was anciently one of the Danish seaports. Reginald's tower, used by Strongbow, after his capture of the place, as a prison for refractory Danish or Irish chieftains, is still in existence. Waterford derives much of its wealth from the Newfoundland fishery, to which it annually sends several vessels; it also exports pork and butter in large quantities. Dungarvan,^e a populous town, about twenty-four miles from this city, is considered to be the largest fishing town in Ireland.

Clonmel, though the county town of Tipperary, and maintaining a considerable population, presents little to arrest attention, while Cashel, a city of inconsiderable magnitude, possesses several claims to particular notice. This city, like Dublin, boasts of being the site of two cathedrals. The more ancient is built on a precipitous rock, whose summit is attained by a winding path. Its ruins exhibit the remains of several splendid edifices, among which was the royal palace.^f In the time of Henry VIII. this cathedral was burnt by the Earl of Kildare, in revenge for some insult offered to him by the archbishop. In it was deposited the fatal stone on which the kings of Munster sat at their coronation.^g Tradition states, that when Fergus obtained the crown of Scotland, he borrowed this stone for his own ceremonial, and retained possession of it, in consequence of

a prophecy which declared that, wherever it was kept, the Milesian race of kings should reign. After being preserved for some centuries at Scone, it was removed by Edward I. to Westminster, where it still remains. Adjoining the cathedral is Cormac M'Cuillenan's chapel. The modern cathedral is an edifice of Grecian architecture adorned with a handsome spire.

The second town in the county of Cork as to population is Youghal,^h a seaport, at the mouth of the Blackwater. Sir Walter Raleigh, who held it by a grant from the crown, disposed of his interest in it to Richard Boyle, the first Earl of Cork, by whom it was much improved. Cromwell sailed hence on the termination of his sanguinary campaign in Ireland. It is a place of little trade, being chiefly frequented for the purpose of sea-bathing. The potato is said to have been first raised in Ireland in a garden here.

The next town, as to population, is Kinsale. It underwent two sieges, one in the time of Elizabeth, the other in that of William. James II. also landed here on his arrival to recover his throne. The town being built on the side of a hill, presents a fine prospect, but, on entering, the streets are found to be narrow, and the communications difficult from the steepness of the declivities. A considerable fishing trade is carried on here. The town gives the title of baron to the head of the De Courcy family, who enjoys the singular right of appearing covered in the royal presence.

Bandon Bridge is chiefly remarkable for the singular antipathy formerly entertained by its inhabitants against Roman Catholics, expressed by an inscription over one of the gates, in the following pithy, though not very liberal or poetical distich:

TURK, JEW OR ATHEIST
May enter here, but not a papist.

So lately as 1750, it is said that it did not contain a single resident Roman Catholic. Nor was a piper allowed to play in the streets, the pipe being proscribed as an Irish instrument. The inscription, however, is erased, and the sectarian distinctions are dying away. Sir Richard Cox, the writer of a prolix history of Ireland,ⁱ was a native of this town. His work breathes the undiluted spirit of the political atmosphere whence he imbibed his opinions.

Fermoy, on the Blackwater, is one of the most regularly built towns in Ireland. It consists of a square with diverging streets, in each of which the houses are built according to an uniform elevation. Its increase in wealth and dimensions was rapid during the late war, chiefly owing to the erection of an extensive barrack in its immediate vicinity.

Mallow, an inland town in the same county,^k is frequented chiefly for its mineral waters. Tralee, the

^a Limerick was taken by General Ireton, after Cromwell's return to England.—P.

^b Before the place was fully invested, Colonel Sarsfield, one of the inferior officers of the garrison, made a sally by night, and disabled William's train of artillery; still the latter continued the siege, and was induced to raise it, in consequence of an unsuccessful assault. (Smollet.)—P.

^c Limerick surrendered to General Ginckel, by a capitulation, called the Articles of Limerick.—P.

^d Waterford stands on the south bank of the Suir, above its junction with the Barrow.—P.

^e Dungarvon.

^f On the rock of Cashel, are the old Gothic cathedral, the ruins of Cormac's chapel, adjoining the cathedral, and a high round tower, of five stories, near the eastern angle of the north aisle. The rock was formerly inclosed with a wall. (Ed. Enc.)—P.

^g Cashel was the residence of the kings of Munster.—P.

^h By the Stat. Tab. (Ireland, No. vii.) Bandon is next to Cork in population (12,617); Youghal, third (9,608).—P.

ⁱ "Hibernia Anglicana," in two parts, 1689, 1700.—P.

^k Cork county, in which Fermoy is also situated.—P.

county town of Kerry, is situated at the extremity of a broad but shallow bay, between Kerry Head and Brandon Head. The episcopal church is a noble modern structure. Large shoals of herrings are frequently taken in the bay. Ennis, the county town of Clare, situated at the northern extremity of the estuary of the Fergus, has little to boast of except a Franciscan abbey, founded by O'Brien in 1250, which is considered the most elegant Gothic monastery in Ireland.

The province of Connaught, as appears from the comparative statement of the numbers of inhabitants in the towns of each of the great divisions of Ireland, is peopled mostly by a rural population. Galway, the chief town both of the province, and of the county of the same name, is but the sixth in Ireland as to numbers.^a The town is situated on the neck of land that separates Lough Corrib from the sea,^b and was formerly of considerable note, both as a place of strength and as a commercial emporium, in which latter character it long disputed the precedence with Limerick. Some manufactures are carried on here, but the fisheries afford the chief source of employment to the people. During the war of 1688, the town, after a gallant defence, surrendered to General Ginkell on honourable terms.^c

Sligo, the second town in size in the province, was built by the English, shortly after their arrival in the country, and has ever since been a place of some importance. It now exports grain in large quantities. Near the town is a relic of antiquity, called Lugna Clough,^d or the Giant's grave, consisting of a number of stupendous stones placed on each other, somewhat similar to those of Stonehenge. Tuam, the seat of the archiepiscopal see, is a town of small note. The cathedral is a neat modern edifice. In trade and manufactures it maintains a respectable rank as an inland town; the inhabitants are generally in good circumstances, and its market is well supplied. The archbishop resides here in a spacious but antiquated palace. Athlone, situated on the Shannon, is but partly in Connaught,^e the eastern portion of it lying in the county of West Meath. It was the main pass over the Shannon, and thence considered

as a place of much importance. During the war of 1688 it underwent two sieges, the first by William III. in person,^f who failed in his attempt to force a passage through it; in the second it surrendered to General Ginkell. At present it is one of the chief depots for arms and military stores, and therefore is the quarters of a large garrison, upon the expenditure of which the town chiefly depends.

This description of Ireland cannot be concluded more appropriately, than by the following quotations, which form the opening and close of Sir John Davies's celebrated tracts on the causes why Ireland continued so long unsubdued and useless to the crown of England.^g The work commences with the description of the natural capabilities of the country: "Wherein I have observed the good temperature of the ayre, the fruitfulness of the soyle, the pleasant and commodious seats for habitation, the safe and large ports and havens lying open for trafficke into all the western parts of the world; the long inlets of many navigable rivers, and so many great lakes and fresh ponds within the land, as the like are not to be seen in any part of Europe; the rich fishings; the wild fowle of all kinds; and lastly, the bodies and mindes of the people endued with extraordinary abilities of nature." The conclusion of the treatise, in which he shows that the island was then, in the beginning of the reign of James I., completely subdued, is wound up by the following emphatic passage:—"In which condition of subjects they will gladly continue without defection or adhering to any other lord or king, as long as they may be protected and justly governed without oppression on the one side, or impunity on the other. For there is no nation of people under the sun, that doth love equall and indifferent justice better than the Irish, or will rest better satisfied with the execution thereof, although it be against themselves, so as they may have the benefit and protection of the law, when upon just cause they do desire it."

SUMMARY.

The population of the following cities and towns is included in the preceding table in the total contents of the counties to which they respectively belong, but it is not particularly specified in the enumeration of 1812. In those of 1821 and 1831, the amounts are as follow :—

CITY or TOWN.	COUNTY.	1821.	1831.	Increase or Diminution.
Dublin City	Dublin	185,881	203,652	Increase, 17,771
Kilkenny City . . .	Kilkenny	23,230	23,741	Do. 511
Drogheda Town . . .	Louth	18,118	17,365	Decrease, 750
Carrickfergus Town .	Antrim	8,023	8,698	Increase, 675
Cork City	Cork	100,658	107,007	Do. 6349
Limerick City	Limerick	59,045	66,575	Do. 7530
Waterford City . . .	Waterford	28,679	28,821	Do. 142
Galway Town	Galway	27,775	33,120	Do. 5345

Belfast Institution,	4,155	0 0
Cork Institution,	43,710	0 0
Hibernian School,	240,356	1 6
Marine Society,	64,262	10 9
Female Orphan School	50,414	10 9
	£2,914,140	3 4

No. XI.

Table of the Income and Expenditure of Ireland from the Year 1792 to 1830.

I.—From the Commencement of the War with France to the Union.

Year	Revenue.	Expenditure.	Debt incurred by the excess of expenditure above the revenue.
1793	1,162,588	1,296,061	133,473
1794	955,030	1,462,415	507,385
1795	1,119,190	1,378,908	189,718
1796	1,487,412	2,799,593	1,312,181
1797	1,891,479	3,420,373	1,528,894
1798	1,613,645	4,944,944	3,331,299
1799	2,137,543	6,887,787	4,750,244
1800	2,732,053	7,110,537	4,377,484

Table of the Income and Expenditure of Ireland, &c. (Continued.)

No. XIII.

II.—From the Union to the Termination of the War with France.

State of the Cross-Channel Trade since the Union.

Year.	Revenue.	Expenditure.	Debt incurred by the excess of expenditure above the revenue.
1801	2,645,716	7,799,988	5,154,272
1802	2,490,978	8,021,011	5,530,033
1803	3,128,093	7,184,522	4,056,429
1804	2,745,762	7,097,123	4,351,361
1805	3,186,450	8,889,885	5,703,435
1806	3,218,774	7,828,503	4,609,729
1807	3,656,910	7,758,815	4,101,915
1808	4,179,923	7,700,531	3,520,608
1809	4,301,781	8,564,200	4,262,419
1810	4,027,583	9,948,238	5,920,655
1811	3,413,450	10,823,800	7,410,350
1812	3,929,106	11,325,093	7,395,987
1813	4,614,037	11,614,024	6,999,987
1814	4,820,511	12,239,003	7,418,492
1815	5,287,581	14,836,409	8,548,828

The amounts are given in official values, which, though they afford no criterion as to present prices, inasmuch as for the last eleven years the real values, which had previously exceeded the official by several millions per annum, have rapidly decreased and come below it, yet they serve to show the increase and decrease in quantity.

	Exports to Great Britain.	Imports from all parts.
1801	£3,270,350 12 0	£4,621,344 16 6
1805	4,067,717 1 7	5,294,967 4 11
1809	5,316,557 5 1	6,896,821 18 10
1813	6,746,353 12 10	7,797,286 11 0
1817	4,722,766 0 3	5,646,563 3 9
1821	5,338,838 4 6	6,407,427 15 9
1825	7,048,936 5 6	8,596,785 8 11

III.—From the termination of the War with France to the present Time.

No. XIV.

Year.	Revenue.	Expenditure.	Debt incurred by the excess of expenditure above the revenue.
1816	5,467,942	18,165,729	12,697,787
1817	4,394,630	13,402,479	9,005,849
1818	4,384,816	6,018,551	1,633,735
1819	4,577,286	4,984,148	0,406,862
1820	4,250,980	6,447,685	2,196,705

In this and the following years, the Debt is shown after deducting the 5 per cents. 1797, paid off in each year

Includes Loan 1811, raised for Ireland, chargeable on Great Britain.

Great Britain and Ireland, consolidated by 65 Geo. 3. c. 98. } 5th Jan. 1818

a The above Debt of Ireland is exclusive of £1,900,000 Irish 5 per cents. payable in England.

b By 57th Geo. III. c. 45, the Sinking Fund Accounts terminate on the 5th January in each year, instead of the 1st February as heretofore.

Note.—The above Sums in Columns 1, 2, and 3, after the year 1806, differ from the return made from this Office on the 13th February last, in consequence of the 5 per cents. 1797, paid off, being included in this Account.

National Debt Office, } S. HUGHAM. }
17th April, 1818.

The Sums in Columns 3 and 7 have been redeemed, and transferred as follows:

By the Sinking Fund	325,274,369
Land Tax	25,389,233
Life Annuities purchased	4,323,385
Stock, the Dividends due upon which have remained unclaimed 10 years and upwards	222,037
Purchased with unclaimed Dividends	348,600
	358,557,624
5 per cents. 1797 paid off	2,363,417
	360,921,041

The Sums in Columns 3 and 7 amount to £360,921,040. The difference arises from the fractional parts of a pound being omitted.

Total Debt of the United Kingdom, Jan. 5, 1838, . . . £785,530,326
 Annual Charge thereof, 30,230,037

Amount of the National Debt, March, 1834.

Comparative Population of Towns and Country.

About half the population of Great Britain is contained in the towns, and the other half inhabit the country. On this subject the following results have been given by *Dr. Colquhoun*, in his "Treatise on the wealth and power of Great Britain:" viz.

	Counties.	Towns.	Houses.	Inhabitants.
In England,	40	861	746,308	4,221,814
Wales,	12	78	29,416	143,467
Scotland,	32	244	139,670	907,431
	84	1183	915,394	5,272,712

	Houses.	Inhabitants.	Total Houses.	Total Inhabitants.
In the Country—England,	979,723	5,317,013	1,726,031	9,538,827
Wales,	93,077	468,321	122,493	611,788
Scotland,	175,752	898,257	315,422	1,805,688
	1,248,552	6,683,591	2,163,946	11,956,303

"Thus it appears, that in England the inhabitants of the Country only exceed those in the Towns to the extent of 95,199 persons, less than one eleventh part; whereas in Wales, the difference is much greater, being more than double on the whole population; while in Scotland the population in the Country and in the Towns is nearly equal. During the 10 years between 1801 and 1811, the increase of population of Great Britain, in the Country and in the Towns, stands thus:—

The Inhabitants of the Country have increased	787,612
The Inhabitants of the Towns have increased	696,643
Total	1,484,255
The Houses have increased, in the Country,	127,661
in the Towns,	98,796
Total,	226,457

Which shows that there is a greater tendency to populate the Towns than the Country. It is probable many of the buildings erected for the accommodation of the rural population, are barns, stables, and other out-houses for agricultural purposes; whereas those erected in towns, are generally for the dwellings of the inhabitants; and it should seem probable that a greater proportion of the population of Great Britain

live in towns than in any other country, Holland, perhaps, excepted, and yet it appears that the general mortality has been progressively diminishing."

Classes of Inhabitants in 1812.

The same author also distributes the population of Great Britain and Ireland into the following classes, with the number of families, of individuals, and the income of each, in 1812, as follows:—

	Families.	Persons, including domestics.	Income of each class.
Royalty,	12	300	£501,000
Nobility,	564	13,620	5,400,480
Gentry,	46,861	402,915	53,022,110
State and Revenue,	21,500	114,500	8,830,000

TABLES

OF

MATHEMATICAL GEOGRAPHY.

I.

COMPARISON OF FRENCH AND ENGLISH WEIGHTS AND MEASURES.

Units which form the Bases of the New French System compared with the Weights and Measures of England.

	<i>English.</i>	
The Metre	=	3,280,916.7 feet, or 39,371 inches.
Are	=	1076,441 square feet.
Litre	=	61,028 cubic inches.
Stere	=	35,317 cubic feet.
Gramme	=	15,444 grains troy.
Gramme also	=	5,6481 drams avoirdupois.

New Weights and Measures of France compared with the Old and also with English Weights and Measures.

	<i>Linear Measure.</i>	
	French Feet.	English Feet.
Distance from the Equator to the Pole	} 30784440	} 32809167

Kilometre	3078,444	3280,9167
Hectometre	307,8444	328,09167
Decametre	30,78444	32,809167
METRE	3,078444	3,2809167
	Lines French.	Lines English.
Decimetre	44,3296	47,2452
Centimetre	4,43296	4,72452
Millimetre	0,443296	0,472452

Square or Superficial Measure.

	French Square Feet.	English Square Feet.
Miriare	9476817,46113	10764414,3923
Kilare	947681,746113	1076441,43923
Hectare	94768,1746113	107644,143923
Decare	9476,81746113	10764,4143923
ARE	947,681746113	1076,44143923
Deciare	94,7681746113	107,644143923
Centiare	9,47681746113	10,7644143923
	Square Inches.	Square Inches.
Square Decimetre	13,646617	15,500756
	Square Lines.	Square Lines.
Square Centimetre	19,651134	22,321088
Square Millimetre	0,19651134	0,2232108

Measures of Capacity.

	French cubic feet.	English cubic feet.
Myrialitre	291,738519	353,1714693
Kilolitre	} 29,1738519	} 35,31714693
Cubic metre		
Hectolitre	2,91738519	3,531714693
	Cubic inches.	Cubic inches.
Decalitre	504,124160	610,280264
LITRE or Cubic Decimetre	50,4124160	61,0280264
Decilitre	5,04124160	6,10280264
	Cubic lines.	Cubic lines.
Centilitre	871,126926	1054,564296

The Litre, which is the unit for measures of capacity = 2,113 English pints, wine measure; and therefore the Hectolitre equals 26,4 such gallons—35 litres = a Winchester bushel.

Solid or Cubic Measures.

	French cubic feet.	English cubic feet.
Decastere	291,738519	353,1700
STERE (cubic metre)	29,1738519	35,3170
Decistere	2,91738519	3,5317

This measure is used for fire-wood, stone, &c. The stere is the same as the kilometre in the preceding measure.

4 quadrants, or 360°, 1 circle,	-	400 0 0

Old Weights and Measures of France.

LONG MEASURE.—The toise or fathom of France is equal to six feet French, the foot to 12 inches French, and the inch to 12 lines, each subdivided into 12 points;

76 French feet are nearly equal to 81 English feet; or, more accurately, 40,000 French feet, inches, or lines, equal 42,638 English feet, inches, or lines. Thus 1 French foot equals 1.06597 English, or 12.78934 English inches; and hence one English foot equals 11.26 French inches. The Paris aune was $46\frac{1}{25}$ English inches.

In the old French road measure, the lieue, or league, is two French miles, each mile 1000 toises; hence the French league equals two English miles, three furlongs, and 15 poles.

The French league, however, in different parts of France, has been applied to different distances. The marine league, (20 to a degree,) equals 2853 toises, or 6081 English yards; and the astronomical league, (25 to a degree,) equals $2282\frac{2}{3}$ French toises, or 1865 English yards.

The arpent, or acre of land, contained in general 100 square perches; but the perch varied in different provinces.

The old French weight for gold and silver (called poids de marc,) makes the pound or livre contain 2 marcs, 16 onces, 128 gros, 384 deniers, or 9216 grains.

The French marc = 3780 grains Troy weight.

For commercial weight, the poids de marc was likewise used, and the quintal of 100 livres = 108 lb. avoirdupois, very nearly.

Weights and measures, however, varied considerably in the different provinces.

Corn measure was the muid of 12 setiers, 24 mines, 48 minots, or 144 bushels.

Wine measure was the muid of 36 setiers, 144 quartes, or 288 pints.

^a " Arpent d' ordonnance, dit des eaux et forêts."

^b This Arpent contained 100 square perches of 22 feet square, or 484 square feet.

^c The Acre, which is the unity of the new French agrarian measures, is equal to ten metres square, or one square decimetre, that is, a space containing one hundred square metres. The Hectare is a space containing 100 ares, or a square hectometre.

In comparing the new and old measures of France, we may make use of the following approximations.

24 = 47 Arpens of the waters and forests.

27 = 79 Arpens of Paris, of 18 feet to the perch.

19 = 45 Common arpents, of 20 feet to the perch.

67 = 82 Acres of Normandy, of 160 perches of 22 feet each.

X.—A comparative Table of Itinerary and Topographical Measures, considered, first, as measures of distance in their relation to a degree (nonspherical) of the Equator; to a Geographical French League, of 25 to a degree; and to the Kilometre (1000 Metres); and, secondly, as measures of superficial extent in their relation to Geographical square Leagues of Germany (15 to a degree,) to square Leagues of France, (25 to a degree,) and to a square Kilometre.

ITINERARY PROPORTIONS.			MEASURES.	TOPOGRAPHICAL PROPORTIONS.

XI.

A Table of the different Measures of Antiquity.

Itinerary Measures.	French Measures.	
	Kilometres.	Metres.
The Schœne of middle Egypt,	20.	• •
The Schœne of the Thebaïde, or the Indian Gau, } known under the name of Stathma, }	10.	• •
The Schœne of the Delta = 9,600 paces,	6.66	• •
The Parasang = 7,200 paces,	5.	• •
The Indian Coss = 3,600 paces,	2.66	• •
The Egyptian Mile = 2,880 paces,	2.	• •
The Persian or Asiatic Mile,	1.5	• •
The Hebrew Mile,	1.166	• •
The Pythian or Delphic Stadium,	•	148.148148
The mean Stadium, called also the Nautical or Persian,	•	166.4
The great Alexandrian or Egyptian Stadium,	•	222.22
The Philetarian or Royal Stadium,	•	210.14
The Grecian Olympic Stadium,	•	185.37
The Stadium of Eratosthenes,	•	159.2
The Stadium of Cleomenes,	•	133.47
The Stadium of Aristotle, or small Stadium,	•	99.8

Linear Measures.	Metres.		Millimetres.	
	Metres.	Millimetres.	Metres.	Millimetres.
The royal Cubit of Babylon,	•	•	468.8	•
The mean Cubit,	•	•	416.66	•
The Pygon or Palmipes,	•	•	347.22	•
The Geometic foot,	•	•	277.77	•
The Pythian or Delphic foot,	•	•	246.9	•
The Palmus Major,	•	•	086.8	•
The common Palm, or Palæsta,	•	•	069.3	•
The Inch, or Uncia of the geometrical foot,	•	•	023.1482	•
The Dactylus or Digit,	•	•	017.361	•
The Olympic Hecatonpede,	30.	•	864.	•
The Exapode,	1.	•	851.	•
The cubit, of 18 Olympic inches,	•	•	463	•
The Olympic foot,	•	•	308.6	•
The exapode of six Roman feet,	1.	•	•	•
The great pace (οπηλια) ^a of five Roman feet,	1.	•	•	•
The common pace, of two Roman feet,	•	•	•	•
The Roman foot,	•	•	•	•

Agrarian Measures.		Square Metres.	
The Plethron = 100 square Olympic feet,	•	•	9,526
The Exapode = 36 square Olympic feet,	•	•	3,429
The Saltus of four Centuries,	•	•	20,22716
The Century of 100 Heredies,	•	•	50,5679
The Heredy of two Jugera,	•	•	5056.79
The Jugerum of 800 Exapodes,	•	•	2528.395

^a The οπηλια was a measure of six feet, corresponding to 6 feet 0 inches. 525 dec. English.—P.

XII.

Comparative View of the Principal Winds.
COMPASS OF FOUR WINDS.

Grecian Names	Modern Names.	Situation upon the Compass.	Degrees.
Boreas,	North,	•	0
Euros,	East,	•	90
Notos,	South,	•	180
Zephyros,	West,	•	270

See Homer, Odyss. b. v. l. 295.

COMPASS OF EIGHT WINDS.

Grecian or Roman Names.	Modern Names.	Situation upon the Compass.	Degrees.
Boreas; Aparctias; Septentrio,	North	•	0
Cæsius; Aquilo; (sometimes Boreas)	North-East	•	45
Apeliotes; Subsolanus (sometimes Eurus)	East	•	90
Euronotos; Vulturinus (often, Eurus)	South-East	•	135
Notos; Auster,	South	•	180
Libs; Africus,	South-West	•	225
Zephyrus; Favonius,	West	•	270
Corus; Skiron; Argestes,	North-West	•	315
Boreas, &c.	North	•	360

See the explanation of the Temple of the Winds at Athens, in Vitruvius, l. i. cap. 6. Aris. Meteor. l. II. cap. 6. Pliny II. 22. Aulus Gellius II. 42. &c

^b In reckoning from the north round the compass. We can thus better understand the arrangement. Navigators reckon by quarters of circles only, in going from the north to east, or to west, and also from the south to east, or to west.

XII.—Continued.

COMPASS OF TWELVE WINDS.

Professor Leslie, to whose liberality the publishers are indebted for the following tables, (XIII. and XIV.) says, "I have been able, after a delicate and patient research, to fix the law which connects the decrease of temperature with the altitude. If B and b denote the barometric pressure at the lower and upper stations; then will $(\frac{B}{b} - \frac{b}{B})$ 25 express, on the centigrade scale, the diminution of heat in ascent. Hence, for any given latitude, that precise point of elevation may be found, at which eternal frost prevails. Put $x = \frac{b}{B}$ and t = the standard temperature; then $(\frac{1}{x} - x) 25 = t$, or $x^2 + .04 tx = 1$, which quadratic equation being resolved, gives the relative elasticity of the air at the limit of congelation, whence the corresponding height is determined. From these data the following table has been calculated.

This table (XIII.) will facilitate the approximation to the altitude of any place, which is inferred either from its mean temperature, or its depth below the boundary of perpetual congelation. The decrements of heat at equal ascents are not altogether uniform, but advance more rapidly in the higher regions of the atmosphere. At moderate elevations, however, it will be sufficiently near the truth, to assume the law of equable progression, allowing in this climate (56° N.) one degree of cold by Fahrenheit's scale for every ninety yards of ascent, and for every hundred yards in the tropical regions.

Dr. Francis Buchanan Hamilton found the temperature of a spring at Chitlong, in the Lesser Valley of Nepal, to be 14° 7 centigrade. But the mean temperature in the parallel of 27° 38' being 22° 8, the density of the atmosphere corresponding to difference 8.1, is 8510, which gives 4500 feet for the corrected altitude.

XIII.

Table of the Decrease of Temperature according to the Altitude.

Latitude	Mean temperature at the level of the Sea.		Height of Curve of Congelation. Feet.	Latitude.	Mean temperature at the level of the Sea.		Height of Curve of Congelation. Feet.

* Dr. Brewster, in Part I. Vol. IX. of the Edinburgh Philosophical Transactions, gives the following formula for ascertaining the mean temperature in a given latitude, in the old world. If T denote the mean temperature in any given latitude, and $\delta 1^{\circ}.5$ the observed temperature on the equator, the formula becomes
 $T = 81^{\circ}.5 \cos. \text{lat.}$

Table of Mean Temperatures.

XIV.

Table of the most Remarkable Heights in different Parts of the World, expressed in English Feet. The Altitudes measured by the Barometer are marked B, while those derived from Geometrical Operations, and taken chiefly from the Observations of General Mudge, are distinguished by the letter G.

Snæ Fiall Jokull, on the north-west point of Iceland, 4558 G
 Hekla, volcanic mountain in Iceland, - - 3950 G

Sulitelma, in Lapland, - - - - 5910 B
 Nuppi Vara, the highest of the table-land in Lapland, - - - - 2655 B
 Lomnijauri, elevated lake in Lapland, - - 2265 B
 Driftue, the highest pastoral hamlet in Norway, 2457 B
 Snähätta, centre of the Norwegian mountains, 8120 B
 Harebacke, Alpine ridge of Norway, - - 4575 B
 Pap of Caithness, - - - - 1929
 Ben Nevis, Inverness-shire, highest mountain in Scotland, - - - - 4358 G
 Cairngorm, Inverness-shire, - - - - 4080 B
 Cairnsmuir upon Deugh, Galloway, - - - 2597 G
 Ben Lawers, west side of Loch Tay, Perthshire, 3944 G
 Ben More, Perthshire, - - - - 3870 B
 Ben Lui, or the Calf, near Tyndrum, - - - 3651 G
 Schihallien, Perthshire, - - - - 3513 G
 Ben Voirlich, near Loch Earn, - - - - 3207 G
 Ben Ledi, near Callender, Perthshire, - - 2863 G
 Ben Achonzie, head of Glen Tilt, - - - 3028 G
 Ben Lomond, near Aberfoil, Stirlingshire, - 3191 G
 Cobbler, near Arrochar, - - - - 2863 G
 Ben Clach, in the Ochils, above Alloa, - - 2359 G
 Lomond Hills, east and west, Fifeshire, 1466 and 1721 G
 Soutra Hill, on the ridge of Lammermuir, - 1716 G
 Coulter Fell, Lanarkshire, - - - - 2440 G
 Carnethy, high point of the Pentland ridge, - 1700 B
 Tintoc Hill, Lanarkshire, - - - - 2306 G
 Leadhills, the house of the Director of the mines, 1280 B
 Broad Law, near Crook Inn, Peebles-shire, - 2741 G
 Queensberry Hill, Dumfries-shire, - - - 2259 G
 Cairnsmuir of Fleet, Galloway, - - - - 2329 G
 Hart Fell, near Moffat, - - - - 2635 G
 Dunrich Hill, Roxburghshire, - - - - 2421 G
 Eldon Hills, near Melrose, Roxburghshire, - 1634 G
 Whitcomb Hill, Peebles-shire, - - - - 2685 G
 Lother Hill, Dumfries-shire, - - - - 2396 G
 Ailsa Rock, in the Firth of Clyde, - - - 1103 G
 Crif Feil, near New Abbey, Kirkcudbright, - 1831 G
 Kells Range, Galloway, - - - - 2659 G
 Goat Fell, in the Isle of Arran, - - - - 2865 G
 Paps of Jura, south and north, in Argyle-shire, - - - - 2359 and 2470
 Snea Fell, in the Isle of Man, - - - - 2004 G
 South Berule, in Isle of Man, - - - - 1584 G
 Macgillicuddy's Reeks, County of Kerry, - 3404 G
 Sliebh Donard, the highest of the Mourne Mountains, - - - - 2786 G
 Helvellyn, Cumberland, - - - - 3055 G
 Skiddaw, Cumberland, - - - - 3022 G
 Saddleback, Cumberland, - - - - 2787 G
 Whernside, Yorkshire, - - - - 2384 G
 Ingleborough, Yorkshire, - - - - 2361 G
 Shunnor Fell, Yorkshire, - - - - 2329 G
 Snowdon, Caernarvonshire, - - - - 3571 G
 Cader Idris, Caernarvonshire, - - - - 2914 G
 Beacons of Brecknock, - - - - 2862 G
 Plynlimmon, Cardiganshire, - - - - 2463 G
 Penmaen Mawr, Caernarvonshire, - - - 1540 G
 Malvern Hills, Worcester-shire, - - - 1444 G
 Cawsand Beacon, Devonshire, - - - - 1792 G
 Rippin Tor, Devonshire, - - - - 1549 G
 Brocken, in the Hartz-Forest, Hanover, - 3690
 Priel, in Upper Austria, - - - - 7000 B

	Feet.		Feet.
Peak of Lomnitz, in the Carpathian ridge, -	8870 B	Awatsha, volcanic mountain in Kamtchatka, -	9600
Terglou, in Carniola, - - - - -	10390 B	The Volcano, in the Isle of Bourbon, - -	7680
Mont Blanc, Switzerland, - - - - -	15646 G	Ophir, in the centre of the Island of Sumatra, -	13842
Village of Chamouni, below Mont Blanc, -	3367 G	St. Elias, on the Western coast of North America, -	12672
Jungfrauhorn, Switzerland, - - - - -	13730	White Mountain, in the State of Massachusetts, -	6230 B
St. Gothard, Switzerland, - - - - -	9075	Chimborazo, highest summit of the Andes, -	21440 B
Hospice of the Great St. Bernard, - - - -	8040 B	Antisana, volcanic mountain in the kingdom of	
Village of St. Pierre, on the road to Great St.		Quito, - - - - -	19150 B

Table Mountain, near the Cape of Good Hope, -	3520		
Chain of Mount Ida, beyond the plain of Troy, -	4960		
Chain of Mount Olympus, in Anatolia, - - -	6500		
Italitzkoi, in the Altaic chain, - - - - -	10735		

^a 10,899 Herschel, jun.--P.

In this list of altitudes, I have not ventured to insert the Himalaya or Snowy Mountains, the Imaus of the ancients, or Great Central Chain of Upper Asia, to which some late accounts from India would assign the stupendous elevation from 23,000 to 27,000 feet. Such at least are the results of observations made with a small sextant and an artificial horizon, at the enormous distance of 226 or 232 miles, as computed indeed from very short bases. But even with the best instruments, and under the most favourable circumstances, the determination of minute vertical angles is, from the influence of horizontal refraction, liable to much uncertainty. The progress of accurate observation has uniformly reduced the estimated altitudes of mountains. More recent statements accordingly diminish those heights near 2000 feet.

APPENDIX.

BOOK VII.

PAGES 58-60. "We shall, perhaps, forever remain ignorant of the secrets which the two polar regions contain." Since Malte-Brun's time, both the polar regions have been, to some extent, explored; and it appears on the one hand, from the explorations of Dr. Kane, especially, that there is perhaps an open sea about the north pole, two of his party having made an expedition from his vessel as far north as $82^{\circ} 27'$, when they saw open water at the north, and various signs of a warmer climate, which led to the belief that this water opened into a great open sea, which abounded with life. On the other hand, land has been discovered in the southern polar sea, and has been traced to such an extent that it is called a "vast antarctic continent." The first discovery was made by the United States exploring expedition under Captain Wilkes, in 1840, and it was confirmed by the explorations of the French and English expeditions in 1840 and 1841. The coast of this land was icebound and inaccessible, so that the only exploration was along its coast, and at some distance. The English expedition above named reached latitude $78^{\circ} 10'$, the highest southern latitude ever attained.

Page 66. The comparison of the height of mountains in the different parts of the world would be greatly modified by the discoveries and measurements made since the author wrote. It is now known that Asia contains the highest mountains on the globe, viz., the Himalaya, and of these Mount Everest is supposed to be highest, being 29,000 feet above the level of the sea. Mount Kunchingga is 28,178 feet high. Others are from 25,000 to 28,000 feet high. In the Andes, the highest mountains are Sorata, which is upwards of 2,500 feet above the sea, and the two summits of Illimani, which rise to the height of more than 24,000 feet. In Chili is Mount Aroncagua, a volcano, which rises about 24,000 feet above the sea, and is the highest known volcano in the world. Chimborazo is 21,300 feet high.

BOOKS IX., X.

Pages 75, 80, 81. "The precious metals, also, more peculiarly belong to the equatorial regions." The gold regions described by Malte-Brun are thrown into the shade by those which have more recently been discovered, and the statement above quoted has proved unfounded. The gold fields which have yielded the greatest abundance of the precious metal within the last ten or twelve years, are those of California and Australia, each in the temperate zone. The first discoveries of gold in each of these regions were in deposits of rivers and streams, and the yield from these "placers" has been very large. But fur-

ther explorations discovered veins of gold and gold-bearing quartz, and these being extensively worked, have proved as productive as the "diggings." The first discoveries were made in California in 1848, and in Australia in 1851. For some years previous to this, the whole annual production of gold was about \$20,000,000, but in six years after its first discovery in California, the yield of gold in that region was estimated at about \$70,000,000, and that of Australia at about the same amount. Gold has also been discovered in considerable quantities in the British possessions north of the Columbia River, and in Oregon and Washington territory.

The total yield of gold in the principal mining countries of the world, for the year 1854, (as late a data as could be obtained for purposes of comparison,) as shown by Mr. J. D. Whitney, in his work on "The Metallic Wealth of the United States," was \$119,523,600. Of this, Russia furnished \$14,880,000; Southern Asia and the East Indies, \$6,200,000; the northern states of South America, \$3,720,000; Mexico, \$2,480,000; Australia and Oceania, \$37,200,000; United States, \$49,600,000. Other authorities give the amount yielded by California and Australia, for the same year, as much larger, making that of California about \$70,000,000, and of Australia about \$45,000,000; and in 1857, the yield of California is stated at \$65,000,000, and that of Australia at \$59,000,000. The average annual yield of gold,^a of the principal gold-producing countries, is stated to be as follows: Australia, \$60,000,000; California, \$55,000,000; Russia, \$20,000,000;—total, \$135,000,000.

The total yield of *silver* for the year 1854, as appears by the authority above named, was \$47,443,200, of which Peru, Bolivia, and Chili yielded \$10,880,000, and Mexico, the great silver-producing country of the world, yielded \$28,000,000.

Page 82. "The whole of Siberia presents to us only two or three ambiguous specimens [of *mercury*.] The new continent is not more abundantly provided with it." The discoveries in California have proved this statement not well founded, for that state has recently furnished about 2,000,000 pounds *avoirdupois*, annually, out of about 7,000,000 pounds, the total production of the world.

Page 82. "We are assured that in the interior of Louisiana it [*lead*] forms vast beds upon the surface." The "interior of Louisiana" comprised, formerly, the vast territory west of the Mississippi River, and the lead regions of Missouri, Iowa, and Wisconsin are referred to, they having, since Malte-Brun's writing, been more fully explored and mined. The product of these mines is from 20,000 to 25,000 tons annually.

^a United States Commercial Digest.

The product of this region is likely to be greatly increased, as capital and improved methods of mining, &c., are introduced, for the ore exists in large quantities.

Page 83. "Immense beds of it [*copper*] are found upon the banks of the Ohio." Of this statement Mr. Percival remarks, in his note, that it is not known that copper occurs in any quantity on the Ohio, but that a large mass of native copper, and abundant indications of copper ores, are found along the southern shores of Lake Superior. More recent explorations have shown that copper exists in abundance in that region, and numerous mines have been opened, and are being successfully and profitably worked, and several large masses of native copper, of immense weight, have been found and taken out. Copper has also been found in the Blue Ridge in Virginia, but not in quantities or quality to prove profitable. In Tennessee and Georgia more profitable mines have been opened, and the mining is prosecuted to a considerable extent. Great Britain and Chili are the two largest copper producing countries, and yield annually from 14,000 to 16,000 tons each.

Pages 84, 85. Although *iron*, as stated in the text, is profusely distributed throughout nature, more than two thirds of all that is mined is produced by Great

Britain and the United States. In the United States it is found, in some of its various formations, in almost all parts of the country; but it is most abundant in Pennsylvania, Virginia, Ohio, Tennessee, and Kentucky. Pennsylvania produces much the largest portion, mining being more extensively carried on than in other parts of the country, which may be equally rich in the ore. The best iron is found in Michigan and Wisconsin, south of Lake Superior, and the mines promise to be very productive. The total amount of iron produced from the ore in the United States, in the year 1856, was estimated at about 1,000,000 tons, and this production is gradually increasing. The amount produced in England the same year was about 4,000,000 tons.

The quantity of metal produced in any country is not a measure of its mineral wealth, for the production depends upon the capital and labor engaged in it, and these upon a variety of circumstances. But in this connection it may be proper to give a table, prepared from those of Mr. Whitney, from returns and estimates for the year 1854, the latest from which such a comparative table could be made, though there are later data from a part of the countries named, showing the value of the various metals produced by some of the principal mining countries.

Countries.	Gold.	Silver.	Mercury.	Tin.	Copper.	Zinc.	Lead.	Iron.
Russia,	\$14,880,000	\$928,000	\$3,900,000	\$440,000	\$92,000	\$5,000,000
Great Britain,	24,800	1,120,000	\$4,200,000	8,700,000	110,000	7,015,000	75,000,000
Belgium,	1,760,000	115,000	7,500,000
Prussia,	480,000	900,000	3,630,000	920,000	3,750,000
Austria,	1,413,600	1,440,000	\$250,000	30,000	1,980,000	165,000	805,000	5,625,000
France,	80,000	172,500	15,000,000
Spain,	10,416	2,000,000	1,250,000	6,000	300,000	3,450,000

United States,	49,600,000	352,000	500,000	2,100,000	550,000	1,725,000	25,000,000

Book XIV.

Much time, and science, and numerous observations have made the ocean currents better known within the last few years, and the general courses and characteristics of those mentioned in Malte-Brun's text have become better known by careful exploration and examination. New currents, or branches of currents, have been discovered, or more accurately mapped, and the charts of ocean currents, such as those by the United States astronomical establishment, are quite exact and full, considering the element which is to be defined. The limited space of this Appendix does not admit of any resumé of such discoveries and explanations, which would require considerable space to add much useful knowledge to that contained in the text. It may, however, be of some interest to add a recent statement about the Maelstrom, page 124.

Of late years, even the existence of the Maelstrom, on the coast of Norway, has been doubted. The ancient accounts of its terrible power were doubtless fabulous, but the Maelstrom actually exists, and is sometimes dangerous. M. Hagerup, minister of the Norwegian marine, has recently given a reliable account of it, in reply to some questions from a correspondent of the *Boston Recorder*. The vast whirl is caused by the setting in and out of the tides between Lofoden and Mosken, and is most violent half way between ebb and flood tide. At flood and ebb tide it disappears for about half an hour, but begins again with the moving of the waters. Large vessels may pass over it safely in serene weather, but in a storm it is perilous to the largest craft. Small boats are not safe near it at the time of its strongest

^a With Bolivia.

^b With Ecuador, New Granada, &c.

action in any weather. The whirls in the Maelstrom do not, as was once supposed, draw vessels under the water, but by their violence they fill them with water or dash them upon the neighboring shoals. M. Hagerup says, —

“In winter, it not unfrequently happens that at sea a bank of clouds shows a west storm, with heavy sea, to be prevailing there, while farther in on the coast, the clear air shows that on the inside of the West-tjord (east side of Lofoden) the wind blows from the land, and sets out through the tjord from the east. In such cases, especially, an approach to the Maelstrom is in the highest degree dangerous, for the stream and under-current, from opposite directions, work there together to make the whole passage one single boiling caldron. At such times appear the mighty whirls, which have given it the name of *Maelstrom*, (i. e., the whirling or grinding stream,) and in which no craft, whatever, can hold its course. For a steamer it is, then, quite unadvisable to attempt the passage of the Maelstrom during a winter storm, and for a sailing vessel it may also be bad enough in time of summer, should there fall a calm or a light wind, whereby the power of the stream becomes greater than that of the wind, leaving the vessel no longer under command.”

BOOK XXIV.

ASIA.

Asia is the largest continental division of the globe, and includes a surface of about 15,500,000 square miles. Its greatest breadth, from north to south, is 5,300 miles, and its greatest length, from east to west, is about 7,600 miles. It has a coast of upwards of 30,000 miles, not including the northern coast, on the Arctic Ocean.

Mountains. — There are three grand mountain systems, the Altai, the Hindoo Koosh, and the Himalaya, the two latter being sometimes considered one system. The Altai system belongs to Central Asia, and is the northern limit of the great eastern plateau. It runs in the mean parallel of 50° north latitude, from 70° east to 110° east, where it joins the great chain of the Aldan, which runs north-east to the arctic circle. The second great system, the Hindoo Koosh, traverses Asia from the Dardanelles to the Yellow Sea, the central chain connecting the Kuen Lun of the east with the Parapomisan, Elbrooz, and the Armenian mountains of the west. It separates the great desert of Gobi from China Proper, and divides the steppes of Independent Tartary from the plateau of Iran. The Himalaya chain runs north-west and south-east for a distance of 1,500 miles, finally, at the north-west, meeting the Hindoo Koosh, where rise, a group of some of the loftiest mountains on the globe, more than 20 of them being upwards of 20,000 feet high. The highest summits, so far as ascertained, are Mount Everest, about 29,000 feet high, and Kunchingiga, which is 28,178 feet high. There are many others, in different parts of the chain, which rise more than 21,000 feet.

There are few active volcanoes in Asia. In Western

Asia, the only one is Demavena, 70 miles south of the Caspian Sea, which is 14,695 feet in height, is always covered with snow, and always emits smoke. In Eastern Asia, in the volcanic range of Thian Shan, are two active volcanoes, Peshan and Hocheoo, about 670 miles apart. Fire springs and fire hills are numerous in China, but there are no volcanoes known to emit lava. In Kamtschatka there are nine active volcanoes, of greater or less magnitude. In Japan there are two or three volcanoes, generally active.

M. Semenoff, a Russian traveller, has discovered a volcano in that part of Central Asia called Mantchoo Tartary. It exists in the district of Ujuu-Holdongt, about nine and a half miles north of the village of Tomolshin, on the Nemez, and some fifteen miles from the town of Mergen. In January, 1721, an eruption occurred there, which lasted nine months; and again in May, 1722, another formidable eruption took place. This is the first account we have of these eruptions, and as the volcanoes in question are situated at a distance of over 600 miles from the sea, the hitherto received theory that the proximity of the sea is an essential condition for the existence of volcanoes, is thus proved to have been fallacious.

The chief political divisions of Asia, as now given by geographers, are as follows:—

BOOKS XXXVII., XXXVIII.

ASIATIC RUSSIA, OR SIBERIA,

Comprising Siberia and the Caucasian provinces, known principally as Georgia, but comprising several somewhat distinct provinces.

Siberia occupies the entire northern part of the continent. Its extreme length is about 3,600 miles, and its breadth about 1,800 miles; area, 4,800,000 square miles. Its population is estimated at about 2,900,000. Irkutsh is the principal town, and the provincial capital of Eastern Siberia; population, including garrison, 120,000. Tobolsk is the provincial capital of Western Siberia; population, 20,000. Kiachta is a frontier town towards China, where the principal trade with that empire centres; population, 6,000; Tomsk, population 24,000; Omsk, population 11,000.

Georgia lies south of the Caucasus Mountains, and its extent is about 28,800 square miles; population about 350,000, including the minor provinces. The capital and principal town is Teflis; population about 50,000.

BOOKS XXXIX., XL., XLII. — XLV.

CHINESE EMPIRE,

Including China Proper, Chinese Turkistan, or Little Bucharina, Mongolia, Manchooria, Elee, Corea, Thibet, and the Koko-nor Territory. Area, 5,200,000 square miles; population 42,000,000.

China Proper.— Area, 1,298,000 square miles; population, 387,633,000. It is divided into eighteen provinces, which are subdivided into numerous departments.

The annual average export of tea is 41,500,000 pounds. Of this, 13,000,000 pounds is exported to the United States, 9,000,000 pounds to Russia, 8,000,000 pounds to England, and 7,500,000 to British colonies.

Chinese Turkistan, Mongolia, Manchooria, and the *Koko-Nor* territory are generally included under the name of Chinese Tartary. They are provinces of China, being under the dominion of that empire. The population is generally sparse, and its number is unknown.

Corea comprises a peninsula north-east of China, and several groups of islands in the Yellow Sea. It is, in most respects, an independent kingdom, though tributary to China. The area of the peninsula is about 80,000 square miles; population, about 8,000,000.

Thibet, north of the Himalaya Mountains, comprises the most elevated plains and plateaus in the world. It is subject to China, and it is but little known. Lassa, its capital, is the residence of the grand lama, and it is the centre of the Boodhist religion. Its population is estimated at about five or six millions.

The chief towns in the Chinese empire are,—

Population.		Population.	
Pekin, . . .	1,500,000	Canton, . . .	1,000,000
Chang-chu-fu, . . .	1,000,000	Nanchang, . . .	700,000
Fu-chu-fu, . . .	500,000	Nankin, . . .	500,000
Singan, . . .	300,000	Amoy, . . .	250,000
Ningpo, . . .	250,000	Shanghai, . . .	190,000
Yarkand, . . .	100,000	Ili, . . .	75,000
Macao, . . .	40,000		

Book LII.
INDO-CHINA.

This division comprises the following countries:—

Anam, an empire, comprising the provinces of Tonquin, Cochin China, (by which name the whole is sometimes called,) Champa, and a part of Cambodia. The population is estimated to be from twelve to fifteen millions. The chief town is Hue, the capital of Cochin China.

Burmah, sometimes called the Kingdom of Ava. Area, about 200,000 square miles; population, estimated at 6,000,000.

Siam, comprising a part of Cambodia and several Malay provinces, contains a population of about 6,000,000. The Tenasserim provinces, belonging to Great Britain, on the western coast of the Indo-Chinese peninsula, formerly belonged to Siam. The loss of these has been compensated by the acquisition of a part of Cambodia and some small Malay provinces.

Anam, Burmah, and Siam, with the British Tenasserim provinces, and some small Malay provinces, are sometimes called Further India, or the Indo-Chinese peninsula.

Books XLVI.—L.
HINDOSTAN OR INDIA.

Area, 1,200,000 square miles; population, about 132,000,000. It embraces the westerly of the two

great peninsulas of Southern Asia, and comprises the British territories, the Protected states, and the Independent states.

The British territories comprise three presidencies, Bengal, Madras, and Bombay. The Bengal presidency embraces the valley of the Ganges, the country watered by the tributaries of the Indus, and the Tenasserim provinces in Indo-China. The Madras presidency embraces a large part of the southern portion of Hindostan. The Bombay presidency embraces the western part of the peninsula, with a part of the interior table lands, and the province of Sind. Population of the three presidencies, about 80,000,000.

The Protected states are in the central part of Hindostan, and are more or less under the control of the British. Population, about 45,000,000. The Independent states comprise Nepal and Bootan, which lie along the southern slope of the Himalaya Mountains. Population, 7,000,000.

There are also some small possessions of the French and Portuguese.

The chief towns in India are,—

Population.		Population.	
Benares, . . .	580,000	Madras, . . .	350,000
Oodipoor, . . .	300,000	Patna, . . .	284,000
Bombay, . . .	235,000	Calcutta, . . .	230,000
Cashmere, . . .	200,000	Delhi, . . .	200,000
Dacca, . . .	200,000	Hyderabad, . . .	200,000
Saigon, . . .	180,000	Surat, . . .	157,000

Book XXXV.
AFGHANISTAN.

Area, about 300,000 square miles; population, estimated at 5,000,000.

The chief towns are Cabul, the capital, population, 60,000; Candahar, population, 50,000; Herat, population, 40,000.

Book XXXV.
BELOOCHISTAN.

Area, about 150,000 square miles; population, estimated at 2,000,000.

Kelat, capital, population, about 12,000; Chonbar, population, about 2,000, and Gundava, population, about 5,000, the chief towns.

Book XXXVI.
INDEPENDENT TURKISTAN.

Area, about 720,000 square miles. Population, estimated at 6,000,000.

The chief towns are Bokhara, famous as a seat of Mahommedan learning, population 160,000, and Khotan, population 80,000.

BOOKS XXXI.—XXXIII.

PERSIA.

Area, 450,000 square miles; population, about 9,500,000.

The chief towns are,—

	Population.		Population.
Teheran, the capital,	60,000	Kermanshah,	35,000
Balfrush,	200,000	Shiraz,	30,000
Ispahan,	150,000	Bushire, chief	
Tabriz,	60,000	seaport,	15,000

BOOKS XXVI.—XXIX.

ASIATIC TURKEY.

Area, 437,000 square miles; population, about 11,000,000.

Its chief towns are,—

	Population.		Population.
Smyrna,	150,000	Erzeroum,	40,000
Damascus,	90,000	Scutari,	40,000
Aleppo,	75,000	Beyrout,	30,000
Bagdad,	65,000	Trebizond,	25,000
Brusa,	60,000	Jerusalem,	20,000
Bassora,	60,000		

BOOK XXX.

ARABIA.

Area, about 834,000 square miles; population, estimated at 12,000,000, divided into numerous tribes, of which Huot gives a list of upwards of 150.

The chief towns are,—

	Population.		Population.
Aden,	50,000	Sana,	40,000
Mecca,	30,000	Derai,	15,000
Muscat,	40,000	Mocha,	7,000
Medina,	18,000		

BOOK XLI.

JAPAN, OR JAPANESE ISLES,

Comprise the islands of Nippon, Sikoke, Kioosio, and some smaller ones, together with dependencies in the Kurile Islands, Jesso, Saghalien, &c., embracing in all a territory of about 170,000 square miles, and containing a population estimated at 25,000,000, and by some at 30,000,000. For two hundred years, closed to all foreign nations except the Chinese and Dutch, who had a limited trade there, these islands have at last been opened to increased foreign trade through the efforts of the United States, followed by England, Russia, France, &c. Several ports are now open to the trade of these nations, and the commerce with Japan promises to become important.

The chief towns are,—

Yedo, or Jeddo, in Nippon, the capital, and residence of the military emperor, containing, formerly, a population estimated at 1,500,000, but within a few years it has been in part destroyed by an earthquake.

	Population.
Hakodadi,	
Mijaco, residence of the spiritual emperor,	220,000
Nangasaki,	50,000
Simoda,	6,000
Matsmai,	50,000
Osaca,	80,000
Kotsi,	
Kokura,	

Simoda and Hakodadi are open to American commerce, by the treaty made by Commadore Perry with the Japanese government. Nangasaki and Hakodadi are open to the British.

BOOKS XLI., XLIII, &c.

ASIATIC ISLANDS.

Besides the Japanese Islands, included in the islands of Asia, are the following:—

Kurile Isles, a range of small islands, extending from Japan to Kamtschatka, containing an area estimated at 3,000 square miles. The population is sparse, and they are but little known.

Loo Choo Islands, consisting of the Great Loo Choo Island and upwards of thirty others, which are smaller, lie east of China and south of Japan. Great Loo Choo is about 65 miles in length. These islands are dependencies of Japan, though in some respects independent.

Formosa, about 90 miles east of China. Area, about 15,000 square miles; population, estimated at 2,500,000.

Hong-Kong, a small island, about ten miles long, at the mouth of the estuary that leads to Canton. It belongs to Great Britain. Population, about 40,000. It is a place of great commercial importance, being the centre of British trade with China. It has attained this position since it was ceded to Great Britain, in 1841. The chief town is called Victoria.

Hainan, a large island south of China, and separating the Gulf of Tonquin from the Chinese Sea. Its area is estimated at 12,000 square miles, and its population at 1,200,000, mostly Chinese. It belongs to China. The chief town is Kiang-Choo, which is a populous city.

Singapore, an island south of the Malay peninsula, belonging to Great Britain. The chief town is Singapore; population, 25,900. It is a place of great commercial importance.

Nicobar Islands lie west of Malaya. Inhabited by savages, but nominally belonging to Denmark.

Andaman Islands, in the eastern part of the Bay of Bengal, also inhabited by savages.

Ceylon, about 60 miles south-east of the southern extremity of Hindostan. Area, 24,664 square miles; population, 1,500,000. It is a very productive and valuable island, belonging to Great Britain. The pearl fishery, for which it was once famous, has ceased since 1837. Coffee, rice, and cinnamon are its principal commercial productions, that of coffee rapidly increasing in importance. Chief town, Colombo.

Maldivé Islands, an extensive chain of islands, of coral formation, south of Hindostan. Estimated pop-

ulation, 150,000, mostly Mohammedans; tributary to the British.

Laccadive Islands, also of coral formation, north of the Maldives. Population, estimated at 10,000.

BOOKS LIII. — LVIII.

OCEANICA.

Oceania, or Oeeania, is the name given to the numerous islands in the Pacific, including Australia, which is itself sometimes considered as a continent. The estimated area of the land in these islands is 4,500,000 square miles, and the population about 21,000,000. Geographers now divide Oeeania into three parts, viz., Eastern Oceania, or Polynesia, Central Oceania, or Australasia, and Western Oceania, or Malaysia.

POLYNESIA includes numerous groups, the principal of which are the following:—

Bonin Isles, three small groups, about 500 miles south-east of Japan, claimed by Great Britain.

Sandwich Isles, or *Hawaii Group*, the most important group in Polynesia, in the north Pacific, about 1,800 miles west of California, consisting of seven inhabited islands, and six islets uninhabited. The first mentioned are Hawaii, Mani, Atauai, Oahu, Molokai, Ranai, and Nilan. Aggregate area, about 6,500 square miles. The larger of these islands are high, and contain several volcanic peaks. In Hawaii, three of these are constantly active. One is 12,500 feet high. Mauna Loa is the most active of these volcanoes, and a great eruption took place in 1852, when a column of molten lava was projected 500 feet into the air. A river of the lava, nearly a mile wide, flowed down the ravines and valleys. Some of the valleys and plains are fertile, and produce sugar-cane, coffee, &c.

The islands have long been a resort for whale ships in the Pacific, for the purpose of transshipping, procuring supplies, &c.; upwards of 500 of these vessels have touched there in a year.

The population, since the natives have become partially civilized, has rapidly decreased. By Captain Cook, it was estimated at 400,000. In 1832, it was 130,315; in 1836, 108,579; in 1850, 84,165; in 1853, 72,964. The government, formerly divided among several rulers, one for each island, is now vested in one king, and is administered on European models. The principal town and seaport is Honolulu, in Oahu; population, 6,000. Most of the commerce centres here.

Marquesas Islands, about 2,000 miles west of Peru. Nukahiva, the largest, is 70 miles in circumference. They belong to France.

Low Archipelago, comprising numerous groups between the Marquesas and Society Islands, in all 90 or more islands, generally uninhabited.

Gambier Islands, in the South Pacific, south-east of the Society Isles. They are resorted to by vessels for water.

Pitcairn Island, 300 miles south-east of the last, midway between Panama and Australia.

Society Islands, south-west of the Low Archipelago, consisting of Tahiti, which is about 30 miles long, and many smaller islands. Considerable trade is carried on here with the natives, who resemble the Sandwich Islanders. They are under the protection of France.

Cork's, or *Hervey Isles*, a small group south-west of the Society Isles.

Tonga, or *Friendly Isles*, west of the last named, (Cork's.) Tongatabu, the largest, is about 50 miles in circumference. The surface is low, and the islands abound in tropical fruits, &c.

Feejee Islands, the most westerly group of Polynesia, comprises about 150 islands, not half of which are inhabited. Viti Levu, the largest, is about 80 miles long. The surface is mountainous, and the origin of the islands is supposed to be volcanic. The inhabitants are the most savage and barbarous of all the Polynesians.

Navigator's Isles, eight islands north-east of the Feejee Isles. Lavaii, the largest, has an area of about 700 square miles. The surface is mountainous, and the soil fertile.

Central Archipelago includes several groups lying between 10° north and 10° south latitude. Among the largest, are Marshall Islands, Gilbert's Islands, Kings mill group, &c.

Caroline Islands consist of numerous groups, lying between 5° and 10° north, and from 135° to 160° east from Greenwich. Many are of coral formation. One of the Yap group, north of Pelew, is mountainous, and abounds in precious metals. The most westerly is the Pelew group, and the most easterly is Onalan. They belong to Spain.

Ladrone Islands consist of 20 islands, north of the Carolines. They are mountainous and picturesque. The soil is fertile, yielding many tropical productions. They belong to Spain.

AUSTRALASIA includes Australia and the adjacent islands.

Australia, or *New Holland*. Area, about 3,000,000 square miles; population, 1,043,000. It lies between the Pacific and Indian Oceans, and extends from about 10° south to 39° south latitude, and from 113° to 153° of longitude east from Greenwich. Its greatest length, from east to west, is about 2,400 miles, and its greatest breadth is about 1,900 miles. It belongs to Great Britain, and is divided into five colonies, North Australia, West Australia, South Australia, New South Wales, and Victoria. The first of these colonies is now abandoned, on account of the hot and unhealthy climate; and the last two are the only ones which have flourished.

The north and west coasts are low, and the interior is generally sterile; extensive regions consisting of sandy plains, or rugged and verdureless hills. Near the east and south coasts are ranges of mountains, none, however, over 7,000 feet high. The valleys and plains here are more fertile, and capable of sustaining a large population. The central part of Australia is almost wholly unexplored, and offers but little attraction to the explorer.

In 1851 gold was discovered in the south-western part of the island, or continent, at Bathurst, 140 miles from

Sidney, and since that time it has rivalled California, and, in some respects, surpassed it. The most productive mines are at Ballarat. The gold has been found in remarkable lumps, or nuggets, some weighing from 10 to 27 pounds of pure gold, and even upwards, and others, less pure, producing 50 to 160 pounds of gold. The first year the yield was about \$17,000,000, and it has increased from that to nearly or quite \$60,000,000 in some years. Copper is also found in large quantities, and the mines (at Burra-Burra, in New South Wales) were producing 20,000 tons or more, annually, when the discoveries of gold diverted the labor and capital almost wholly. Tin, manganese, iron, coal, &c., are found. New South Wales is a good agricultural country, and yields large quantities of wool and tallow.

The native Australians are a distinct race from that inhabiting the Indian Archipelago. They are black, or dark brown, with curly but not crisp hair. They are barbarous, and inclined to cannibalism. The different tribes are constantly engaged in feuds. The highest estimate of their numbers is 80,000, which is probably much more than the actual number.

The population of Australia, in 1857, was about 1,043,000. The population of the colony of Victoria, in which the gold region, as at present known, lies, has rapidly increased. In 1850, it was about 50,000; in 1857, it was 414,000.

The chief towns are, —

Sidney, the capital of New South Wales; population, about	100,000
Melbourne, the capital of Victoria; population, about	50,000
Adelaide, the capital of South Australia; population,	20,000
Perth, the capital of West Australia,	
Gulong,	
Brisbane,	

Van Diemen's Land, or *Tasmania*, an island containing an area of 24,000 square miles, south of Australia, from which it is separated by Bass Strait. It belongs to Great Britain, and a penal colony of that country is established here. The interior is mountainous, some of the peaks being snow-capped even in summer, and rising to the height of 7,000 or 8,000 feet. Coal, lead, and iron are found, of excellent quality. It is well watered, and the valleys are fertile. The population is about 80,000, of whom nearly one third are convicts.

The chief town is Hobart-Town, the capital, in the south-eastern part of the island. Population, about 25,000.

New Zealand comprises three islands, New Ulster, New Munster, and New Leinster, together with some smaller islands, situated south-east of Australia, and belonging to Great Britain. The area of all is about 105,000 square miles, and the population about 150,000, of whom about 27,000 are whites. The interior of the islands is rugged and mountainous. In New Ulster are Mount Edgecomb, 10,000 feet high, and Mount Egmout, 8,300 feet high. The island is well watered and fertile. The principal settlements of the English are at Auckland, the capital, New Plymouth, and Wel-

lington, in New Ulster, and at Nelson and Canterbury, in New Munster.

Papua, or *New Guinea*, north of Australia, contains an area of 250,000 square miles. It is inhabited by a mixed Malay and Papuan race, and has no European settlements. But little is known of its interior.

Admiralty Isles, a group of about 30 fertile islands, north of Papua. The largest, Great Admiralty Island, is about 60 miles in length.

New Ireland, a long, narrow island, south-east of the last, about 200 miles in length and 20 wide, covered with luxuriant forests.

New Britain, two large islands south-west from the last, and east of Papua, well wooded and fertile.

Solomon Isles, a group east of Papua and New Britain, of which little is known.

Louisiade Isles, a group of small islands south-east of Papua, 80 of which are known, and it is believed that others remain to be discovered and explored. Some of these islands are fertile, and inhabited by savages of a dark copper color.

New Hebrides, a group of about 20 islands, south-east of the Solomon Isles. Espiritu Santo is the largest, and is about 65 miles in length by 20 wide. They are inhabited by the Papuan race, and abound in tropical trees and fruits.

Norfolk, a solitary island, about 1,000 miles east of Australia, comprising an area of 14 square miles. It belongs to Great Britain, and is used as a penal establishment.

MALAYSIA, or the *Asiatic Archipelago*, is the general name given to the large islands lying south-east of Asia. They are also sometimes called the East Indies. Malaysia comprises the following islands: —

Philippine Isles, a group consisting of about 1,200 islands, the most northern in the Indian Archipelago. The estimated area of the whole is about 120,000 square miles. They mostly belong to Spain, and are a valuable colonial possession to that kingdom. The principal islands are Luzon, Mindanao, Palawan, Mindoro, Samar, Leyte, Negros, &c. Population, estimated at about 5,000,000, of whom 1,000,000 belong to the Papuan race, 3,700,000 are Malay Indians, 55,000 half-castes and Chinese, and 245,000 whites. The chief town is Manilla, which has an extensive foreign trade. Population of the city and suburbs, 140,000. The town has many times suffered from earthquakes, the last severe one of which was in 1852, when great damage was done.

Borneo. — This island contains an area of about 290,000 square miles, and is more than three times as large as the island of Great Britain, and larger than the Eastern and Middle States of the United States.

Population, estimated at 2,000,000, of whom about 1,400,000 are Dyaks, the aboriginal tribes, 140,000 Chinese, 400,000 Malays, 100,000 Boogis from Celebes. The western and southern coasts, and a part of the eastern, are subject to the Dutch, who have settlements at Banjarmassin and Pontianale. The northern coast, including Borneo Proper, is now under the protection of Great Britain, with a native sovereign. Under this protection piracy has become less frequent, and com-

merce more prosperous. Borneo is the chief town of this part of the island; population, 22,000.

Celebes, an irregular-shaped island, east of Borneo. Area, about 70,000 square miles. Population, estimated at 2,000,000, of whom the Boogis are the most numerous, and are one of the finest races in Oceania in appearance. The island is under native rule, though the Dutch have heretofore claimed authority over some portions, and still hold the settlement of Macassar.

Moluccas, or *Spice Islands*, a general name of islands between Celebes and Papua, the largest of which are Gilolo, Ceram, Booro, and Amboyna. Area, estimated at 38,000 square miles. They are subject to the Dutch, who have a settlement at Amboyna.

Timor, an island south of the Spice Islands, about 300 miles long and 40 wide. It is claimed partly by the Portuguese and partly by the Dutch, each of whom have some small settlements. Population, about 200,000.

Sunda Isles, consisting of Sumatra, Java, Sumbawa, Flores, and Sandalwood, together with some smaller islands.

Sumatra, south-west of the Malayan peninsula, a large island directly under the equator. Area, about 140,000 square miles. Population, according to the most reliable estimates, about 4,500,000, and composed of mixed races. The Dutch have long had settlements there, and have gradually extended their dominion over a large part of the island.

Java, south-east of Sumatra, has an area of about 50,000 square miles. It belongs to the Dutch, and is the centre of their power in the East Indies. It has a governor-general, and is divided into 22 residencies, with local governors. Batavia, Samarang, and Sourabaya are places of much commercial importance, especially the first, which is the capital, and the centre of the Dutch East India trade. Population of the island, (1845,) 9,560,380, of whom 16,000 were Europeans or their descendants. Population of Batavia, 118,300, of whom 2,800 are Europeans.

Flores, next to Java, the largest of the Sunda Isles, is about 200 miles long and 35 wide. It has several high volcanic peaks.

Sandalwood, south of Flores, about 120 miles in length and 30 in average breadth. The Dutch have settlements there.

Sumbawa, west of Flores, about 160 miles in length. It is divided into several native states, which are generally under the protection of the Dutch.

BOOK LIX.

AFRICA.

This great division of the globe, though the seat of the most ancient civilization, is the least known, and has been the least explored of any of the grand divisions. It has an area of 11,236,000 square statute miles. Its length is estimated at 4,968 statute miles, and its breadth at 4,692 statute miles. It has a coast line of about 16,000 miles, a great part of which has never been accurately surveyed, and much is very im-

perfectly known. Of the interior, vast regions are unexplored; and though Dr. Livingstone has within a few years penetrated and explored some distance in Southern Africa, and Dr. Barth in Central Africa, and have added much to the knowledge of those portions of the continent, yet the geographical knowledge of the country is limited. These recent explorations, however, have met with such success as to lead to further expeditions, which will, in the course of a few years, probably afford a better knowledge of this vast extent of territory, and, in the process of time, open it to civilization. The population is variously estimated from 60,000,000 to 110,000,000, composed of numerous savage and degraded tribes, mostly black, except where a branch of the Caucasian race has extended along the northern part and along the eastern coast. These tribes speak innumerable languages or dialects, and are in other respects very dissimilar, while some of those of the southern portion appear to be almost a distinct race.

Mountains. — The Mountains of the Moon is a name applied to a range commencing near the western coast, in latitude 9° north, and longitude 9° 20' west, and thence running, it was supposed, across the continent. It has been discovered, however, that this range does not run across the continent, where it was once laid down on the maps. Whether any such range exists, as supposed, future explorations may show. The name given to the western part of the range is Kong Mountains. The name of Mountains of the Moon is also sometimes given to a range north-west of Zanguebar. North of the Kong Mountains are other lofty ranges running north. The Atlas range, in Morocco and Algiers, is an extensive range, the highest known peak of which, Mount Mitsun, is 11,380 feet high. A lofty mountain has been recently discovered in Eastern Africa, called Killimandjaro, which rises to a height of 20,000 feet or upwards, and though within four degrees of the equator, its summit is covered with perpetual snow. The Black Mountains, north of the great desert, and a range west of Mozambique, are extensive ranges, as also are the Red Mountains, in Madagascar.

Rivers. — The principal and most noted rivers are the Niger and the Nile, the sources of which, and the mouth of the former, were long the subjects of geographical speculation. The outlet of the Niger was finally ascertained to be in the Bight of Benin, in the eastern part of Upper Guinea. The sources of the Nile have not yet been reached, though long supposed to be in the Mountains of the Moon. The following are the principal rivers: —

	Miles in Length.
Nile, (running into the Mediterranean,) about .	3,000
Niger, (in West Africa, emptying into the Atlantic,)	2,500
Senegal, “ “ “ “ “	1,000
Gambia, “ “ “ “ “	1,000
Congo, “ “ “ “ “	“
Coanza, “ “ “ “ “	500
Orange, “ “ “ “ “	1,000
Geba, “ “ “ “ “	“
Rio Grande, “ “ “ “ “	“
Sierra Leone, “ “ “ “ “	“
In East Africa, Zambeze, Juba, or Fumbo, and Liowma.	

Lakes.—Tchad, in Central Africa, explored by Barth, and stated to be about 220 miles in length and 140 in breadth. Lake Nyassi, north-west of Mozambique, unexplored. Lake Ngami, discovered and explored by Livingstone, in the central part of South Africa, about 70 miles in length. Lake Dembra, in Abyssinia. Lake Lowdeah, in Tunis.

The chief political divisions of Africa at present, are as follows:—

BOOK LXV.

BARBARY STATES.

Morocco, (empire of,) the largest of the Barbary States, in North-Western Africa. Area, 223,000 square miles; population, 8,500,000 Moors, or Arabs, Berbus, and Jews.

The chief towns are, —

	Population.
Morocco, the capital,	80,000
Mequinez,	60,000
Tangier, a seaport on the Strait of Gibraltar,	7,000
Fez, an interior town,	90,000
Mogador, on the Atlantic,	17,000

Algeria, or *Algiers*, one of the Barbary States, between Morocco and Tunis, now belonging to France. Area, about 90,000 square miles; population, 2,500,000. The population is chiefly composed of Moors, Turks, Berbers, Jews, &c., with some French settlers. Under French rule (since 1831) the resources of the country are being somewhat developed, its agriculture improved, good roads constructed, &c.

The chief towns are, —

Algiers, the capital, on the Mediterranean; population 94,600, of whom about one half are Europeans. Constantine, population, 20,000.

Tunis, another of the Barbary States, east of Algeria. Area, about 70,000 square miles; population, 2,500,000. The inhabitants are like the last, without the European element.

The chief towns are, —

Tunis, the capital, population, 130,000. Kairwan, an interior town, estimated population at 50,000.

Tripoli, another of the Barbary States, south-east of Tunis. Area, about 140,000; population estimated at 1,500,000. *Barca*, on the east, and *Ferran*, on the south of Tripoli, are dependent or tributary provinces of Tripoli. The population of Barca is estimated at about 1,000,000, mostly Bedouin Arabs. The inhabitants of Ferran are a mixed race, and number about 100,000. The chief town of Tripoli is Tripoli. Population, about 15,000. Moorzouk, in Ferran, a seat of caravan trade. Population, 3,500.

BOOKS LX. — LXII.

EGYPT.

Area, 224,000 square miles; population, 2,896,000. More than 2,000,000 of the inhabitants are Fellahs, of Arabic descent, and the remainder Copts, Turks, Greeks, &c.

Egypt is in many respects an independent kingdom, though a fief of the Ottoman Empire, which has main-

tained its power only through the interference of the great powers, and the government is a despotism; though under Mohammed Ali, it has advanced the prosperity of the country.

The chief towns are, —

	Population.
Cairo, the capital, the largest city in Africa,	250,000
Alexandria,	60,000
Damietta,	28,000

Suez, on the Red Sea, though numbering but two or three thousand permanent inhabitants, is a place of importance, as being one of the stations of the "overland route" to the East. A railroad is being constructed to connect it with Cairo and Alexandria, which places are already connected by railroad.

BOOK LXIII.

NUBIA, ABYSSINIA, &c.

Nubia, south of Egypt, and under the dominion of that kingdom. Area, 320,500 square miles. Population, 500,000. The chief towns are, —

	Population.
Khartown, the residence of the viceroy,	15,000
Sonakin, on the Red Sea,	8,000

Abyssinia, south-east of Nubia. Area, 280,000 square miles; population, estimated at 3,000,000.

The country is little known. It is divided into several states, or provinces, and the inhabitants embrace many tribes, most of whom are in a state of barbarism. The Gallas, a savage tribe on the west of Nubia, have overrun much of the country.

Gondar and Ankobar are the chief towns.

BOOKS LXXI., LXXII.

EASTERN AFRICA

Includes the following countries:—

Somauli Territory, consisting of the districts of Adel and Ajan, south-east of Abyssinia, and south of the Straits of Babel Mandeb.

The inhabitants are divided into numerous tribes, some of whom carry on considerable trade at Berbera, the chief town.

Zanguebar, between the Somauli Territory and Mozambique, belongs in part to the Sultan of Muscat, a sovereign of a district in Arabia, and in part to native princes. Considerable trade is carried on by the Arabs, the centre of which is at Zanzibar, the chief town, on Zanzibar Island. Population of the island, 150,000; of the town, 80,000. Other towns are Magadoxa, Juba, Melinda, Quiloa.

Mozambique, a country extending along the coast from Cape Delgado, the southern limit of Zanguebar, to the Zoolu country, and stretching indefinitely into the interior. On the coast are three Portuguese settlements—at Mozambique, Quilimane, and Sofala,—and that nation claims the whole country, though it is not occupied by them. The population of the first named town is about 6,000; the others are inconsiderable places, the channels of trade being now turned

towards Zanzibar. The Portuguese tenure of the country, except in the towns, is altogether uncertain.

BOOK LXX.

SOUTHERN AFRICA

Includes the following countries:—

Zoolu Country, inhabited by a tribe of the Caffre race, lies between Mozambique and the Natal Colony of Great Britain.

Natal Colony, a territory of about 18,000 square miles; population, about 120,000, most of whom are Caffres, acknowledging allegiance to the British, who possess the country as a dependency of Cape Colony. The chief towns are Pietermaritzburg, the capital, and Port Natal, the latter containing about 1,000 inhabitants.

Cape Colony occupies the entire south of Africa, from the ocean on the south to Orange River, including a portion of the Hottentot Country and Caffraria, though a part of the Caffres have almost constantly resisted the dominion of the British. Area, about 110,000 square miles; population, 166,000, 70,000 of whom are of the native races. The chief towns are Cape Town, population 23,000; King William's Town.

Hottentot Country lies north of Cape Colony, on the coast. In the interior, north of Cape Colony, is

Country of the Bechuanas, an extensive region, inhabited by offshoots of the Caffres and Hottentots. This region has been explored to some extent of late years, especially by Dr. Livingstone, some distance north of Lake Ngami, and from the west coast into the interior of Mozambique. It proves to be a more fertile country than was supposed, tolerably well watered in some parts, and quite productive. Further explorations, which are progressing, and efforts to gain the good will of the various native tribes, it is hoped will result in opening a considerable trade with the interior. Sugar-cane and cotton are both produced, wild and cultivated, as well as wheat, &c. Gold is found, and extensive beds of coal have been discovered.

BOOKS LXVI.—LXIX.

WESTERN AFRICA

Includes the various countries extending from the Hottentot Country to the Great Desert.

Country of the Cimbebas and Damaras, north of the Hottentot Country, inhabited by savage tribes, and but little known. North of this country is

Lower Guinea, extending from 17° south to 10° north of the equator, near the mouth of the River Niger. It is divided into several states, the chief of which are Benguela, Angola, Congo, Loango, Biafra. They are inhabited by various negro tribes. The Portuguese have some small settlements, the chief of which is Loanda. The interior of the country is productive, and the explorations of Livingstone show that it might produce large quantities of cotton, &c.

Upper Guinea lies north of the Gulf of Guinea, extending westward along the coast from the northern part of Lower Guinea. It is also subdivided into Benin, Abomey, Coomassie, &c. The British have a

few small settlements, of which Cape Coast Castle is capital.

Liberia, a republic, established as a colony by the American Colonization Society, for free negroes from the United States. It became an independent republic in 1847. It is situated in the western part of Upper Guinea, extending about 320 miles along the coast, and 80 into the interior. Some thousands of the natives have placed themselves under the government of Liberia. The country is productive, yielding cotton, sugar-cane, and coffee abundantly, and tropical fruits, &c. Population, 250,000. The chief town is Monrovia, the capital; population, 2,500.

Sierra Leone, a British colony, north-west of Liberia, and in the southern part of Senegambia, comprises an area of 232 square miles. The chief town is Freetown; population, 18,000.

Senegambia occupies the most western part of Africa, south of the Great Desert. It is divided into several states, all of native government. The inhabitants are chiefly negroes, of various tribes, the most important of which are the Foulahs, Jaloofoos, and Mandingoes. The French, English, and Portuguese have some small settlements on the rivers Senegal, Gambia, and Nunez.

Sahara, or *The Great Desert*, occupies a large part of northern Central Africa. Its length is about 2,500 miles, and its breadth from 600 to 900 miles, its area being about 1,300,000 square geographical miles. Oases, of greater or less extent, relieve this barren region in the east, and some are found in the central and western parts, the latter of which is the most desolate. Although so desolate, Sahara is inhabited by Moors, Tuariks, and Tibboos. Explorations of late years have added but little geographical knowledge of this region more than is given in the text, except in limited portions of it.

BOOK LXVII.

CENTRAL AFRICA

Is the general name applied to a vast region extending from the Great Desert, indefinitely, south to the country of the Bechuanas. It comprises numerous states, or kingdoms, and is inhabited by many distinct tribes of negroes and mixed races. The great division is Soudan, which comprises the states of Bournou, Houssa, Kanem, Bergoo, Darfur, Begharmi, Adamana, Yarriba, Upper and Lower Bambarra, and Kordofan and the Galla country are sometimes included in it, besides many smaller states. The northern part of this territory is sometimes known as Nigritia, and is so applied indefinitely in the text.

Lake Tsad, or Tehad, is situated in the northern central part of Soudan, between Bournou and Kanem. It is about 130 miles long and 60 to 80 wide. This region has been explored to some extent recently by Drs. Barth and Overweg, and their explorations will add something to the geographical knowledge of the country, but the expeditions now in progress will probably in a short time accomplish more.

The country south of Soudan is sometimes called Ethiopia, but it is as properly, perhaps, included under

the name Soudan, and is probably made up of numerous states and kingdoms, of which little is known, though enterprising explorers are gradually opening the whole of this vast region to our knowledge.

BOOKS LXXIII., LXXIV.

ISLANDS OF AFRICA.

Socotra, in the Indian Ocean, 120 miles east of Cape Guardafin.

Seychelle Isles, a group of about 30 small islands, in the Indian Ocean, belonging to Great Britain

Amirante Isles, a smaller group, south west of the preceding.

Comoro Isles, near the north end of Mozambique channel.

Madagascar, a large island, 1,000 miles long, and 240 in average breadth, containing a territory nearly as large as that of France, east of Africa, and separated from the continent by the Mozambique channel. The people have relapsed from the civilization which was encouraged under one of their princes, who was educated in Europe, in the early part of this century, and who conquered the whole island by organizing a powerful army. They have returned to their old practices of paganism and cruelty. Population, estimated at 4,700,000. The capital and chief town is Tananarivo.

Mauritius, east of Madagascar, belongs to Great Britain. Population, 162,000. Chief town, Port Louis; population, 35,000.

Bourbon, between Mauritius and Madagascar, belongs to France. Population, 108,000. Chief town, St. Denis; population, 20,000.

St. Helena, about 1,200 miles from the west coast of South Africa, in the Atlantic, belonging to Great Britain. It contains 48 square miles; population, 5,000.

Ascension, about 800 miles north-west of St. Helena, belonging to Great Britain. Its area is 35 square miles.

Cape Verde Isles, a group of 14 islands in the Atlantic, 320 miles west of Cape Verde. The names of the ten larger ones are Sal, Bonavista, Mayo, Santiago, Fogo, Brava, Grande, Rombo, St. Nicholas, and Santa Luzia. They belong to the Portuguese. They comprise an area of 1,680 square miles; population, 86,700.

Canary Isles, a group of seven large and several smaller islands, about 60 to 80 miles west of the coast of Sahara and Morocco. They belong to Spain. Area, about 3,000 square miles; population, 258,000.

Madeira Isles, consisting of Madeira and Porto Santo, with a few small islands, west of Morocco. They belong to Portugal. Area, about 400 square miles; population, 110,000. Chief town, Funchal; population, 25,000.

Azores, or *Western Isles*, consist of 9 islands north-west of Madeira, belonging to Portugal. They are in three groups, the north-western being 114 miles, and the south-eastern being 70 miles from the central group. The islands are, —

	Population.		Population.
Terceira, . . .	40,000	Flores, . . .	14,000
Pico, . . .	24,000	Gracioza, . . .	7,800

Total, . . .			203,500

BOOK LXXV.

AMERICA.

The area of the American Continent is stated, by good authority, as follows:—

	Square Miles.
North America,	7,400,000
South America,	6,500,000
Islands,	150,000
Greenland and islands N. of Hudson's Strait,	900,000

Total, 14,950,000

The length of the entire continent is about 10,500 miles. Its greatest breadth north of the equator is at about the parallel of 45°, where it is 3,100 miles wide; its greatest breadth south of the equator is between 4° and 7° south, where it is 3,250 miles wide.

The area of North America is sometimes stated larger than that given above, the United States census of 1850 making it 8,373,648 square miles, including Central America.

BOOKS LXXVI. — LXXXV.

NORTH AMERICA.

The great changes which have taken place in the political geography of North America, the extension of settlements, and the more thorough exploration of the country, render it impossible to follow precisely the order of the text, and a brief description of the chief features of the continent and of the several countries is given, independent, for the most part, of the text.

Since Malte-Brun's time, arctic explorations have added something to the knowledge of the northern regions of America. The expeditions of Sir John Franklin, Sir John Ross, Captains Beechey, Clavering, Scoresby, Back, Sir Edward Belcher, McClure, Kellett, Bellot, De Haven, Dr. Kane, and others, have explored the northern seas extensively, but, it must be confessed, without many practical results. The attempts to discover the north-west passage, which was the object of some of these expeditions, at last resulted more favorably than Malte-Brun anticipated; for Captain McClure, of the British ship Investigator, after long struggles with the ice, succeeded, in 1850, in sailing from Behring's Strait to a point 73° 10' north, and 117° 10' west longitude, about 30 miles from the series of straits, Melville, Barrow, and Lancaster, which communicate with Baffin's Bay, leaving an extensive region at the north. Obstructed by ice, McClure left his ship, and continued his explorations along the shore, and discovered that there was a passage into those straits, and thus connected his explorations on the west with those of Parry on the east. The passage, however, was obstructed by ice, and impassable on that account. Subsequently, McClure was reached by another expedition, which had sailed up through Baffin's Bay as far as the ice would permit, and then sent on a party by

sledges. McClure's party returned with this expedition, abandoning their ship, but verifying the north-west passage, though frozen and impassable for vessels.

Dr. Kane's expedition penetrated through Smith's Sound, which is north of Lancaster Sound, directly towards the pole from Baffin's Bay, and his party reached, by sledge and foot journeys beyond his vessel, latitude 81° 22' north. At this point, which was reached by two of the doctor's companions, an open channel was discovered, extending into what appeared to be an open polar sea. Seals and bears were numerous, and a variety of birds were abundant. This exploration showed that Greenland was separated from Grinnell Land and other land on the west of Smith's Sound, as Parry's and McClure's expeditions showed that it was separated from the continent of North America; and that the regions north of Melville and Barrow's Straits are one or more large islands, known as Melville Land, Grinnell Land, &c.

Mountains.—The mountains of North America comprise two principal systems, the Rocky Mountains on the west, and the Appalachian Mountains on the east. The Rocky Mountains are a continuation of the Andes of South America, and extend, under different names, from the Isthmus of Panama to the Arctic Ocean. In Central America the mountains increase in height as they recede from the Isthmus, and there are, within a limited space, some 30 volcanoes. The Volcan d'Agua, which emits water and stones instead of fire, is 14,450 feet high. In Mexico, the same mountain chain, called Cordilleras, spread into high table land, from Durango to Puebla, from 6,000 to 9,000 feet high, and from 100 to 300 miles wide. Near the tropic the chain divides into three, one running to the east, and terminating near the coast, and the other to the west, and sinking in the same manner. The central chain runs north into the territory of the United States, and so on to the Arctic Ocean. The highest peaks in this chain are as follows:—

In Mexico.—Popocatepetl, 17,720 feet; Orizaba, 17,380 feet, both volcanoes, but the latter extinct; Iztacihuatl, 15,705 feet; Nevado de Toluca, 15,250 feet.

In United States.—Fremont's Peak, 13,570 feet; Long's Peak, 13,575 feet; and Pike's Peak, 11,497 feet.

In British America.—Mount Brown, 15,990 feet; Mount Hooker, 15,700 feet.

A range, sometimes considered a part of the same system, extends between the Rocky Mountains and the Pacific from the Russian Possessions to the peninsula of California, and is called the Cascade Range and Sierra Nevada. The range widens into high table land in some places, or branches into other ranges, and is not altogether a well-defined range in the northern part. Mount St. Elias, in Russian America, is considered as belonging to this range, and is 17,900 feet high. Mount Shaste and Mount Hood, in Oregon, are about 14,000 feet high; other peaks reach the height of 10,000 feet. Another range, less lofty, extends along the sea-coast, called the Coast Range.

The Appalachian chain, beginning in the north-eastern part of the United States, extends to Alabama, at

a distance of 100 to 300 miles from the coast. There are numerous branches or spurs, and even distinct ranges, which may properly be considered a part of this chain, as the Blue Ridge, Alleghany Mountains, Cumberland Mountains, &c. The highest peaks in the range are Mount Clingman, in North Carolina, 6,941 feet high, and Mount Mitchell, in the same state, 6,732 feet high. The mean height is about 2,400 feet.

There are several smaller ranges, as the Adirondack Mountains, in New York, and the Green, in Vermont and Massachusetts, which more properly belong to the Appalachian range, the White Mountains, in New Hampshire, &c. The highest of these are Mount Marcy, of the Adirondack, 5,460 feet, and Mount Washington, of the White, 6,234 feet. The Ozark Mountains, in Arkansas and Missouri, are a low range. The Humboldt River Mountains, and other short ranges, are found between the Rocky and Cascade ranges. The Black Hills are a range running north-east from the Rocky Mountains, at about the forty-third parallel.

Between the two great systems of mountains lies the great plain, extending from the Gulf of Mexico to the Arctic regions, including the great lakes and the mighty rivers of North America. This plain is the largest in the world, except the Desert of Sahara, and it is so plentifully watered that all that lies south of the Arctic regions is fertile and habitable. That portion south of the forty-fifth parallel, comprising an area of about 1,500,000 square miles, is a region of almost unexampled fertility.

Between the Rocky Mountains and the Sierra Nevada, or Cascade Mountains, is a great plain, or basin, which is sometimes called Fremont's Basin, which is not abundantly watered, and is not fertile, except in small portions. The greater part is rugged and sterile.

Lakes.—North America has some of the largest inland seas, or lakes, on the earth, and the chain of great lakes, between British America and the United States, form a remarkable extent of inland navigation. The following are the principal lakes:—

	Area in Sq. Miles
Lake Superior, between Canada and U. S.,	32,000
“ Huron, “ “ “ “	20,400
“ Erie, “ “ “ “	9,600
“ Ontario, “ “ “ “	6,300
“ Michigan, in United States,	22,000

These are connected with each other by straits, or channels, or artificial canals, and by means of the St. Lawrence, open the commerce of a vast region to the Atlantic. Other lakes are,—

	Length in Miles.
Great Slave Lake, in British America,	300
Great Bear, “ “ “	240
Winnipeg, “ “ “	125
Winnepagoos, “ “ “	200
Athabasca, “ “ “	126
Champlain, in United States,	75
Great Salt, “ “	40
Seneca, “ “	40
Pontchartrain, “ “	40
George, “ “	36

Moosehead, in United States,	40
Winnepiseogee, " "	23
Utah, " "	30
Terminos, in Mexico,	70
Tczeuco, "	15
Nicaragua, in Central America,	90

There are numerous smaller sheets of water, especially in the northern part of the great plain between the Rocky and Appalachian chains.

Rivers.—The rivers of North America may be divided, generally, into four classes: 1. Those which flow into Hudson's Bay, the Arctic Ocean, and the waters connected therewith, being all those in British America, north of the St. Lawrence. 2. Those that flow into the Atlantic, mostly from the eastern side or slope of the Appalachian chain. 3. Those which flow into the Gulf of Mexico, either directly or by the Mississippi. 4. Those west of the Rocky Mountains, which flow into the Pacific. Besides these, there are a few rivers, not very large or important, which flow into the great lakes, and a few in the basin between the Rocky and Cascade Mountains, which flow into the lakes of that region, which have no outlet to the ocean.

The following are the principal rivers in North America:—

RIVERS IN BRITISH AMERICA.

Humboldt River flows into Humboldt Lake, 350	

The Mississippi and Missouri are navigable for boats for the distance of about 3,900 miles, measuring by the stream, and their numerous tributaries are also navigable to a great extent, affording facilities of transportation for many thousands of miles. The area of the basin drained by the Mississippi and its tributaries is estimated to be about 1,350,000 square miles.

BOOK LXXVI.

RUSSIAN AMERICA.

Area, about 450,000 square miles; population, estimated at 61,000. The inhabitants are chiefly Indians and Esquimaux, and the Russian Possession is but little else than a fur-trading establishment.

The chief town is Sitka, or New Archangel.

BOOK LXXVII.

DANISH AMERICA

Consists of Greenland and Iceland, neither of which belongs to the American continent, though usually included under the name.

Greenland.—The area of this country is unknown. Its climate and rugged soil has prevented any extensive settlement. The Danish settlements are mostly on the west coast, and of these Upernavik is the northernmost. The population, in 1851, was 9,400, of whom but 250 were Europeans.

Iceland.—Area, about 40,000 square miles; population, in 1851, 60,000.

Chief towns, Reykjavik, the capital, population, 900, and Skalholt.

Spitzbergen, which, in the text, is considered as belonging to America, is now classed with European islands, and is claimed by Russia.

BOOKS LXXVII., LXXVIII.

BRITISH AMERICA.

Hudson's Bay Territory.—Area, 2,190,000 square miles; population, 180,000. This territory is usually

considered as comprising all the territory of North America north of Canada and the United States, except the Russian territory in the north-west, and extending from the Atlantic to the Pacific Oceans, and is bounded by the Arctic Ocean on the north. Labrador, which is attached to the colony of Newfoundland, forms its eastern limit. There are no settlements in the northern and eastern parts, except the fur-trading posts. West of the Rocky Mountains, the government has now resumed control of the territory, and the colony of British Columbia is established there. The fisheries on the east coast of Labrador are profitable, and give employment to hundreds of vessels from the British Provinces and the United States.

BRITISH COLUMBIA.

This colony was established in 1858, the British government resuming the jurisdiction, which it had granted for a term to the Hudson's Bay Company. It extends from the northern boundary of the United States (49th parallel) to Simpson's River, about the 55th parallel, and from the Rocky Mountains to the Pacific. Including Queen Charlotte's Island, which is attached to the colony, the area is about 200,000 square miles. The colony was established in consequence of the discovery of gold, and the great influx of population occasioned thereby.

The gold region, so far as known, is confined to a portion of the course of Fraser River and its tributaries. Hostile Indians have prevented extensive explorations or mining, and the quantity of gold yet produced is not large. But it is believed that rich placers will be found on the table land between the Fraser and Columbia Rivers, and that rich auriferous quartz will be found upon further exploration. Gold has been discovered in Queen Charlotte's Island, but the hostility of the Indians has prevented any prosecution of mining there. It is also said to exist in Vancouver's Island, which lies west of the southern part of the colony, but, though under the same administration, is not called a part of Columbia. The present organization and limits of the colony, it is probable, will soon be changed.

Though far to the north, the climate of Columbia is not so severe as it is east of the Rocky Mountains, and much of the soil is well adapted to agriculture. A considerable portion is well adapted for settlements, and wheat, barley, potatoes, &c., can be grown, while apples and some other fruits will ripen. There is an abundance of timber, and coal exists in extensive fields.

The population is uncertain and fluctuating. The first discovery of gold brought from twenty to thirty thousand immigrants the first year, but many left. The immigration has continued, however, more moderately.

The principal town is Victoria, which has grown up suddenly in consequence of the gold discovery.

CANADA.

Area, (estimated,) 357,822 square miles; population, 2,506,755.

Canada extends along the north of the United States and the great lakes and New Brunswick, from

Labrador and the Gulf of St. Lawrence, to longitude 90° 30' west; its extreme length is about 1,300 miles, and its average width is something less than 300 miles.

Mountains.—The surface of Canada is not much broken by hills and mountain ranges, and Canada West has no elevations that attain to the dignity of mountains, that province being, for the most part, of a level or gently undulating surface, scarcely ever rugged. In Canada East are the Green Mountains, (so called from the thick forests which cover them,) extending from the vicinity of Quebec to the mouth of the St. Lawrence, on the south side of the river, following the course of the river. A similar range rises on the north side of the St. Lawrence. These hills sometimes approach the great river; and form high precipices, overhanging its waters. Farther north are other mountains, as the Mealy Mountains, about 1,500 feet high, and generally covered with snow, and the Watchish Mountains.

Rivers.—Besides the St. Lawrence, which flows from the great lakes through Canada, the principal rivers are the Ottawa, which divides the two provinces, about 750 miles in length, the Saguenay, which runs through the most grand and beautiful scenery, the St. Maurice, the Batiscau, the Chaudiere, and St. Francis. There are numerous smaller rivers, and the country is dotted over with lakes of more or less magnitude.

Canada was formerly divided into two colonies, Canada West, or Upper Canada, and Canada East, or Lower Canada. They are now united under one colonial government, though each retains some of its peculiar laws and customs, and the inhabitants differ in many respects.

Canada West.—Area, 147,822, square miles; population, (1861,) 1,396,091.

Canada West is rapidly progressing in population and wealth. It contains some excellent agricultural country, and the facilities for commerce are excellent. The country about the St. Lawrence and the lakes is being rapidly settled.

Canada East.—Area, 210,000 square miles; population, (1861,) 1,110,664.

This portion of Canada has been longer settled than the upper province, being the territory which was chiefly settled by the French when the country belonged to France; but its progress has not been so rapid as that of Canada West, and it does not offer the agricultural advantages which the latter possesses.

In Canada West the population is principally of English or Irish origin, while in Canada East a majority of the people are of French origin. Protestantism predominates in the former, while the Roman Catholic is the prevailing religion of the latter.

Agriculture is the chief employment of the population, and lumbering next. The forests yield vast quantities of timber. Ship-building, also, is an important branch of industry. Of minerals, gold has been found on the Chaudiere River, and more recently discoveries of it in other places have been reported. Copper is found in the western part, and abounds about Lakes Superior and Huron, where considerable quantities have been mined, and iron, of excellent quality, is found in some localities, but the mines yield

but a small proportion of the products of the country. In 1857, the agricultural products, including animals, were valued at about \$10,000,000; products of the forest, at about \$11,500,000; manufactures, at about \$400,000, and products of the mines, at about \$280,000. There are indications of coal, but no mines are worked.

Education is encouraged, and a common school system is established, supported partly by legislative grant, and partly by local taxation and contribution. In 1856, the amount expended for common schools in Canada West was about \$1,225,000, and in Canada East, about \$1,000,000.

The chief towns are, —

Ottawa, the capital, (selected by the queen, to settle the differences arising from the claims of various cities,) situated on the Ottawa River, formerly called By-town. Population, 14,669.

	Population, (1861.)
Montreal, in Canada East,	90,323
Quebec, " "	51,109
Three Rivers, " "	6,058
Sherbrooke,	5,899
Toronto, in Canada West,	44,821
Hamilton, " "	19,096
Kingston, " "	13,743
London, " "	11,555

The following is the population of Canada by counties, (in addition to the foregoing cities,) according to the census of 1861:—

CANADA EAST, OR LOWER CANADA.

Population.	Population.
Assumption, 17,355	Maskinongé, 14,790
Argenteuil, 12,897	Mégantic, 17,889
Arthabaska, 13,473	Missisquoi, 18,608
Bagot, 18,841	Montcalm, 14,724
Beauce, 20,416	Montmagny, 13,386
Beauharnois, 15,742	Montmorency, 11,136
Bellechasse, 16,062	Napierville, 14,513
Berthier, 19,608	Nicolet, 21,563
Bonaventure, 13,092	Outaouais, 27,757
Brome, 12,732	Pontiac, 13,257
Chambly, 13,132	Portneuf, 21,291
Champlain, 20,008	Quebec, 27,893
Charlevoix, 15,223	Richelieu, 19,070
Chateauguay, 17,837	Richmond, 8,884
Chicoutimi, 10,478	Rimouski, 20,854
Compton, 10,210	Rouville, 18,227
Dorchester, 16,195	Saguenay, 6,101
Drummond, 12,356	Shefford, 17,779
Gaspé and Madeleine	Soulanges, 12,221
Isles, 14,077	St. Hyacinthe, 18,877
Hochelaga, 16,474	St. Jean, 14,853
Huntingdon, 17,491	St. Maurice, 11,100
Iberville, 16,891	Stanstead, 12,258

Kent, 31,183	Welland, 24,988
Lambton, 24,916	Wellington, 49,200
Lanark, 31,639	Wentworth, 31,832
Leeds, 35,700	York, 59,674
Lennox and Addington, 28,002	Algoma, District, 4,916
Lincoln, 27,625	Nipissing, District, 2,094
Middlesex, 48,736	

Total, including cities before given, 1,396,091

Railroad facilities are rapidly multiplying in Canada, and there are now upwards of 2,000 miles in operation and under construction. These railroads open communication, not only with the interior of Canada, but with the North-Western States of the Union, and connecting with the similar works in the United States, connect Canada with the Atlantic at Portland, Boston, and New York. Similar communication with Halifax, Nova Scotia, is in progress.

Not less important to the interests of Canada are the numerous canals, which greatly facilitate commerce. The most important of these are the Rideau and Welland Canals. The Rideau Canal extends from Lake Ontario, at Kingston, to the Ottawa, at Chaudiere, 135 miles, and is capable of receiving vessels of 120 tons burden. The Welland Canal connects Lake Erie with Lake Ontario, around Niagara Falls. It is of sufficient capacity to float vessels of considerable size, and some of the largest lake steamers pass through it. By means of these canals vessels have passed from the lake ports in the Western States to the Atlantic, and one or more have sailed from Europe to Chicago, in Illinois. The amount of tonnage which passes through the Welland Canal is very large. Various other canals facilitate navigation around the rapids of the St. Lawrence and other rivers.

NEW BRUNSWICK.

Area, 27,700 square miles; population, (1851,) 193,800.

New Brunswick is indented by numerous bays, the principal of which is the Bay of Chaleur, 90 miles in length and 15 to 30 miles in width. There are also numerous rivers and creeks, which afford facilities for transportation. The soil in the valleys of the rivers is very fertile, and the country is capable of great agricultural products. The quantity of land under cultivation, in 1851, was 644,000 acres.

The chief products of New Brunswick are from the

fisheries, agriculture, the forest, and mining. Coal is abundant, the coal fields occupying an extent of 10,000 square miles. Iron, copper, plumbago, and manganese also abound.

The chief towns are, —

	Population.
Frederickton, the capital,	4,500
St. Johns,	22,800
St. Andrews,	8,000
Bathurst,	2,000
Liverpool,	

New Brunswick is divided into 14 counties. Internal improvements and railroad facilities are increasing, and several important railroads are already in operation.

NOVA SCOTIA.

Area, (including Cape Breton,) 18,746 square miles; population, (1861,) 530,699.

Nova Scotia is indented with numerous bays, and it abounds in small lakes, while there are also several rivers navigable for some miles. The most remarkable bay is Mines Bay, the eastern arm of the Bay of Fundy, penetrating 60 miles inland. The tides rush into these bays with great impetuosity, and in Mines Bay it sometimes rises from 50 to 70 feet.

Agriculture flourishes, though a considerable portion of the soil is not fertile. In 1851 there were about 540,000 acres under cultivation, 40,000 acres of which was diked land. The chief mineral product is coal, excellent bituminous coal abounding in several parts of the province. In 1850, the quantity of coal produced was about 115,000 chaldrons, and the quantity has gradually increased. Iron ore of excellent quality is also abundant. Native copper and silver are also found in the mountains of the northern part. Large quantities of gypsum are also found.

Gold has been found recently (1861) in Nova Scotia. The first discoveries were in the neighborhood of Tangier. The following is from the report of Mr. Howe, the Provincial Secretary: —

“The Tangier River is a stream of no great magnitude, taking its rise not very far from the sources of the Musquodoboit, flowing through a chain of lakes, which drain, for many miles on either side, a rugged and wilderness country, and falling into the Atlantic about 40 miles to the eastward of Halifax. In this region from 600 to 800 persons have been employed the present summer.

“The lowest depth yet reached is 45 feet, and the largest nugget found is valued at \$300. The gold is got in quartz veins, running through slate or earth, resting upon granite, in the form of scales, jagged and torn bits, like shot or bullets fired against a wall. It is sometimes globular, but seldom completely round. The veins run east and west.

“In June, gold was discovered in the county of Lunenburg, about 60 miles to the westward of Halifax. A peninsula, which forms the western side of Lunenburg harbor, and which stretches from the shire town of that name for five miles into the Atlantic, terminates in a bluff promontory about 40 feet high, with steep cliffs on the eastern side, but on the western

sloping down to a stretch of level land with another bay beyond.

“The quartz veins run in all directions through the promontory, and are visible to the naked eye without labor.”

Gold has also been discovered in other places, though but little that is tangible in regard to the product is given to us.

Nova Scotia is divided in 18 counties. The chief towns are, —

Population, (1851.)	Population, (1851.)
Halifax, capital, 26,000	Annapolis, . . . 1,200
Pictou, . . . 2,000	Ariehat, . . . 1,200
Antigonish, . . . 1,500	

Pictou, Windsor, Digby, and Sidney, population each about 1,000.

Cape Breton, an island north-east of Nova Scotia, forms a part of the province. Area, 3,122 square miles; population, about 55,000. Sidney and Ariehat are on the island.

ISLAND OF NEWFOUNDLAND.

Area, 57,000 square miles; population, (1851,) 101,600.

The climate and soil of Newfoundland are not favorable to agriculture, and the chief employment of the inhabitants is in the fisheries. Large quantities of fish and of seal skins are exported.

Chief town, St. John's; population, (1852,) 21,000.

Trinity Bay, on the eastern shore of the island, is the place of the western terminus of the Atlantic telegraph cable, by which communication was had for a short time with Europe, by way of Ireland, from which this part of the island is about 1,650 miles distant.

PRINCE EDWARD'S ISLAND.

Area, 2,100 square miles; population, (1854,) 90,000.

This island, in the Gulf of St. Lawrence, east of New Brunswick and north of Nova Scotia, has a climate milder than that of the main land, and the soil is excellent, rendering it a fine agricultural country. It has no valuable minerals. It is sometimes considered as a dependency of Canada, but has a separate government. The principal town is Charlottetown, the capital; population, 4,800.

OTHER BRITISH NORTH AMERICAN ISLANDS.

Anticosti, a desert island, at the mouth of the St. Lawrence. Area, 2,600 square miles.

Magdalen Isles, a chain of small islands in the Gulf of St. Lawrence. Population, 2,000.

Bermuda Isles. About 300 small islands, containing an area of about 20 square miles, situated in the Atlantic Ocean, 600 miles east of South Carolina. Many of the islands are not habitable. Others produce fruits and vegetables, of both tropical and temperate regions, in abundance.

Vancouver's Island, west of British Columbia, in the Pacific, contains an area of 16,000 square miles. It has some small settlements, and from its position and natural advantages will grow with that new colony.

BOOKS LXXIX.—LXXXII.

THE UNITED STATES.

The United States comprise the central portion of North America, extending from the Atlantic Ocean to the Pacific, and from the Gulf of Mexico to the great lakes, or from latitude 24° 30' to latitude 49°. The average length of the territory, from east to west, is about 2,400 miles, and the average breadth, from north to south, is 1,300 miles. The greatest length is 2,700 miles, and greatest breadth 1,600 miles. The area is 2,936,166 square miles. All this territory lies within the temperate zone, and has a variety of climate, from the almost tropical heat of the southern portion, to the more rigorous but not unpropitious climate of the north. It is greatly diversified in its surface, and affords a great variety of soil.

Topographically, the territory of the United States is divided, by the Appalachian chain and the Rocky Mountains, into three grand sections, viz., the Atlantic slope, the Pacific slope, and the Mississippi valley. The Atlantic slope, lying between the Appalachian chain and the Atlantic Ocean, extends from Maine to Alabama, and varies from 75 to nearly 300 miles in width. The Pacific slope, lying between the Rocky Mountains and the Pacific Ocean, extends through the whole territory from north to south, and is from 600 to 1,000 miles in breadth. This slope is, however, broken and divided by several mountain ranges, as the Coast Range, and the chain called Sierra Nevada, in California, and Cascade Mountains, in Oregon and Washington Territory. The Mississippi valley comprises all the vast territory lying between the Rocky Mountains and the Appalachian chain, which is drained chiefly by the Mississippi and its tributaries, and extends through 18 degrees of latitude, and from 800 to 1,600 miles in breadth. On the north, this section rises to a table land, of an average elevation of about 1,500 feet above the sea, varying from 800 to 1,900 feet. From this table land the waters flow, in various directions, towards the Great Lakes and Hudson's Bay, but chiefly towards the great valley of the Mississippi. In some parts of the great valley are chains of low mountains and ridges, sufficient to diversify the surface, but not dividing it into distinct topographical sections. Towards the west, the valley rises almost imperceptibly towards the Rocky Mountains, at the base of which it is about 7,500 feet above the sea. The southern portion of the valley is low, and towards the Gulf it is for the most part a vast swamp or marsh.

Mountains.—The Rocky Mountains form the most extensive range in the United States, extending through the country, from north to south. Near the Pacific coast is a chain of mountains stretching from the Straits of Juan de Fuca to about the 34th degree of north latitude, where it joins the Sierra Nevada, in the south part of California. As a range, they run parallel to the Pacific. East of this is a lofty chain, bearing the name of the Cascade Range, in Washington and Oregon Territories, and Sierra Nevada, in California. The greatest ascertained heights in the United States are in this chain. Mount Shaste, Mount St.

Helen's, Mount Hood, and Mount Rainier rise to heights varying from 12,000 to 14,000 feet. This chain extends from Russian America to the southern extremity of Old California, at an average distance from the sea of 100 to 150 miles, and has a mean elevation of 5,000 or 6,000 feet. Between the Cascade and Rocky Mountains are several groups, called Blue, Humboldt, and Wahsatch Mountains. The Rocky Mountains also run parallel to the Pacific, at distances varying from 450 to 850 miles, within the territory of the United States, and attain, in Fremont's Peak, (the highest known summit,) an elevation of 13,570 feet. The great Appalachian range extends, with some breaks, from Maine to Alabama. This is not a high range, though Mount Katahdin in Maine, Mount Washington in New Hampshire, Mount Mansfield in Vermont, and Mount Marcy in New York, reach severally the heights of 5,000, 6,234, 4,280, and 5,460 feet. South of New York, this range and its outlying ridges are mostly within an elevation of 2,000 feet, though the peaks of Otter and White Top, in the southern part of Virginia, and Black Mountain, or Mount Mitchel, in North Carolina, (the highest land east of the Mississippi) rise from 4,000 to 6,476 feet, but in no case do the summits reach the line of perpetual snow.

Rivers.—Through the middle of the territory of the United States, from the summit of the great table-land of Minnesota, runs the Mississippi for 3,000 miles, "like the trunk of a vast tree, with its roots in the Gulf of Mexico, and its branches extending east to the Alleghanies, and west to the Rocky Mountains, receiving the tributes, of perhaps, 100 important affluents," some of which, such as the Missouri, Arkansas, and Red Rivers (including South Fork) from the west, and the Ohio from the east, are streams of the first class in point of magnitude and volume of water.

These rivers are severally, in the order named, about 2,900, 2,000, 2,000, and 1,000 miles in length, and many of the secondary tributaries have courses of from 300 to 1,000 miles. The country drained by the Mississippi reaches from Western New York and Pennsylvania on the east, to the summits of the Rocky Mountains on the west, and from the 49th parallel of north latitude to the Gulf of Mexico. The rivers of the Alleghany slope of the most importance, are, beginning in Maine, the Penobscot, Kennebec, Connecticut, Hudson, Delaware, Susquehanna, Potomac, Chowan, Roanoke, Pamlico, or Tar River, Neuse, Cape Fear, Great Pedee, Santee, Savannah, and Altamaha. These are rivers of at least 300, and some 600, miles in length, and are more or less navigable, some for vessels of the largest class 100 miles or more, all of them flowing directly into the Atlantic, or into bays opening into that ocean. The southern slope, towards the Gulf of Mexico, has also several large rivers, independent of the Mississippi, as the Appalachian and Mobile, with their large tributaries on the east of the Mississippi, and the Sabine, Trinity, Brazos, Colorado, and Rio Grande del Norte, west of that river. These streams vary in length, including their main affluents, from 300 to 1,800 miles, and are navigable by steamboats from 100 to nearly 500 miles. The Rio Grande forms the boundary between Texas and Mexico.

The Pacific slope has but one great river flowing through the Cascade Mountains into the ocean. This is the Columbia, a river of 1,500 miles in length, and with several important affluents from 300 to 800 miles in length. There is but one other great opening into the territory of the United States from the Pacific, viz., the channel, or strait, from one to two miles in width, leading into the Bay of San Francisco, which receives the Sacramento and San Joaquin Rivers, each about 300 miles in length. The Colorado of the West, entering the Gulf of California, drains the eastern and south-eastern portions of the great basin between the Rocky and Sierra Nevada Mountains.

Lakes.—The whole of the United States, north of the 42d parallel of latitude, is dotted over with sheets of water, from a few miles circuit, to those inland seas which separate British America from the United States. There are five of these, viz., Lakes Ontario, Erie, Huron, Superior, and Michigan, the latter only being wholly within the limits of the United States. These vast lakes are navigated by steamers of the highest tonnage, and by sailing vessels of large capacity, affording a continuous navigation of 1,100 miles, and, by aid of the Welland Canal around the Falls of Niagara, and that around the Saut St. Mary, (recently completed,) furnish an inland ship navigation of 1,600 miles. These lakes cover areas of from 6,300 to 32,000 square miles each, or a total of 90,000 square miles.

The United States consist of thirty-four States, composing the Federal Union, to which belong the outlying territories, not yet formed into states, but organized as seven territories, and the District of Columbia. The limits of this Appendix will not admit of a detailed account of each State, but statistics of the more important subjects will be found succinctly given in the following tables.

According to geographical situation, the States are usually arranged as follows:—

NEW ENGLAND, OR EASTERN STATES.

	Area in Sq. Miles.	Total Population.	Pop. to Sq. Mile.	No. of Counties.
Maine, . . .	30,000	628,279	20.94	16
New Hampshire, . . .	9,280	326,073	35.14	10
Vermont, . . .	9,056	315,098	34.79	14
Massachusetts, . . .	7,800	1,231,066	157.83	14
Rhode Island, . . .	1,306	174,620	133.71	5
Connecticut, . . .	4,674	460,147	98.45	8

NORTHERN, OR MIDDLE STATES.

New York, . . .	46,000	3,880,735	84.36	60
New Jersey, . . .	8,320	672,035	80.77	21
Pennsylvania, . . .	46,000	2,906,115	63.18	65
Delaware, . . .	2,120	112,216	52.93	3

SOUTHERN STATES.

Maryland, . . .	9,356	687,049	73.43	22
Virginia, . . .	61,352	1,596,318	26.02	148
North Carolina, . . .	45,000	992,622	22.06	87
South Carolina, . . .	24,500	703,708	28.72	30
Georgia, . . .	58,000	1,057,286	18.23	137
Florida, . . .	59,268	140,425	2.37	37
Alabama, . . .	50,722	964,201	19.01	52

	Area in Sq. Miles.	Total Population.	Pop. to Sq. Mile.	No. of Counties.
Mississippi, . . .	47,156	791,305	16.78	60
Louisiana, . . .	46,431	708,002	15.25	48
Texas, . . .	237,321	604,215	2.55	151

WESTERN STATES.

Ohio,	39,964	2,339,502	58.54	88
Indiana,	33,809	1,350,428	39.93	72
Illinois,	55,405	1,711,951	30.90	103
Michigan,	56,243	749,113	13.32	62
Wisconsin,	53,924	775,881	14.39	58
Iowa,	55,045	674,948	12.26	99
Minnesota,	83,531	173,855	2.08	64
Kansas,	uncertain	107,206	41
Kentucky,	37,680	1,155,684	30.67	109
Tennessee,	45,600	1,109,801	24.34	84
Missouri,	67,380	1,182,012	17.54	113
Arkansas,	52,198	435,450	8.34	54

PACIFIC STATES.

California,	188,982	379,994	2.01	44
Oregon,	95,274	52,465	.55	19

Principal cities and towns, and population. Capital cities in Italics.

MAINE.

	Population.
<i>Augusta</i> , on the Kennebec River,	7,609
Portland, (chief seaport,) on Casco Bay,	26,341
Bangor, on the Penobscot River,	16,407
Bath, on the Kennebec,	8,076
Eastport, on Passamaquoddy Bay,	

NEW HAMPSHIRE.

<i>Concord</i> , on the Merrimack,	12,000
Manchester, manufacturing town, on the Merrimack,	20,109
Portsmouth, only seaport, on the Piscataqua,	9,335
Dover, manufacturing town, on the Cochecho,	8,502
Nashua, " " on Merrimack,	10,065

VERMONT.

<i>Montpelier</i> ,	2,411
Burlington, on Lake Champlain,	7,714
Brattleboro', on the Connecticut,	3,855
Windsor, " "	1,669

MASSACHUSETTS.

<i>Boston</i> , on Massachusetts Bay,	177,818
Cambridge, ^a near Boston,	26,060
Charlestown, ^a " "	25,063
Chelsea, ^a " "	13,395
Roxbury, ^a " "	25,137
Lowell, manufacturing, on the Merrimack,	36,827
Lawrence, " " "	17,639
Lynn, shoe manufacturing, near Salem,	19,083
Newburyport, commercial and manufacturing, near the mouth of the Merrimack,	13,401
Salem, commercial, on Massachusetts Bay,	22,252
Worcester, in the central part,	24,960
Springfield, on the Connecticut,	15,199

^a These four cities (Cambridge, Charlestown, Chelsea, and Roxbury) might properly be considered a part of Boston, with which they are joined (except Chelsea) as closely as if they were but one continuous city. The combined population would be 267,467.

	Population.
New Bedford, commercial,	22,300
Fall River, " and manufacturing,	14,026

MINERAL PRODUCTS IN THE UNITED STATES IN 1860.

	Value.
Iron ore mined, . . . 2,514,282 tons, ^a	\$19,487,790
Copper, 14,432 "	3,316,516
Lead,	977,281
Zinc, 11,800 tons,	72,600
Nickel,	28,176
Coal, Anthracite, . . . 9,398,332 tons.	
" Bituminous, . . . 5,775,077 "	
Aggregate, 15,173,409 "	
Aggregate value,	19,365,765

Gold, the production of the United States, deposited at the U. S. Mint and its branches, during the year ending June, 1861, \$34,216,889 52

Of this, \$31,800,000 was from California, and \$2,000,000 from Kansas or Nevada.

Silver, the production of the United States, deposited at the mint and its branches during the same period, \$610,011 20

These statistics do not show the real product of the precious metals produced in the United States, nor does the foregoing statement relative to other metals appear to be complete, though taken from the preliminary report on the eighth census.

Statistics of Coal produced in the United States during the year ending June 1, 1860.

STATES.	Bituminous.		Anthracite.	
	Bushels.	Value.	Tons.	Value.
Rhode Island,	95,000	\$28,500	1,000	\$5,000
Pennsylvania,	66,994,295	2,833,859	9,397,332	11,869,574
Maryland,	14,200,000	464,338		
Ohio,	28,339,900	1,539,713		
Indiana,	379,035	27,000

Missouri,	97,000	8,200		
Kentucky,	6,732,000	476,800		
Virginia,	9,542,627	690,188		
Georgia,	48,000	4,800		
Alabama,	10,000	1,200		
Tennessee,	3,474,100	413,662		
Washington Territory,	134,350	32,244		
	144,376,927	7,491,191	9,398,332	11,874,574
Anthracite — tons,		9,398,332		\$11,874,574
Bituminous — tons,		5,775,077		7,491,191
Aggregate tons,	15,173,409			\$19,365,765
Value of coal mined in 1850,				7,173,750
Increase, (169.9 per cent.,)				12,192,015

^a Of the whole quantity of iron, Pennsylvania produced 62.5 per cent. Pennsylvania also produced the whole of the nickel and zinc given above. That state also produced 75.9 per cent of all the coal, in value.

LEADING AGRICULTURAL PRODUCTIONS FOR THE YEAR ENDING JUNE, 1860.

Indian Corn,	830,451,707 bushels.
Wheat,	171,183,381 "
Oats,	172,554,688 "
Rye,	20,976,286 "
Buckwheat,	17,664,914 "
Barley,	15,635,119 "
Rice,	187,140,173 "
Peas and Beans,	15,188,013 "
Potatoes, (Irish,)	110,571,201 "
" (Sweet,)	41,606,302 "
Tobacco,	429,390,771 pounds.
Hops,	11,010,012 "
Wool,	60,511,343 "
Flax,	3,783,000 "
Hemp,	17,300 tons.
Hay,	19,129,128 "
Butter,	460,509,854 pounds.
Cheese,	105,875,135 "
Orchard products, (value,)	19,759,361 dollars.
Market garden "	15,300,885 "
Cotton, (ginned,)	5,198,077 bales, of 400 lbs. ea.
Sugar, (cane,)	302,205 hhd., 1,000 lbs. "
" (maple,)	38,863,884 pounds.
Molasses, (all kinds,)	25,516,699 gallons

Lands improved,	163,261,389 acres.
Cash value of farms,	6,650,872,507 dollars.
Value of farming implements and machinery,	247,027,496 "
Value of live stock,	1,107,490,216 "
Value of animals slaughtered,	212,032,055 "

Of the agricultural productions above named, it will be seen by the following table (page 692) that the state of Illinois is by far the greatest producer of Indian corn and wheat, the quantity produced in 1860 being upwards of 115,000,000 bushels of Indian corn, and 24,000,000 bushels of wheat. Wisconsin, Indiana, and Ohio are the next largest producers of wheat, and Missouri, Ohio, and Indiana the next largest producers of Indian corn.

South Carolina and Florida produce the greater part of the rice, the former producing more than 119,000,000 bushels, and the latter upwards of 52,000,000 pounds. Virginia and Kentucky are much the largest producers of tobacco. The largest cotton-growing states are Mississippi, producing nearly 1,200,000 bales, (of 400 lbs. each;) Alabama, producing nearly 1,000,000 bales; Louisiana, producing more than 722,000 bales, and Georgia producing about 702,000 bales. Ohio, New York, and Pennsylvania are the largest wool-growing states, but other states at the west are likely soon to surpass them. California is very rapidly developing as a wool-growing state, as well as a large producer of other agricultural products.

^a Of 400 pounds each.

LEADING MANUFACTURES, AND THE VALUE OF PRODUCT OF EACH, FOR THE YEAR ENDING JUNE 1, 1860.

	Value, in Round Numbers.
Flour and meal,	\$224,000,000
Cotton goods,	115,000,000
Lumber,	96,000,000
Boots and shoes,	90,000,000
Leather, including morocco and patent leather,	72,000,000
Clothing,	70,000,000
Woolen goods,	69,000,000
Machinery, steam engines, &c.	47,000,000
Printing — book, job, and newspaper,	42,000,000
Sugar refining,	38,500,000
Iron founding,	28,500,000
Spirituos liquors,	25,000,000
Cabinet furniture,	24,000,000
Bar and other rolled iron,	22,000,000
Pig iron,	19,500,000
Malt liquors,	18,000,000
Agricultural implements,	17,800,000
Paper,	17,500,000
Soap and candles,	17,000,000

Value of Sawed and Planed Lumber produced during the year ending June 1, 1860.

IMPORTS AND EXPORTS.

The following table shows the value of the imports into the United States, and the value of the exports of domestic produce and foreign merchandise, for the year ending June 30, 1860.

COUNTRIES.	IMPORTS.	EXPORTS.		
		Foreign Merchandise.	Domestic Produce.	Total.
Great Britain—England,	\$133,064,713	\$5,831,248	\$187,095,952	\$192,927,200
Scotland,	4,607,187	137,206	4,867,218	5,004,424
Ireland,	923,726	111,711	4,297,586	4,409,297
Total Great Britain,	138,595,626	6,080,165	196,260,756	202,340,921
France,	43,218,094	3,158,047	58,048,231	61,206,278
British East Indies,	10,692,342	128,953	1,111,697	1,240,650
Philippine Islands,	2,886,166	73,265	368,209	441,474
Cuba,	34,032,277	634,956	11,747,913	12,382,869
Porto Rico,	4,512,188	263,913	1,517,837	1,781,750
Two Sicilies,	2,384,577	26,458	484,190	510,648
Hayti,	2,062,723	231,777	2,441,905	2,673,682
New Granada,	3,843,568	152,699	1,642,800	1,795,499
Venezuela,	2,883,464	91,650	1,056,250	1,147,900
Brazil,	21,214,803	335,020	5,945,235	6,280,255
China,	13,566,587	1,735,334	7,170,784	8,906,118
All other countries,	82,271,526	14,020,785	85,393,467	99,414,252
Total,	362,163,941	26,933,022	373,189,274	400,122,296

Of the exports in the year named, the following were the principal :—

Products of agriculture, (value,)	\$48,451,894
“ the forest,	13,738,559
“ manufactures,	39,803,080
Cotton,	191,806,555
Tobacco,	15,906,547
Specie and bullion,	23,799,870

For the year ending June 30, 1861, the exports of cotton fell to \$34,051,483, and the exports of agricultural produce rose to \$101,655,833.

Tonnage of the merchant marine of the United States, for the year ending June, 1861, —

Registered sail tonnage,	2,540,020
“ steam tonnage,	102,608
Enrolled and licensed sail tonnage,	2,122,589
“ “ steam tonnage,	774,596

Total tonnage, 5,539,813
Estimated value of aggregate tonnage, \$221,592,520

Total population,	7,853,394	Total population,	703,189

Of the population, about four sevenths are Indians, two sevenths of mixed origin, and one seventh native whites or creoles.

Mexico is sparingly watered, and has no navigable rivers of importance. Along the coast of the Gulf of Mexico there are scarcely any indentations, and the Gulf Stream sweeps near the shore, causing a constant change of the sands, creating bars and filling channels, so that on the whole coast there is no safe and commodious harbor.

The mines, which were once considered the great source of the wealth of Mexico, have become of less importance. Those which were once the richest are now exhausted. Silver is most abundant, though gold is found to some extent. The disturbed political condition of the country has seriously interfered with mining enterprise, but within the last ten years the yield of the mines has increased, and but for the greater temptation offered to miners in California, would have increased still more. The amount of gold coined in 1850, was \$1,351,400, and of silver, \$27,003,989. In 1850, valuable quicksilver mines were discovered in Sonora.

New Mexico and Upper California, as well as Texas, which are included in Mexico in the text, now belong to the United States. The extent of territory thus lost to Mexico was, New Mexico and California, 530,000 square miles, Texas, 325,000 square miles. Yucatan separated from Mexico in 1846, but has since rejoined the confederation. The Central American states, which are also included in Mexico in the text, are independent republics.

BOOK LXXXV.

CENTRAL AMERICA.

The Central American states are Guatemala, San Salvador, Honduras, Nicaragua, and Costa Rica.

Guatemala.—Area, 44,500 square miles; population, estimated at 1,000,000, only 7,000 or 8,000 of whom are whites, the remainder being Indians and

Mestizos. One of the most important articles now produced in Guatemala is cochineal, of which the quantity produced is nearly equal to the entire consumption of that article. Cocoa, tobacco, indigo, and cotton are also produced.

The capital and chief town is New Guatemala. Population, estimated at 35,000 to 50,000.

San Salvador.—Area, 7,500 square miles. Population, 280,000. This state is well watered, and the soil is fertile. The productions are coffee, tobacco, cotton, sugar, and indigo, the last of which is the most important crop. Excellent iron ore was formerly mined and smelted, but the mines are no longer worked.

The chief town and capital is San Salvador, the population of which, previous to 1854, was about 18,000, but in that year the town was almost wholly destroyed by an earthquake.

Honduras.—Area, about 33,000 square miles; population, about 350,000. It has some extensive forests of fine timber, including cedar and mahogany, but it is not an agricultural country. Gold, silver, lead, and copper are found, the two former often combined. Its mineral wealth was formerly better developed than now.

The chief towns are Comayagua, the capital, population, estimated, 12,000, and Truxillo, the principal port, population, 4,000.

Nicaragua.—Area, about 39,000 square miles; population, 235,000. Much of the soil of Nicaragua is well adapted for agriculture, but the unsettled condition of the people, by reason of revolutions and civil wars, has rendered its agriculture of little account. Cotton of superior quality has been grown here, but its culture is now almost wholly neglected. Coffee, cocoa, and sugar are also produced. Gold, silver, and copper are said to exist in some quantities, but they are not mined or explored. A route for travel from the Atlantic to the Pacific has been opened via Lake Nicaragua, and a canal has been contemplated, but political troubles have prevented the prosecution of such enterprises.

The chief towns are Leon, the capital, population, 30,000, formerly one of the finest towns in Central America, but greatly damaged by civil commotions; Nicaragua, population, about 8,000.

Costa Rica.—Area, about 16,500 square miles; population, 150,000. The climate of Costa Rica, except on the seacoast, is fine and healthy. The country produces some of the fruits and vegetables of both the temperate and the tropical regions, and the soil is excellent. Coffee is now grown to a considerable extent, from 50,000 to 60,000 quintals being exported annually, but the country is capable of vastly greater agricultural products.

Costa Rica contains some rich gold mines, but they are worked but little. Silver and copper are also found there, but the product of these is of little account.

The chief towns are San Jose, the capital, population, 18,000, and Puntas Arenas, the principal port.

Belize, or British Honduras.—Area, about 15,000 square miles; population, 10,000. The greater part of the population are blacks and Indians.

The chief town and capital is Balize, on a small river of the same name. The exports are mahogany, cochineal, sarsaparilla, and cocoa-nuts.

BOOK LXXXVI.
SOUTH AMERICA.

Area, 6,500,000 square miles; population, about 17,000,000. The greatest length of South America is 4,550 miles, and its greatest breadth 3,250 miles. About three fourths of the entire peninsula are within the tropics, and the remainder in the southern temperate zone. It may be divided into five distinct physical regions, as follows: 1. The extensive plains of the basin of the Orinoco, which are generally destitute of wood, but covered with tall herbage for a part of the year, and excessively hot in the dry season. 2. The basin of the Amazon, covering an area of about 2,000,000 square miles, covered with dense forests of luxuriant growth, and very fertile, but thinly inhabited. 3. That part of Brazil east of the Parana and Araguay Rivers, covered with wood on the Atlantic side, and opening into plains or steppes in the interior, and traversed to some extent by mountain ranges. 4. The plains watered by the Rio de la Plata, an extensive region abounding in steppes, and affording sustenance for innumerable herds of cattle and horses. 5. The low country between the Andes and the Pacific, stretching the whole length of the peninsula, and from 50 to 100 miles in width, the extremities of which are fertile, and the middle a desert.

Mountains.—The great physical feature of South America is its succession of mountain ranges, stretching from its southern extremity to its northern limit, and connecting, through the Isthmus of Panama and Central America, with the Cordilleras and Rocky Mountains of North America. These mountains extend over 4,500 miles, bearing the general name of the Andes, though composed of successive ranges, with numerous lateral chains. Between 6 and 33 degrees south, the Andes spread to a width of 200 to 300 miles; north of the sixth parallel they are narrower, and form elevated plateaus, one of which is known as the Desert of Asuay, which is 13,000 feet above the sea, and covers an area of 50 square miles. On another plateau, 9,500 feet high, is built the city of Quito. North of this, the mountains divide into three distinct and diverging ranges. One of these, the Cordilleras of the coast, finally turns to the east, and runs about 700 miles to the vicinity of the Gulf of Pavia. Another transverse range starts from the Andes, between three and four degrees north, and extends to French Guiana, near the mouth of the Amazon. The mean height of both of these ranges is about 4,000 feet, though some peaks rise to a much greater height. A third transverse range extends across the continent, between 12 and 18 degrees south, and connects with the Brazilian Mountains, dividing the basin of the Amazon from that of La Plata. The Brazilian Mountains extend parallel to the coast, from 5 degrees to 25 degrees south. They are a series of ridges and plateaus, with a few elevated summits, and spread to a width of nearly or quite a thousand miles.

The mean height of the Andes is, in Peru, about 12,000 feet; in Chili, about 8,000 feet; in Patagonia the height is unknown. Some of the highest peaks are as follows:—

In New Grenada. Feet high.
Tolima, 18,270

In Ecuador. Feet high. Feet high.
Chimborazo, 21,440 Cayamba, 19,535
Antisana (volcano), 19,150 Cotopaxi (volcano), 18,890

In Chili.
Aconcagua (volcano), 23,200 ft., the highest volcano known.
Antuco (volcano), . 16,000 Maypu (volcano), 15,000 ft.

Other peaks are from 13,000 to 18,000 feet high. The highest summits in the Cordilleras of the coast are Sierra de Merida, 15,300 feet high, and Silla de Caracas, 8,400 feet high. The highest summit of the Brazilian Mountains is Itacolumi, 5,710 feet in height. It is supposed that there are at least 30 volcanoes in South America, all in the Andes, the highest of which are given above, and are the highest volcanoes in the world.

Lakes are few in South America. The largest is Lake Titicaca, on the borders of Peru and Bolivia, 12,800 feet above the sea, and covering an area of 4,000 square miles.

Rivers.—South America rivals North America in rivers. They all flow into the Atlantic Ocean and Caribbean Sea, there being no river of any consequence west of the Andes. The two great river systems are those of the Amazon and the La Plata, which, with their tributaries, water the greater part of the continent, and afford means of transportation through thousands of miles. It is stated that the greater part of the Amazon, from the Andes to the Atlantic, is uninterrupted by any cataract or serious rapid. Some of the principal rivers, with their length, are as follows:—

RIVERS IN SOUTH AMERICA.	
	Miles.
Amazon,	4,000
Araguay,	1,000
Beni,	2,000
Caqueta,	1,200
Essequibo,	500

Vermejo,	750
Xingu,	1,300
Yapura,	1,000

The present political divisions of South America differ somewhat from those given in the text. They are the republics of New Grenada, Ecuador, and Venezuela, French, English, and Dutch Guiana, the empire of Brazil, the republics of Peru, Chili, Bolivia, the Argentine Republic, the republics of Paraguay and Uruguay, Patagonia; and to these may be added Terra del Fuogo and the Falkland Islands.

BOOK LXXXVII.

NEW GRENADA.

Area, estimated at 480,000 square miles; population, (1853,) 2,363,054. Of the population, about one fourth are whites, more than one half of mixed races, and the remainder Indians and negroes.

New Grenada joins Costa Rica in Central America, and includes the Isthmus of Panama. It borders on the Caribbean Sea on the north, and the Pacific Ocean on the west. It is diversified in its surface, soil, and climate, and though the lower country is hot and unhealthy, there are higher regions more temperate, but fertile, and producing the vegetables of the temperate zone. The resources of the country are as yet but little developed, and the more healthy regions but little improved or settled. In minerals, the country is said to be rich, platina, gold, and silver existing there, and on the Isthmus of Panama, iron and copper, but the mining is not pursued with any enterprise. The agriculture and manufactures of the country are also limited, the former being confined chiefly to raising cattle and horses, immense herds of which are pastured on the llanos, or plains.

The chief towns are, —

Population.	Population.
Bogota, the capital, 45,000	Santa Martha, . . . 8,000
Popayan, . . . 20,000	Panama, 6,000
Carthagena, . . . 18,000	Aspinwall, 2,500

The last two are connected by the only railroad in the country, which forms the connecting link between the Atlantic and Pacific. Aspinwall is essentially an Anglo-Saxon town, being founded chiefly by citizens of the United States.

ECUADOR.

Area, 240,000 square miles; population, 500,000. The Indians form a large part of the population.

This state embraces every variety of climate, which ranges from the insufferably hot, on the low tract, to the temperate on the table lands and valleys between the mountain ranges, and the cold on the still higher mountain regions, where may be found perpetual snow. In Ecuador the Andes branch into two distinct ranges, each of which has many lofty peaks. Chimborazo, Cayambe, Antisana, Cotopaxi, and other lofty

mountains, are within the limits of Ecuador. The cultivated land lies chiefly in the valley which extends between the two mountain ranges, and its average height is about 9,000 feet above the sea, though at its southern extremity it is not more than 2,000 feet above the sea. Gold and silver have been found in some parts of the country, but little attention is given to mining, except iron and copper, which are mined to a moderate extent.

The agricultural products are wheat, which attains the greatest perfection in the high valleys, maize, cotton, sugar cane, rice, and pepper. The cocoa tree flourishes in some parts of the state, and on the low lands are vast forests, and a variety of tropical fruits.

The chief towns are, —

Population.	Population.
Quito, the capital, 70,000	Cuenca, 20,000
Guayaquil, the chief port, 20,000	Ibarra, 12,000
Riobamba, near the site of a former town of the same name, which was destroyed by a flood caused by a volcanic eruption.	

VENEZUELA.

Area, 420,000 square miles; population, (1854,) 1,419,289.

The whites compose about one fourth part of the population, the remainder being Indians, negroes, and mixed races. The domesticated Indians form about one sixth part. Included in the above number are about 50,000 independent Indians.

The mountains do not form so important a feature in this state as in the two preceding. The east range of the Andes, sometimes also considered a part of the coast range of the Cordilleras, stretches transversely to the main direction of the chain, and runs about 300 miles into Venezuela, forming a rugged mass of rocks. The highest peak is the Nevado de Merida, 15,300 feet high. There are other mountains, unexplored, in the southern part of the state.

The llanos or plains of Venezuela cover about 150,000 square miles. In the wet season large portions of them are flooded by the rivers, and in the dry season they are a parched and barren desert.

Venezuela is well watered by navigable rivers, the Orinoco and its tributaries affording extraordinary facilities for communication and transportation. Much of the country in the valleys of these rivers is fertile, and abounds in sources of wealth.

Gold was formerly found in considerable quantities, but the old mines appear exhausted. Silver has been found, but the mines have not been fully explored. Copper mines have proved more productive and profitable. There are also extensive beds of excellent bituminous coal in the coast districts, and an abundance of petroleum.

The lower regions of Venezuela abound with tropical vegetation and fruits, and in the higher regions the cereals of the temperate zone flourish. One of the chief productions is cocoa, or cacao. Cotton, coffee, sugar cane, and indigo are also extensively cultivated. Large herds of cattle are raised, and hides, with the pro-

ductions above named, form the chief articles of export.

The chief towns are, —

Population, (1853.)	Population, (1853.)
Caracas, the capital, 63,000	Angostura, . . . 8,000
Maracaybo, . . . 8,500	Barcelona, . . . 15,000
La Guayra, . . . 8,000	Valencia, . . . 17,000
Cumana, . . . 6,500, (once 30,000.)	

BOOK LXXXVIII.

PERU.

Area, 370,000 square miles; population, (1851,) 2,279,085. About one fourth of the population are white, one half Indians, and the remainder of mixed races.

The present republic of Peru comprises but a part of the territory which formerly went under that name, the republic of Bolivia having been set off, as also parts of the present republics of Chili, Ecuador, and the Argentine Republic.

The Andes are estimated to occupy nearly 200,000 square miles of the area of Peru. Between the mountains and the coast only some of the transverse valleys are really habitable, the greater part of the country being rugged and barren. The region which is most inhabited is the higher sierras or table lands of the mountain region. East of the mountains are boundless plains, watered by the tributaries of the Amazon, and but little known. The average height of the western, or coast range, of the Andes, is 15,000 feet, and of the eastern range, or Andes proper, 17,000 feet. Chuquibamba and Omati are the highest peaks. Between the two ranges are the sierras, or table lands, from 8,000 to 14,000 feet above the sea, where the fruits and cereals of the temperate zone flourish. In the lower valleys and east of the mountains, the tropical fruits and plants grow in great perfection. Agriculture, however, is in a very low condition.

The gold and silver mines of Peru were formerly considered inexhaustible, and capital and intelligent labor would probably make them very productive. The gold mines or diggings are of little consequence compared with California or Australia, and the silver mines are so situated among the mountains that they cannot well be worked by machinery. The annual produce of silver is five or six million dollars. Coal is found at a great height.

Political commotions and revolutions, as well as the character of the people, retard the development of the agricultural and mineral resources of the country.

The *Chincha Islands*, lying off the coast of Peru, about 150 miles from Lima, have of late years afforded the most valuable article of export from Peru, viz., guano, large quantities of which have been shipped for manure to Europe and the United States.

The chief towns are, —

Population, (1850.)	Population, (1850.)
Lima, the capital, 100,000	Cuzco, 41,152
Arequipa, . . . 35,000	Huanta, . . . 26,300
Callao, 8,135	Pasco, 10,000

BOLIVIA.

Area, 374,000 square miles; population, 1,030,000. Hardly one third of the population is white, the remainder being Indians and Mestizos.

The republic of Bolivia is almost wholly in the interior of South America, and mostly east of the Andes; having Brazil on the south and east, La Plata on the south, and Peru on the west, except for a space of about 250 miles, where it bounds on the Pacific Ocean. It was formerly called Upper Peru.

Bolivia possesses the greatest variety of soil and climate, from tropical heat to the temperature of perpetual snow, and from the most luxuriant vegetation to barren deserts. The western part is a region of immense mountains, the Andes attaining their greatest height in Bolivia. Among the highest peaks here are Sorata, Illimani, Lahama, Gualateira, Parinacota, Huayna, and Pomarapi. Between the ranges of the Andes is a great plateau, in which is Lake Titicaca, 12,000 feet above the sea. In the eastern part are valleys and plains, covered with the richest of vegetation. On the sierras, the fruits and grains of Europe are grown; on the lower plains, coffee, cacao, cotton, indigo, tobacco, &c.

The minerals of Bolivia are gold and silver, in moderate quantities, rich mines of tin, and pure copper. The difficulty of transportation to the coast prevents the exportation of the latter ores.

The chief towns are, —

Population.	Population.
Chuquisaca, or La Plata, the capital, 12,000	Cochabamba, . . 30,000
Potosi, 16,700	La Paz, 20,000

BOOK LXXXIX.

CHILI.

Area, 170,000 square miles; population, 1,080,000.

Chili extends along the Pacific 1,150 miles, with a breadth of 88 to 130 miles, its eastern boundary being marked by the Andes. The greater part of the country is rugged, but there are some fertile valleys. In the southern part, the country is very picturesque and pleasant, but in the northern part it is rugged and barren. The climate is very healthy. The productions are similar to those of the northern temperate zone, but agriculture is in a backward state.

Chili is rich in minerals, especially in the northern part, where are found gold, silver, iron, copper, lead, quicksilver, antimony, arsenic, &c. Bituminous coal is also found. The product of the silver and copper mines is very considerable, but the rugged nature of the country and want of water are great impediments to mining. The business, aided by foreign capital, is pursued with more enterprise than in the other countries of the Andes, and the inhabitants generally exhibit more energy and industry than the other Spanish South Americans. The foreign commerce of Chili is considerable.

The chief towns are, —

Population.	Population.
Santiago, the cap., 80,000	Coquimbo, . . . 8,000
Valparaiso, . . . 60,000	Quillota, . . . 8,000
San Felipe, . . . 12,500	Ballenar, . . . 7,000

LA PLATA, OR THE ARGENTINE REPUBLIC.

Area, estimated at 820,000 square miles; population, estimated from 600,000 to 2,000,000; about 800,000 is probably more nearly correct, exclusive of the independent Indians.

From the Andes, which form the western boundary of La Plata, there are lateral ranges of mountains extending into the great plains from 100 to 200 miles; in the eastern part, around the River Paraguay, the country is hilly, and in the south-western part, are ranges of hills. But the greater part of the territory opens into vast plains or pampas, which afford pasturage to immense numbers of cattle and horses. The cultivated land is along the banks of the rivers, but agriculture is in a backward condition. In some portions of the northern country cotton, rice, sugar-cane, and tobacco are grown, and in the south, wheat, maize, and other grains. The principal wealth of the country is its herds, and upwards of 3,000,000 hides of horned cattle, and 250,000 horse hides are exported annually. The river La Plata and its tributaries afford thousands of miles of navigable waters, and supply the only facilities for transportation. The main rivers are open to the commerce of the world.

In the mountainous districts, gold, silver, copper, and iron are found, but are not extensively mined, though some of the ores are said to be very rich. Coal is said to be abundant in the south-western provinces.

The number of states or provinces is 13. The chief towns are,—

Population, (1854.)	Population, (1854.)
Buenos Ayres, the capital, . . . 85,000	Corrientes, . . . 12,000
of which number one fifth are foreigners.	Cordova, . . . 15,000
Santiago, . . . 5,000	Mendoza, . . . 12,000
	Tucuman, . . . 12,000
	Salta, . . . 10,000

Civil wars and dissensions for a long time have prevented the improvement and development of this fine country; but it is hoped that a new era has commenced.

URUGUAY.

Area, 75,000 square miles; population, 250,000.

The republic of Uruguay lies north of the River La Plata, and between the River Uruguay and the Atlantic, being bounded north by Brazil. The territory is a vast undulating plain, with the central parts somewhat elevated and broken by ridges and hills of moderate height. The climate is humid, but temperate and healthy. The extensive plains are covered with rich pasturage, and are roamed over by vast herds of cattle and horses, which form the chief source of the wealth of the country. The soil, where cultivated, is good, and wheat and other cereals, maize and other products of the temperate zone, flourish, but the agriculture is rude and limited. Wars with Buenos Ayres and the Argentine Republic have prevented the development of the resources of the country, but the prospect is now more encouraging; and as the laws offer liberal inducements to immigration, Uruguay

may become a rich and thriving country, and Monte Video the commercial emporium of the River Plata.

The chief towns are,—

Population.	Population.
Monte Video, the capital, . . . 15,000	La Colonia, . . . 2,500
	Maldonado, . . .

PATAGONIA.

Area, including islands near the western coast, 350,000 square miles. The population, composed of savages, is unknown, and there are no sufficient data on which to estimate it.

Patagonia comprises all the territory south of the Rio Negro, the southern boundary of La Plata. The Andes extend through Patagonia to the Strait of Magellan, (or Magalhaens,) and among them are several volcanoes. The highest peak known is 8,030 feet high. The eastern part of the country is generally low and level, but there are vast pampas, or table lands, elevated above the lowest plains. There are no settlements of whites.

Terra del Fuego.—This is a large group of islands at the southern extremity of South America, from which they are separated by the Strait of Magellan. They are barren and inhospitable islands, inhabited by savages.

Falkland Islands.—A group of nearly two hundred islands, east of the southern extremity of South America. Only two are of considerable size. The islands are not attractive in appearance, and are destitute of trees, but have a variety of flowering shrubs and plants, and grass. There are numerous herds of wild cattle and horses, the progeny of animals carried there by early Spanish expeditions. The islands belong to the British, who have a settlement in East Falkland, called Stanley.

BOOK XCI.

BRAZIL.

Area, 3,004,460 square miles, or, by other authority, 3,956,800 square miles; population, 6,065,000. In this number are included 3,500,000 slaves, 500,000 free persons of color, and the savage tribes are not included.

The surface of Brazil is about equally divided into upland and lowland, the former comprising the hilly districts and table lands of the eastern, southern, and central parts, and the latter comprising the woody districts of the Amazon and the llanos or plains of the northern and north-eastern parts. There are several mountain ranges of moderate elevation, the principal of which is nearly parallel to the Atlantic coast. The highest mountain peak is the isolated mountain of Itambe, which is estimated to be 8,426 feet high. The river system is hardly equalled in any other country, and affords great facilities for communication and transportation. Steam navigation is now introduced on some of the most important rivers.

Brazil has been famous for its gold and diamonds, being richer in the latter than any other country. The amount of gold found has greatly diminished of late years, the auriferous sands being mostly exhausted.

The most valuable products are the agricultural, coffee and sugar being produced in large quantities; and in the different parts of the country various fruits and grains of the tropics and temperate zones yielding abundantly. The quantity of coffee annually produced is now about 500,000,000 pounds, and is constantly increasing. In 1857, nearly 200,000,000 pounds were exported to the United States, and a little more than that to Europe. The total export of sugar is about 300,000,000 pounds.

The government of Brazil is an empire, but it is a representative and constitutional monarchy, and exceedingly liberal. Education is cared for, internal improvements fostered, the general interests of commerce promoted, the freedom of the press secured, and the elective franchise enjoyed to some extent. Slavery exists, but manumission is easy, and the emancipated slave finds all positions and offices open to him. The stability of the government and its internal peace have given advantages to Brazil not enjoyed by the other South American states, and it is by far the most prosperous and important.

The chief towns are, —

	Santarem, . . . 10,000

BOOK XCII.

GUIANA.

Area, estimated at 94,000 square miles, (sometimes much larger,) but the boundaries are so uncertain that an accurate estimate is impossible. A portion of what was formerly called Guiana is now comprised within the limits of Brazil. The coast is low and flat, and for a distance varying from 40 to 70 miles the country preserves the same low and flat surface, its average elevation being scarcely above high water, and in some places dikes being necessary to keep out the sea. Beyond that there are low hills, and then an elevated plateau, and occasional ridges and hills, succeeded by another low plain, and in the south-west a chain of mountains of moderate height. The soil is very fertile, and the low lands are covered with water during the rainy season, which leaves a rich deposit. The climate is equable, and not excessively hot, and, except in some localities, is healthy and pleasant. Vegetation is luxuriant, and there is a magnificent growth of timber, much of which is very valuable. The cultivated crops are sugar-cane, tobacco, rice, indigo, maize, coffee, &c. The culture of cotton is now nearly abandoned. Among the native fruits are pine-apples, guavas, cacao, &c.

Guiana is divided into the three colonies of British, Dutch, and French Guiana.

British Guiana, or Demerara. — Area, about 50,000 square miles; population, (1851,) 135,994; of whom 96,467 are whites, 7,682 coolies, and 14,251 negroes, the Indian tribes not being included. The European settlements extend along the coast, and about 50 miles inland on the rivers Demerara, Berbia, and Corentyn. The productions are sugar, molasses, rum, coffee, timber, dyestuffs, &c.

The colony is divided into three counties, Demerara, Essequibo, and Berbia.

The chief towns are, —

Population.	Population.
Georgetown, the cap., 25,508	New Amsterdam, 5,000

Dutch Guiana, or Surinam. — Area, about 30,000 square miles; population, (1856,) 52,533, of whom five sixths are negroes. The productions are similar to those of British Guiana.

The chief town is, —

Paramaribo, the capital, population, 20,000

Slavery was abolished in Dutch Guiana in 1851, but the negroes were required to work as apprentices till 1863.

French Guiana, or Cayenne. — Area, 14,000 square miles; population, (1851,) 17,625; a large decrease since 1836, and a decrease of 2,170 since 1846. The soil and general character of the country is like those of the last two, but the climate is not so healthy as that of British Guiana, and the productions are the same, with the addition of pepper and spices. Since 1848 the colony has been a penal settlement.

The chief town is, —

Cayenne, the capital, population, (1853,) 3,000

BOOK XCIII.

WEST INDIA ISLANDS, OR "COLUMBIAN ARCHIPELAGO."

This Archipelago is divided into three groups, the Bahama Isles, the Greater Antilles, and the Lesser Antilles, or Caribbean Isles. Besides these there are several islands along the coast of South America, which are sometimes called the Lesser Antilles. The entire area, including the small islands, is about 90,000 square miles; population, about 3,590,000.

The islands are mostly in the possession of European powers, the extent of whose colonial possessions here on the inhabited islands is as follows: —

	Area in Square Miles.	Population.
British,	13,000	800,000
Spanish,	38,500	1,600,000
French,	1,026	250,500
Dutch,	450	27,000
Danish,	195	41,000
Swedish,	35	18,000

The following table shows the area, population, and dominion of the principal islands: —

BAHAMA ISLES.

These number some 500 in all, but many are mere coral rocks. They are the least productive and valuable of the great groups. The chief articles of export are salt, (from Turk's Island, principally,) sponge, dyewoods, mahogany, and a little cotton. Nassau, on the island of New Providence, is the capital; population, 7,000.

GREATER ANTILLES.

Cuba is the largest and richest of the West India Islands. The latest estimates of its area are from 42,383 to 45,277 square miles. A range of mountains extends longitudinally through the island, spreading at the eastern end so as to occupy the greater part of the surface, and reaching an altitude of about 8,000 feet. From the bases of the mountains, or highlands, the country opens into extensive plains and meadows, every where covered with the most luxuriant vegetation of the tropics.

Cuba is not deficient in mineral wealth, though its resources in this respect have not been developed or explored. Copper is mined in considerable quantities, and coal has been found near Havana, but not yet mined to any extent. The climate is equable and generally healthy, the thermometer seldom rising above 82° in summer, or sinking below 55° in winter. The forests abound in valuable timber trees, such as mahogany, cedar, and ebony. The principal cereal crop is the indigenous maize, of which two crops are raised annually. Rice is also grown extensively. The principal crops for export are sugar, coffee, tobacco, with some cotton, indigo, and cocoa. Cattle are also raised in the higher portions of the island. Oranges and other tropical fruits are abundant

In 1852, there were on the island 7,979 tobacco plantations, 1,560 sugar plantations, 1,218 coffee plantations, 5,128 cattle farms, 224 cotton plantations, 34 cocoa plantations, &c.

From 1853 to 1858, the yearly exports of sugars were from 700,000,000 to 750,000,000 pounds. The cultivation of coffee is not so extensive as formerly.

In 1857, there were 397 miles of railroad in *Cuba*, and steamboats ply between the different ports. The electric telegraph extends between the principal towns.

The population of *Cuba*, in 1857, was 1,096,943, of whom 549,674 were whites, 174,810 free colored, and 374,549 slaves. To this may be added 5,240 emancipados, and 5,308 coolies. It is supposed that the census is not complete, the number not reported being chiefly slaves.

The government is vested in a viceroy, who is the head of all departments, civil and military, and is responsible only to the Spanish government.

The chief towns are, —

	Population, (1853.)	Population, (1853.)
Havana,	134,225	Santiago de Cuba, 24,253
Puerto Principe,	26,684	Trinidad, 14,119
Matanzas,	26,000	Guanabucoa, 8,100

Porto Rico, the other principal island belonging to Spain, is the fourth in size of the Greater Antilles. It lies east of Hayti, from which it is separated by the

Mona passage. A range of wooded mountains runs through the island from east to west, the highest peak of which is 3,678 feet high. In the interior are extensive savannas, on which numerous herds are pastured. On the north side are numerous navigable lagoons, but few safe harbors. The soil is every where fertile, though but a small proportion of it is under cultivation, and the climate is more salubrious than in the other islands of the Antilles. Gold is found in some of the streams flowing from the mountains, and copper, iron, lead, and coal have been found, but are not mined in any quantity. The agricultural products are sugar, rum, molasses, coffee, tobacco, rice, hides, dyewoods, timber, &c.

The island is governed by a captain-general, with powers similar to those of the captain-general of Cuba.

The population, by recent estimates, is about 500,000, of whom 50,000 are slaves.

The chief towns are, —

Population.	Population.
San Juan, the capital, (on a small island off the N. coast)	12,000
Guayamas,	5,000
Mayaguez,	

Hayti, or *St. Domingo*. — The second in size of the Greater Antilles, lying south-east of Cuba, from which it is separated by the Windward Passage. The island is very irregular in form, and the numerous indentations of the coast afford many excellent harbors.

There are three chains of mountains connected by transverse chains, and between them are extensive savannas, the principal of which is the Vega Real, or Royal Valley, 130 miles long, and watered by the rivers Yagui and Yuma. The highest mountain peak is in the central chain, and is 7,200 feet high. There are numerous rivers, mostly flowing west, south, or east. Most of them are obstructed by sand bars, and are not navigable. There are many lakes in the island, two of which are salt. The minerals are gold, silver, platinum, mercury, copper, iron, tin, sulphur, manganese, antimony, &c. The gold mines have been abandoned, and but little is done with the other minerals for want of capital and machinery.

The climate is hot and moist, but generally salubrious. The soil is fertile over the entire island. The mountains are covered with the most valuable timber, — mahogany, cedar, lignum-vitæ, &c., — and on the lower grounds are great varieties of tropical fruits, vegetables, and flowering plants. The staple articles of agriculture are coffee, cacao, sugar, indigo, cotton, and tobacco, but the production is not so great as formerly, the natural products of the island being now exported to a greater extent. The island is capable of producing great quantities of all the above articles, but agriculture is in a primitive state, and is pursued without vigor or enterprise.

Hayti has been subject to destructive earthquakes, the last most serious one of which was in 1842, when many towns were destroyed, and thousands of lives were lost.

The island is politically divided into two republics, the black republic of Hayti in the west, and the Dominican republic in the east, corresponding mainly

to the territory of the French and Spanish colonies respectively.

The republic of Hayti contains about 10,000 square miles, and a population estimated at 550,000 to 572,000. The annual value of exports is stated at about \$6,000,000.

The chief towns are, —

Population.	Population.
Port au Prince, the capital,	25,000
Cape Haytien,	6,000
Gonaives,	
Jacmel,	6,000
Jeremie,	5,000

The Dominican republic comprises nearly three fifths of the island, or an area of 17,500 square miles. The population is about 136,000, of whom one tenth claim to be whites, the remainder being of African and mixed descent. The agricultural resources of the republic are very great, and the mineral resources are considerable, but neither are developed. Political disturbances and revolutions have retarded its progress. The most recent is the renewal of the sovereignty of Spain, which has recently been brought about, (1861.)

The chief towns are, —

Population.
San Domingo, the capital,
Santiago de los Caballeros,

Jamaica. — The third in size of the Greater Antilles, and the largest of the British West India Islands, lies south of Cuba. There is a range of mountains, called Blue Mountains, extending through the island, the highest of which are Blue Mountain Peak, 7,770 feet high, and Portland Gap Ridge, 6,501. According to other authorities the highest peaks are 8,184 and 7,656 feet high. From these mountains more than 200 streams flow into the sea, the largest of which, Black River, is navigable for small vessels about 30 miles.

Lead is found in some quantities, and copper, silver, zinc, antimony, iron, and some gold have been found, but, with the exception of copper, are not mined. But the vegetable productions form the chief source of the wealth of the island. The forests furnish quantities of the most valuable timber, as rosewood, satinwood, mahogany, lignum-vitæ, ebony, cedar, logwood, &c. Coffee is cultivated on the high grounds; the low grounds yield abundantly the sugar-cane, cacao, pimento, ginger, indigo, tobacco, plantain, banana, yam, &c., while the pine-apple, orange, lemon, fig, and a variety of other tropical fruits are plentiful; and the grape and apple are also grown in some parts of the island. Sugar, rum, ginger, pimento, and coffee are the principal articles of export, but none of these, except pimento, is exported so extensively as before the emancipation of the slaves, in 1833.

The climate is very hot on the low lands, but among the mountains it is much cooler, and ice is sometimes formed on the highest peaks. On the low lands it is unhealthy, fever and ague prevailing in some parts, and the yellow fever and cholera are sometimes very destructive.

By the census of 1844, (the last previous to 1861,) the population was 377,433, of whom 15,776 are whites, and the remainder negroes and mulattoes. In 1849, Governor Grey estimated the population at

400,000. Between 1840 and 1856, about 18,000 coolies and other emigrants were brought into the island, while in 1850 and 1851 nearly 40,000 persons died of cholera and small pox.

There is a railway from Kingston to Spanish Town, and communication by steam with England semi-monthly. The island is divided into three counties.

The chief towns are, —

	Population.		Population.
Spanish Town, the capital, . . .	7,000	Montego Bay, . . .	4,000
Kingston, . . .	32,000	Falmouth, . . .	
		Port Royal, . . .	

LESSER ANTILLES.

Of the Lesser Antilles, the principal islands of the Windward group belong to the British, with the exception of Martinique, which belongs to the French.

Trinidad is the largest, and is the southernmost of the Lesser Antilles, being at the mouth of the Gulf of Paria, in South America. Much of the island is rugged and mountainous, some of the peaks being 3,000 feet high, but there are extensive plains and savannas. In the south-western part are several mud volcanoes. The island is covered with a perpetual verdure, is well watered, and seldom subject to droughts. The climate is healthy, and the soil is generally very fertile. The mountains are covered with timber of the most valuable kinds, and in the open lands sugar-cane, cocoa, or cacao, coffee, and cotton are grown. The population, in 1851, was 68,645.

The chief town is, —

Port of Spain, the capital, and a beautiful town; pop., 11,700.

Barbadoes is the oldest British colony in the West Indies, and is the residence of the governor of the British possessions in the Windward Islands. Its chief mineral is bituminous coal. It is healthy, and the soil is very fertile. Of 106,470 acres, which the island contains, 100,000 are cultivated, and 40,000 are planted with sugar-cane, of which the yield is abundant, and the export has increased, while in other islands it has decreased. It is very densely populated, and in a flourishing condition.

The chief town is, —

Bridgetown, the capital; population, 25,000

Of the other British islands of the Windward group, —

Tobago is for the most part rocky and rugged, with some fertile valleys, and lowlands and plains in the southern part. The climate is unhealthy. The principal product is sugar. The chief town and capital is Scarborough.

Saint Lucia is of volcanic origin, and has several mountain peaks, which were evidently volcanoes. The soil is very fertile, but the climate is insalubrious. The principal product is sugar. The chief town is Castine, the capital.

Saint Vincent is also of volcanic origin, and has a chain of mountains running through it from north to south, with lateral branches. The low land is very fertile, the principal product being sugar. The chief town is Kingstown, the capital.

Grenada is another volcanic island, with a chain of

mountains extending through it. It is a beautiful island, with a rich soil, well watered and wooded. The principal production is sugar, though cotton was formerly cultivated.

Martinique belongs to the French. It is a volcanic island, with high mountains, and valleys of great fertility. The highest peak is 4,450 feet high, and there are six extinct volcanoes on the island. The principal productions are sugar, coffee, cocoa, and cotton. The chief town is St. Pierre.

In the Leeward Islands the British possess nine. Of these, the most important are as follows: —

Antigua, which has rugged coasts and a diversified interior, with a climate of remarkable dryness. It produces sugar and grain. Chief town and capital, St. John's.

St. Christopher, or *St. Kitts*, an island of volcanic origin, with a high peak in the central part, from which the land slopes on all sides to the sea. The climate is dry and healthy, and the soil fertile and highly cultivated, the principal production being sugar.

Dominica, the most elevated of the Lesser Antilles, the highest peak being 5,314 feet. It has fertile valleys, and abounds in valuable timber. The products are sugar, coffee, cocoa, &c. The other British islands of this group are of less importance.

The French possess four, and part of another in this group. The most important of these is, —

Guadaloupe, which is composed of two distinct islands, separated by Salt River, a narrow stream or strait. The surface is rugged in that part called Guadaloupe Proper, which is of volcanic origin, and there are high mountains, the most prominent of which is La Souffriere, which is 5,108 feet high. The other part is low and flat. The climate is hot and unhealthy; the soil of the valleys is fertile and well cultivated, and in the mountainous parts are fine forests. The chief product is Tahiti and sugar-cane. The island is subject to destructive hurricanes. A severe earthquake took place here in 1843, when Point à Petre, an important seaport, was destroyed, and other places damaged.

St. Martin belongs to the French, and south part to the Dutch. It is a hilly island, and the climate is tolerably healthy. The French portion is the most fertile, sugar being a chief product. Many cattle are also reared. The population of the two colonies is about equal. The other French islands are of little importance.

St. Bartholomew, the only Swedish colony in America, is a small island, quite fertile, but destitute of fresh water. Its products are sugar, cotton, tobacco, and cocoa.

The Danish West India possessions consist of three islands, belonging to the Virgin group, the largest of which is, —

Santa Cruz, or *St. Croix*. — This island is generally flat, and is well watered and fertile. A large proportion of the soil is under cultivation, the principal crop being sugar-cane, though some indigo, coffee, and cotton are raised. Christianstadt is the chief town and capital.

The other Danish islands, *St. John* and *St. Thomas*,

are not very productive, but St. Thomas is a place of great commercial importance, having a free harbor, and being the centre of trade for some of the other islands.

Tortola, the principal British island of the Virgin group, is a hilly island, fertile but unhealthy. The other British islands are of little importance.

The islands on the South American coast are sometimes called the Lesser Antilles, while the Windward and Leeward groups are called the Caribbee Islands. There are seven principal islands, of which the Dutch possess four, and three belong to Venezuela. The only two of importance are *Curaçoa*, (Dutch,) and *Margarita*, (Venezuelan.) *Curaçoa* is somewhat rugged and hilly. Iron and copper are found there, but not mined. The soil is not rich, and is destitute of water, though some sugar, indigo, and cotton are raised. The chief article of export is salt, which is of the finest quality. *Margarita* is arid and barren on the coast, but the interior is fertile, producing maize, sugar, coffee, cotton, &c. There are some minor manufactures, and considerable trade is carried on with some of the West India islands.

BOOK XCIV.

EUROPE.

Area, 3,830,000 square miles; population, about 270,000,000.

The general description of Europe, which is the most fully known of all the grand divisions of the earth, its physical geography, &c., are fully given in the text. The present condition of its political geography is as follows, in the order of the text:—

BOOKS XCVII. — C.

EUROPEAN TURKEY.

Area, including Wallachia, Servia, and Moldavia, 203,628 square miles; population, 15,500,000.

Of the inhabitants, 3,800,000 are Mohammedans.
 11,370,000 Greeks and Armenians.
 260,000 Roman Catholics.
 70,000 Jews.

The tenure of the Ottoman empire in the Danubian provinces is somewhat uncertain, and is still a matter of dispute among the great powers of Europe. It is most probable that the European part of the Ottoman empire, which is not its most important part, and contains but a small proportion of Mohammedans, the natural supporters of the empire, will gradually diminish under its native weakness and the jealousy and influence of the great powers. The present sultan (1862) is, however, introducing reforms which will strengthen his empire.

The chief towns and population are, —

Constantinople; pop., (including suburbs,) about . 800,000

The suburbs of Constantinople, 15 in number, are like independent cities in some respects. About one half the population are Mussulman.

	Population.		Population.
Adrianople, . . .	160,000	Rodosto,	40,000

BOOKS CIV. — CXII.

RUSSIA IN EUROPE.

Area, 2,142,504 square miles; population, 60,098,821.

Russia is divided as follows, for administrative purposes:—

	Area in Sq. Miles.	Population, (1851.)
Great Russia,	893,913	20,700,497
Little Russia,	81,213	6,046,467
South Russia,	176,329	4,234,329
West Russia,	162,757	8,021,510
Baltic Provinces,	57,809	2,216,936
Finland,	146,489	1,636,915
Kezan,	250,480	6,990,580
Astrakhan,	323,420	5,939,532
Poland,	49,734	4,852,055
Total,	2,142,504	60,098,821

The government of Russia is an absolute monarchy, the supreme power being vested in the czar. Although sometimes termed a despotism, under the late emperors the despotic power has been somewhat relaxed, and the present czar, Alexander II., has taken steps for the emancipation of the serfs. The military power of Russia is greater than that of any other country, the army numbering nearly 800,000 men; and the navy, notwithstanding the limited seacoast and commerce, numbers 60 ships of the line, 37 frigates, 70 corvettes and small vessels, and 40 steamers, the whole carrying 9,000 guns, 42,000 seamen, and 200,000 marines and artillerists.

BOOKS CXIII., CXIV.

POLAND.

This kingdom has been divided between Russia, Austria, and Prussia. Successive partitions occurred from 1772 to 1795, which nominal protectorates finally resulted in the absolute partition, and the parts are now incorporated into the dominions of the above-named powers. The attempt of the Poles to establish their independence in 1830, had the effect to bind the chains more tightly, and the country was then made integral parts of Russia, Austria, and Prussia. The republic of Cracow, established by the allied powers in 1815, existed till 1846, when it was seized by Austria, and incorporated with her portion of Poland, the kingdom of Galicia. A new insurrection has recently occurred, (1863.)

BOOKS CXV., CXVII., CXX.

PRUSSIA.

(Partly included under the head of Germany in the text.)

Area, 109,314 square miles; population, (1852,) 16,935,420.

The principal provinces of Prussia are Prussia Proper, Posen, Brandenburg, Pomerania, Silicia, Saxony, Westphalia, Rhine. The principalities of Hohenzollern have lately been added to Prussia. Of the population, about 10,000,000 are Protestants.

In education, Prussia has taken the lead of the European nations. In 1849, the number of schools established by government was, —

	Teachers.
Elementary schools,	24,201 30,865
Higher schools,	505 2,269
Upper female schools,	385 1,918
Gymnasia,	117 1,664

Pupils attending, 2,605,408; Universities, 7; Normal seminaries, 46.

The army, (regular,) on a peace footing, numbers about 250,000; the Landwehr, or provincial army, numbers about 350,000. The navy consists of about 60 vessels, with 300 guns.

BOOKS CXVI. — CXXIX.

GERMANY.

The area of the states, kingdoms, and principalities of the Germanic Confederation is about 235,000 square miles, and the population about 42,000,000.

The confederation comprises a third part of Austria, nearly all of Prussia, a part of Denmark, (the duchies of Holstein and Lauenburg,) the duchy of Luxemburg, besides twenty-nine independent states and four free cities. The confederation is for defensive purposes and the regulation of commerce, to some extent, and its head is the Emperor of Austria, though there has long been a rivalry between Austria and Prussia for a controlling influence in the confederation. Those parts of the confederation belonging to Austria, Prussia, &c., are more properly comprised under those countries. The twenty-nine independent states and four free cities compose

GERMANY PROPER.

Area, about 90,000 square miles; population, about 16,000,000.

BOOKS CXXV. — CXXIX.

AUSTRIA.

Area, about 250,000 square miles; population, about 34,000,000.

The provinces of Austria are, —

Lower Austria,	Silicia,
Upper Austria,	Galicia,
Salzburg,	Bukowina,
Styria,	Dalmatia,
Carinthia,	Venetia,
Carniola,	Hungary,
Littorale,	Servia,
Tyrol and Vorarlburg,	Croatia and Slavonia,
Bohemia,	Transylvania,
Moravia,	Military Frontier.

Lombardy was included in the Austrian empire till 1859, when it was liberated from Austrian rule, and

forms a part of the new kingdom of Italy, reducing the area of Austria about 8,000 square miles, and the population about 2,700,000. Of the population, 7,000,000 are Germans, 15,000,000 Slavonians, 6,000,000 Magyars, 5,000,000 Italians, and the remainder Jews, Gypsies, Tartars, and Greeks.

The army of Austria consists of about 450,000 men in time of peace, which may be increased to 650,000 in time of war. The navy consists of 100 vessels, (mostly small,) with 700 guns.

BOOKS CL.—CIII.

HUNGARY,

Though named as a separate political division, is a part of the Austrian empire, and after the unsuccessful attempt at revolution, in 1848, the Hungarian constitution was abrogated, and it has been made less independent than before. Certain reforms have been instituted in 1861, apparently for the restoration of some of the independence of the ancient kingdom, together with its constitution, but they have not yet proved satisfactory to the Hungarians, and another revolution is not improbable. Croatia and Slavonia, formerly connected with Hungary, together with the Transylvania countries and other provinces, in 1848, were disconnected, and placed under different governments.

Hungary, thus reduced, contains 83,724 square miles, and a population of 7,864,262.

The chief towns are,—

Population.	Population.
Presburg, . . . 38,000	Buda, 40,500
Pesth, (1854) . 100,000	

BOOK CXXX.

SWITZERLAND.

Area, 15,261 square miles; population, 2,390,116. Switzerland still retains its territory and government as established by the congress of Vienna in 1815.

The chief towns and their population, by census of 1850, are,—

	Population.
Basil, in Canton of Basil,	27,313

Lucerne, " Lucerne,	10,068
St. Gall, " St. Gall,	11,234

BOOKS CXXXI.—CXXXVI.

ITALY.

The kingdom of Italy, as established by conquest and revolution in 1859 and 1860, comprises all of the country usually known by that name, except the States of the Church and Venetia, or Venice, and the little republic of San Marino, and the principality of Monaco, both of which latter states are insignificant in extent of territory and population. The several kingdoms and

duchies, except those above named, have been united under the constitutional monarchy of Sardinia, which has thus expanded into the kingdom of Italy. Lombardy was wrested from the Austrians by the Sardinians, aided by the French. The duchies of Tuscany, Parma, and Modena were revolutionized with the aid of Sardinia, and annexed to the latter kingdom by popular vote. Naples and Sicily were subsequently annexed in a similar manner. Austria still holds Venetia, and the States of the Church are still under the dominion of the pope, protected by French troops; but the indications are, that these important parts of the country may also be annexed to the new kingdom of Italy. Nice, a city in Piedmont, with its surrounding territory, and a part of Savoy, have been annexed to France.

The kingdom of Italy comprises,—

	Area in Square Miles.	Population.
Piedmont and Sardinia,	28,229	5,090,245
Lombardy, ^a	about 8,000	about 2,700,000
Tuscany, (including Lucca,)	8,586	1,807,000
Parma,	2,766	507,881
Modena,	2,073	605,194
Naples and Sicily,	41,906	8,704,472
Total,	91,560	19,204,742

The capital of the kingdom is Turin; population, 143,157.

The other chief towns and population (1851-2) are,—

Population.	Population
Milan, 161,966	Pisa, 25,000
Naples, 416,475	Lucca, 22,000
Florence, 114,000	Palermo, in Sicily, 167,222
Genoa, 120,000	Messina, " . 97,074
Leghorn, 78,060	Catania, " . 54,167
Parma, 40,900	Cagliari, in Sar-
Modena, 32,000	dinia, 30,000
Piacenza, 29,000	

Monaco, a small principality, between Nice and Genoa, comprising an area of 53 square miles, and containing a population of 6,800, is nominally independent, but virtually under the protection of the king of Italy.

The Papal States, Pontifical States, or States of the Church.—These states occupy the same territory, substantially, in the central part of Italy, as described in the text. Area, 17,210 square miles; population, (1850,) 3,006,771.

The chief towns and population are,—

Population, (1852.)	Population, (1852.)
Rome, 175,838	Ancona, 36,000
Bologna, 75,000	

San Marino, a small republic, comprising only 22 square miles, and containing a population of 7,600, is surrounded by the Papal States.

Austrian Italy now comprises the territory of Venetian Italy, Lombardy having been annexed to Sardinia, and now forming a part of the kingdom of Italy. Area,

^a The boundaries do not exactly correspond with those of the former Austrian province of Lombardy.

about 17,800 square miles. The population of the territory is about 2,300,000.

The chief towns are,—

Murcia,	55,000	Saragossa,	30,000
Valladolid,	30,000	Santiago,	29,000
Malaga,	68,577	Carthagena,	28,000

The colonial possessions of Spain are,—

	Area in Sq. Miles.	Population.
In West Indies,	39,779	1,511,660
In Asiatic Islands,	52,148	2,679,500
In Africa,	516	17,071
In Oceanica,	592	

During the last fifteen or twenty years, Spain, having been comparatively free from internal dissensions,

has increased in prosperity and national power, although her policy is by no means a liberal one.

BOOKS CXL. — CXLVI.

FRANCE.

Area, including Corsica, 200,671 square miles ; population, (1852,) 35,779,222.

The province of Nice, or department of Maritime Alps, was annexed to France, by treaty, in 1860, adding some 40,000 to the population. It had, at different periods, previously belonged to France.

The foreign or colonial possessions of the French empire are as follows:—

	Area in Sq. Miles.	Population.
Algeria,	90,000	2,119,264
In West Africa, (Senegal,)		14,876
Bourbon, (island in Indian Ocean,)	1,000	108,000
St. Marie, " " "		4,000
Asiatic Possessions,		170,000
In West Indies, (Martinique, Guadeloupe, St. Martin, Saintes Group, &c.)	1,200	270,718
In South America, (Guiana,)	27,560	19,795
St. Pierre and Miquelon, (islands on coast of N. America, near Newfoundland,)	85	2,000
In Oceanica, (the Marquesas, Taiti, New Caledonia, &c.) area and population unknown.		

The imports into France, in 1851, were \$231,600,000 in value, of which \$27,400,000 were from the United States, and \$24,400,000 from Great Britain. The exports for the same year amounted to \$325,800,000, of which \$54,600,000 were to the United States, and \$59,000,000 to Great Britain. The exports of silks amounted to upwards of \$40,000,000 ; of wines, to \$16,000,000. In 1853, the number of miles of railway in operation was 2,303, and 1,100 miles were in course of construction.

Under the Emperor Napoleon III. the military power of France has been increased, and is one of the most formidable, though not the greatest numerically, in Europe. The army numbers upwards of 400,000 men. The navy comprises 300 sail vessels, including upwards of 50 of the very largest class, and nearly 200 steam vessels, many of the largest class, and several steel or iron plated.

The chief towns in France are,—

	Population.		Population.
Paris,	1,053,262	Lyons,	156,169

Cork, . . .	84,485	Limerick, . . .	55,268
Galway, . . .	24,697	Waterford, . . .	25,297
Sligo, . . .	11,209	Kilkenny, . . .	20,283

The smaller islands belonging to Great Britain are,—

^a By the census of 1851, the details of the last census not having been received.

Shetland Isles, comprising about 100 islands, and a large number of rocky islets. About 30 are inhabited, and 70 used for grazing. Area, 5,300 square miles; population, 31,000.

Orkney Isles, comprising 29 inhabited islands, 38 grazing islets, and numerous rocks. Area, 600 square miles; population, 30,500.

Hebrides, comprising 160 islands, 70 of which are inhabited. Estimated area, 3,180 square miles; population, about 100,000.

Scilly Isles, consisting of about 100 small islands and rocks, only six of which are inhabited. Area, about 40 square miles; population, 3,000.

Isle of Wight. Area, 136 square miles; population, 50,324.

Anglesea, (a county of Wales.) Area, about 270 square miles; population, 50,891. It is connected with the main land by a splendid suspension bridge across the Menai Strait, and also by the Britannia Tubular Bridge, on which a railroad track is laid,—opened in 1849.

Holyhead, a small island near Anglesea, from which it may be reached by a ford at low water.

Isle of Man.—Area, 280 square miles; population, 52,000.

The colonial possessions of the British Empire are far more extensive than those of any other power, and make it the greatest empire of the world. Its possessions are,—

In Europe.—

	Area in Sq. Miles.	Population.
Helgoland, in North Sea,	5	2,300
Gibraltar, a military station,	1	13,123
Malta and Gozo,	130	119,247
Ionian Islands,	1,092	219,797
<i>In Africa</i> ,	135,799	940,426
<i>In Asia</i> ,	1,472,837	172,684,616
<i>In America</i> ,	3,194,790	3,634,874
<i>In Australasia</i> ,	3,431,156	632,213

Making the total area of the British Empire 8,356,781 square miles, and the population 205,884,357.
